the extraordinary expenditure caused by the Crimean war of 1854-'56, and the Franco-Sardinian war against Austria in 1859, has increased the indebtedness to near \$12,000,000,000. Before the last oriental war the proportion of the public indebtedness to the population was, in all Europe, \$35.28 per head, in Holland \$187.92, in Hamburg \$129.60, in Great Britain \$128.52, in Spain \$120.96, in Lübeck \$92, in Frankfort \$73.44, in France (1858) \$46. Only a few states of the fourth rank were entirely free from debt, viz.: Lichtenstein, the principalities of Lippe and Reuss, Mecklenburg-Strelitz, Modena, Waldeck, and San Marino. The paper currency of Europe amounted about 1850 to \$846,000,000, but it has since been increased, so that its aggregate amount undoubtedly exceeds \$1,000,000,000. The amount of coin was approximatively stated at \$1,700,000,000 in 1850.—The military establishments of Europe include in time of peace 2,781,000 men, kept at an expense of \$300,000,000. The proportion of the principal powers is:

Countries.	Men.	Expenditure.
Russia 790,000\$54,720,000
Germany:		
Austrian empire..	530,000.....	\$41,040,000
Prussia.....	129,000.....	19,440,000
Lesser states.....	161,000.....	12,960,000
 820,000 73,440,000
France (exclusive of Algiers) 885,000 59,000,000
Turkey 133,000 15,000,000
Gt. Britain & Ireland 102,000 45,000,000

The navies of Europe consist of over 3,000 vessels, carrying over 30,000 guns, with 250,000 men, at a yearly expenditure of over \$125,000,000.

EUROTAS, in ancient geography, a river of Greece, in Laconia, which had its source near the frontiers of Arcadia, flowed by the city of Sparta, and emptied into the gulf of Laconia. The Spartans rendered to it divine honors, and its banks, shaded by olives, laurels, and myrtle trees, were very beautiful.

EURYDICE, the name of several historical and mythological persons, the best known of whom was the wife of Orpheus. Persecuted by Aristæus, she trod in her flight upon a snake, and was bitten to death; her husband followed her to the regions below, and by the charm of his lyre obtained from Pluto permission for her to return; but lost her again, having broken the condition of not looking back after her.

EUSEBIUS, surnamed PAMPHILI, to commemorate his friendship with the martyr Pamphilus, the father of ecclesiastical history, and next to Origen the most learned of the Christian teachers of antiquity, born in Palestine about A. D. 264, died about 340. He early devoted himself to the study both of Christian and pagan antiquities, visited the monks of the Thebais, in Egypt, witnessed and shared the persecutions to which the Christians of that region were subjected, and gathered those incidents and confessions which he has transmitted to us in his history. About 314 he became bishop of Cæ-

sarea. In his time Arianism began to be formidable, and, regarding the controversy as of less vital importance than most of his contemporaries, he sought to find a mean between the opinions of Arius and the extreme orthodoxy of Athanasius. His aim was to conciliate, and his works are more strongly characterized by political complaisance than by dogmatic consistency. At the council of Nice he sat on the right hand of the emperor Constantine, whose favor he enjoyed throughout his life, and made the first draft of the Nicene creed; this, however, was modified to suit the more orthodox views of the majority, and he signed the creed as finally adopted with some reservation. His "Ecclesiastical History," written in Greek, in 10 books, and in the composition of which he had the use of numerous libraries and of the archives of the empire, recounts the events of the church from its beginning to the year 324. It was continued by Socrates, Sozomen, and Theodoret, and was translated by Rufinus into Latin and continued to 395. His "Evangelical Preparation" preserves many passages from the ancient authors, and exposes the reasons why the learned as well as the vulgar paganism of Greece and Rome should be abandoned for Christianity. A portion only of his "Evangelical Demonstration" remains, in which he shows that the Mosaic law was only preparatory. His "Onomasticon" is a nomenclature of the cities and places mentioned in Scripture, and his "Chronicle" is an abridged statement of events from the beginning of the world to the 20th year of the reign of Constantine. Fragments only of this chronicle were known, till in 1784 an Armenian version was discovered, which was published by Mai and Zohrab at Milan in 1818, and which gave occasion for a dissertation of Niebuhr showing the new dates and events which this discovery made known. Eusebius wrote under the pressure of the great commotions of his age, but with much freedom from prejudices, with a more critical spirit than many both of his predecessors and successors, and with an ecclesiastical erudition unsurpassed in his age.—The principal editions of the "Ecclesiastical History" are those of Stephens (fol., Paris, 1544), Valois (fol., Paris, 1659), Reading (Cambridge, 1720), and recently those of Heinen (2 vols. 8vo., Leipsic, 1829) and Burton (Oxford, 1838). Translations have been made of it into Latin by Rufinus, who took great liberties with the Greek text; into French by Louis Cousin; into German by Stroth (1778), and into English by Parker (1708), Cater (1736), Dalrymple (1778), and Crusé. The last-named translation is reprinted in Bohn's "Ecclesiastical Library" (London, 1852). There is no complete Greek edition of the works of Eusebius; the best complete Latin edition is that of Paris, 1580, containing all his writings then known.

EUSTACHI, or EUSTACHIO, BARTOLOMEO, (Lat. *Eustachius*), an Italian anatomist, born probably at San Severino, near Salerno, died in Rome in 1574. He was a contemporary

of Vesalius, and shares with him the merit of laying the foundation of the science of human anatomy. He extended the knowledge of the internal ear, by giving a correct description of the tube between the throat and the ear, which has been called after him the Eustachian tube. He was also the pioneer in the accurate study of the anatomy of the teeth. His *Tabulæ Anatomicae*, the text to which seems to have been lost, were first published in 1714 by Lancisi. Eustachi, who officiated as professor of anatomy and as physician to the cardinals Borromeo and Rovero, seems to have been so poor that he was unable to publish his works. Lauth remarks that if he had been able to publish them, anatomy would have attained the perfection of the 18th century 200 years earlier at least. A new edition of the *Tabulæ* was published by Albinus with an excellent commentary (Leyden, 1748). A Dutch commentary by Bonn appeared in Amsterdam in 1798; and one in German by Krauss in the same city in 1800.

EUSTIS, WILLIAM, an American physician and politician, born in Cambridge, Mass., June 10, 1753, died in Boston, Feb. 6, 1825. He was graduated at Harvard college in 1772, and subsequently studied medicine. He entered the American army during the revolutionary contest as a regimental surgeon, and served throughout the war in that capacity, or as hospital surgeon, being for some years stationed at the house opposite West Point in which Arnold had his head-quarters. Upon the conclusion of the war he practised his profession in Boston. Between 1800 and 1805 he was one of the representatives from Massachusetts in congress, and in 1809 he was appointed by President Madison secretary of war, a position which he retained until the surrender of the American forces under Gen. Hull to the British in 1812, when he resigned. In 1814 he was appointed minister to Holland, and after his return served again in congress between 1820 and 1823. In the latter year he was elected governor of Massachusetts, and died while holding that office.

EUTAW SPRINGS, a small affluent of the Santee river, in S. Carolina, about 60 m. N. W. from Charleston, near which was fought, Sept. 8, 1781, a battle between the Americans under Gen. Greene and the British under Col. Stuart. Greene had been several weeks awaiting reinforcements on the Santee hills, when on Aug. 22 he broke up his encampment to march against Stuart, who had succeeded Rawdon in command of all the British troops in the field, and who was stationed on the Congaree, 16 m. distant, across a marshy country. The latter moved down 40 m. to the vicinity of Eutaw Springs, followed by Greene at easy marches, who bivouacked on the night of Sept. 7 within 7 m. of the enemy. The whole American force, not exceeding 2,000 men, advanced in two columns, the first of which was commanded on the right, left, and centre respectively by Gen. Marion, Gen. Pickens, and Col. Malmedy, and the second by Gen. Sumner, Col. Williams, and Col. Camp-

bell. The number of the enemy was about 2,300. Four miles from Eutaw a reconnoitering detachment of British cavalry was put to flight after a severe skirmish. One mile from the British camp a body of infantry was encountered, which soon fell back. The action became general soon after 9 o'clock, and after a sharp contest the British were driven from their camp. The American soldiers had scattered among the tents of the enemy, plundering and drinking, when Stuart suddenly renewed the battle, maintaining a severe fire from the windows of a house and from a palisaded garden. Greene withdrew the American troops out of range, deciding, as the enemy could maintain themselves but a short time, to wait and attack them on their retreat. He left a strong picket on the field, and returned for the night to the position 7 miles off which he had left in the morning, not finding water nearer. During the night the British retreated toward Charleston; and on the next day Greene advanced and took possession of the battle field, and sent detachments in pursuit of them. The British lost 133 killed and wounded, and 500 who were made prisoners. The American loss was 535 in killed, wounded, and missing. One of the most lamented of the slain was Col. Campbell, who fell early in the battle bravely leading the Virginians in a charge with the bayonet.

EUTERPE (Gr. *ευ*, well, and *τερπω*, to delight), the inspirer of delight, one of the nine muses, daughter of Zeus and Mnemosyne (memory). She presided over lyric poetry, and played on the flute, of which she was the inventor; according to some, she also invented tragedy. She is usually represented as a virgin, crowned with flowers, with a flute in her hand, or various musical instruments around her, and sometimes as dancing.

EUTYCHES, a heresiarch of the 5th century, born A. D. 378, died about 454. For many years he lived as a priest and archimandrite in the cloisters of Constantinople, where he had more than 300 monks under his direction. He was the head of the party opposed to Nestorius, who, in order not to confound the divine and human natures in Christ, had affirmed that there were in him two distinct persons. Eutyches, in his zeal for singleness of person in Christ, was led to maintain also that he possessed but one nature. This opinion became popular in the Alexandrian church, where the doctrines of Nestorius had been most loudly condemned. The rising heresy was examined and condemned by a synod at Constantinople in 448. The influence of Eutyches and his friends obtained from Theodosius the reference of the matter to a general council to meet at Ephesus in 449 under the presidency of Dioscurus, a violent Eutychian. Here the triumph of Eutyches was secured by the outcries of monks, the threats of soldiers, and the overbearing violence of the president; and the most prominent hostile bishops were deposed. Pope Leo refused to recognize the acts of this council, which was

known as the Latrocinium, or robber synod, and excommunicated Dioscurus; and at the general council of Chalcedon in 451 both the doctrines of Nestorius and of Eutyches were condemned. In the 6th century a great revival of the doctrine took place under the auspices of the monk Jacob Baradaeus, who died bishop of Edessa. From him the sect took the name of Jacobites, who still constitute a numerous church in Egypt, Syria, and Ethiopia. The emperor Heraclius sought to mediate between the Monophysites and Catholics, and promulgated a decree in 630, requiring the doctrine to be taught that there were two natures in Christ, but only a single will. Hence the name of Monothelites, the last offshoot of the heresy of Eutyches.

EUXINE SEA. See **BLACK SEA.**

EVAGORAS, king of Salamis in Cyprus, flourished about the beginning of the 4th century B. C. His family, which claimed descent from Teucer, the reputed founder of Salamis, after having long held the sovereignty of that city, had been expelled by a Phœnician exile. Evagoras recovered the kingdom in 410 B. C., and endeavored to restore in it the Hellenic customs and civilization, which had almost disappeared under the long domination of barbarians. He gave a friendly reception to the Athenian general Conon, after the defeat at Ægospotamos; it was by his intercession that the king of Persia permitted the Phœnician fleet to aid Conon; and he himself commanded the Cypriote squadron which joined Conon and Pharnabazus at the battle of Cnidus. For these services a statue was erected to him at Athens in the Ceramicus by the side of that of Conon. His increasing power attracted the jealousy of the Persian king Artaxerxes II., who declared war against him. Evagoras immediately extended his power over almost the whole of Cyprus, ravaged the coasts of Phœnicia, excited the Cilicians to revolt, and even captured the city of Tyre; but a Persian army, landing in Cyprus, recaptured the island and besieged Evagoras in his capital. He was saved only by the dissensions of his enemies, and was able to conclude in 385 a peace by which the sovereignty of Salamis was secured to him. He survived this treaty 10 years, and died by assassination.

EVANGELICAL, a term applied to those denominations of Christians which make the atonement of Christ alone, and not the performance of moral duties, the ground of salvation. It is often used as synonymous with orthodox. In Prussia it is applied in state documents to the Lutherans and Calvinists, whom the government has shown a strong disposition to unite.

EVANGELICAL ASSOCIATION, an ecclesiastical body, sometimes, though erroneously, called the German Methodist church, probably because its confession of faith and its polity are very similar to that of the Methodist Episcopal church, while its members are chiefly, though by no means exclusively, Germans, or of Ger-

man descent. It took its rise in the year 1800, in the eastern part of Pennsylvania, and resulted from an organization into classes and congregations of the disciples of the Rev. Jacob Albright, a native of eastern Pennsylvania, who being impressed by the general decline of religious life, and the corruption of doctrines and morals that prevailed in the German churches in that portion of the country, undertook about 1790 to work a reform among them. The effect of his first preaching encouraged him to travel through a great part of the country at his own expense, preaching the gospel as he had opportunity, in churches, in schools or private houses, in the public roads, &c. Although he commenced his labors without any ulterior design of forming a distinct ecclesiastical organization, yet he soon found it necessary to unite his converts, scattered over several counties, into small societies for mutual support and sympathy. At a meeting called for the purpose of consulting upon the best measures to be adopted for the furtherance of a cause in which they all felt a deep interest, the assembly, without regard to the teachings of high-churchism respecting a valid Christian ministry, unanimously elected and solemnly ordained Mr. Albright as their pastor, authorizing him to exercise all the functions of the ministerial office over them, and declared the Bible to be their rule of faith and practice. This organization, though incomplete at first, was soon after considerably improved by the adoption of a creed and rules for church government. In the course of time, as laborers increased, and the society spread, annual conferences were held; and in 1816, 16 years after the first organization of the church, a general conference was held for the first time in Union co., Penn., which consisted of all the elders in the ministry. Since 1843, a general conference, composed of delegates elected by the annual conferences from among their elders, has held quadrennial sessions. This body constitutes at once the highest legislative and judicial authority recognized in the church. The ministry is divided into two orders, deacons and elders; and, faithful to the principles and example of their founder, they practise itinerancy. Its highest permanent order is the eldership; for, although the society has its bishops and presiding elders, yet these, to be continued, must be reelected every 4 years; and if not reelected, they hold no higher rank or privilege than that of an elder. For the first 25 years of its existence, the society struggled against violent opposition, but for the last 30 years it has made rapid progress, so that in Jan. 1859, it comprised 8 annual conferences, consisting of over 300 itinerant and a still greater number of local preachers, whose field of labor extends over nearly all the free states except New England, beside Maryland, Virginia, and the territories, and to some extent also in Canada. The membership approximates 40,000, all adults, and sustains, beside its ministry, about 65 missions in the various states and territories

of the Union, chiefly among the Germans, and 2 missionaries in Germany, in the kingdom of Würtemberg. Two flourishing institutions of learning are also sustained by the church, one at New Berlin, Union co., Penn., and the other at Greensburg, Summit co., Ohio. Its prosperous publishing house at Cleveland, Ohio, issues 3 periodicals: one, its German organ, *Der Christliche Botschafter*, which is the oldest German religious paper published in America; another, its English organ, "The Evangelical Messenger;" and the third, *Der Christliche Kinderfreund*, a non-denominational German juvenile monthly. The society forbids its ministers and members the use of intoxicating liquors as a beverage, and refuses church fellowship to manufacturers and vendors of them, as well as to slaveholders and slave traders. In theology it is Arminian, but holds the essential doctrines of the gospel as they are held in common by the various evangelical churches of our land, with all of whom it aims to cultivate a fraternal spirit.

EVANGELIST (Gr. *eu*, well, happily, and *αγγελλω*, to announce), one who brings good tidings. Hence the writers of the four Gospels are called the evangelists, because they, in a preëminent sense, declare the glad tidings of salvation by Christ. Evangelists were early designated as a particular class of religious teachers in the Christian church, next in order to the apostles, and under their direction; not attached to any particular church or place, but going forth to preach the gospel wherever they were called or sent, and to travel among the infant churches, ordain their ordinary officers, and finish the work the apostles had begun. The primitive order of evangelists, distinct from other public religious teachers, is supposed to have been merely temporary, like that of apostles and prophets. Their extraordinary powers and miraculous gifts have long since ceased; but the class of duties and services which they performed seems to have fallen more especially on the missionaries of modern days.

EVANS, SIR DE LACY, a British general, born in Moig, Ireland, in 1787. He became ensign in the 22d regiment of foot, and his first service was with the British army in India, where, from 1807 to 1810, he shared in the war against Ameer Khan. He also assisted at the capture of the Mauritius. In 1810 he joined his regiment in Spain. He was present at nearly all the principal battles and sieges, and was noted for volunteering for storming parties and other dangerous duties; receiving the war medal, with 3 clasps, for his share in the actions of Vittoria, the Pyrénées, and Toulouse. Early in 1814, having become brevet lieutenant-colonel of the 5th West Indian regiment, he was ordered for service in America. At the battle of Bladensburg, Aug. 24, 1814, he had 2 horses killed under him. It was he who, at the head of 100 men, acting under orders from Gen. Ross, forced the capitol at Washington. He also took part in the attack on Baltimore. At

New Orleans he was the only landsman who volunteered to accompany the expedition against the American sloops which defended Lake Borgne. In Dec. 1814, and again in Jan. 1815, he was wounded before New Orleans, and was sent home. He recovered just in time to join Wellington at Quatre Bras, where again he had 2 horses killed under him. After the peace of Paris he returned to England. Until the time of the reform agitation, on the accession of William IV., he remained in private life. In 1830 he came forward as a radical reformer, was for a few months a member of parliament for Rye, but lost his seat at the general election of that year. He was reëlected in 1831, and unsuccessfully contested the borough of Rye as well as the city of Westminster in 1832, and represented the latter from 1833 to 1841. In 1835 the British government gave permission to the Spanish authorities to enlist a "British auxiliary legion" of 10,000 men, to serve against the cause of Don Carlos. Evans accepted the command of this force; but no sooner was the legion enrolled than the policy which originated it fell into disfavor, and discouragements were thrown in its way, the result of which was that Evans found himself on Spanish soil with an undrilled multitude, the refuse of the streets. By degrees they were brought into serviceable condition, and at the end of the 2 years for which they were engaged, Evans was able to state in his place in parliament that no prisoner had been taken from the legion in action, nor any part of its artillery or equipage captured, while it had taken from the enemy 27 pieces of artillery and 1,100 prisoners. In 1846 he was reëlected to parliament from Westminster, and has retained this seat ever since. When the Crimean war broke out he was appointed, with the rank of lieutenant-general, to command the 2d division of the English army. At the battle of the Alma his division was distinguished, and again before Sebastopol, where, on Oct. 26, they repulsed a sortie of 6,000 Russians, of whom they put 800 *hors de combat*, and took 80 prisoners. At the battle of Inkermann, Nov. 5, when the Russians attacked, Gen. Evans was sick on shipboard at Balaklava, Gen. Pennefather having temporary command of his division. Evans hurried on shore, and acted as Pennefather's assistant, rather than deprive him of the honor of the day. He received for his services the thanks of parliament and the grand cross of the bath, and Louis Napoleon made him grand officer of the legion of honor (1856). He abstained from voting on the Chinese war question (1857), is opposed to the present system of selling commissions in the army, and voted against the Derby reform bill (1859).

EVANS, Lewis, an American geographer and surveyor, born about 1700, died in June, 1756. During an active professional life, he collected many materials for a map of the British North American colonies, and in 1749 published one of the middle colonies, chiefly of New York,

New Jersey, and Delaware, and of the Indian country adjacent. A 2d edition appeared in 1755, much enlarged, and containing in addition Virginia, Maryland, Pennsylvania, and a part of New England. In 1756 he published in London a pamphlet in reply to some strictures on a statement questioning the English title to Fort Frontenac which had been appended to the last edition of his map. Both publications appeared under the title of "Geographical, Historical, Political, Philosophical, and Mechanical Essays, Nos. 1 and 2."

EVANS, OLIVER, an American inventor, born in Newport, Del., in 1755, died in New York city, April 21, 1819. The inventive faculty was developed in him while he was apprentice to a wheelwright, and before he had reached the age of manhood the construction of a land carriage to be propelled without animal power began to occupy his attention. At the age of 22 he invented a machine for making card teeth which superseded the old method of manufacturing them by hand. Two years later he entered into business with his brothers, who were millers, and in a short time invented the elevator, the conveyor, the drill, the hopper-boy, and the descender, the application of which to mills worked by water power effected a revolution in the manufacture of flour. For some years after these improvements were perfected, the inventor found much difficulty in bringing them into use, although in his own mill the economy of time and labor which they effected was very manifest. In 1786-'7 he obtained from the legislatures of Maryland and Pennsylvania the exclusive right to use his improvements in flour mills, and the former state also gave him a similar privilege with respect to steam carriages, more from the desire to encourage his inventive powers than from a belief that he could ever derive any benefit from it. It was not until 1799 or 1800 that he was able to set about the construction of a steam carriage; but finding that his steam engine differed in form as well as in principle from those in use, it occurred to him that it could be patented and applied to mills more profitably than to carriages; and in this he was completely successful. This was the first steam engine constructed on the high pressure principle; and to Evans, who had conceived the idea of it in early life, and in 1787 and again in 1794-'5 had sent to England drawings and specifications, the merit of the invention belongs, although it has been common to assign it to Vivian and Trevethick, who had had access to Evans's plans. In 1803-'4, by order of the board of health of Philadelphia, he constructed the first steam dredging machine used in America, consisting of a flat scow with a small engine to work the machinery for raising the mud. The machine, which he named the "Oructor Amphibolis," having been placed upon wheels, propelled itself to the Schuylkill, a distance of $1\frac{1}{2}$ miles, and upon being fitted with a paddle wheel in the stern, navigated the river to its junction with the Delaware. This is believed

to have afforded the first instance in America of the application of steam power to the propelling of land carriages. He indeed predicted the time when such carriages would be propelled on railways of wood or iron, and urged the construction of a railroad between Philadelphia and New York, but was always prevented by his limited means from prosecuting his mechanical experiments to the extent he desired. He was the author of the "Young Millwright's Guide," and the "Young Steam Engineer's Guide," and wrote with force and facility on his favorite subjects.

EVANSVILLE, a city and the capital of Vanderburg co., Ind., built on high ground on the N. bank of the Ohio river, 200 m. from its mouth, and 200 m. below Louisville, Ky.; pop. in 1853, 8,000; in 1859, about 15,000. The bend of the river at this point describes a half moon, whence Evansville is sometimes called the "crescent city." The Wabash and Erie canal, 462 m. in length, commencing at Toledo, Ohio, terminates at this point; and the Evansville and Crawfordsville railroad, in operation from Evansville to Terre Haute, opens railroad communication with almost every part of the country. The geographical and geological position of the place is favorable to the building up of a large manufacturing and commercial city. Coal and iron ore abound in the vicinity; several large flouring mills, factories, and machine shops are now in operation; and 8 daily and 2 weekly newspapers are published. The value of merchandise sold in 1857 was \$4,076,000; of manufactures, \$1,598,708; of exports, \$7,053,216. The city contains 22 church organizations, of almost all denominations, 3 public libraries, a national marine hospital erected by the general government, and public schools attended by 1,446 pupils. Evansville was laid out in 1817 by Gen. Robert M. Evans, James W. Jones, and Hugh McGeary, from the first of whom it was named. In 1857, some laborers digging a well came upon the remains of a cabin 18 feet below the surface of the earth. In the interior were found an old-fashioned spring wheel, a wooden mall, and a pair of European boots. It is surmised that the cabin may have been inhabited by the early French settlers, and that it had been erected in an excavation, and covered over with earth to conceal it, as was frequently done by the early settlers of the West.

EVAPORATION, the dissipation of bodies by the volatile particles at their surface assuming the form of vapors and disappearing in the space around them. Liquids manifest this property most sensibly. Mercury exhibits it at temperatures exceeding 60° F., as is shown by the invisible fumes forming an amalgam upon the surface of a bit of gold leaf, suspended for some days over the surface of the metal. Many solid bodies are subject to it; camphor, ice, snow, and others, wasting away by their particles being taken in invisible vapor into the surrounding atmosphere. It is a part of the process provided by nature for restoring to the earth, through the medium

of the clouds, the waters which have drained from its surface into the sea, and those also held in the soil, or upon the leaves of the forest. After having performed their office, they are recalled by the process of evaporation, purified of it of their earthy contaminations, and are again poured out for the refreshment of vegetable and animal life. (See ATMOSPHERE, COLD, WIND, HEAT, and ICE.) As evaporation takes place in ordinary temperatures only from the surface of objects, the amount of moisture removed is dependent, under the same circumstances in other respects, upon the extent of surface exposed. It is greater in a warm dry air than when the temperature is low, or the atmosphere is already nearly filled with vapor. The more moisture is taken up into the same body of air, the more the process is retarded, until at length it is entirely checked. It is renewed by new supplies of dry air. The most favorable natural conditions for its rapid action are presented upon the Atlantic ocean under the trade winds, which strike off from the hot deserts of Africa, and blow across to the Cordilleras. The Amazon and the Orinoco are the fruits of the evaporation thus produced. The vapors that are continually ascending from moist surfaces are for the most part invisible, like those exhaled in breathing. Their existence is proved by instruments called hygrosopes and hygrometers; and at times they become visible, as when in our frosty weather they rise copiously from the surface of pools fed by deep springs, and are seen mingled in white clouds, like the vapors of our breath under the same conditions. But when deprived of their heat they possess the properties of gaseous bodies; a given bulk of air or of other gases takes up of them the same quantity as would be received in a vacant space at the same extent and temperature. This was conclusively proved from the experiments of John Dalton. It results that no more vapor can be received into any space after the weight of that already there amounts to the elastic force of the vapor at the temperature of the surface which generates it. Increase of temperature leads to the elasticity of the vapor and promotes evaporation; cold reduces the elasticity and promotes precipitation. Pressure does not affect the capacity of air to contain vapor; but evaporation proceeds more slowly by its increase. It can be removed, as when a liquid is placed in an exhausted receiver of an air pump, evaporation goes on with great rapidity. Ether may thus at ordinary temperature be thrown into ebullition. A difference is observed in the tendency of different liquids to pass into vapor; the lower their boiling point the more rapid is their evaporation; but it is also observed that the vapor thus easily produced is correspondingly less rare, occupying less space than that requiring a greater expenditure of heat for its evolution. The density of alcoholic vapor is 2.5 times greater than that of water. Fluids, therefore, that may be vaporized at little expense of fuel, might not, after all, even if obtained at little cost, have any advan-

tage over water in generating mechanical power. Dalton discovered that the presence of air or any gas impeded evaporation by the resistance its particles opposed to the circulation of the vapor; but whether any gas were present or not, the same amount of vapor would always be formed at the same temperature. The effect of the air was seen in the longer time required to fill the space with the amount of vapor belonging to the temperature. Vapors have a greater capacity for heat than their particles when condensed into liquid or solid form. In their formation consequently they abstract heat from surrounding bodies, producing an amount of cold corresponding to the rapidity of the process. Under the exhausted receiver of an air pump water is very rapidly converted into vapor, but the process is soon checked by the vacuum becoming filled with the vapor. By placing in the receiver a substance that rapidly absorbs aqueous vapor, as sulphuric acid, the operation goes on without check, and the cold produced is so intense that the water may be frozen, as was first demonstrated by Leslie, by its own evaporation. If liquids that evaporate more readily than water, as benzole or ether, are used, mercury itself may be frozen under them. Upon this principle the intense cold is obtained that is required for the solidification of carbonic acid gas. Heat may be abstracted so much more rapidly than it is imparted by surrounding bodies that even mercury may be frozen, as was done by Faraday, in a red-hot crucible. The principle is applied in the water and wine coolers used in hot countries. The water with which they are filled, and in which the wine bottles are placed, filters through the porous vessels and evaporates from their surface, cooling all the contents. A similar effect is experienced in the animal body by rapid evaporation. The heat generated by the chemical actions going on within is taken off by the vapor formed at the surface. Damp clothes furnish the means for the production of much vapor and consequent reduction of temperature, often to an injurious extent. The heat abstracted by vapor in its formation is given out on its condensation. In low pressure steam engines it is economized by being transferred in the condensers to the water that is returned to the boilers.—Hygrosopes and hygrometers, already referred to, are instruments designed, the first for detecting the presence of moisture in the atmosphere, and the second for determining either the temperature at which the air under observation begins to shed its moisture, called the dew-point, or else the temperature of evaporation. Either of these and the normal temperature of the air being known, the elastic tension of the atmospheric vapor, and the amount of moisture in a given quantity, are approximately ascertained by reference to tables constructed for this purpose. The results cannot be considered exact, as the air does not always contain just the amount of moisture due to its temperature. The hygroscope of De Saussure was a hair connected with a

dial, its variations in length indicating the presence of more or less moisture. (For an account of these instruments, see *HYGROMETER*.) The elastic force given in the tables for any temperature of the water is expressed by the height in inches of a column of mercury which will balance it; but this is to be diminished by the force of the vapor that may already be present in the air, also obtained from the same table. The amount of water that may be evaporated at any given temperature from a square foot of surface in a minute of time is thus readily calculated, on the supposition that the air is previously dry. If it be continually removed from over the surface of the water by wind, natural or artificial, the operation is of course more rapidly accomplished.—Evaporation is accompanied with ebullition when the elastic force pressing upon the surface of a liquid is less than that due to the temperature of this liquid. In the case of water at the ordinary pressure of the atmosphere, and under ordinary circumstances, the particles of fluid throughout the mass are converted into vapor as rapidly as they acquire the temperature of 212° . The evolution of this vapor, generated in all parts of the liquid, throws it into the state of commotion called ebullition. By taking off the outside pressure by the air pump, or by ascending to great elevations above the surface, the same phenomenon is exhibited at reduced temperatures. (See *BOILING POINT*.) The quantity of heat required to convert a quantity of water into vapor is $5\frac{1}{2}$ times as much as will raise it from the freezing to the boiling point. Steam consequently contains $5\frac{1}{2}$ times as much heat as the water producing it when at the boiling point; yet the thermometer indicates no higher degree of temperature in the steam than in the water. The heat, however, reappears when the steam is condensed into water, sufficient being then developed to raise $5\frac{1}{2}$ times as much water as produced it from the freezing to the boiling point.—The principles developed by the philosophical researches in the evaporation of liquids have been applied in a variety of ways to facilitate and render more economical several practical operations. Sirups are evaporated, as in the refining of sugar, in vacuum pans, or vessels in which the atmospheric pressure may be partially taken off by air pumps. A low degree of heat only is thus required, producing economy in fuel, and avoiding the risk of overheating and burning the sirup. Extracts are conveniently prepared on the same principle. But when it is desirable to effect the boiling at high temperatures, as for digesting bones and subjects difficult to dissolve, the evaporation is prevented by the vapor being confined, so as to exert its elastic force upon the surface of the fluid. Thus the escape of more steam is checked until, by greater heat, its elastic force is made greater than that upon the surface. By this method the temperature of the water has been raised to more than 400° F. Rapid evaporation has been promoted in salt works and in bleacheries by caus-

ing currents of air to blow over the extended surfaces of the liquids, thus constantly bringing new portions of dry air to absorb fresh quantities of moisture.—Some remarkable phenomena exhibited by liquids when dropped upon heated surfaces may properly be here noticed. Every one must have observed the tendency of water, when it falls upon red-hot iron, to separate into spherical drops, which dance around upon the metal, apparently without touching it, and thus continue without evaporating much longer than the fluid would if exposed to the same degree of heat under other circumstances. A platinum crucible brought nearly to a white heat may be almost half filled with water introduced drop by drop, which will continue in this state for some minutes without perceptible evaporation. On cooling the crucible, the liquid suddenly begins to boil, and discharges a volume of vapor. While in the spheroidal state drops are seen to be supported upon an atmosphere of vapor, which prevents their contact with the surface of the metal. Most liquids, except oils which are decomposed by the heat, display the same phenomena. Their temperature while in this condition is not only much less than that of the surface upon which they rest, but is also below their own boiling point; and if they are already boiling when dropped upon the heated surface, the temperature falls to a certain point, which appears to be a fixed one for each liquid in this condition. Water remains at 205° ; alcohol, which boils at 173° , falls at least 8° ; ether, which boils at 100° , falls at least 5° . The temperature of the heated surface at which liquids are caused to assume this condition has been found, for water, to be 840° or more; for alcohol, 273° ; and for ether, 140° . The check upon evaporation is very remarkable. A quantity of water which would ordinarily disappear in vapor in one minute at the temperature of 212° , has been kept from total dispersion nearly an hour in a metallic vessel heated nearly to redness. Sulphurous acid, which is the most volatile of fluids, can be kept from evaporation only under a pressure of two atmospheres, equal to 80 lbs. to the square inch, or at a temperature below 14° F., which is its boiling point. This being dropped into a hot crucible, its temperature falls to 12° , and water poured in at the same time is immediately frozen. That the surface of the spheroids is not in contact with the hot surfaces is proved by dropping nitric acid upon a hot silver plate, where no chemical action is observed to take place; but if a piece of cold silver be brought in contact with the acid spheroid, nitrous acid fumes immediately appear, and nitrate of silver is formed. The light of a candle also may be seen between a metallic surface and an opaque spheroid spinning upon it. The protection thus afforded against the heat is exemplified also by the fearful experiment of thrusting the hand into molten metal, as cast iron or copper, which has several times been done with impunity; the moisture

upon the hand forming the protecting stratum of vapor between it and the hot metal. A feat of this kind is described by Beckmann in the chapter on "Jugglers" in his "History of Inventions," as having been performed in his presence in 1765 at the copper works at Awestad, by one of the workmen, who took the melted metal in his hand, and again skimmed with it a ladle of the same, and moved his hand backward and forward in it. M. Boutigny also (to whose researches in this direction, as well as those of Charles Tomlinson, Esq., the author of the "Student's Manual of Natural Philosophy," and more recently of the "Cyclopædia of the Useful Arts and Manufactures," we are much indebted for the knowledge we possess upon this subject) has performed, together with M. Michel, similar experiments with cast iron. The last named states: "I divided or cut across with my hand a jet of cast iron, issuing from a cupola furnace, and I also plunged my other hand into a ladle of cast iron in the molten state, which was fearful to look at. I trembled involuntarily in making the trial, but both hands escaped uninjured." The subject is fully treated in Bouchardat's *Physique élémentaire* (Paris, 1851). The sudden formation of vapor produced by the spheroids assuming the gaseous state as the metallic surface is cooled, is probably one of the causes of the explosion of steam boilers. When these have become overheated by deficiency of water, that which is next introduced is likely to assume the spheroidal form. As more is added the metal is cooled, and the spheroids suddenly burst into vapor, every cubic foot producing 1,700 cubic feet of steam.

EVARTS, JEREMIAH, secretary of the American board of commissioners for foreign missions, born in Sunderland, Vt., Feb. 8, 1781, died in Charleston, S. C., May 10, 1831. He was graduated at Yale college in 1802, and after some time spent in teaching, commenced the study of law in New Haven. He was admitted to the bar in 1806, practised his profession in New Haven for about 4 years, and then undertook the editing of the "Panoplist," a religious monthly magazine published at Boston. In 1812 he was chosen treasurer of the American board of commissioners for foreign missions, and in 1820, when the "Panoplist" was discontinued, and the "Missionary Herald" was issued by the board in its stead, he took charge of the latter periodical. He was chosen corresponding secretary of the board in 1821, retaining that office until his death. He wrote 24 essays on the rights of the Indians, under the signature of "William Penn," which were published in 1829.—See "Memoirs of Jeremiah Evarts," by E. C. Tracy (8vo., Boston, 1845).

EVE, the name given by Adam to his wife. It is derived from a word that signifies life, and was applied to her as "the mother of all living." She was created to be a help meet for Adam, and was placed by God with him in Eden; but yielding to the temptation of the serpent, and tasting and leading Adam to taste the forbidden

fruit, was with him driven forth from paradise, and was doomed to many sorrows and sufferings, especially in the birth of her offspring.

EVECTION (Lat. *evection*, a carrying out), the principal perturbation of the moon in longitudes, causing her to be alternately nearly 8 times her own breadth in advance of, and behind, her mean place. The fact of evection was discovered by Ptolemy, but its cause was unknown before the law of gravitation was discovered. It arises from the disturbing influence of the sun, alternately elongating the moon's orbit, or reducing its eccentricity, according as the end or side of the orbit is toward the sun.

EVELYN, JOHN, an English author, born in Wotton, Surrey, Oct. 31, 1620, died Feb. 27, 1706. He was educated at Baliol college, Oxford, and then began to study law in the Middle Temple. He served for a short time in 1641 as a volunteer in the Netherlands, returned to England as the civil war was breaking out, and joined the royal army, but after the king's retreat to Gloucester left England to travel through France and Italy. He returned to England in 1651, assisted in the restoration of 1660, and was received with favor at the court of Charles II. He was one of the founders of the royal society in 1662, and a member of the first council. Upon the breaking out of the Dutch war two years later, he was named one of the commissioners to tend the sick and the wounded, and attended to his charge during all the raging of the plague. In 1664 the English naval commissioners dreaded a scarcity of naval timber in the country, and at the request of the royal society Evelyn wrote his "Sylva, or a Discourse on Forest Trees, and the Propagation of Timber in his Majesty's Dominions," a work which induced many landholders to plant an immense number of young oak trees, which furnished the ship yards of the next century. He published several other popular works on learned subjects, on painting, sculpture, architecture, and medals, and was one of the first in England to treat gardening and planting scientifically. The most valuable of his works is a diary, in which, during the greater part of his life, he related the events in which he was interested. This was published in 1818, and contains a large variety of curious and minute information concerning the manners and society of the last half of the 17th century. An enlarged edition has recently been issued in London by John Forster (4 vols. 1859).

EVERDINGEN, ALDERT VAN, a Dutch landscape painter, born in Alkmaar in 1621, died there in 1675. He excelled in painting wild and rugged scenery. Having been shipwrecked on the coast of Norway during a voyage to the Baltic, he employed the time while the vessel was repairing in making sketches of rocks, waterfalls, and other prominent features of a mountainous country. His sea pieces, particularly those in which storms are represented, are very effective, being painted with a broad, free pencil, and carefully colored. He also excelled as an etcher, and executed upward of 100

prints of Norwegian scenery, beside a series of 56 illustrations to the fable of "Reynard the Fox."

EVERETT, ALEXANDER HILL, an American diplomatist and man of letters, born in Boston, March 19, 1792, died in Canton, China, May 29, 1847. His father, the Rev. Oliver Everett, was settled over a church in Boston from the time of his entering upon the ministry till 1792, when in consequence of declining health he gave up his charge, and retired to the neighboring town of Dorchester, where the remainder of his life was passed. His son entered Harvard college in 1802, and was graduated in 1806 with the highest honors of his class, although he was the youngest of its members. After leaving college he passed a year as assistant teacher in Phillips academy in Exeter, N. H. Then removing to Boston, he began the study of the law in the office of John Quincy Adams, and became a member of a literary club by which a periodical called the "Monthly Anthology" was conducted. When Mr. Adams went as minister plenipotentiary to Russia in 1809, Mr. Everett accompanied him, and resided 2 years in his family, attached to the legation. He passed the winter of 1811-'12 in England, made a short visit to Paris in the spring of 1812, and came home in the summer of that year. Upon his return he commenced the practice of the law in Boston. His profession, however, occupied an inferior place in his affections to both literature and politics. He contributed articles to some of the periodicals of the day, and wrote for one of the Boston journals a series of political papers, in which, in opposition to the dominant public sentiment around him, he sustained the policy of the administration in the war with Great Britain. A discourse pronounced by him before the Phi Beta Kappa society of Harvard college, in which he called in question the justice of some of Burke's strictures upon the French revolution, attracted some attention and comment. At the close of the war, when Mr. Eustis of Massachusetts was appointed minister to the Netherlands, Mr. Everett accompanied him as secretary of legation; but after a year or two of service he returned to the United States. On the retirement of Mr. Eustis he was appointed his successor, with the rank of *chargé d'affaires*. He continued in this post from 1818 to 1824. His official duties were not onerous, and his leisure hours were given to the preparation of a work which was published in 1821, in London and Boston, under the title of "Europe, or a General Survey of the Political Situation of the Principal Powers, with Conjectures on their Future Prospects." This work attracted much attention, and earned for its author considerable reputation, both at home and abroad. Some of the English critics were unwilling to believe that an essay written in such excellent English could have proceeded from the pen of a foreigner. It was translated into German by Prof. Jacobi, of the university of Halle, and subsequently into French and Spanish. In one of the chapters of

this work he recommends a total abstinence from the seizure of private property at sea as the only just and consistent plan of maritime warfare; a practical result to which the world is a good deal nearer now than it was when Mr. Everett suggested it. In 1822 he published at London and Boston a work entitled "New Ideas on Population, with Remarks on the Theories of Godwin and Malthus," in which he controverts the well known views of Malthus on population, and contends that increase of population leads to a relative abundance, and not a relative scarcity, of the means of subsistence. When the work was ready, Mr. Everett visited London for the purpose of carrying it through the press, and while there he saw and conversed with Mr. Malthus upon the subject of the difference between them. Their discussions were courteous, inspiring each party with respect for the other, but leaving each only more fully confirmed in his own view. During his residence in the Netherlands Mr. Everett was a frequent contributor to the "North American Review," mostly upon subjects drawn from French literature. In 1824 he returned to the United States, on leave of absence, and passed the following winter at home. In 1825 he was appointed by Mr. Adams, then recently elected president, minister plenipotentiary to Spain, and remained in that post till 1829. At that time the independence of the revolted Spanish colonies in America had been recognized by the United States, but not by Spain, or by any of the European states. Mr. Everett, as the representative of the only government that had acknowledged the independence of the South American republics, became the medium of communication between them and their mother country, and in some sort their virtual representative. This imposed upon him a great amount of additional labor, and often threw him into positions requiring much tact and discretion. On one occasion, when a Colombian privateer, among the crew of which were several American citizens, had been wrecked upon the coast of Spain, and the crew seized by the government, Mr. Everett, through his personal influence with the king, procured the release of the Americans, and caused them to be sent home. Though the duties of his post were arduous, and required habits of regular industry for the successful discharge of them, Mr. Everett did not, while in Madrid, neglect the claims of literature. Beside several papers contributed to the "North American Review," he wrote a work entitled "America, or a General Survey of the Political Situation of the Principal Powers of the Western Continent, with Conjectures on their Future Prospects" (Philadelphia, 1827; London, 1828). This was intended as a complement to his former publication on Europe, and to trace the further growth and development of the political ideas which had taken shape upon the fall of Napoleon. The elevation of England into the rank of a first-rate power, the comparative decline of Austria, Spain, and France, the recent appearance of two commanding nations,

Russia and the United States, and some speculations upon the history and prospects of the South American republics, formed the leading topics of discussion in this work, which, like its predecessor, was translated into the German, French, and Spanish languages. He was always ready to employ his official influence in aiding the literary researches of others. He invited Mr. Irving to Madrid, made him an *attaché* to his legation, and encouraged him in those studies in Spanish history and biography which subsequently bore such rich fruit. He also aided Mr. Prescott in procuring materials for the history of Ferdinand and Isabella, a service acknowledged by that distinguished historian in his preface to that work. In the autumn of 1829 he returned home, and assumed the charge of the "North American Review" as editor and proprietor. For about 5 years he conducted this periodical with marked ability. The subjects which he discussed ranged over a wide field, embracing politics, political economy, metaphysics, and literature. He defended in several elaborate papers the policy of the friends of the American system, so called, by which domestic manufactures were to be stimulated by duties upon foreign imports. Some articles, in which he reviewed the course and policy of the federal and democratic parties from a historical point of observation, are among the ablest of the productions of his pen. He was chosen to the senate of Massachusetts in 1830, and continued a member of that or the other branch of the legislature for the ensuing 5 years. He took an active and controlling part in the proceedings of each legislature of which he was a member. In 1833 he attended the tariff convention held at New York, and as chairman of a committee of that body, prepared the memorial which was presented in their name to congress at its next session. This is a very able exposition of the policy of the friends of a protective tariff. He had thus far been a member of the whig or national republican party, and had drafted the address reported by the convention which in 1831 nominated Mr. Clay for the presidency; but during the 2d term of Gen. Jackson's presidency, and after the proclamation against nullification, he became an adherent of the national administration; putting himself again, as he had done in early manhood, in opposition to the controlling public sentiment around him. In 1836, being a resident of Roxbury, he was nominated by the democratic party for congress, and again in 1838 and 1840; but in each of the contests he was unsuccessful. In 1840 he was despatched by the government upon a confidential mission to the island of Cuba, and passed 2 months at Havana, in the discharge of the duty intrusted to him. In the autumn of the same year he went again to Havana upon private business, and while there he received a letter from the governor of Louisiana, requesting him, in the name of the board of directors of Jefferson college in that state, to assume the presidency of that in-

stitution. After some deliberation he accepted the proposal, and entered upon the duties of the office in June, 1841. His declining health compelled him, after a short period, to resign his trust, and return to the north. His literary activity always continued undiminished. He was an occasional contributor to the "Democratic Review," to the "Boston Quarterly Review," and the "Boston Miscellany," a periodical edited by one of his nephews. A duodecimo volume of selections from his critical and miscellaneous essays was published in Boston in 1845, and a 2d series appeared in 1847. A small volume of poems, original and translated, was published by him in New York in 1845. In the same year he received from President Polk the appointment of commissioner to China, and set out for his post in the month of July; but on arriving at Rio de Janeiro his infirm health compelled him to return home. He sailed a second time in 1846, and arrived safely in Canton. His various cultivation, his acquaintance with oriental literature, his knowledge of European politics and society, and his fine habits of observation, enabled him to turn to the best account the advantages of his position; and had not a disease of long standing soon put an end to his life, he would undoubtedly have enriched the literature of his country with contributions equal in value, and superior in popular interest, to any of the former productions of his pen. Beside the writings which we have above enumerated, Mr. Everett contributed a life of Joseph Warren to the first series of Sparks's "American Biography," and of Patrick Henry to the second. In Oct. 1816, he married Lucretia, daughter of Judge Oliver Peabody, of Exeter, a lady who survives him. Mr. Everett was one of the most accomplished men that the United States has ever given birth to. His mind was not marked by originality and creative power, but was characterized by comprehensiveness and breadth, an uncommon power both of analysis and generalization, luminous method, accurate discrimination, and clear statement. It was philosophical in its structure and training, and he never appeared to greater advantage than when applying the essential principles of politics and government to existing systems, and pointing out how far they conformed to, and how far they fell short of, an ideal standard. His occasional essays on psychological subjects showed a metaphysical faculty of no mean order. In his purely literary essays he succeeded better in solid research and careful statement than in the treatment of airy and sportive themes. There was a want of lightness and ease in the movements of his mind, of which he was himself, apparently, not always fully aware. His industry was great, and his powers of acquisition were equally so, and thus his attainments were very large and various. As a public man, he was a vigorous debater and a judicious counsellor; but he was not remarkable for that nameless and indefinable personal influence over others which secures to some men a power over their contemporaries quite

inexplicable to those who come after them, and judge of them by the monuments which they have left behind. The value of his pen and speech was acknowledged by his political associates; but inferior men had a larger share in the direction and discipline of the party. As a public speaker he was always heard with attention and respect; his matter was sure to be weighty, good, and carefully prepared; his face was dignified, intellectual, and expressive, and lighted up with fine dark eyes; but his voice was not very flexible, and his temperament was not sufficiently ardent to secure for him, without visible effort, the animation which the popular taste demands. His private life was without a stain. He was fond of society, and always able and willing to draw liberally upon the capacious stores of his memory for the instruction and entertainment of the social circle.

EVERETT, EDWARD, an American statesman, orator, and man of letters, a younger brother of the preceding, born in Dorchester, Mass., April 11, 1794. He entered Harvard college in 1807, at the early age of 13, and was graduated in course in 1811, with the highest honors, in a class containing more than an average amount of ability. While an undergraduate, he was the principal conductor of a magazine published by the students, called the "Harvard Lyceum." He left behind him at the college a very brilliant reputation as a scholar and writer, which long lingered there in tradition. For some time after leaving college, he was employed there as a tutor, at the same time pursuing his studies in divinity, the profession which he had selected. In 1812 he delivered a spirited poem before the Phi Beta Kappa society on American poets. In 1813 he was settled as pastor over the Brattle street church in Boston, filling the place left vacant by the death of the lamented Buckminster. He immediately won great admiration by the eloquence and power of his pulpit discourses. In 1814 he published a work entitled "Defence of Christianity," against the work of George Bethune English, entitled the "Grounds of Christianity Examined, by comparing the New Testament with the Old." In the same year he was chosen by the corporation of Harvard college to fill the chair of Greek literature, a professorship then recently created by the bounty of the late Samuel Eliot. With a view of qualifying himself for the duties of this post, he entered upon an extended course of European travel and study, leaving home in the spring of 1815, and returning in the autumn of 1819. After a brief stay in England, he proceeded to the university of Göttingen, where he remained for 2 years. In the winter of 1817-'18 he was at Paris. In the spring of 1818 he went over to England, where he was kindly received by many of the leading men of the day, including Scott, Byron, Jeffrey, Campbell, Mackintosh, Romilly, and Davy. He spent a day or two under Scott's hospitable roof at Abbotsford. Returning to the continent, he passed the winter in Italy, and thence made a journey into Greece, returning through Wal-

lachia and Hungary to Vienna. During his residence in Europe, his range of study embraced the ancient classics, the modern languages, the history and principles of the civil and public law as then professed in the German universities, and a comprehensive examination of the existing political system of Europe. Upon his return home, he entered upon the duties of his professorship. He gave a new impulse to the study of classical literature by a series of brilliant lectures upon Greek literature and ancient art, first delivered to the students at Cambridge, and afterward repeated before large audiences in Boston. At the same time he took the editorship of the "North American Review," which he conducted till 1824. His object in assuming the charge of this periodical was to imbue it with a thoroughly national spirit; and in pursuance of it, he contributed a series of articles in which this country was defended with great spirit against the shallow and flippant attacks of several foreign travellers. He also found time to prepare and publish a translation of Buttman's Greek Grammar. In 1824 he made his first essay in that department of demonstrative oratory, which he has since cultivated with such signal success, by the delivery of a discourse before the Phi Beta Kappa society on the "Circumstances favorable to the Progress of Literature in America." An immense audience came to hear him, attracted partly by his own fame, and partly by the wish to behold Lafayette, who was present at the orator's side. He was heard with the greatest enthusiasm and delight. Our own recollections confirm the strong statements of a writer in the "Christian Examiner" for Nov. 1850: "The sympathies of his audience went with him in a rushing stream, as he painted, in glowing hues, the political, social, and literary future of our country. They drank with thirsty ears his rapid generalizations and his sparkling rhetoric. The whole assembly put on one countenance of admiration and assent. As with skilful and flying hand the orator ran over the chords of national pride and patriotic feeling, every bosom throbbed in unison to his touch; and when the fervid declamation of the concluding paragraph was terminated by the simple pathos of the personal address to Lafayette, his hearers were left in a state of emotion far too deep for tumultuous applause." This was the first of a series of discourses pronounced by Mr. Everett on public occasions between that time and the present, embracing every variety of topic connected with our national history, character, and prospects, and which combine in an eminent degree the peculiar charm of popular oratory, with those substantial merits of thought and style which bear the cold criticism of the closet. Mr. Everett's public life began in 1824, when he was nominated and elected to congress by the constituency of the district in which he resided. His nomination was made without his being consulted, and was a spontaneous movement on the part of the young men of his district, almo-

without distinction of party. He was himself, as might naturally be expected, a supporter of the administration of Mr. Adams, then just elected president. Mr. Everett served, by successive reëlections, 10 years in congress; and during the whole period he was a member of the committee of foreign affairs, perhaps the most important one at that time in the house. In the 20th congress, though generally acting with the minority, he was chairman of that committee, having been selected for that post by the democratic speaker, Mr. Stevenson of Virginia. He also held a place on all the most important select committees raised while he was in congress, and in every instance he was selected to draw either the majority or minority report. In the 19th congress, though then just elected to the house, and the youngest member of the committee of foreign affairs, he drew the celebrated report on the Panama mission, the leading measure of that session. In the 20th congress, forming with Mr. John Sergeant of Philadelphia the minority of the well-known retrenchment committee, he drew up all those portions of its report which relate to the departments of state and of war. He was chairman of the select committee, during Mr. Adams's presidency, on the Georgia controversy, and was always zealous and prominent in his efforts to secure good treatment to the Indians. He drew the report for the committee in favor of the heirs of Fulton. With Gov. Ellsworth of Connecticut he formed the minority of the bank investigating committee which was sent to Philadelphia in 1834, and drew up the minority report. He wrote the minority report of the committee of foreign relations upon the controversy with France in the spring of 1835, and took a leading part in the debate upon the subject. He made two or three reports on the subject of the claims of American citizens on foreign powers, for spoliations committed on our commerce during the French continental system, and continued the discussion further in the "North American Review." He always served on the library committee, and generally on that for public buildings. In 1827 he addressed a series of letters to Mr. Canning on the colonial trade, which were extensively read. In the summer of 1829, in the congressional vacation, he made an extensive tour through the south-western and western states, and was everywhere received with marked distinction. At Nashville, at Lexington, and at the Yellow Springs in Ohio, he was complimented with public dinners, and charmed his hosts by beautiful specimens of that species of eloquence in which he is generally admitted to hold the first place among his contemporaries. The points of Mr. Everett's congressional career which we have indicated form but a small part of his labors and services in the house of representatives. He was a faithful and assiduous attendant of the sessions, and a diligent observer of the proceedings of that body. He was a frequent but not an obtrusive debater. His

speeches were carefully prepared, full of information, weighty in substance, polished in form, and perfectly free from those indecorums and personalities which sometimes deface congressional debates. In his attention to the private affairs of his constituents he was always prompt and patient. Occupied as he was with public business during his congressional life, his regular and inflexible habits of industry enabled him to find time for literary labor. Beside the elaborate public addresses which he occasionally delivered, he prepared several articles of high merit for the "North American Review." Among them may be mentioned with particular commendation a paper in the number for Oct. 1830, in which the South Carolina doctrine of nullification is discussed and controverted with masterly ability. To this article Mr. Madison's letter on the subject, addressed to Mr. Everett, was with the author's permission appended. In the autumn of 1834 he declined a renomination to congress, as his political friends in Massachusetts were desirous of presenting his name as candidate for the office of governor, to which he was chosen by a large majority in the ensuing election. He was afterward 3 times reëlected, holding the executive office 4 years. His administration was dignified, useful, and popular. Among the measures which marked the period of his official service were the subscription of the state to the stock of the Western railroad, the organization of the board of education and the establishment of normal schools, the scientific and agricultural surveys of the state, and the establishment of a commission for the revision of the criminal law. In the discharge of what may be called the ceremonial duties of his station, Gov. Everett was eminently happy. His manner in presiding was dignified, graceful, and courteous. To the natural desire of his constituents to hear him speak he responded with the most good-natured readiness, and the many occasional speeches he delivered were uniformly spirited and happy. In the autumn of 1839, after an animated struggle, he was defeated by Marcus Morton by a majority of one vote. Relieved from public duty, he was led by the state of his own health and that of his family to visit Europe a second time. He sailed with his family in June, 1840. They passed the summer in France, and the following winter in Italy, most of it in Florence and its neighborhood. He intended to pass another winter in Italy, but the course of political events at home interfered with his purpose, and sent him upon a new path of public duty. Gen. Harrison was chosen president in 1840, and Mr. Webster, the secretary of state, Mr. Everett's warm personal and political friend, perceived his eminent fitness to represent the country at the court of St. James, and to this post he was accordingly appointed. Our relations with England at that time were grave. The controversy touching the north-eastern boundary, which for half a century had been a subject of difference,

seemed to have reached a point beyond which an amicable adjustment was hopeless. The recent burning of the *Caroline*, and the arrest of McLeod, had inflamed the public mind in both countries. The case of the *Creole*, and questions connected with Oregon and Texas, were also elements of irritation. American vessels had been seized and detained by British cruisers on the coast of Africa. The confidence reposed in him by the administration at home was shown by the fact that he was sent to London to discuss all these questions without any specific instructions from the government of the United States, but every thing was left to his own unfettered judgment. Entering at once upon the discharge of his arduous and delicate duties, he justified by his ability, discretion, and tact, the large confidence which had been reposed in him. Though the settlement of the north-eastern boundary, and of the Oregon question, was transferred to Washington by the appointment of Lord Ashburton as special ambassador, yet many important questions were left in Mr. Everett's charge. Among the most important was that involving the construction of the first article of the convention between the two countries on the subject of the fisheries. Mr. Everett secured for our fishermen the long disputed right to take fish in the bay of Fundy. He procured at various times, and in the face of great obstacles, the release from the penal colony of Van Diemen's Land of 60 or 70 American citizens convicted of participation in the Canadian rebellion. Mr. Everett's position at the court of St. James must have been rendered more difficult by the frequent changes in the department of state. Mr. Webster retired in the spring of 1843, and was succeeded within a brief period by Mr. Upshur, Mr. Legaré, and Mr. Calhoun. But by all these gentlemen Mr. Everett's services were duly appreciated, and he enjoyed the confidence of all. Mr. Everett's social position in England was equally honorable and agreeable to him, and a source of just pride to his countrymen. His cultivation and accomplishments were everywhere recognized, and his public speeches were received with enthusiasm. In the spring of 1843 he was appointed to fill the newly constituted mission to China, with a view to establish commercial relations with that country, which honorable trust he was compelled to decline. Immediately upon his return to the United States in the autumn of 1845, Mr. Everett was chosen president of Harvard university. He entered upon the duties of this new trust with characteristic energy and enthusiasm, and it was a subject of great regret to the friends of the college that the burdensome details and monotonous confinement of his official life wore so heavily upon his health as to compel him to resign his post at the end of 3 years, before he had been able to carry into effect his important plans for educational improvement. Mr. Everett gave a portion of his leisure, after resigning the presidency, to the preparation of a collected edition of his orations and

speeches, which appeared in 2 vols. 8vo. in 1850. He also superintended the publication of the new edition of the works of Mr. Webster, at his special request, and prepared an elaborate memoir, which was prefixed to the first volume. Upon the lamented death of that great statesman, in Nov. 1852, Mr. Everett was called upon by President Fillmore to fill the vacant place of secretary of state. He held the office during the last 4 months of President Fillmore's administration, and the condition of the public business made them months of most severe labor; and nothing but his indefatigable industry and great patience could have carried him through what he was called upon to do. Beside paying the most conscientious attention to the regular business of the department, always heavy, and in this case greatly accumulated, he adjusted the perplexing affairs of the *Crescent City steamer* and the *Lobos islands*, prosecuted with energy the difficult negotiations pertaining to the fisheries, concluded an international copyright convention with Great Britain and a consular convention with France, and reviewed the whole subject of Central American affairs in their relations to the government of the United States and Great Britain, and recommended and induced congress to establish a mission of the first class to Central America. But the question which attracted most of the public interest during Mr. Everett's administration of the department of state was the joint proposition of Great Britain and France to enter with the United States into a tripartite convention, guaranteeing to Spain in perpetuity the exclusive possession of Cuba. This proposition was declined by the United States, in a diplomatic note of great ability drawn up by Mr. Everett. His exposition of the policy of this country was received with very general approbation by the people and the press, without distinction of party. Notwithstanding his arduous official duties, he found time to prepare an elaborate address for the annual meeting of the American colonization society in Washington, in 1853, in exposition and defence of the objects of that association. Before leaving the department of state Mr. Everett was elected by the legislature of Massachusetts to the senate of the United States, took his seat in that body at the commencement of the special executive session in March, 1853, and made an able and elaborate speech on the Central American question. In the summer and autumn of 1853, beside an address before the New York historical society on colonization and emigration, and a reply to the protest of Lord John Russell against the doctrines asserted by our government in the note declining the tripartite convention, Mr. Everett spoke more than once in opposition to the proposed new constitution in Massachusetts. Upon the assembling of the 33d congress, in Dec., 1853, Mr. Everett, as might have been expected, found himself in a state of impaired health from the severe and uninterrupted labors of the previous 18 months, but he applied himself with

his usual industry to the discharge of the duties that lay before him. Had the session proved one of no more than average labor and excitement, perhaps his strength would have enabled him to meet the duties of his post; but such was not the character of the session. The introduction of the bill for the repeal of the Missouri compromise, commonly called the Nebraska-Kansas bill, produced great agitation throughout the country, and brought the opposing parties in the senate into violent and protracted antagonism. For many weeks the sessions were long continued, and the discussions of the most vehement and impassioned character. Mr. Everett delivered a speech against the bill, on Feb. 8, 1854, characterized by his usual moderate and conservative views, as well as by good taste and good temper. His health, under the pressure of official toil and excitement, grew constantly worse, and in the following May, under the imperative advice of his physician, he resigned his seat. A few months of rest and quiet restored him; and now there began a new phase in his life, and the opening of a new and peculiar sphere of action. In the year 1853 the project of purchasing Mount Vernon by private subscription was first started by Miss Ann Pamela Cunningham, in an address to the women of the United States, under the signature of "A Southern Matron." The proposal was favorably received, and associations of ladies began to be formed in several of the states, for the purpose of collecting funds. Mr. Everett, having been applied to by the mercantile library association of Boston to deliver a lecture during their course of 1855-'56, proposed that the association should celebrate the next anniversary of the birthday of Washington, and offered to prepare for that occasion a discourse upon his character, the proceeds to be applied to some commemorative purpose. The offer was accepted; and on Feb. 22, 1856, Mr. Everett pronounced his oration on Washington, for the first time, before an immense audience at the music hall in Boston. It was immediately repeated at New York, New Haven, and Baltimore; and the proceeds were applied to various objects. It was delivered for the first time for the benefit of the Mount Vernon fund at Richmond, Va., on March 19, 1856; and down to the present time (June, 1859) it has been delivered in various parts of the country 129 times, always, except in 7 cases, for the benefit of the Mount Vernon fund. No deduction has ever been made by Mr. Everett from the amounts received on account of his expenses, which have been uniformly paid by himself; they have been much reduced by the hospitality with which he has been received, and the liberality of railroad corporations and the proprietors of steamboats. The proceeds received were deposited by him in the hands of a board of trustees appointed by himself. They have paid over to the general treasurer of the fund at different times the sum of \$53,393 81, and have now on hand the further sum of \$4,769 75. In the course of the autumn of

1858 Mr. Everett entered into an engagement with Mr. Robert Bonner, editor and proprietor of the "New York Ledger," to furnish an article weekly for that paper for one year in consideration of \$10,000 to be paid in advance to the Mount Vernon fund. This sum has been paid to the treasurer of the fund. In the first of these articles, Mr. Everett invited the readers of the "Ledger" to transmit each the sum of 50 cents or more toward the increase of the Mount Vernon fund. Many persons have responded to this call, and the net amount received from this source is \$2,929 94, which is included in the sum of \$53,393 81 mentioned above as having been paid over to the general treasurer. Nor have Mr. Everett's labors and journeyings been limited to the augmentation of the Mount Vernon fund. On Dec. 22, 1857, he delivered at Boston an address on charity and charitable associations for the benefit of the Boston provident association, which has since been repeated in different parts of the country 15 times, with an aggregate net receipt, for the benefit of various charitable associations, of about \$13,500. On Jan. 17, 1859, he delivered an address at Boston on the "Early Days of Franklin," at the invitation of the association of the Franklin medalists of that city, which has since been repeated 5 times, yielding about \$4,000, for the benefit of various charitable and public associations. On Dec. 7, 1858, he pronounced a eulogy on Mr. Thomas Dowse, before the Dowse institute, at Cambridge, Mass., which was afterward repeated before the Massachusetts historical society, yielding to the two institutions about \$1,500. The aggregate sum total realized in the various ways above mentioned, and paid over to the Mount Vernon fund and sundry public or charitable associations, including the proceeds of the 7 repetitions of the Washington discourse which were not for the benefit of the fund, will not fall short of \$90,000. We have gone somewhat into detail in our sketch of this part of Mr. Everett's life, not merely on account of its peculiar and interesting character, but because we think the facts we have mentioned are entitled to record as illustrating the genius of our people, and the relations which our political institutions have established between the general community and those men who from their abilities, attainments, and accomplishments, are the natural leaders of public sentiment. It would not fall within the plan of this work to give any elaborate analysis of the mental qualities or personal traits of a man who is still living and in the prime of his powers; and the wide reputation he enjoys, and the opportunity which so many of his contemporaries have had of listening to his eloquence, render this a superfluous task. It may not, however, be unbecoming to hold him up for commendation and imitation, to the young men of the country especially, for his indefatigable industry and his methodical habits of labor, and as an example in disproof of the common notion that such habits are not compatible with the most brilliant natural powers.

EVIDENCE. Judicial evidence, which is the subject of this article, differs from the proofs by which human judgment is ordinarily determined in non-judicial matters, chiefly in certain rules established for the sake of facility in disposing of complicated questions of fact, or of public policy when by lapse of time or other causes there would be a deficiency of evidence. These rules may be conveniently reduced under the following heads: 1, cases in which a rule is prescribed for the purpose of getting at a certain conclusion, though arbitrary, when the subject is intrinsically liable to doubt from the remoteness, discrepancy, or actual defect of proofs; 2, cases in which evidence is excluded on the ground of being untrustworthy and tending to unnecessary prolixity, or from its very nature likely to be untrue; 3, cases in which a legal presumption is substituted for actual proof, or in place of what could be proved, being supposed to be more consistent with the real rights of the parties than any result which could be expected from positive testimony; 4, the graduation of the weight of evidence, which will be found in some instances to be arbitrary in its origin, and perhaps not altogether in accordance with the ordinary process of judgment.—Under the 1st class will be included various rules which have been adopted, not from any exact uniformity *per se*, but for the sake of having some rule of general application, among which may be specified the following: *a.* That after 7 years' absence without having been heard from, a man shall be presumed to be dead. It is obvious in this case that the period fixed upon is no more certain than any other, but it was necessary for the protection of the rights of parties who were compelled to act upon some presumption, that a legal rule should be established. If a man therefore has been absent 7 years without any thing being heard of him, his wife may marry again without incurring a penalty for bigamy, though it has not been provided that the 2d marriage shall be absolutely valid in case the husband should afterward return; and his heir, or the person entitled to his estate by succession, becomes vested with the legal ownership, the same as if his decease was actually proved. *b.* That after the exclusive possession of land or of an incorporeal hereditament for a certain period of time, a grant shall be presumed, and the title of the occupant will be sustained against all claimants. In England this period was formerly expressed with some vagueness, as being beyond the memory of man, and the rule applied there only to incorporeal estates; but by a recent statute (2 and 3 William IV.) the period has been limited to 20 years in cases of aquatic rights, ways, and other easements, and to 30 years in respect to right of common and other uses arising out of lands, except tithes and rents. In the United States the presumption is generally the same both in respect to corporeal and incorporeal estates. In the state of New York 20 years' exclusive, undisturbed possession is sufficient to establish title to lands or easements; it being

understood, however, that this possession has been under claim of right. But it is provided that no one shall be entitled to recover against the occupant unless he or those from whom he claims have had possession within 20 years. *c.* That deeds more than 80 years old may be used as evidence without proof of their execution; in other words, that they prove themselves. The presumption in such cases is that the subscribing witnesses by whom proof of execution is ordinarily made are dead, but the rule is the same even if such witnesses are actually living. In offering such a deed in evidence, it is only necessary to give some account of the custody of it, so as to rebut any suspicion in respect to its genuineness. *d.* An infant under the age of 7 years is conclusively presumed to be without discretion. Beyond that age it will be a subject of proof whether he is *doli capax*, but prior to that time no inquiry is permitted. So an infant under the age of 14 is presumed incapable of committing a rape, though in fact there are instances of sexual capacity before that age. So when husband and wife are living together and impotency is not proved, the issue will be presumed legitimate, although it should be proved that the wife has during that time committed adultery. *e.* By the common law, if a wife do any act in the presence of her husband amounting to felony, other than treason or murder, she is presumed to have been under coercion, and therefore not criminally liable. This rule, however, having as is supposed grown out of the arbitrary privilege known as benefit of clergy, is not admitted in the United States, but proof must be made of actual coercion; slight proof is in general however sufficient.—The 2d class of cases includes two rules which were formerly of very frequent application. *a.* What is called hearsay is inadmissible. By this is meant that a witness should not be permitted to testify what he has heard another person say, but only what he knows himself. To this rule there are some qualifications rather than exceptions. Thus it is sometimes proper to prove what was said by a person at the time of performing a certain act, as having some tendency to explain the intent, and therefore admissible as a part of the *res gestæ*, according to legal phraseology. In such a case, however, what was said does not strictly come under the designation of hearsay, but is itself a principal fact. So also it is admissible to prove what has been said by a party to an action. This again is a principal fact, or at all events comes under the designation of declarations or admissions, and as such is admissible. So it is permitted in cases of homicide to prove dying declarations, that is, what was said by the murdered person shortly before and in expectation of death. This is not unusual in trials for murder, and is competent evidence, both to show the manner of the death and who was the murderer. The testimony of a witness on a former trial may also be proved on a second trial, in case of his decease prior thereto. Again, witnesses are allowed to testify

to matters of tradition in respect to old boundaries of estates. The rule in England is limited to cases in which some public right is involved, as when a right of common is in question; but in the United States it has been allowed in many cases where the lines of large tracts of land became material in determining the limits of smaller estates. The traditional evidence, as it is called in such cases, consists of proof of what has been said long since by persons who may be supposed to have had some personal knowledge, or to have heard from others who had such knowledge. Pedigree, including the facts relating to birth, marriage, and death, may also be shown by proof of what has been said by members of the family or relatives of the person whose parentage or relationship is in question. Many other illustrations could be cited, but these will suffice. It should be remarked that upon the same principle by which the kind of evidence last referred to is admissible, other modes of proof, which are ordinarily classed under hearsay, though they in fact belong to that species of evidence in no other sense than as above explained in respect to oral testimony, are admitted, such as a family register, inscriptions on monuments, and the like. But with the exceptions, if they may be so called, which we have specified, hearsay evidence is wholly and absolutely excluded by the English law. The reason usually given for this exclusion is hardly satisfactory. That hearsay is an imperfect kind of evidence is certainly true, and also that in many cases, but not in all, better evidence can be procured; as if the person is living whose declarations it is proposed to prove, and could himself be called as a witness, in which case another principle would apply, viz.: that a party should produce the best evidence which he has the power to obtain. But in some cases it is the best which the party can procure, and yet it is excluded. And again, although not of a high order, it is not in any case entirely without weight, and should therefore be admissible subject to proper allowance as to the degree of credit to be given to it, unless it should be excluded on the ground of greater disadvantage by the prolixity which it would involve, than there would be of benefit to either party by its admission. This last consideration might be sufficient often to shut out evidence as not being of importance enough to warrant the consumption of time that it would require; but it can scarcely be maintained that all evidence of this class is wholly immaterial, and therefore *per se* unworthy of attention.

2. Another rule relates to the competency of witnesses, and it has been more prolific of subtle distinctions and perplexing questions than any other rule in the law of evidence. A chief ground of exclusion was formerly interest in the subject of the action. The theory was that there is an inevitable tendency to suppress or pervert the facts, under the influence of a supposed interest in the result. This of course constituted a proper exception so far as respects

credibility; but instead of receiving the testimony subject to a proper discrimination as to its effect, courts relieved themselves of all embarrassment in determining its relative weight, by wholly excluding the testimony of an interested witness. Under this rule not only the parties to the action, but all persons having an interest in the result, were, as a general rule, adjudged incompetent to testify. In determining, however, the nature of the interest which should constitute a disqualification, it was found exceedingly difficult to fix precise rules of general application, and much confliction was involved in the decisions. Finally it was settled that the interest must be a direct gain or loss by the operation of the judgment in the action, or that the record would be evidence for or against the witness in some other action. This, however, left a variety of difficult questions as to what would be the actual effect of the judgment as respects the witness. Some exceptions also to the rule itself were by necessity admitted. Thus carriers, brokers, and other agents were held competent to prove the receipt or delivery of goods and other acts done in the course of their employment, although they have a direct interest in showing the performance of their duty; and yet, as if to prove the absence of all general principles in reasoning upon the subject of the admissibility of evidence, an agent or servant was excluded from testifying in a suit against the principal founded upon the alleged misconduct of the agent. The inconsistency is that the judgment in the action against the principal would not be evidence of any such misconduct in a subsequent action against the agent, and the interest of the witness in the case supposed is no greater than in the ordinary cases where agents are admitted to testify as to their own acts. Again, a bailor, though a plaintiff in the suit, has always been permitted to show the contents of a trunk, box, or package, which has been lost or embezzled by the bailee, the delivery of the trunk, &c., being proved by other testimony. But it is unnecessary to pursue the subject of the competency of witnesses further. The conviction at length became general that the exclusion of witnesses on account of interest worked injuriously, and accordingly, both in England and the United States, the system has been virtually abrogated. By statute 3 and 4 William IV., c. 42, it was provided that no person offered as a witness should be excluded on the ground that the verdict or judgment in the action could be used for or against him. The act 6 and 7 Victoria, c. 85 (1843), provided that no one except a party, or the husband or wife of a party, should be excluded from testifying on the ground of interest in the subject of the action or event of the trial. The act 14 and 15 Victoria, c. 99 (1851), enacted that parties and persons on whose behalf a suit is brought or defended shall be competent and compellable to testify as witnesses for either party, except that in criminal proceedings for an indictable offence neither the party charged nor the husband or wife of such

party could be a witness; and except also that the provision should not apply to actions founded upon adultery, or for a breach of promise of marriage. By a subsequent act, 16 and 17 Victoria, c. 83 (1853), the husband or wife of a party in a civil action was made competent as a witness except in cases of adultery, but with the qualification that such witness should not be bound to disclose any confidential communication made by either to the other during marriage. In the state of New York similar provisions have been adopted by the code of 1849, which abolished the objection to witnesses on the ground of interest; and by an amendment in 1857 which authorized parties to testify in their own behalf in civil suits the same as other witnesses, except when the adverse party is an assignee or legal representative of a deceased person. One disability, however, was left, viz., as respects husband and wife, neither of whom can testify for or against the other except in a prosecution for injuries committed by one against the other. So far as this disability rests upon any supposed bias derived from personal interest, it is inconsistent with the statutory change in the law of evidence above referred to. Another reason given for the common law rule of exclusion seems equally untenable, viz., that the wife is presumed in law to be under a sort of duress, by reason of which she was formerly not criminally chargeable for felony (except treason and murder) committed in presence of the husband, inasmuch as she is in the United States allowed to hold property, and to execute conveyances in respect thereto. So also the reason sometimes given, that it is the policy of the law to preserve domestic harmony (which has been carried so far that courts have refused to allow the wife to testify even with consent of the husband), if entitled to weight, should also disqualify parents and children, brothers and sisters, so long at least as they belong to the same household. In England a bill has been recently introduced into parliament, which is not yet acted upon, by which the defendant in trials for treason, felony, or misdemeanor may testify in his own behalf, and so also the husband or wife of the party charged.—The 3d of the classes into which we have divided the rules of evidence consists of presumptions of law in lieu of actual proof, or of what could be proved, under which may be specified the following:

- a. The statutes of limitation, by which a period of time is fixed when a debt shall be presumed to have been paid, or satisfaction to have been received. This sort of presumption is made, not for want of actual proof, as the period is usually short, and therefore not like the case of prescription for incorporeal rights, or title to land by adverse possession, in respect to which the time by the English law extends back far beyond the memory of living witnesses, and even the less remote time prescribed in the United States being still subject to the loss of important evidence. But the limitation of time as to personal actions for debt or injuries has in view

not so much the irreparable loss of testimony, by death or otherwise, as to put an end to controversy within a reasonable period. The current business of life has enough to employ our attention without our being burdened with the memory of all former transactions.

- b. Estoppel. A man is said to be estopped when it would be inconsistent with good faith or with the policy of the law to allow him to deny a certain fact or legal conclusion. Thus, if he claims under a deed or will, he is bound by all that is contained in it, and is estopped either from denying any recital therein, or from setting up any claim of title adverse to or inconsistent with such deed or will. In order to constitute an estoppel the recital must be distinct and clear, but it is not subject to the same strictness that would be applied to extraneous proof of the same fact. Thus, if a testator says in his will that he has conveyed his lands in A to his son D, and he devises all his remaining lands to another, the conveyance referred to must be understood to be in fee, and no other proof of it is required as against any of the parties claiming under the will. On the other hand, good faith demands that the estoppel should take effect only according to the real intent of the grantor with a right understanding of the facts, and therefore proof of mistake is sometimes admitted. An *estoppel in pais*, as it is called in the old cases, is when a man is precluded by his own act or admission from proving any thing contrary thereto. An instance of this is when a man has by some statement or admission induced another with whom he was dealing to enter into a contract; he will not afterward be permitted to deny the truth of such statement or admission if the effect would be to work an injury to such third party. So a tacit admission, as when a person having a claim to land allows another to purchase it of a party who has a defective title, or to make valuable improvements, without giving such third party notice of his claim, will operate as an estoppel to his setting up his claim against such innocent purchaser; but, according to some of the cases, it can only be enforced as an equitable relief, and is not a bar to an action at law. Upon the same principle, if a person allows a promissory note or other obligation, which he has given to another, to be assigned by the holder to a *bona fide* purchaser, and neglects to apprise such purchaser of a defence which he has to it, he will not be permitted to set up such defence as against him. To this head also belongs what is called *res judicata*, that is to say, the rule that when a fact necessarily involved in an action is once determined it shall not afterward be called in question as between the same parties or persons claiming under them. A judgment or decree of a competent court is final not only as to what was actually determined, but as to every matter which was involved in the issue, and which could have been decided. The record of the judgment is the only proper evidence of what was in issue, and it cannot be proved *alioquin* that some matter was in fact involved

and taken into consideration which does not appear by the record to have been involved in the issue. This is the rule as to decisions of tribunals in our own country. In respect to foreign judgments and decrees, the effect is the same when the court had jurisdiction of the case, and no fraud has been practised. The record itself, which must be produced, is not conclusive as to facts necessary to give jurisdiction, and a defendant will be permitted to prove that he was not personally served with process; so any fraud on the part of the court or its officers may be shown. But the regularity of the judgment having been established, it is conclusive upon all matters embraced in the issue.—The 4th class in the arrangement we have made of our subject, viz., the comparative weight of evidence, is of a twofold character. Judicial discrimination may lead to the rejection of testimony as being entitled to no weight at all, or it may determine the relative influence which it should have if admissible in the decision of a question of fact. The former we have already considered, so far as respects the incompetency of witnesses and the exclusion of hearsay testimony. But evidence is sometimes excluded for reasons of more limited application. Thus, inferior testimony is not admitted when a party has it in his power to produce what is of a higher order; as if the question be as to the title to real estate derived from a deed, the best proof will, of course, be the production of the deed itself, and no other proof will be admitted as a substitute, unless a satisfactory reason is given for its non-production, as where it has been lost or destroyed. But in this case, the substituted evidence must be exclusively as to the contents of the deed. In the United States that particular question is of rare occurrence, as conveyances of real estate are usually recorded, and the record or a certified copy may be read in evidence with the same effect as the original. So when a contract is in writing, it is necessary to produce the writing itself, and no other evidence can be given of the terms of such contract, without showing first the loss of the writing, or that for some other satisfactory reason it is impracticable to produce it; upon making which proof, parol evidence may be given as to the contents. And whenever, in the course of a trial, a fact comes in question, the evidence of which is in writing, the same rule is applied, viz., that no other evidence can be admitted than the writing itself if in existence, and if not, then only the substituted proof of its contents. It may however happen that nothing more than the purport can be shown, and not the exact phraseology; and some latitude will be allowed in such case, as by admitting proof of the acts of parties, and other circumstances, but still having in view to get at what was expressed by the writing. It does not follow, however, that when the best or what is called primary evidence cannot be produced, inferior or what is called secondary evidence will in all cases be admitted. Thus, as we have before shown, hearsay evidence is ex-

cluded, even if none better can be procured. Upon the same principle, when a writing is put in evidence, it must have effect according to its terms, and parol evidence is not admissible to give it a different construction, or to defeat its operation according to the import thereof; or even if the writing is ambiguous, it cannot be explained by other evidence, if the ambiguity be intrinsic, that is, if the phraseology is *per se* doubtful. But if the ambiguity arises from something referred to, but not fully expressed in the writing, explanation by other evidence is admissible. The latter is designated in law as a latent ambiguity, by which is meant that it does not appear upon the face of the instrument, but arises from something extrinsic. So also, when parties to a contract have undertaken to express it in writing, it will be assumed that they have expressed the whole, and nothing can be added by parol evidence, so far as relates to what the parties had in view at the time the contract was made. This is in effect saying that the written contract must speak for itself, and will be presumed to contain all that was intended at the time, though this contract may be varied by a subsequent parol agreement for good consideration. To the general rule as above stated there are, however, some qualifications. 1. It is admissible to explain the subject of the contract and all the circumstances which may properly be supposed to have been had in view by both parties, for the purpose of understanding the phraseology which they may have used. 2. Terms peculiar to a science, profession, art, or trade may be explained by witnesses conversant therewith. 3. Parol evidence is admissible to impeach a written instrument, by showing fraud, illegality of the subject matter, or whatever would operate in law to avoid it.—The admissibility of evidence is in judicial proceedings a matter of law, and in jury trials is determined by the court. But it is not alone for this purpose that discrimination is required. A question of fact usually involves testimony on both sides, which must be collated, and the relative weight of which must be determined in order to reach a correct conclusion. Usually the court arranges and sifts the evidence in the instructions given to the jury, and it is obvious that without this aid the jury would be incompetent to analyze the evidence in a complicated case. Since the disqualification to testify by reason of interest has been abolished, the reasons which formerly were insisted upon as grounds of such disqualification are still proper to be considered with reference to the credit of the witness. It would be out of place to discuss these reasons at large in a brief summary of principles to which this article is necessarily limited. A single case may however be appropriately referred to, viz., the impeachment of a witness by direct testimony of other witnesses, showing that he is unworthy of credit. This kind of testimony is peculiar. The inquiry is limited to the general reputation of the witness whose veracity is in question, and the im-

peaching witness is not allowed to testify to particular facts. The usual course of examination is to inquire what is the general reputation of the witness as to veracity, and formerly it was permitted then to ask the impeaching witness whether he would believe the other under oath, but the authorities are in this country not altogether uniform as to the latter practice. It may not be improper here to say that the rule as to impeachment of a witness is seldom of use, except where he is notoriously destitute of principle. But in many cases it may be essential to a proper judgment of the credit to be given to a witness, to know any particular exceptions to his character, although not extending to notoriety; and therefore the opinions of witnesses on the facts of which they may be cognizant may sometimes be important, even if not generally known. The only serious objection to this mode of inquiry is the liability to involve protracted collateral issues. The impeached witness should of course have the right to rebut, and this might sometimes lead to a conflict of evidence upon matters aside from the principal issue. Still, if there be any value in testimony called in for the impeachment of the credit of a witness, the opinions of those who have had dealings with him, or the transactions themselves which constitute the ground of exception, are far more to be depended upon than general reputation, which is in fact but common rumor, and usually has an intermixture of the false with the true. The common judgment of men is that falsehood in one instance affords a strong presumption in every other case when the statement of the same person is called in question. The existing legal rule is however restricted within the narrow limit first mentioned, viz., general reputation.—We have thus briefly analyzed the general principles of the law of evidence. Our subject would however be imperfectly treated if we should not refer to some of the rules which have more particular relation to the practice of the courts. One is that the best evidence must always be produced; or in other words, that inferior evidence will not be received when a party has it in his power to produce better. But it does not follow, as before remarked, that when a party has not the power to produce the best, any other without restriction is admissible. The secondary proof must still be such as is held competent under other rules, or it will be rejected. The meaning of the rule is that inferior evidence, although otherwise competent, shall not be admitted when better can be had. We have before adverted to the distinction between writings or documentary proof, and oral, or as it is usually called, parol evidence. The distinction is founded upon the uncertainty of memory. Whatever has been put in writing can never be proved by mere recollection with perfect exactness; the writing itself is of course the most trustworthy, and according to the rule above mentioned it must be produced or its loss proved before its con-

tents can be shown by other evidence; and this is true whether the writing relates to the principal fact or subject of the action, or is merely incidental. Again, when the question is as to a fact respecting which there is evidence in writing, but an offer is made to prove the fact by evidence *aliunde* without producing the writing or proving its contents, the rule is that if the writing was the concurrent act of both parties, as if it was signed by them or was prepared with the privity of both as an expression of their mutual understanding, it is thereby constituted the primary evidence of the fact to which it relates, and must be produced. This includes not merely a written contract which is the subject of the action, but any other writing which the parties have agreed upon as the expression of any fact incidentally involved in the action. There is this difference, however, between the two cases: that in the former no other proof can be received but the instrument itself, or if lost, proof of its contents; whereas in the latter there may be other evidence bearing upon the same point which is admissible, together with the writing, and in some instances without it, where it is not intentionally withheld. Thus a written correspondence between the parties may be material to show their understanding in respect to some transaction, but this would not preclude proof of conversations or other acts. If, however, the correspondence contains a contract, the rule would be otherwise; for then, according to another rule, no other evidence can be received except what is necessary for the proper explanation of the meaning of the parties in the language used by them. It is not material which party has possession of the writing; the rule is the same in either case. If wanted by one party, and the other has possession of it, upon notice by him to the other to produce it, and its non-production, he may give parol evidence of its contents.—It is to be understood that the rule above mentioned applies only to a writing in which both parties have concurred. When it is a memorandum by one without the privity of the other, it cannot be evidence at all, except under the recent modification of the law of evidence allowing parties to be witnesses, and is subject to the same rule that applies to any other witness. The rule as to a memorandum made by a witness at the time of the transaction referred to in it is, that he may refer to it for the purpose of refreshing his memory; but having done so, he is to testify what with this aid he is able to recollect. If, however, he has no recollection independent of the memorandum, the later doctrine is that on proving that it was made at the time of the transaction referred to, and that he then had knowledge of the subject, the memorandum itself may be put in evidence. The mode of proving a writing which is attested by a subscribing witness is peculiar. In such a case the subscribing witness must be called if living and within the jurisdiction of the court; but if dead or absent from the country, proof of his handwriting or of that of

the party will be sufficient to make the instrument evidence. The exclusion of proof of execution, by any other person than the subscribing witness has been often the occasion of inconvenience; and the reason usually assigned for it, viz., that the subscribing witness is supposed to have some knowledge of the subject which another would not have, is certainly very singular, as if he had such knowledge he would not be allowed to testify to it, if it would at all vary the effect of the instrument. In England, by a recent act, 17 and 18 Victoria, c. 125 (1854), a subscribing witness to an instrument which is not required by law to be attested need not be called, but the instrument may be proved in the same manner as if there was no such witness. The rule that parol evidence is not admissible to contradict, vary, or explain a written instrument has been before referred to, and certain exceptions or qualifications were mentioned viz.: that evidence may be given of such contemporaneous circumstances as would be essential for the proper understanding of the expressions used by the parties; or in explanation of technical language where the transaction relates to some trade or art, and the like; or lastly, when some ambiguity arises not involved in the language and in the instrument. An instance of the last exception is a case where a devise has been made to John Jones, and it turns out that there are two persons of that name; in which case it is admissible to show by other evidence which of the two was meant. But if from the language of the instrument it should be impossible to determine the meaning even with the aid of such explanations as would be admissible under the exceptions above mentioned, the defect could not be supplied, and the instrument would be void. Probably the greater strictness in the latter case is founded upon the fact that the admission of such explanations would be substituting other language than what the party himself has used, whereas in the case of latent ambiguity the court gives effect to the language of the party, but is obliged to obviate a doubt to which his attention was not directed. The distinction is not however very satisfactory; and a forced construction has been often resorted to in order to give effect to an instrument, which for the want of explanation that might perhaps have been given, but was not allowed by law, would otherwise have been void. Thus a grant of 10 acres of woodland described only as belonging to the grantor, when he had in fact 100 acres, was held in the old books to give an election to the grantee to take which 10 he pleased; it would probably now be held to give an undivided tenth part, and a partition would be necessary. So if a deed recited that the grantor had two tenements, and granted one without specifying which, the grantee was allowed an election to take either. But this liberality of construction was capriciously exercised. Thus an obligation to J. S. describing him as son and heir of G. S. has been held good, although he was a bastard

and therefore no heir. But a grant to John, son and heir of G. S., if in fact the name of the heir was Thomas, was held not good. It is likely that the courts would however now hold it to be good if there was no son of the name of John. But when it is sought to contradict an instrument which has an intelligible meaning, there is sound reason for enforcing the rule of exclusion. If there has been a mistake of expression, the proper remedy is by an appeal to a court of equity for correction. Under the code of the state of New York the amendment can be made and the instrument as amended enforced by judgment in the same action.—In the examination of witnesses, a very different mode is prescribed to the party calling a witness from what is allowed to the opposite party. The counsel of the former must not put leading questions, and if the witness should make adverse or unsatisfactory answers, still he was deemed the witness of the party and could be examined only in accordance with that theory; that is to say, he could not be cross-examined by such party. This at least was formerly the rule, but it has recently been relaxed so far as to allow him to be treated to some extent as an adverse witness, when it is apparent that he is so. On the other hand, cross-examination by the other party is allowed to an almost unlimited extent, and the privilege is often used to pervert rather than elicit the truth. It would be difficult to fix a precise limit of restriction, as it necessarily rests very much in the discretion of the court; but the prevailing practice, especially in the English courts, seems to be suited rather to a remote period, when from the disorders of society and consequent laxity of moral principle there was little reliance to be placed on the oath of witnesses, than to the present advanced state of social order, when the exigencies of vastly accumulated private transactions, and a superior intelligence extending to the lowest class, have induced a greater integrity, and when it may be assumed as a general rule that a witness is disposed to speak the truth.

EVORA (anc. *Ebora*, and *Liberalitas Julia*), capital of the province of Alemtejo, Portugal, and of a district of the same name, situated on high ground, 85 m. E. S. E. of Lisbon; pop. 15,000. It is surrounded by a wall, and contains the remains of 2 ancient forts. A splendid Gothic cathedral, a number of convents, hospitals, a house of charity, a diocesan school, barracks, and a museum are the principal buildings of modern date, while among its monuments of antiquity are a ruined temple of Diana, and an aqueduct by which the city is still supplied. Evora has some manufactories of hardware and leather.

EVREUX (anc. *Civitas Eburovicum*), a city of France, capital of the department of Eure, 52½ m. by railway from Paris, in a pleasant valley, on the Iton, which by means of a canal and a natural arm is made to water every part of the city; pop. in 1856, 10,615. It is surrounded by gardens, vineyards, and highly

cultivated fields. At a little distance from the town was the fine old château of Navarre, founded in the 14th century, which was for 2 years the residence of the empress Josephine after her divorce, and was destroyed in 1836. Evrenx has cotton and woollen mills.

EWALD, GEORG HEINRICH AUGUST VON, a German orientalist and theologian, born in Göttingen, Nov. 16, 1803. He was one of the 7 professors who were dismissed in 1837 on account of their remonstrance against the unconstitutional proceedings of King Ernest Augustus of Hanover. He repaired to England, where he remained until 1838, from which time until 1848 he officiated as professor of theology at Tübingen. He was then reinstated in his chair at Göttingen, where he continues (1859) to hold a prominent position in the department of oriental languages and exegesis. He is one of the best living oriental scholars and biblical critics. Among his most important works are *Grammatica Critica Linguae Arabicæ* (2 vols. 8vo., Leipzig, 1831-'33); *Ueber das äthiopische Buch Henock* (1854); *Ausführliches Lehrbuch der hebräischen Sprache des alten Bundes* (6th and enlarged edition, 1855; also an abridged edition of the same, *Hebräische Sprachlehre für Anfänger*, 2d ed., 1855). His principal theological work is his *Geschichte des Volkes Israel bis Christus* (3 vols. in 5, 8vo., 2d ed., Göttingen, 1851-'52). He was the projector of the *Zeitschrift für die Kunde des Morgenlands*, and since 1849 he has edited the *Jahrbücher der biblischen Wissenschaft*, in which he propounds his theological views, his leaning toward Baur and other adherents of the Tübingen school with whom he became acquainted during his residence in that city, involving him in many controversies. In 1841 he was ennobled by the king of Württemberg.

EWALD, JOHANNES, a Danish poet, born in Copenhagen, Nov. 18, 1743, died there, March 17, 1781. He early displayed his love of romance by an attempt to go to sea, the reading of "Robinson Crusoe" having excited his imagination, but he was overtaken by his friends before he had reached the sea shore. He afterward joined the army in Prussia and Austria, but was eventually induced by his friends to return to Copenhagen, where he studied theology, and passed his examination in 1762. Disappointed in his love for a young lady whom he celebrated in verse under the name of Arense, he fell into a state of melancholy, which cast a gloom over the rest of his life, but tended to stimulate his poetic genius. He devoted himself to literature, was deeply impressed with the beauties of modern German poetry, especially of Klopstock's "Messiah," and became the author of exquisite lyrical poems and songs, which secure for him a prominent place among the classical writers of Denmark. His first composition, "The Temple of Fortune, a Vision," was followed in 1766 by a poem on the death of Frederic V. In 1769 appeared his lyrical drama of "Adam and Eve." His tragedy of *Rolf Krage* (1770)

was the first attempt to dramatize the ancient history of Denmark, and bears evidence of the careful study of both Ossian and Shakespeare. About this time he became lame, and poverty, neglect, and intemperance added to his misfortunes. He was eventually deserted even by his mother, and the last two years of his life were spent in the house of a benevolent friend. But his literary activity remained undiminished, and in 1771 and 1772, while in the greatest distress of mind and body, he wrote even humorous plays, which were very successful. His most celebrated work, *Baldur's Död* ("Baldur's Death"), a drama of great power and poetic beauty, devoted to the heroic reminiscences of Scandinavian mythology, appeared in 1778. His lyrics and sacred poetry, however, are now most admired. His finest lyrical poem, "The Fishermen," appeared in 1778. He also wrote a famous national song of Denmark, and some works in prose. He began to prepare his poetical works for publication, but the edition was completed only after his death (4 vols., Copenhagen, 1781-'91; 2d ed., 1814-'16).

EWBANK, THOMAS, an American writer on practical mechanics, born at Barnard Castle, Durham, England, March 11, 1792. At the age of 13 he was apprenticed to a tin and copper smith, subsequently was employed for several years in London, and about 1819 emigrated to New York. In 1820 he commenced the manufacture of metallic tubing in that city, from which business he retired in 1836-'7 in order to devote himself to literary and scientific pursuits. In 1842 appeared his "Descriptive and Historical Account of Hydraulic and other Machines, Ancient and Modern; including the Progressive Development of the Steam Engine," a highly suggestive work, of which the 14th edition was published in 1856. In 1845-'6 he made a visit to Brazil, recording his observations in a work which was published in 1856 under the title of "Life in Brazil," with an appendix descriptive of a collection of American antiquities. In 1849 he was appointed by President Taylor U. S. commissioner of patents, in which capacity he prepared 8 annual reports, a portion of the first of which was published in pamphlet form in New York with an introduction by Mr. Horace Greeley. He retired from office in 1852. He has also published a work on the physical relation of man to the earth, entitled "The World a Workshop" (New York, 1855), "Thoughts on Matter and Force" (New York, 1858), and a variety of miscellaneous essays on the philosophy and history of inventions, which have appeared chiefly in the "Transactions of the Franklin Institute." His "Experiments on Marine Propulsion, or the Virtue of Form in Propelling Blades," was reprinted in Europe. As a member of the commission to examine and report upon the strength of the marbles offered for the extension of the national capitol, he made some suggestions which led to the discovery of a means of greatly increasing the power of resistance to pressure in building stones.

EWING, JOHN, D.D., an American divine, born in Nottingham, Md., June 22, 1782, died in Philadelphia, Sept. 8, 1802. He was educated in the college of New Jersey, was tutor in that college and instructor of the philosophical classes in the college of Philadelphia, and in 1759 became pastor of the 1st Presbyterian church in Philadelphia. In 1773 he visited England, and had interviews with Dr. Robertson, Lord North, and Dr. Johnson; the last of whom, affirming that the Americans were as ignorant as rebellious, said to Dr. Ewing: "You never read. You have no books there." "Pardon me," was the reply, "we have read the 'Rambler.'" When the college of Philadelphia was changed in 1779 to the university of Pennsylvania, Dr. Ewing was placed at its head as provost, and remained in this station together with his pastorate till his death. He was vice-president of the American philosophical society, and made several contributions to its "Transactions." His collegiate lectures on natural philosophy (2 vols., 1809) and a volume of sermons have been published since his death.

EWING, THOMAS, LL.D., an American statesman and jurist, born in Ohio co., Va., Dec. 28, 1789. His father, who had served in the American army during the revolution, and had become reduced in circumstances, removed his family in 1792 to the Muskingum river, and thence to a place 17 m. N. W. of the frontier settlements, in what is now Athens co., Ohio. Thomas was taught to read by an elder sister, and devoured with avidity the few books within his reach, studying mostly at night by the light of hickory bark. In his 20th year he left home and worked in the Kanawha salt establishments, until in 2 or 3 years he had laid up money enough to pay for his father's farm and enable himself to enter the Ohio university at Athens. Having exhausted his purse, he returned to the salt works, laid by his earnings, then resumed his studies, and in 1815 received the first degree of A.B. ever granted by the Ohio university. He studied law in Lancaster, Ohio, was admitted to the bar in 1816, and practised with great success in the state courts and the supreme court of the United States. In March, 1831, he took his seat in the U. S. senate as a member of the whig party, and became associated with Olay and Webster in resisting what were deemed the encroachments of the executive. He spoke against confirming the nomination of Mr. Van Buren as minister to the court of St. James's, supported the protective tariff system of Mr. Clay, and during the same session advocated a reduction of the rates of postage, a recharter of the U. S. bank, and the revenue collection bill known as the "force bill." On Jan. 9, 1834, as a member of the committee on post offices and post roads, he presented a majority report on abuses in the post office department, accompanied by 14 resolutions of censure. These were afterward reduced to 4, and were passed by a small majority. The committee were directed to continue their investigations, and at the next

session Mr. Ewing presented a second majority report, with a bill for the reorganization of the department. The bill passed the senate without opposition, Feb. 9, 1835, but was lost in the house of representatives; the postmaster-general, however, resigned, and the reorganization was effected during the following session. Mr. Ewing took a warm part in the debates on the removal of the deposits from the U. S. bank, which he looked upon as an unconstitutional measure, and on Dec. 21, 1835, he introduced a bill for the settlement of the much vexed Ohio boundary question, which was passed March 11 and June 15, 1836. During the same session he brought forward a bill, which became a law, for the reorganization of the general land office; and on several occasions he opposed the policy of granting preëmption rights to settlers on the public lands. He spoke against the admission of Michigan, on the difficulties with France, the deposit bill, the limitation of executive patronage, and the fortification bill, and presented a memorial for the abolition of slavery and the slave trade in the district of Columbia, which he insisted ought to be referred, though he was opposed to granting the prayer of the memorialists. In July, 1836, the secretary of the treasury issued what was known as the "specie circular," directing receivers in land offices to accept payments only in gold, silver, or treasury certificates, except from certain classes of persons for a limited time. In December Mr. Ewing brought in a bill to annul this circular, and another declaring it unlawful for the secretary to make such discrimination. The bills excited violent debates, and were not carried. In March, 1837, Mr. Ewing's term expired, and he resumed the practice of his profession. In 1840 he advocated the election of Gen. Harrison to the presidency, and when that gentleman came into office he became secretary of the treasury, which office he retained under President Tyler. His first official report, presented at the extra session in May, 1841, proposed the imposition of 20 per cent. *ad valorem* duties on certain articles for the relief of the national debt, disapproved the independent treasury act passed the preceding year, and urged the establishment of a national bank. He was requested to prepare a bill for the last purpose, which was passed with some alteration, but vetoed by the president. Mr. Tyler thereupon indicated to his friends a plan for a bank of moderate capital for the regulation of exchanges, and at his request Mr. Ewing helped to frame a charter, which was immediately passed and in turn vetoed. Mr. Ewing, with all the other members of the cabinet except Mr. Webster, thereupon resigned (Sept. 1841), and published his letter of resignation explaining his course. On the accession of Gen. Taylor to the presidency in 1849, he took office as secretary of the recently created department of the interior, which was still unorganized. Among the measures recommended in his first report, Dec. 3, 1849, were the extension of the public land laws to Califor-

nia, New Mexico, and Oregon, the establishment of a mint near the California gold mines, and the construction of a road to the Pacific. On the slavery question he separated from his old associates, Mr. Clay and others, who urged the necessity of comprehensive legislation to settle the whole matter at once and for ever, while Mr. Ewing agreed with the president in thinking the action of congress uncalled for. On the death of Gen. Taylor and the accession of Mr. Fillmore, July 9, 1850, this division in the whig party was made the basis of a change of the cabinet. Mr. Corwin became secretary of the treasury, and Mr. Ewing was appointed by the governor of Ohio to serve during Corwin's unexpired term in the senate. In this body he was an active defender of Gen. Taylor's administration. He did not vote for the fugitive slave law, helped to defeat Mr. Clay's compromise bill, reported from the committee on finance a bill for the establishment of a branch mint in California, advocated a reduction of postage, river and harbor appropriations, and the abolition of slavery in the district of Columbia, and paid great attention to the business details of the senate, particularly as affecting the new territories. In 1851 he retired from public life, and has since resided in Lancaster, Ohio, engaged in the practice of law. Among the most elaborate of his written professional arguments are those in the cases of *Oliver vs. Piatt et al.*, involving the title to a large part of Toledo, Ohio; the Methodist church division; the McIntire poor school *vs.* Zanesville; and the McMicken will, involving large bequests for education. His celebrity as a lawyer and public speaker equals his reputation as a statesman.

EXARCH (Gr. *ἐξάρχος*, prince), in the eastern Roman empire, an ecclesiastical or civil dignitary invested with extraordinary authority. At first exarchs were officers delegated by the patriarch or synod to visit a diocese for the purpose of restoring discipline. The exarch was also the superior of several monasteries, in distinction from the archimandrite, who was the superior of one, and was of a rank inferior to that of patriarch and superior to that of metropolitan. In the modern Greek church the exarch is a legate *a latere* of the patriarch. He visits the provinces to investigate ecclesiastical cases, the differences between prelates and people, the monastic discipline, the administration of the sacraments, and the observance of the canons; and usually succeeds to the patriarchate.—As a civil officer, the exarch was a viceroy intrusted with the administration of one or more provinces. This title was given to the prefects who during the 6th, 7th, and 8th centuries governed that part of Italy which was subject to the Byzantine empire. They were instituted after the reconquest of Italy from the Ostrogoths by Narses to oppose the progress of the Lombards then threatening to occupy that country. They were 17 in number, held their court at Ravenna, continued their government till 752, and combined civil, military, judicial, and often ecclesi-

astical authority. They appointed dukes as vice governors for several parts of Italy. The exarchate was destroyed by the Lombards. When Pepin of France conquered Ravenna, it was ceded to the pope. The title of exarch for high civil and military officers remained in the West till the 12th century.

EXCELLENCY, a title borne originally by the Lombard kings, and then by the emperors of the West from Charlemagne to Henry VII. It was adopted in the 15th century by the Italian princes, who exchanged it for that of highness (*altezza*) after the French and other ambassadors had been permitted to assume it. In France it became about the middle of the 17th century a common title for the highest civil and military officers; and in Germany it was given also to doctors and professors in universities. It is the title of every nobleman in Italy; in France, a duke is addressed as *excellence*, and a prince as *altesse*. It is the usual address of foreign ministers and of the governors of British colonies. Newspapers sometimes speak of the president of the United States as his excellency the president, but there is no legal sanction for this, the founders of the government having decided after discussion to bestow no title upon the president. A committee of the senate reported in favor of the style "his highness," but the house opposed any other title of office than those expressed in the constitution. Massachusetts is the only state which by a constitutional provision grants the title of excellency to its governor.

EXCHANGE, a gathering place for the transaction of business. The merchants of Athens met at the Piræus, where commercial operations derived a picturesque character from the animated scene presented by the shipping in the harbor. The first regular commercial meeting in Rome was held 493 B. C., and was called the merchants' college. In Venice, Genoa, and other Italian cities, similar gathering places existed at an early day. The modern institution of exchanges dates more particularly from the 16th century. In continental Europe the name *Börse* in German, *bourse* in French, and *birza* in Russian, originated from the belief that the first gathering of the kind took place in the early part of the 16th century at Bruges, in Flanders, in the house of a family of the name of Van der Beurse. According to another tradition the first exchange was held at Amsterdam in a house which had 3 purses hewn in stone over the gates, thus accounting for the use of the word *bourse*. Previous to the latter part of the 16th century the London merchants used to meet without shelter in Lombard street. Sir Richard Gresham, having seen the covered walks used for exchanges abroad, contemplated erecting a similar building in London. The scheme was carried into effect by his son Sir Thomas Gresham, who offered to erect a building if the citizens would provide a plot of ground. The site north of Cornhill, in the city of London, was accordingly purchased in 1566 for about \$18,000. On Jan. 23, 1570, Queen

Elizabeth caused it to be proclaimed the "Royal Exchange." This structure was destroyed in the great fire of 1666. The new exchange was commenced at the end of 1667, and publicly opened for business Sept. 28, 1669. This building, which was 210 feet by 175, cost nearly \$300,000, but was again destroyed by fire, Jan. 10, 1838. The corner stone of the present royal exchange was laid in 1842, and the building was opened Oct. 28, 1844, by Queen Victoria. It is an imposing edifice, embellished with many statues. The area appropriated to the meetings of the merchants is 170 feet by 112, of which 111 feet by 88 is uncovered. Here the English, German, Greek, Mediterranean, and other foreign merchants, all have their appropriate places and corners, and meet daily for the transaction of business. On Thursday and Friday an extra meeting for transactions in foreign bills of exchange takes place previous to the regular meeting, which is attended by the principal bankers and merchants of London, and which derives great importance from the immense business transacted within about half an hour. The whole foreign commerce which centres in London is here concentrated in a handful of bills of exchange. There is much less excitement than at the general exchange. A few brokers pass between the bankers and merchants, and the bills are bought and sold almost in a whisper.—The most celebrated continental exchange is the *bourse* of Paris, which was inaugurated in 1824. The building has the shape of an ancient peripteral temple; the exterior measures 234 feet by 164, the interior 108 feet by 59, exclusive of galleries, or 6,372 square feet, and is calculated to hold more than 2,000 persons. The Paris exchange is a combination of a stock and bill exchange, and confines itself chiefly to these branches of business. The St. Petersburg exchange approaches the Paris bourse in splendor. It was built between 1804 and 1810; its exterior is 330 feet by 246, its interior 190 feet by 90, or 17,100 square feet. The Hamburg exchange resembles also that of Paris in the shape and the grandeur of its building. The exchange of Amsterdam was finished in 1618, and is an edifice of great magnitude. The *bourse* of Antwerp, one of the oldest and most remarkable of Europe, which was chosen by Sir Thomas Gresham as a model for the royal exchange in London, was totally destroyed by fire, Aug. 2, 1858. A large portion of the commerce of the world was transacted in it for a considerable time. At Madrid, Lisbon, Leghorn, Marseilles, Trieste, Vienna, Smyrna, Odessa, Berlin, Frankfort, &c., the exchanges are numerous attended, but the exchange of London stands unrivalled in Europe for the magnitude of its transactions. Next to it in commercial importance rank the exchanges of Amsterdam and Hamburg.—The merchants' exchange in Wall street, New York, is erected on the site occupied by the exchange building destroyed by the great fire of Dec. 16, 1835. It occupies an entire block, is built of Quincy granite, and is fire-proof, no wood hav-

ing been used in its construction except for the doors and window frames. The front has a massive portico with 18 columns, each of which is a solid block of granite, 38 feet high, 4½ feet in diameter, and weighing about 40 tons. The entire building is 200 feet long by 171 to 144 wide, and 124 to the top of the dome. Its central rotunda is constructed of white marble, and lighted by a lofty dome, which is in part supported by 8 Corinthian columns of Italian marble, 41 feet high. Its cost, ground included, was over \$1,800,000.

EXCHANGE, BILL OF, in commercial transactions, a written instrument designed to secure the payment of a distant debt without the transmission of money, being in effect a setting off or exchange of one debt against another. This important instrument is of modern origin. It was not because its use was not perceived that it was unemployed in ancient commerce, but because its basis is mercantile integrity, which never existed till a recent period in trading communities to a sufficient extent to warrant putting money or other valuable commodities at risk upon so frail a security. Thus we have evidence in the case of the Athenian banker, which is the subject of one of the discourses of Isocrates, that the convenience of such an exchange as is now usual among merchants was well enough understood then, but it was deemed necessary to take security for the payment of the bill. Transactions of the same kind have doubtless occurred at all periods where parties have had sufficient confidence in each other; but that they were unfrequent is manifest from the silence of the Roman law in respect thereto. It is said that the Jews of the middle ages first introduced bills of exchange into ordinary use, and this is entitled to credit, inasmuch as the frequent migrations and spoliations to which they were subjected in those times of persecution, made an easy transmission of wealth and its safe-keeping in foreign countries almost a necessity. Of course the bills drawn by them were upon persons of their own race. The negotiation of bills of exchange by law can be traced back about 4½ centuries, the earliest being an ordinance of the city of Barcelona in 1394 respecting the acceptance of bills of exchange. An edict of Louis XI. in 1462 is the first notice of the subject in the laws of France. (See Kent's "Commentaries," vol. iii. p. 72, note.)—In form, a bill of exchange is an order or request addressed by one person to another directing the payment of money to a third person. The first is called the drawer; the second is the drawee until the bill has been presented and accepted, and then he is called the acceptor; the third is the payee. But sometimes the bill passes through several hands, which may be either by successive endorsements specifying to whom payment is to be made, or by what is called an endorsement in blank, by which is meant that the payee, or the subsequent holder to whom the bill has been endorsed, merely writes his own name on the

bill, which is equivalent to making it payable to bearer. The most important incident of a bill of exchange is its negotiability, that is to say, facility of transfer from one person to another. For this purpose it is essential that the engagement of the several parties, whether drawer, acceptor, or endorser, should be disentangled from all matters not appearing upon the face of the bill. This, therefore, is the general rule, subject to some exceptions which will be presently mentioned. Equally necessary is it that the bill itself should by its terms involve no uncertain contingency, as to depend upon an event that may not happen, or upon some condition which may be the subject of controversy. Hence it has been uniformly held that it must be payable at a fixed time, that is to say, at some period which is certain; but it may be so far contingent as to depend upon an event which must inevitably happen, though the precise time cannot be specified. Thus a bill may be payable a certain time after the death of a particular person; but it would not be a good bill if made payable after the arrival of a certain vessel. The one event is certain to happen at some period, though it may be remote; the other may not happen at all. Again, a bill of exchange must be expressed to be for the payment of money only, and would not be good if payable in cattle or other species of property, nor even if it is made payable in bank bills. In the state of New York it has indeed been held that a bill is good which calls for payment in bank bills current within that state, though it would not be so if specified that it is to be paid in bank bills of another state or country. But in England the rule is strictly adhered to that there must be no restriction in the bill precluding the right of the payee to be paid in specie if he chooses to demand it, and this is the generally received doctrine in the United States. When it is said that a bill is not good if subject to any contingency or payable otherwise than in money, it is intended merely that it is not negotiable with the legal effect which appertains to a bill drawn in the prescribed form. It may nevertheless constitute a valid contract between the original parties, and may even be transferred so as to vest in the assignee the same right which the payee would have had against the drawer or acceptor. The transfer in such case will, however, be subject to the same rules that apply to other personal contracts usually denominated *choses in action*. In other words, the transfer is itself a contract; and although it is not necessary that it should be in writing, yet it derives no aid from mercantile usage respecting the endorsement of bills. The delivery of a note not negotiable may give an ownership if so designed, and this is so in respect to a bond or other contract. But by the common law there was this limitation, that the right of the holder could be enforced only in the name of the original obligee, it being a rule that a chose in action was not assignable. In equity, however, the right of the assignee was recognized, and so to a certain extent it

came to be in the common law courts, the formality of using the name of the assignor in a suit brought upon such chose in action being all that is retained of the old strictness. In the state of New York even this has been abrogated, and by the code of practice the real party in interest, by which is meant whoever has the actual ownership, although the aid of a court of equity may formerly have been necessary for enforcing it, must be the party to the action; and this has been followed in many other states. Again, such transfer confers no greater right than the original payee or obligee had, and is subject to any defence, legal or equitable, which the other parties had against such payee or obligee prior to actual notice of the assignment, or what in law would be tantamount thereto. The bill, or rather contract, as it should be termed in the case supposed, is itself also subject to one important rule distinguishing it from a proper bill of exchange, viz., that it does not import a consideration unless expressed. If, therefore, no consideration is specified, parol evidence thereof will be necessary, as the rule of the common law is that a consideration is an essential requisite of a contract; but parol evidence will be inadmissible in all those cases in which by statute it is required that the contract should be in writing, as when the contract is not to be performed within one year, or when it is to answer for the debt of another person, &c. It will now be understood what is the negotiability above referred to as being the peculiar incident of a bill of exchange. The bill, in the first place, imports *per se* to have been given for value even if it does not contain the usual clause "for value received," which, though generally inserted, is mere surplusage; and every successive holder who has received it before it was due, in the regular course of business, for a valuable consideration, is entitled to enforce it according to the terms of the obligation expressed therein, without regard to any transactions between the original parties. To this rule there are some exceptions, as when the bill was given for a gaming debt or when usury is involved, in which cases the bill is declared to be absolutely void by statutes in England, which have been generally reenacted in the United States. When there has been fraud in the transaction to which the bill relates, which would have been a defence as between the original parties, the rule is that a *bona fide* holder for value is not affected thereby; with however this limitation, that the bill has been received not only without knowledge of the fraud, but without such notice of the circumstances as should have induced suspicion and inquiry. If the bill at the time of transfer has become due, this is in law deemed sufficient to call for inquiry, and the endorser in such case takes the bill subject to whatever defence there would have been against the party from whom he received it. There is one case, however, in which a bill is void for fraud even in the hands of a *bona fide* holder, viz., when it was drawn for a

specific purpose, and has been fraudulently appropriated by the person intrusted with it to another purpose; as if the bill was made for the purpose of being discounted, and should be applied by the agent in payment of a debt due by himself. When a bill has been stolen or lost, and has been put into circulation again, a *bona fide* purchaser is entitled to enforce it against all previous parties, provided there were no circumstances that should have led him in the exercise of ordinary prudence to inquire into the title of the party from whom he received it. It will in such a case be a question of fact whether due diligence has been used by the holder, and the burden of proof is imposed upon him, upon its being shown that the bill had been stolen or lost. The question in such case would be between the person who had lost the bill or from whom it had been stolen, and the person who had received it after the theft or loss. The liability of the original parties is not affected.—Bills of exchange are of two sorts, foreign and inland; the former being drawn by a merchant in this country upon another residing abroad, or by a foreign merchant upon one residing here; the latter when both drawer and drawee reside in the same country. The principal rules relating to bills of exchange grow out of mercantile usage respecting foreign bills; but by statute in England and the United States both are now put upon the same footing, with the exception only that damages are allowed upon foreign bills which come back protested for non-acceptance or non-payment. In the state of New York these damages are fixed by statute at 10 per cent. upon the principal of any bill payable in Europe or in the West Indies, or on this continent north of the equator. The rate varies upon bills drawn in the state of New York payable in another state, being in some cases 5, in others 3 per cent. By statute in England and the United States, promissory notes are made negotiable in like manner as inland bills of exchange. The same principles therefore, in respect to negotiability and the legal incidents thereof, apply to both.

EXCISE, a term originally used in England in distinction from customs, which were duties levied upon merchandise imported or exported; excise duties being such as were imposed upon domestic commodities, chiefly those which were manufactured, as glass, soap, distilled spirits, &c. Both kinds of duties are designated by the term *impost*. A tax upon land or personal property by a percentage of the value, as is now the usual mode, is not classed with excise duties, which strictly apply only to what is annually consumed. They were first imposed by the long parliament in 1643, but a number of articles of foreign production were included in the act, as tobacco, wine, sugar, &c., which were charged with a duty in the hands of the retailer in addition to what had been paid upon importation. Since that time they have been regularly continued, with only some modifications as to the articles subject to duty and the rate of

charge, the number of commodities having been however largely increased. The articles of foreign growth or manufacture are now transferred to the department of customs. Some of the domestic manufactures formerly subject to excise have by various statutes been exempted, as salt, wire, beer, cider and perry, hides, printed goods, candles, tiles, starch, glass, stone bottles; and the articles remaining subject to excise duty are hops, malt, paper, spirits, and stage and hackney coaches. Among the subjects of excise duty have been classed with some incongruity licenses and auctions. The duty on the former still continues; the latter has been repealed. The revenue derived from the excise in 1857 was £17,472,000, of which the proportion derived from malt and spirits was £15,842,837.—It has been much debated what is the relative advantage of excise duties as compared with customs. The latter mode of collecting duties is evaded to a large extent by smuggling; but so likewise, it appears, is the excise duty evaded, particularly in respect to malt and spirits. It is objected to the mode of collecting the excise, that it exposes a manufacturer's private operations, and thus deters him from making improvements. It was upon this ground that the duties upon glass were removed. The soap manufacturer was subjected to the same disadvantage that was complained of by the glass manufacturers, and the duty has since been repealed. Another objection has tended to make the excise duty more obnoxious than any other, viz., the arbitrary manner of enforcing it, which is felt to be an interference with private liberty and independence, which the common law has sedulously protected.—In the United States there is properly no excise duty. The revenue of the federal government is derived from customs or duties upon imported goods, tonnage duties on shipping, and land sales. In the several states there is a property tax, but differing in most of them from the similar tax in England in one important particular, viz., that the valuation of property is made annually.

EXCOMMUNICATION (eccl. Lat. *excommunicatio*, from *ex*, out of, and *communio*, communion), the highest ecclesiastical punishment, consisting of exclusion from fellowship with the church. It is distinguished by the Roman Catholic writers as greater (*anathema*) or lesser (*excommunicatio*); the former entirely cutting off the offender from the body of the church and the society of the faithful, and being proclaimed only when a sin has been mortal, manifest, and scandalous; the latter prohibiting from participation in the sacraments and in public worship, and, according to the *Pontificale Romanum*, being imposed especially upon those who cherish intercourse with anathematized persons. Only the lesser excommunication is in practice among most Protestants, though the Anglican church recognizes them both.

EXECUTION, in law, the final process to enforce the judgment of a court, according to the old maxim, *executio est fructus et finis legis*. In this larger application it includes the process of

sequestration, formerly used by the court of chancery to carry into effect its decrees, attachments for contempt of court, and process in summary proceedings, as upon mandamus and the like; but in its ordinary acceptance it is a writ issued to enforce a judgment in a suit or action in a court of common law. It is unnecessary to speak of the execution in the various real actions which have become obsolete. In England the actions for recovery of real estate, whether corporeal or incorporeal, are, by statute 3 and 4 William IV., c. 27, now limited to ejectment, *quare impedit*, and actions for dower. The first is the ordinary mode of trying a title to lands, and the execution upon a judgment of recovery is a writ of possession, which in form is directed to the sheriff, commanding him to deliver to the plaintiff the possession of the lands so recovered. *Quare impedit* is an action by which the right to a benefice is determined, and takes its name from a clause in the old Latin form of the writ by which the defendant was commanded to appear in court and show the reason why he hindered the plaintiff from presenting a proper person to a vacant office in a church. Upon judgment in favor of the claim, the execution is a writ directed to the bishop commanding him to admit the person nominated by the prevailing party. The action also lies for an office in eleemosynary institutions, as hospitals and colleges, which are endowed for the support of their inmates, and the execution in such cases is the same, except that it will be directed to the corporate officers or persons who have the control of the institution. In respect to lay offices, as they are called in distinction from ecclesiastical and eleemosynary, the mode of proceeding is by *quo warranto*, or *mandamus*. The former was strictly a proceeding in behalf of the crown against any one who had intruded into an office, but is now allowed by statute in England (9 Anne, c. 20) to determine disputes between private parties claiming an office adversely to each other. The proceeding in that case, although in form in behalf of the crown, yet is stated to be on the relation of the person prosecuting, and upon judgment in his favor execution issues to remove the intruder. *Mandamus* is a remedy where there is a refusal to admit the claimant to an office, or where he has been wrongfully removed. If the claim be established, a peremptory mandamus issues, directed to the defendant, commanding him to admit or restore the claimant, who is in this case, as well as the proceeding by *quo warranto*, called the relator. This is, however, not strictly an execution, as if not obeyed it must be enforced by another process called an attachment. In other actions, where the subject is an injury to real estate, usually the remedy is a recovery of damages; but in some instances specific relief is given, as in an action for a nuisance there may be a judgment that it be abated, and the execution in such case follows the judgment. So in some personal actions, formerly there might be judgment for the delivery of the specific thing,

as in detinue, which was brought to recover possession of chattels, and the judgment was enforced by an execution called a *distringas*, which commanded the sheriff to make distress of any goods of the defendant until he complied with the judgment; but if he still refused, there could only be an assessment of the value of the thing recovered, and a sale of defendant's property to pay the same. In the action of replevin, which was originally limited to the recovery of property which had been wrongfully distrained for rent, the writ by which the action was commenced directed the sheriff to replevy, that is, take the property in question, and deliver it to the plaintiff upon pledges to prosecute. If the defendant succeed in the action, the judgment is that he have return of the property, or if he elects, he may have an assessment of the value, and recover that amount as damages. In the former case the execution is for redelivery of the property, in the latter merely for the damages.—Before proceeding to the consideration of other actions, it will be proper to state the modifications which have been made in the United States in respect to those already noticed, limiting ourselves, however, to the state of New York. All the common law real actions are abolished except ejectment, which, in a simplified form, is used for the trial of title to land in all cases. *Quare impedit* is not retained, nor is there any action for the recovery of an office except the proceedings by *quo warranto* or *mandamus*. The action of detinue has been abolished, and the action of replevin has been extended to all cases of the wrongful taking or wrongful detention of personal property. In the latter action the plaintiff, instead of an actual replevy of the goods, may arrest the defendant and compel him to give bail, and the final judgment in such case will be for damages; and so the defendant, if he succeeds in a case where the goods have been replevied, may take judgment for the value, the execution being in either of these cases merely for damages.—We now come to the ordinary actions in which there is judgment for a money demand. At common law there are 3 forms of execution upon such a judgment: 1, a *fieri facias*, so called from the terms of the writ by which the sheriff is commanded that of the goods and chattels of defendant he cause to be made the amount of the debt or damages recovered; 2, *elegit*, which is a writ given by an ancient statute (13 Edward I., c. 18), whereby, if the plaintiff elected, possession of the goods and chattels of defendant was delivered to plaintiff under an appraisement of the value thereof, which to that extent was to be a satisfaction of the judgment; but if not sufficient, then possession of one half of the freehold lands of defendant was also to be delivered until from the rents and profits thereof the judgment should be paid; 3, a *capias ad satisfaciendum*, which is a writ directed to the sheriff commanding him to take the body of the defendant, and keep the same until satisfaction of the debt. The course of proceeding upon this writ was to imprison the defendant in the

gaol, of which the sheriff had in law the

It will not be necessary to follow the which have been made by statute in

The present state of the law has been ly stated in the article DEBTOR AND

Having traced the origin of the plied to executions, we shall limit our

a brief explanation of the legal inci- now prescribed by statute in the state

York, to which there is a general con- in the laws of most of the other states.

There are but two forms of execution, viz., the *vi* and the *capias ad satisfaciendum*,

have been already explained, and which nated by the abbreviated terms *fi. fa.*

a. The *fi. fa.* is a writ directed to the y which he is commanded to make the

of the judgment by sale of the defend- ds and chattels, or if these should not

ent, then of the lands of which he was n the day when the judgment was

l. An exemption is made of certain from levy under execution, viz.: kitch-

ils, necessary provisions for family use, y fuel for the use of the family for 60

cessary wearing apparel, bedding, &c., c's tools and implements to an amount

eding \$25, a family Bible, family pic- school books and other books not ex-

\$50 in value, a pew in a church, land for a burial place not exceeding $\frac{1}{4}$ of an

nd in addition, a lot and building occu- residence by the debtor, being a house-

nd having a family, to the value of but if the premises so occupied shall

hat amount in value, the debtor must r the surplus, or the premises may be

ject to the payment of \$1,000 of the to the debtor. (See *FIERI FACIAS*.)

a. is the old form of execution against on of the defendant. By the act to

imprisonment for debt, passed in 1831, provisions of the code of 1849 and sub-

modifications, there is no longer a lia- arrest for debt, either upon mesne or

ress, except in certain specified cases, en the action is for an injury to person

eter, wrongfully taking or detaining, embezzlement or fraudulent misappli-

f property by a public officer, or by an or counsellor or officer of a corpora-

by a broker or other person acting in a capacity, or where the defendant has

ilty of a fraud in contracting the debt, pting to avoid the payment of it by re-

r other disposition of his property. An n against property is made returnable

ys from the time when it is issued. The nay make a return earlier, but is not

ed to do so. An execution against the cannot be issued until the return of an

n against property. As to the modearge from an execution against the

it has already been considered in the ar- TOR AND CREDITOR. (See also BANK-

EXECUTOR, the person appointed to carry

into effect the directions contained in a last will and testament. By the common law of

England, or rather by the law as administered in the ecclesiastical courts, which have the ex-

clusive jurisdiction of the probate of wills and the granting of letters testamentary, an infant

of the age of 17 was qualified to act as execu- tor. Prior to that age, letters of administration

were granted to some other person *durante minore etate*; but by statute 38 George III., c.

87, such administration must now continue until the person named as executor has reached the

age of 21. A married woman cannot act as an executrix without the assent of her husband,

inasmuch as he is responsible for her acts. Let- ters of administration may issue to the wife in

case of the absence of the husband from the country, or of his legal incompetency, upon her

procuring some one to execute an administra- tion bond in place of the husband. As no bond

is required upon issuing letters testamentary, it would seem that the wife should be entitled

without giving security when the husband is absent or incompetent; yet if he is to be held

liable for her acts, his consent must be neces- sary, or security given in place thereof. When

executors are not named in a will, or are incom- petent, or refuse to act, letters of administration

with the will annexed may be issued, under which the same powers may be exercised that

could have been by competent executors duly appointed. By statute in the state of New

York, no person is competent to serve as an ex- ecutor who is incapable in law of making a con-

tract (except a married woman), or is under the age of 21 years, or an alien, or has been

convicted of an infamous crime, or shall be ad- judged incompetent by the surrogate, by reason

of drunkenness, improvidence, or want of un- derstanding. It is further provided that a mar-

ried woman shall not be entitled to letters tes- tamentary unless her husband consent thereto

by a writing filed with the surrogate. In such case the letters issue to her, and she adminis-

ters in her own name; but letters of adminis- tration (which issue when there is no will)

must be taken out by the husband in behalf of the wife. When a woman who is acting as ex-

ecutrix or administratrix marries, her letters are not thereby superseded, but may be revoked

upon the application of any person interested. The husband would probably be liable for her

acts as administratrix if he took no proceedings to take out letters of administration in his own

name, and for her acts as executrix if he makes no application for the revocation of her power.

An executor *de son tort*, as he was formerly called, i. e., one who intermeddled with the

estate without having lawful authority, was liable to the extent of any assets which he might

have appropriated to be sued as an executor of his own wrong, but was not entitled to insti-

tute a suit as executor. In the state of New York, any one intermeddling with the estate of

a deceased person without having an appoint-

ment as executor or administrator, may be made liable to the rightful representative as a wrong doer, but cannot be treated as an executor of his own wrong. An alien cannot be either an executor or administrator, unless he is an inhabitant of the state. Letters testamentary or of administration issued abroad are not recognized in New York; but if issued in another state, by competent authority, the person appointed will be entitled, on production of such letters, to receive letters of administration. It is held, however, that a foreign executor or administrator may be called to account for assets received abroad and brought here.

EXELMANS, REMY JOSEPH ISIDORE, count, a French general, born in Bar-sur-Ornain, Meuse, Nov. 13, 1775, killed by a fall from his horse, July 10, 1852. He served first in Italy, became an aide-de-camp of Murat, whom he followed to Germany, and attracted the attention of Napoleon, who made him a colonel after the battle of Austerlitz. In 1806 and 1807 he fought in the campaigns of Prussia and Poland. In 1808 he accompanied Murat to Spain, where he was taken prisoner and carried to England, whence he escaped in 1811, and rejoined Murat, then king of Naples. He returned to France, however, as soon as Murat's policy began to clash with that of Napoleon, and served in the Russian campaign with the rank of general of division, when he was severely wounded. In 1813 the emperor intrusted him with the command of the army in Saxony, and afterward of the operations in Holland. During Napoleon's exile at Elba he was at first treated with great distinction by the Bourbons, who conferred upon him the title of count; but afterward he incurred their displeasure by a congratulatory letter which he wrote to Murat, and which was intercepted. He was acquitted, however, by the court martial before which he was tried. He hailed Napoleon's return from Elba with enthusiasm, and, after having been raised to the French peerage in June, 1815, he resumed his duties in the army of the emperor, and fought with his wonted bravery in the battle of Waterloo. After passing several years in exile, he received in 1819 permission to return to France, and was to some extent reinstated in his military position. Louis Philippe restored him to the chamber of peers, where he denounced the execution of Ney as an "abominable assassination." Under Louis Napoleon he was appointed in 1850 grand chancellor of the legion of honor, and in 1851 marshal of France.

EXETER (Ind. name *Squamscott*), a township and one of the capitals of Rockingham co., N. H., situated on Exeter river, a branch of the Piscataqua, 14 m. S. W. from Portsmouth; pop. in 1850, 3,329. The Boston and Maine railroad passes through Exeter village, which is built around the falls upon both banks. The tide flows to the falls, to which place the river is navigable for small schooners. Manufacturing is largely carried on. The Exeter company was incorporated in 1829 with a capital of \$170,000, for the manufacture of cotton goods. The mills

contain 7,224 spindles. The New England gas-pipe company was incorporated in 1848, with a capital of \$100,000. There are also 3 saw mills, 4 grist mills, and 1 steam planing mill. In the western part of the township is a village where paper, carriages, morocco, and other articles are extensively manufactured. The total value of manufactures yearly is estimated at \$450,000. The principal village is pleasantly situated on a plain. The streets are wide and shaded by elm trees. The court house and town hall is a handsome brick edifice, erected in 1855 at a cost of \$32,000. There are 9 church edifices—2 Baptist, 1 Christian, 2 Congregational, 1 Methodist, 1 Roman Catholic, 1 Second Advent, and 1 Unitarian. There are 13 public schools, 1 female seminary, and Phillips academy for boys, 2 banks with a capital of \$200,000, a savings institution, and a public library containing 2,100 volumes. Phillips academy was founded in 1781 by John Phillips, LL.D., who bequeathed to it property valued at the time at about £10,000. The settlement of Exeter was commenced July 4, 1638, by a party of emigrants from Massachusetts bay, under the lead of the Rev. John Wheelwright, who had been banished from that colony on account of his adherence to Antinomian opinions. They purchased lands of the Indians near the falls on the Squamscott, and named the town after Exeter in England. They formed a church, and made themselves a body politic by choosing rulers. Their laws were made in popular assembly, and were formally assented to by the people. It was a near approach to a pure democracy. The town suffered severely during the Indian wars from 1690 to about 1710. A portion of it was annexed to South New Market in 1853.

EXETER, a city, port, and parliamentary borough of England, capital of Devonshire, and a county in itself, on the Exe, 10 miles from its mouth, 159 m. W. S. W. from London; pop. in 1851, 32,810. The Exe is here crossed by a handsome stone bridge leading to the suburb of St. Thomas. The city, standing on a steep acclivity, has 2 wide principal streets, which cross each other at right angles near its centre. It is generally well built, has many fine squares and terraces and ancient houses, and in its suburbs and environs are numerous elegant villas. It was formerly strongly fortified, but its exterior wall is now in a ruinous state, and a part of the rampart has been converted into a promenade. On an eminence N. E. of the town is Rougemont castle, formerly the residence of the West Saxon kings, repaired by William the Conqueror. Exeter is the seat of a bishopric founded in 1049. Its cathedral, a magnificent building of cruciform shape, was begun in the 11th century. Its entire length is 408 feet; it has 2 Norman towers 130 feet in height, 10 chapels or oratories, and a chapter house. One of the towers contains an immense bell weighing 12,500 lbs., and the other has a peal of 11 bells. Among the numerous schools is a free grammar school founded by the citizens in the reign of

Charles I., in which the sons of freemen are instructed gratuitously, and which has 16 exhibitions to either of the universities. Exeter has a theatre and various literary and charitable institutions. The commerce of Exeter is much less now than formerly, but as the metropolis of Devon and Cornwall it has considerable internal trade. The river Exe is navigable for vessels of large burden to Topsham, 3 m. below Exeter; and by means of a canal built in 1568, subsequently much enlarged, and one of the oldest in England, vessels of 400 tons burden can come up to the quay near the walls of the town. The registered shipping of the port, Dec. 31, 1856, was 172 vessels of 21,546 tons; entrances during the year, 688 vessels of 64,175 tons; clearances, 216 vessels of 12,951 tons. Barges and other woollen goods were formerly manufactured in this city and the neighboring towns to a large extent, and shipped hence to the continent and the East Indies; but the introduction of machinery and the lower price of fuel in the north of England have very much diminished this trade.—This city is of unknown antiquity, and is the *Caer-Isca* of the Britons, and the *Ica Damnoniorum* of the Romans. It was the capital of the West Saxons, and in the reign of Alfred in 876 it was surprised by the Danes. It was besieged and taken by William the Conqueror. In the reign of Henry VII. it was successfully defended against Perkin Warbeck, who landed with an army in Cornwall. It sustained a siege in the reign of Edward VI., when the religious changes and the enclosure of lands which had been common while the monasteries existed caused a general insurrection of the people of Cornwall and Devonshire. In the civil war it espoused the royal cause, was taken by the parliamentarians, was retaken by Prince Maurice, became the head-quarters of the royalists in the west and the residence of Charles's queen, and in 1646 surrendered after a blockade to Gen. Fairfax. Exeter has returned 2 members to parliament ever since the reign of Edward I.

EXHAUSTION (Lat. *exhaurio*, to draw out), a method of the ancient geometry, applied with peculiar success by Archimedes, by which the value of an incommensurable quantity was sought by obtaining approximations alternately greater and less than the truth, until two approximations differed so little from each other that either might be taken as the exact statement. Thus the length of a circumference was sought by calculating the length of inscribed and circumscribed polygons, and increasing the number of sides until the lengths of the outer and inner polygon were sensibly the same, when that of the circumference could not differ sensibly from either. Exhaustion is now interesting chiefly because it led, in the 17th century, to the invention of the differential calculus.

EXHILARATING GAS. See **NITROGEN**.

EXMOUTH, EDWARD PELLEW, viscount, an English admiral, born in Dover, April 19, 1757, died in Teignmouth, Jan. 23, 1833. He entered

the royal navy in 1770, and in 1775 was a midshipman of the frigate *Blonde*, which carried Gen. Burgoyne to America, and first saw active service in the American revolutionary war. Appointed to the armed schooner *Carleton*, on Lake Champlain, he took a brilliant part in the naval action of Oct. 11, 1776, and distinguished himself in the same waters on several subsequent occasions. Attached to the army with a party of seamen under his orders, he rendered invaluable assistance during the difficult advance of Burgoyne to Saratoga, and, though a midshipman only 20 years of age, was called to the council of war at which that general's capitulation was determined. Young Pellew pleaded earnestly that his naval brigade might not be included, urging that they had been the pioneers of the army, and could make their way back to the St. Lawrence. But he was overruled, and sent home as bearer of despatches, receiving immediate promotion. In June, 1780, being first lieutenant of the frigate *Apollo*, he succeeded to the command, the captain being killed at an early period of a severe action fought with a French frigate off Ostend. It ended in Lieut. Pellew driving the enemy on shore under the neutral batteries; and for his good conduct he was made a commander. In 1782 the rank of post captain was awarded him for a successful conflict with 8 French privateers, inside the isle of Bass. From 1786 to 1791, he commanded successively the frigates *Winchester* and *Salisbury* on the Newfoundland station, but on the breaking out of the war with France in 1793, he was appointed to the *Nymphé*, 36, for employment nearer home. He soon signalized himself by fighting and capturing the French frigate *Cléopâtre*. This was the first prize taken in the war, and it gained Capt. Pellew the honor of knighthood. His next ship was the *Arethusa*, a name immortalized in Dibdin's naval songs; and his merit procured him, in 1794, the command of the famous flying squadron of crack frigates, organized for service in the British channel. In 1795 he was moved into the frigate *Indefatigable*, and was actively engaged in blockading and watching the French coast. In January of the following year, while he was refitting at Plymouth, the *Dutton*, a large transport ship, with troops on board, was driven on the rocks in a terrific gale. Sir Edward, who chanced to be on shore, by extraordinary personal exertions, got on board, assumed direction, and succeeded in saving the lives of all on board. He himself, the first to render assistance, was the last to swing himself ashore, and the wreck shortly afterward went to pieces. The whole deed was so brilliant and masterly that it created an immense sensation, having been witnessed also by thousands of spectators. Plymouth voted the modest hero of it the freedom of the town, in a gold box; Liverpool, a service of plate; George III. created him a baronet, as Sir Edward Pellew of Trevery; and a stranded ship was quartered in his armo-

rial bearings. The blockade of the harbor of Brest and various minor sea fights ensued. In 1799 he commanded the *Impétueux*, 78; and in that ship, as in the *Indefatigable*, he breasted and broke, so far as his own crews were concerned, the mutinous spirit which was rank in the British navy about this period, and assumed from time to time a perilous significance. In 1800 he took part in the abortive expedition against Ferrol, but under superior officers. During the short peace that followed the treaty of Amiens, Sir Edward was elected member of parliament for Barnstable. In 1803, on the renewal of hostilities, he was appointed to the *Tonnant*, 80, and proceeded to blockade a French squadron at Ferrol; but he was recalled in the following year, to support the admiralty under Earl St. Vincent in the house of commons, against a motion of censure brought forward by Mr. Pitt, and contributed greatly by his straightforward testimony to the vote which exonerated the head of the naval department. In the same year Sir Edward became rear admiral, receiving simultaneously the appointment of naval commander-in-chief in India. He hoisted his flag in the *Culloden*, and until 1809 was occupied in protecting commerce against French privateers in the eastern seas, destroying also several French ships of war at Batavia and other Dutch East Indian ports. In the spring of 1810 the North sea squadron was placed under his orders, and a year later he succeeded Sir Charles Cotton in the Mediterranean. Blockading Toulon, Genoa, and the various harbors that are scattered along the northern coasts of that sea, was his occupation during the next 8 years, which, if not marked by any salient points, were unchecked by disasters. At the close of the war, when honors were freely bestowed upon the British army for its triumphant campaign in the Peninsula, it was thought right that one peerage should be awarded to the navy. For this distinction Sir Edward Pellew was selected, and he was created Baron Exmouth of Canonteign. A pension was also granted him, as usual when a peerage is awarded for public services. A commandership and then a grand cross of the bath soon followed; but the admiral's services were not yet complete. When Napoleon escaped from Elba, he again hoisted his flag in the Mediterranean, proceeding first to Naples, where he landed a body of marines, and preserved order. Early in July, 1815, he embarked an Austrian force at Genoa, under Sir Hudson Lowe, and sailed for Marseilles, which they protected from the attack of Marshal Brune, who threatened to march thither from Toulon. The inhabitants presented him a splendid testimonial in plate, bearing the inscription: *A l'amiral milord Exmouth, la ville de Marseilles reconnaissante*. In March following, he was ordered to demand from the Barbary chiefs the release of all the Ionian prisoners enslaved, the Ionian islands having just come under British guardianship. The dey of Algiers, first visited, complied. At Tunis, however, Lord Exmouth's interpreter gave the

bey to understand that he was required to abolish Christian slavery altogether. He consented, as did his colleague of Tripoli. Lord Exmouth hereupon returned to Algiers, and pressed the same demand, but not with the same result. The dey refused this further concession, and the violent conduct of his myrmidons nearly brought on him summary chastisement. But the admiral had already exceeded his instructions, and not feeling justified in proceeding to hostilities, agreed that negotiations should be transferred to London and Constantinople, warning the dey that he might be compelled eventually to return, in which case he further undertook to batter down the defences of Algiers with 5 line-of-battle ships only, a prophecy most accurately fulfilled. The boast might have been termed presumptuous, but Lord Exmouth never trusted to chance. He had at that moment in his possession accurate plans and soundings made expressly for him, which corrected many grave errors in the admiralty charts. These latter had doubtless been the ground of Lord Nelson's expressed opinion that 25 line-of-battle ships would be necessary to bring the dey to terms. On the return of the squadron to England, preceded and followed by tidings of fresh outrages, it was determined, after a stirring debate in the house of commons, that the Algerines should be forced into submission. Lord Exmouth was empowered to execute the task, and allowed an unrestricted selection of material. Greatly to the surprise of the admiralty, and in the teeth of protests from many naval officers of ability and experience, he persisted in limiting his main force to 5 line-of-battle ships, including the *Queen Charlotte*, which was to carry his flag, and one other three-decker. There were also 5 frigates, 4 bomb vessels, and 5 gun brigs. The squadron was to be manned by volunteers; and as the expedition was a perilous one, Lord Exmouth peremptorily refused his brother, his two sons, and his two sons-in-law, all officers who had served under him with more or less distinction, permission to accompany him. The fleet sailed from Portsmouth on July 25, and thus the raw hands, of whom the crews were mostly composed, had but a month's training at the guns. On touching at Gibraltar, the Dutch vice-admiral, Baron Van der Capellan, being there with 5 frigates and a corvette, earnestly begged leave to take part, which was accorded. On Aug. 27 the fleet arrived off Algiers, and a flag of truce with the admiral's demands was sent in, the vessels lying-to about a mile from the town. At 2 P. M., no answer having been received, the *Queen Charlotte* led in to the attack, every detail of which had been preconcerted with the most consummate judgment. Algiers was very strongly defended. A series of forts and batteries faced the sea, massively built and heavily mounted, the guns that commanded the sea approaches being estimated at nearly 500. These had all been put in repair, new works being also added. In the harbor, which is artificial, and has an entrance only 120

yards wide, lay 4 frigates, 5 large corvettes, and 89 gun boats. The garrison had been increased to 40,000 men. The dey was bent upon obstinate resistance. So confident also was he in his preparations and resources, expecting moreover to be able to carry the ships by boarding from his gun boats, which were crowded with men, that the Algerines allowed the British flag ship and another one to take their stations before firing a shot themselves. The *Queen Charlotte* accordingly was anchored by the stern, a half-cable's length from the mole head, being there lashed to the mainmast of an Algerine brig, abandoned at the harbor's mouth. The plan of attack, most ably conceived, was carried out with gallantry and skill by all the ships engaged, including the Dutch auxiliaries, who bore their full share of the brunt. Lord Exmouth had rightly estimated the power of his own ship's unerring and tremendous broadside. It soon silenced the battery on the mole; but the Algerines fought their numerous guns with precision and intrepidity, and at an early period of the engagement their gun boats daringly swept up to board the admiral and the frigate next him. Concealed at first by the dense smoke, they were discovered ere they ranged alongside, and nearly all sunk by a few well-directed shots. At great risk the Algerine fleet was subsequently fired and burnt, the *Queen Charlotte*, from her close proximity, narrowly escaping a similar fate as one of the burning vessels drifted past her. Toward night, as the guns on shore became silenced, and the ammunition fell short, the fleet gradually slackened fire; and at 11 P. M. the admiral hauled off, after an engagement of nearly 9 hours' duration. The material result of this fierce and protracted bombardment was that nearly all the Algerine batteries toward the sea were crumbled into ruins, together with a large portion of the town, and that the arsenal and armed shipping were burned. The damage was enormous. The dey reported his loss in men as exceeding 7,000. Of the British force 818 men were killed and wounded, and 65 of the Dutch. No officers of distinction fell, though the admiral himself had several narrow escapes. He was struck in 3 places, and a cannon shot tore away the skirts of his coat. The moral effect of the achievement was in keeping with the material. On the morning after this severe lesson, the dey submitted to all the demands that had been made upon him by Great Britain, including the abolition of Christian slavery for ever, and the immediate release of 1,200 slaves of all nations. On Lord Exmouth's former visit to the Barbary coast 1,800 had been set at liberty. Returning to England, the victor in this memorable conflict was welcomed with unbounded enthusiasm. He was advanced to the dignity of a viscount, received the thanks of parliament, and was knighted by several of the continental potentates. In 1817 the naval command at Plymouth was given him, which he retained for 3 years, and then retired into private life. In seamanship, vigi-

lance, coolness, readiness of resource, promptness and accuracy of judgment, and the sagacious adaptation of means to an end, Viscount Exmouth had no superior in the service of Great Britain. He was never foiled; never failed. As a schoolboy, under 10 years of age, he gave proof of his resolute spirit, by entering a house on fire to bring out a keg of gunpowder, when no other bystander durst approach. As a captain in the *Winchelsea*, when his crew were close-reefing the main topsail, in a hard gale on a dark night, his voice was suddenly heard from the yard-arm, the most perilous position. Jumping overboard to save life was of frequent occurrence with him. When his flag ship, the *Culloden*, took fire off the Coromandel coast, and many of the crew jumped overboard, and there was general confusion, he beat to quarters, ordered the marines to fire upon any one attempting to leave the ship, cut the tackles of the boats to prevent their being hoisted out, restored confidence, and had the fire extinguished. Among a mutinous crew, on a lee shore, or in the heat of battle, he was always the same—always ready, always resolute. In addition to all this, he was religious, loyal, truthful, humane, and charitable.

EXODUS (Gr. *ἐξόδος*, departure), the going out or departure of the Israelites from Egypt under Moses. This event has been largely discussed by critics and commentators, and there is very considerable discrepancy in regard to the date of the exodus, the place where the Hebrews crossed the Red sea, the nature and extent of the miracle connected with this passage, &c. Dr. Robinson advocates the view that the Red sea was crossed at or near Suez; other critics and travellers express themselves convinced that the passage was effected at Ras Attaka, where the Valley of Wandering terminates. The date of the exodus is fixed by Usher at 1491 B. C., by the Septuagint 1614 B. C., by Dr. Hales 1648 B. C., and by Bunsen, Lepsius, and Wilkinson at or about 1320 B. C. in the reign of a Pharaoh whose name was Pthahmen or Menephthah.—The book of Exodus is the second of the Pentateuch, or five books of Moses. It gives a narrative of the fortunes of the Israelites after their migration into Egypt, the birth and education of Moses, the plagues inflicted on the Egyptians, the departure of the Hebrews, the passage of the Red sea, the giving of the law on Mount Sinai, and the erection of the tabernacle, and includes the period from the death of Joseph to the end of the first year after the going out of Egypt.

EXOGENS (Gr. *ἐξω*, outward, and *γενναω*, to generate), a class of plants so called because their woody matter is increased by additions to the outside of that which first surrounds the central pith. As there are no specific limits to the age of exogenous trees, their diameter indefinitely increases by this annual process, a distinct external layer being added by each year's growth. The stem of an exogen consists of a central column of pith or medulla, woody zones, and bark. Processes from the central medulla called me-

dullary rays cross the zones transversely. The bark of an exogen parts readily from the underlying wood at a particular season of the year, when a viscid secretion called *cambium* is produced between the wood and the inner surface of the bark. It is at this period that the leaves expand and the trunk lengthens. The woody fibres in the leaves are prolonged into the stem or trunk, passing down among the cambium, and adhering partly to the wood and partly to the bark of the previous year. By this means new living matter is continually deposited upon the outer portion of the woody stem and the inner portions of the bark. It is in this part of the stem that the intensest vitality exists, the outer and older layers of the bark and the inner and older concentric rings of the wood becoming inert and falling off or decaying without injury to the vegetative parts. The office of the medullary processes is very important as means of communication between the centre of the stem and the outside layers or rings; and they are conduits, so to speak, by which the fluid matter passing down the bark can reach the wood next the medulla or pith. These processes, which resemble thin plates, are of a spongy nature similar to that of the pith from which they originated. They sometimes assume sinuosities and undergo partial obliteration; and sometimes the wood itself assumes an excessive irregularity. As these circumstances are to be found mostly in tropical exogenous trees, vines, and climbers, difficulty is sometimes experienced in perceiving from transverse sections their claims to be considered as exogens. This natural character of an outward growth in the exogens is associated with other peculiarities of development of other organs. Thus, the leaves have veins ramifying from the midrib outwardly to the circumference; or if there are several ribs, the veins are still of the same quality, so as to form an irregular network. These veins never run parallel to each other without ramifications, and even some which appear to do so will be found to possess secondary veins. The leaves also fall away from the branches, being disarticulated from their places of insertion, leaving a clear scar behind. Certain foliolar organs, called stipules, are also frequently attached to the leaves, which is very unusual in endogens. The flowers are quinary, that is, they have 5 sepals, 5 petals, and 5 stamens, or some power of that number. The tall and feathery outline of the palms is never seen in the exogens, as none of them depend on a single terminal bud for their developing growth. From the very germination of the seed the difference is apparent in the form, of the embryo and in the dicotyledonous characteristics of the young plant.

EXORCISM (Gr. *ἐξορκισμός*, to conjure), a rite having for its object the casting out of evil spirits. As the natural attendants of a belief in demoniacal possession, exorcisms have been practised in every age and country. The pagans of old, like those of to-day, attributed diseases which baffled their skill, and almost all misfor-

tunes of which they did not readily perceive the cause, to the agency of malignant spirits, whose power they sought to break by incantations, music, the use of certain words, burning drugs or chemical compounds, amulets, &c. Epicurus and Æschines were the sons of women who lived by such arts, and were accused of having sometimes assisted their mothers in the imposture. Even human sacrifices were resorted to in order to destroy the spells of demons. Josephus tells us that Solomon acquired great skill in exorcising, and left several formulas to be used in the ceremony. He gives a curious example of the efficacy of the king's system which he says fell under his own observation. The exorcist "put a ring that had a root of one of those sorts mentioned by Solomon to the nostrils of the demoniac, after which he drew out the demon through his nostrils; and when the man fell down immediately he adjured him to return unto him no more, making still mention of Solomon and reciting the incantation which he composed." In the book of Tobit we read of an exorcism practised by Tobit at the bidding of an angel. Neither the belief in diabolical possession nor the use of exorcisms was condemned by our Saviour, and the cure of persons tormented by devils was among the commonest proofs of a divine mission given by him and his disciples. The devil-worship of the pagans led to a general practice in the early church of exorcising converts before baptism; in the case of the "energumens," or really possessed, it was intended to cast out the evil spirit; in others it was merely to break the power of Satan over the convert by driving out wickedness, and was a symbol of belief in original sin and of the horror with which Christians ought to shun the devil and his works. With this view the Roman Catholics have always retained it, even in the baptism of infants. They exorcise water before blessing it, in token of disbelief in the pagan doctrine that all useful things are given and presided over by spirits, and not unfrequently they seek by exorcisms to allay storms and check the ravages of noxious animals and insects. All such are called ordinary exorcisms; extraordinary are those pronounced over energumens. The form used for such purposes greatly varies; in some cases it is very simple, but when the subject is an energumen it is attended with many ceremonies. The exorcist marks the subject with the sign of the cross, sprinkles him with holy water, reads over him various litanies, psalms, and prayers, abjures the demon by the mysteries of the Christian religion to afflict the person no more, and commands him in the name of Jesus Christ to depart. The exorcist in such cases is a priest who must receive special authority from the bishop, but in former times the duty was intrusted to an inferior clerk. The order of exorcist is the 8d of the minor orders, and is still retained, though its functions are performed by priests.—The art of casting out devils is the subject of several very curious old works, one of the most

remarkable of which is the *Thesaurus Exorcismorum et Conjuratumum terribilium, potentissimorum, efficacissimorumque, cum Practica prebatiissima, quibus Spiritus maligni, Dæmones, maleficiaque omnia de Corporibus Humanis tanquam Flagellis Pustibusque fugantur, expelluntur. Doctrinis refertissimus atque uberrimus: ad maximam Exorcistarum Commoditatem in lucem editus et recusus* (Cologne, 1608). In this we have not only the verbal formulas to be used, with the most efficacious drugs for fumigations (*profumigatio horribilis*), but directions for dieting the possessed on bread, mutton, and wine or holy water, and for administering emetics and other wholesome medicines. A picture of the demon, *effigie horribili ac turpi*, with his name written under it, thrown into the flames, is said to be an excellent remedy, and a judicious use of vituperative epithets may compel the spirit to tell his name, which is always an important consideration. (See DEMON.)

EXOSTOSIS (Gr. *ἐξ*, out of, and *οστέον*, bone), an osseous tumor developed on the surface of a bone, originally or eventually continuous with its substance, circumscribed, without interior cavity, having the same structure and life as the bone on which it is found. There are two varieties of this growth; in one the bone, like all other tissues of the system, takes on a morbid development, an eccentric hypertrophy of its substance, forming a well-defined tumor on its surface by the mere excess of interstitial osseous deposit; in the other the new ossific matter is deposited originally on the surface, under or between the laminae of the periosteum, separated from the bone at first by cartilage, but afterward becoming consolidated to it in the usual manner of bony processes. The first variety may affect the greater part of a bone, and deserves rather the name of *hyperostosis*; and the second, by the progress of ossification, may be converted into the first; this distinction is of considerable importance in the prognosis and treatment of the affection. The muscles and soft parts over an exostosis are generally not changed, unless the tumor be of considerable size and in the neighborhood of large nerves and vessels; but the periosteum is almost always thickened, and less adherent to the bone than usual. In the first variety the form is regular, and the bony fibres diverge from the natural direction to enter the tumor, as in other forms of eccentric hypertrophy; in the second variety the form is irregular, often fantastic and rough, and there is an evident base by which it is as it were immovably articulated to the supporting bone, except in very old growths; this base in recent cases is cartilaginous and readily separated, and shows that this kind of exostosis originates from and is nourished by the investing periosteum; it indicates also a method of treatment which has been found successful, by denuding them of their periosteum and causing their necrosis and separation from want of nutrition. If the cartilaginous base rests upon the bone, under the periosteum, the removal of this

membrane will cause an exfoliation of the subjacent bone; but if between the laminae of this envelope, a similar operation will effect the fall of the tumor without injury to the surface of the bone; the cartilage soon becomes ossified, and the exostosis forms one body with the bone, resembling the first variety in having no basal line of separation. In course of time the excessive deposit of phosphate of lime in these growths may convert them into a substance having the appearance, consistence, weight, and polish of ivory. Among the constitutional causes of exostosis are syphilitic poisoning, the scrofulous diathesis, and the gouty and rheumatic conditions; but local causes are the most common. These tumors are frequent in domestic animals. All require for their production an irritation or inflammation either of the periosteum or the internal structure of bone; the syphilitic taint generally develops its exostoses from the periosteum, and on bones sparingly covered with soft parts, as the forehead, lower jaw, tibia, sternum, clavicles, and ribs; while the scrofulous constitution favors their origin in the deep-seated portions of the long bones; the superficial exostosis can hardly be developed under a thick mass of frequently contracting muscles. Contusions, local irritations, and wounds of bone, frequently give rise to periosteal exostosis; in some constitutions there is such a disposition to the deposit of ossific matter, that the slightest contusion is sufficient to cause the development of these bony growths, not only on bones but in the substance of tendons and ligaments. An exostosis may grow toward the interior of a bone, and make no appearance externally; when muscles and tendons are displaced or distended, the movements of the joints may be impeded, even to the formation of ankylosis; pressure upon arteries, veins, and nerves may cause oedema, aneurismal tumors, pain, cramp, and partial paralysis. In the upper jaw exostoses often project toward the orbital and the buccal cavities; very common on the lower jaw, they grow sometimes to a large size; on the clavicle they are comparatively rare, but exceedingly common in the pelvic cavity, especially in females. There is nothing in the nature of the growth incompatible with life, the only trouble and danger being from their mechanical action upon neighboring parts. The treatment consists in remedies addressed to the constitutional cause, if there be any; in exciting the absorbents by mercurials, mineral acids, and stimulating applications; in producing artificial necrosis by denuding them of the periosteum; and in removing the tumors by the saw, chisel, trephine, or other instruments.

EXPANSION, the property displayed by bodies of enlarging in bulk by increase of heat, or in a few instances by increase of cold, and also of moisture. It is seen in solids in the common operation of setting the tire of a wheel; the iron ring, being heated in the circle of burning chips and coals arranged upon the ground, enlarges in bulk, so as easily to slip over the fel-loes, which it pinches closely together, as it

grows cool on the application of cold water. It is seen in liquids in the rise of mercury in the thermometer; and in æriform bodies in the ascending currents of heated air, or more plainly in the bursting of a tight bladder, as the air it encloses swells by exposure to heat. The amount of expansion exhibited by different bodies by any given increase of heat is very various. Those only which exist in the æriform state, or as vapors, can be classed together in this respect. They all expand alike by the same increase of temperature. Like air they increase in bulk from the freezing to the boiling point, so that 100 measures at the lower degree fill 137½ at the higher. For each degree of temperature the expansion is $\frac{1}{488}$. Each solid body has its own rate of expansion, which however is not uniform for equal increments of temperature, but increases at high degrees in a faster ratio. This, unless special allowance is made for it in the graduation, introduces error in thermometers, those marked off in equal divisions for the high degrees evidently not being correct. Another source of error also is in the unequal expansion of the different materials. The mercury from the freezing to the boiling point of water expands 1 in 55.08; between the latter and 392°, 1 in 54.61; and between this and 572°, 1 in 54.01. Glass expands in the same range of temperature, in the first division, $\frac{1}{5555}$; in the 2d, $\frac{1}{5333}$; and in the 3d, $\frac{1}{5000}$. In a mercurial thermometer it is the difference of expansion between the mercury and the glass that is indicated, and the temperature indicated by 586° would correspond to 667° determined by the expansion of glass alone, or to 572° by the air thermometer. Various instruments called pyrometers have been devised to determine high degrees of temperature by the amount of expansion of bars of different metals. They are all approximate only in their results, for the reasons given. Daniell's register pyrometer is the most accurate. (See PYROMETER and THERMOMETER.) The expansions of various bodies from 32° to 212° are presented in the following table:

Names.	Expansion in length.	Expansion in bulk.	Authorities.
Zinc, cast....	1 in 823	Smeaton.
" sheet...	1 " 840	1 in 113	
Lead.....	1 " 851	1 " 117	
Tin	1 " 516	1 " 172	Lavoisier and Laplace.
Silver	1 " 524	1 " 175	
Brass.....	1 " 536	1 " 179	
Copper	1 " 582	1 " 194	
Gold	1 " 682	1 " 227	Smeaton.
Bismuth....	1 " 712	1 " 239	
Iron.....	1 " 846	1 " 282	Dulong and Petit.
Antimony...	1 " 923	1 " 307	Smeaton.
Temp'r'd steel	1 " 926	1 " 309	Lavoisier and Laplace.
Palladium....	1 " 1,000	1 " 333	Wollaston.
Platinum	1 " 1,181	1 " 377	Dulong and Petit.
Glass, without lead	1 " 1,148	1 " 382	
Flint glass...	1 " 1,248	1 " 416	Lavoisier and Laplace.

The expansion in bulk is thus found to be about 3 times the linear expansion. When metals become liquid by fusion, a change takes place in the law of their expansion; their

specific gravity increases, as is shown by solid pieces of a metal always floating upon the surface of a melted mass of the same metal, and on cooling the metal expands. Thus it is that in most castings, the mould is entirely filled in its minutest parts.—A great difference is shown in the amount of expansion of different liquids; thus water gains $\frac{1}{4}$ in bulk when its temperature is raised from 32° to 212°; oil of turpentine $\frac{1}{14}$; and mercury in a glass tube $\frac{1}{85}$. A remarkable exception to the general law of expansion of liquids in proportion as they are heated is shown in the case of water. When this is cooled from the temperature of 60°, it continues to contract until it reaches the temperature of 39.2°. From this point it expands until it freezes at 32°, its rate of expansion being about the same from 39° whether it is heated or cooled. An important beneficial effect resulting from this peculiarity in the expansion of water is seen in the protection it affords to the natural bodies of this fluid, as lakes and ponds, against being frozen throughout. For, as the surface of the water is cooled below 39° by the cold air above, this portion by its expansion becomes specifically lighter than the water below, and consequently remains at the top. At 32° a covering of ice forms over the water, which being a poor conductor of heat preserves the great body of water below from falling to a lower temperature than 39°, the point of its greatest density.—So great a power is exerted by the contraction of metals on cooling after being expanded by heating, that this has been applied as a mechanical force, as in the bringing together of heavy walls of buildings which had separated by unequal settling. Strong iron bars are passed horizontally through the opposite walls, and being heated throughout their length, are closely keyed up and then allowed to cool; and the process is repeated until the desired effect is obtained. This suggests the danger of inserting bars of metal closely in walls of masonry, as by the force exerted by their expansion they tend to thrust portions of the wall out of place. The expansion of water in freezing has been practically applied to the rending of rocks, the fluid being poured into the fissures and allowed to freeze. This is one of the most efficient agents employed by nature for the disintegration of rocky cliffs. The expansion by access of moisture is exhibited in the swelling of the fibre of wood or of ropes. This, too, is sometimes employed as a powerful mechanical force, as by inserting wedges of wood into cracks, or into holes drilled for the purpose in rocks, and then covering the wood with water. As this is absorbed, the wood slowly expands, exerting a steady pressure of surprising force to open the fissure.—The presence of moisture in the atmosphere is ascertained by instruments based on this principle. (See HYGROMETER.) For the effect of expansion of steam, see STEAM.

EXPLOSION, the sudden and violent expansion of a body by its component parts ac-

quiring a great increase of bulk. In gunpowder this is the result of its elements suddenly entering into new combinations and assuming the gaseous state by the application of heat. As mentioned in the article **BLASTING**, the bulk is thus instantly increased more than 450 times, supposing the temperature of the gases to be at the freezing point; but such a degree of heat is developed in the chemical changes which take place, that the volume of the gases is supposed to be from 4,000 to 6,000 times that of the powder. A remarkable feature in these explosions is the immense velocity with which the gases expand; and another is the intense degree of heat produced. Explosions are caused by the sudden formation of steam in considerable quantities, or by the sudden failure of the vessel in which it is confined to longer retain it. By its property of elasticity it instantly assumes a greater volume, breaking from its confinement with the violent movement of an explosion. Electrical explosions are produced by the instantaneous restoration of equilibrium between two bodies differently excited. It is witnessed in its most terrific forms in the stroke of lightning, and in the discharge of the fire balls which are seen at times to burst with tremendous reports in the atmosphere. Liquids thrown in very small quantity upon the surface of molten copper cause most violent explosions, which can hardly be explained by the mere evolution of the gaseous bodies which the liquid employed is capable of producing. If melted metal is allowed to flow in moist sand or moulds containing water, explosions are produced which are often attended with serious consequences. They are not of rare occurrence in iron foundries. In these, but more particularly in large blast furnaces, explosions sometimes occur from bodies of inflammable gases collecting in the furnace itself, or in the hot air chambers or flues, or under the boilers, where they are conveyed to be consumed for the heat they produce, and where they become mixed with atmospheric air. At one of the large blast furnaces of the Thomas iron company, on the Lehigh river in Pennsylvania, a terrific explosion occurred a few years since from the gas from the lower part of the stack finding its way back into the air receiver and blowing cylinders; and a still more disastrous explosion of the same nature took place at the Hudson iron works on the Hudson river, by which an enormous globe of boiler plate iron, 40 feet in diameter, used for giving regularity to the blast, was blown apart, the upper half of the shell being torn and thrown off with a report that startled the city as if it had been an earthquake. Explosions in the stacks occur in new furnaces not well dried before they are put in blast, and sometimes are repeated at intervals for weeks. A new furnace at Rossie, St. Lawrence co., N. Y., some years since exploded from this cause, throwing out a considerable portion of its contents and setting fire to all that was combustible about it. A most serious explosion

occurred at a large blast furnace in Wales some years ago, which was caused by one of the workmen throwing a shovelful of hot coals into the top, when the charges had run very low, preparatory to blowing out. The whole stack was instantly demolished with a tremendous explosion, and 9 men were killed.—The wonderful power developed by the explosion of gunpowder is shown by the experiments of Count Rumford. He loaded a mortar with $\frac{1}{16}$ of an ounce of powder, and closing up every aperture he placed a cannon so as to rest upon the charge with a pressure of 8,081 lbs. On firing, the mortar burst with a loud explosion, raising the cannon upon it. Twenty-eight grains of powder closely confined in a cylindrical space which it just filled on exploding burst a bar of iron capable of resisting a strain of 200 tons. One of the most remarkable gunpowder explosions on record occurred at Wilmington, Del., May 31, 1854. Three wagons from Dupont's mills, loaded with 150 barrels of powder which contained 12,000 lbs., were passing through the town near together. By some means fire was communicated to the powder, and the whole blew up. The effects were felt in the buildings for more than a mile around. Some were destroyed; windows in those near by were burst in; in others the nearest windows to the explosion were burst in, and the others out; while in those further off the force was exerted outward. A wagon tire was torn off the wheel, and a piece left on a hill a quarter of a mile off. Shoes were stripped off the feet of the horses, and in the houses the casters from the furniture and the hinges from the doors. Under the wagons depressions were made in the hard macadamized road by a condensation of the earth. The one under the middle wagon measured 10 feet by 5, and was 8 feet deep. Cast iron water pipes 4 or 5 feet below the surface were broken off. The most terrible explosion which ever occurred was that at Brescia in Aug. 1767. In the vaults of the church of St. Nazaire a large quantity of ammunition was stored belonging to the republic of Venice. This was fired by a stroke of lightning, 207,600 lbs. exploding at once, reducing nearly $\frac{1}{2}$ of the city to ruins, and destroying about 8,000 of the inhabitants.—In the explosion of gaseous mixtures, most powerful effects are caused when these produce water by the combination of their elements, as in the mixture of two volumes of hydrogen with one of oxygen. The vapor generated is rendered extremely rare by the intense heat. By condensing this, and thus producing a vacuum, it has been thought practicable to apply explosions to generate mechanical power for useful purposes; and machines have been contrived with this object. In the *Dictionnaire des arts et manufactures* an account is given of an invention of M. Selligue, by which it was proposed to propel vessels through the water by exploding repeated charges of carburetted hydrogen mixed with atmospheric air through two strong tubes

which were directed through the stern and opened under the water.

EXPONENT (Lat. *exponere*, to manifest), in arithmetic and algebra, a small figure or letter, written to the right of and above a quantity or algebraic term, to show how often the quantity or term must be multiplied by itself. Thus, 3^4 signifies that 4 threes must be multiplied together, and 3^4 is equal to 81; in like manner $(a+b)^c$ signifies that the sum of the numbers represented by a and b must be written down as many times as there are units in c , and then multiplied consecutively into itself. (See **ALGEBRA**).—Exponential equations and functions are those in which the exponents contain unknown or variable quantities; such as $y=a^x$, in which a is the only known quantity. Exponential equations are usually reduced to logarithmic, and thus solved.

EXPRESS, a messenger or conveyance sent on any special errand, particularly a courier despatched with important communications. In the United States the word is applied to a system organized for the transportation of merchandise or parcels of any kind. This system was originated March 4, 1839, when, agreeably to announcement published for several days in the newspapers, Mr. William F. Harnden of Boston made a trip from that city to New York as a public messenger. His route was by the Boston and Providence railroad and the Long Island sound steamboat, which connected with that line. He had in charge a few booksellers' bundles and orders, and some brokers' parcels of New York and southern and western bank notes to deliver or exchange—a service for which he charged an adequate compensation. Mr. Harnden proposed also to take the charge of freight, and attend to its early delivery. For this purpose he had made a contract with the above named railroad and steamboat companies. He was to make 4 trips per week. The project recommended itself to business men, especially those whose communications between the two cities were frequent. It was particularly acceptable to the press, to which Mr. Harnden made himself very useful in the voluntary transmission of the latest intelligence, in advance of the mail. A year later (1840) a competing express was started by P. B. Burke and Alvan Adams, the ownership and sole operation of which soon devolved upon the latter. In 1841 Mr. Adams associated with him William B. Dinsmore of Boston as his partner, and gave him the charge of their New York office. Adams and co.'s express was carried by the Norwich and Worcester route. In 1840 Mr. D. Brigham, jr., Harnden's New York agent, became his partner, and soon after went to England, where he laid the foundation of Harnden and co.'s foreign business. He returned in 1841, and in that year their line was extended south as far as Philadelphia, and west to Albany. A year or two later Adams and co. established E. S. Sanford as their agent in Philadelphia, and he became a partner in their business there. He also became associated with S. M.

Shoemaker of Baltimore in an express from Philadelphia to Washington, D. C. About the same time Harnden and co.'s Boston, Springfield, and Albany express was purchased by Thompson and co., who gave it their name, which it still bears. About the same period Gay and co., afterward Gay and Kinsley, commenced what is now known as Kinsley and co.'s express, running between New York and Boston, *via* Newport and Fall River. The express lines from Albany to Buffalo, and thence to the remoter west, were established by Henry Wells. The first express west of Buffalo was commenced in April, 1845, by Messrs. Wells, Fargo and Dunning, under the style of Wells and co. It was disposed of, 2 years afterward, to William G. Fargo and William A. Livingston, who continued it, under the style of Livingston and Fargo, until March 18, 1850, when it was consolidated with the expresses of Wells and co., and Butterfield, Wasson, and co. The express line last named had been created about a year previous by John Butterfield. These 3 concerns, when united, were called the "American Express Company." William F. Harnden, the founder of the express business, died in 1848, leaving little or no property. In the mean time numerous short express routes and local expresses had come into successful operation throughout Massachusetts and the rest of New England. Messrs. Pullen, Virgil, and Stone, who by their efficient services had contributed largely to the success of Harnden's business in its infancy, now started an express between New York and Montreal, and laid the foundation of the "National Express Company." Wells, Fargo, and co.'s California express was created in the city of New York in 1852. Adams and co.'s California express, established in 1849, was succeeded in 1855 by that of Freeman and co. In 1854 Adams and co., the Harnden express (then owned by Thompson and Livingston), Kinsley and co., and Hoey and co., were consolidated in a joint stock institution, now famous as the "Adams Express Company." Its stock is in 12,000 shares, of no stated par value, but usually regarded as worth at least \$100 per share. The "United States Express Company" was commenced in 1853. It runs a through express twice a day to Buffalo, over the New York and Erie railroad, and thence to numerous western cities, towns, and stations. Between New York and Dunkirk, and at all the stations upon its route, the New York and Erie railroad company is doing an express business which was first established by the regular express company last mentioned. The "Hope Express Company," the "New Jersey Express Company," and the "Howard Express Company," established as joint stock concerns since 1854, were founded upon successful individual enterprises of some years' standing prior to that date. They serve every part of New Jersey and Pennsylvania. The "Eastern Express Company" also is a union of several individual enterprises, consolidated Jan. 1, 1857. Its principal office is in Boston,

see its lines diverge by various railroad and boat routes into Massachusetts, New Hampshire, Fiske and co., and Cheney, Fiske, and proprietors of expresses which have been useful, for some years past, in Massachusetts, New Hampshire, and Vermont. Massachusetts is remarkable for the number of its expresses, the most of which have short routes, and are operated by individual enterprise. The American-European Express and Exchange Company, created in New York, July 1, 1855, founded upon the business of Livingston Wells, and Edwards, Sanford, and co. It sends and receives an express by every regular of foreign steamships, and transacts business in London, Paris, and all the European cities. American express company does an immense carrying and collecting business throughout the western states and territories. It has branches and agencies in upward of 400 cities and towns. Its joint stock capital, \$750,000, is in shares of \$100 each, selling, when they find their way into the market, which is seldom, at a premium.—The aggregate capital invested at present in the express business is variously estimated at from \$10,000,000 to \$15,000,000. It is said to yield from 12 to 14 per cent. per annum to the stockholders. The amount of bank notes and other money transported by express companies is not less than \$10,000,000 per day. They have contracts with banks for this service, charging from 18 to 30 cents per \$1,000, according to the distance, and these prices, in ordinary times, regulate the rate of exchange between the cities of the United States. The expresses travel at the most rapid rate possible, and make the transit of 100 miles of railroad twice daily. Every carload of express freight is accompanied by a messenger, who has also in charge sundry large trunks, full of small but valuable articles, and one or more iron boxes or safes, 18 inches square, containing money for delivery to banks, brokers, and others. To every express agent at each station he delivers a way bill to that place may call for, and receives freight, &c., to be forwarded from that point to towns further on. All this is done at the station during the ordinary pause made by the express train. Every thing in charge of an express for transportation is entered with its value upon a way bill at the office or station to which it is forwarded. The address of the package is entered in full, and the fare to be paid by the express is to receive upon it. If the package has received it from some other express, the messenger, to which he has paid a prior freight upon it, he enters the amount so paid by the sender in the column of "cash expenses," or "freight," and it is put to his credit, and collected, together with the freight, upon the delivery of the package at its destination. If, on the other hand, the freight has been prepaid, the amount is entered in the "prepaid" column. If it has been prepaid to some point, the messenger, at the terminus of the express line, or at the destination, the

freight upon it to the nearest station to which the express can convey it is entered in the prepaid column, and the balance of the prepayment is entered in what is called the "paid through" column, to defray the cost of completing its transit to destination. The footings of the prepaid and paid through columns are charged to the agency where the package was billed; the footings of the expense and freight columns to the agent to whom the way bill is sent. Every package is compared with the entry in the way bill by the agent receiving it, and if correct, it is checked off; if wrong, information of the error is sent to the proper source. If it consists of an erroneous charge, the receiving agent charges it back in his way bill to the office where it was made. Thus the mistake is speedily rectified. As every agent issuing a way bill keeps a copy of it, the correction of errors is greatly facilitated. The agents file all the way bills received by them, and periodically return them to the main office of the division. The express messengers are great travelers; there is one in the city of New York who has made the transit of 1,500,000 miles during the last 10 years. The express service, in all its departments, gives employment to upward of 5,000 men.

EXTRACTS, in pharmacy, matters obtained by digesting vegetable substances with water, alcohol, ether, or acetic acid, and evaporating the products until they are reduced to a pasty or sometimes hard and dry consistence. In some instances, as in succulent and green vegetable matter, the active principle which it is desired to obtain is separated by expressing the juices of the plant. These are then evaporated to the proper consistence. Before pressing, the substances are also sometimes mixed with the fluid selected for the solution and allowed to stand for some hours. In selecting a suitable menstruum in which to procure the principles of the plant, reference is had to the nature of these; if they are gums or starch which may be taken up by water, the cheap fluid is employed, and the resins which are soluble only in alcohol or ether are left behind. But if it be the resins or the volatile oils which it is desirable to obtain, alcohol or ether is employed to separate these, and the gums, starch, &c., which are soluble only in water, do not pass with the matters soluble in alcohol through the filter. Various methods are adopted to effect solutions of vegetable principles, so as to obtain their full strength without endangering their decomposition by exposure to too great heat. It was the opinion of Orfila, from numerous experiments upon extracts, that their virtues diminish in proportion to the degree of heat to which they are exposed. The method by hot infusion is consequently adopted, and that also of maceration. By the latter, plants are left with alcohol a week or more at a time, and the process is sometimes hastened by digestion at a moderate heat. An excellent method of obtaining concentrated extracts with cold liquids has been introduced by

the French, and is called by them the method of displacement, for which the name percolating process might well be substituted. It is the principle of lixiviation exhibited in the common mode of extracting the lye from wood ashes for making soap. A quantity of water poured into the cask upon the ashes becomes saturated with the potash; and if more water is afterward added, the first portion is not weakened by its mixing with it, but the strong liquor is displaced on the passage for its exit being opened under the filtering material in the bottom of the cask. The second body of water, allowed to stand in the same way, acquires much less strength; and the third still less. Cylindrical vessels of tin and of queensware or glass are now used for obtaining vegetable extracts on this plan. They terminate below in the form of a funnel, and where the cylinder begins to contract into this shape, a colander is accurately fitted. On this is placed some cotton or tow, and then the vessel is nearly filled with the vegetable substance, which has been first ground to powder in a mill. Water, ether, or some other liquid is then gradually added until the powder is saturated with it, the escape through the funnel being stopped by a plug or stopcock in the lower end as long as may be desired. The powder may be covered with a second colander or diaphragm pierced with holes, and upon this successive portions of water may be poured, filling the cylinder. It is important that this should be kept constantly full. By making the top of the cylinder airtight and introducing a tube, any amount of pressure may be obtained, according to the height to which this is extended. In evaporating the solution after this is obtained, the same care is required to avoid too high a degree of heat; and in some instances, too, access of air has an injurious effect, and is consequently to be guarded against. Though concentration by boiling is the common method adopted, and the liquid is for greater safety heated by steam pipes, it is readily seen that evaporation conducted under the receiver of an air pump, as in the vacuum pans used in sugar refineries, is a far better method, the process going on at a very low temperature, and without exposure to currents of air. It is even found expedient in some cases to make use of a surface of sulphuric acid in the exhausted receiver for absorbing the vapors as they are formed, that their elastic force may not act like atmospheric pressure to check their evolution. (See EVAPORATION.) The most perfect processes are thus conducted in the United States upon a very extended scale, and the result is a great improvement in the quality of the extracts, and particularly in their uniformity. The evaporation is continued until the extract is procured in a thick pasty state suitable for being made into pills; or in other cases it is carried on till the product is thoroughly dried. The vapors are sometimes condensed and the liquid applied again to the same uses. Extracts should be

carefully protected from the air; and when applied to use, it may be in the form of pills, dry powder, or tinctures, prepared by dissolving in alcohol or some other proper solvent.—**EXTRACTIVE**, or **EXTRACTIVE MATTER**, is the name given to a brownish substance, which forms in evaporating vegetable solutions by a portion of the vegetable matter absorbing oxygen from the air and becoming insoluble in water. It gives a brownish color to the water with which it is mixed, and appears to be similar in its properties to the humine or ulmine of different chemists. Berzelius proposed for it the name apotheme, meaning deposit. It is used as a basis for brown dyes, and combines with the mordant alumina.

EXTRACTION OF ROOTS, in arithmetic, the process of finding a number which multiplied by itself a given number of times will produce the given number. The first root is the number itself, the 2d root requires to be multiplied once by itself, the 3d root twice, &c. Thus the 2d root of 4,096 is 64, the 3d root is 16, the 4th root is 8, the 6th is 4, the 12th is 2. The 2d root is called the square root, because it expresses the linear side of a square whose superficies is expressed by the original number; and the 3d root is called the cube root, because it expresses the linear side of a cube whose solidity is expressed by the original number. Thus 4,096 cubic inches would be contained in a cube of 16 inches; and 4,096 square inches in a square of 64 inches. Roots are most easily extracted by means of logarithms. (See LOGARITHMS.)

EXTREME UNCTION, a sacrament of the Roman Catholic church, administered to persons in danger of death, and held by that church to have the effect of absolving from sin, infusing grace, strengthening against temptation, and sometimes restoring bodily health. It is administered by a priest, who, while repeating the prescribed form of words, anoints the eyes, ears, nostrils, lips, hands, feet, and in some places the breast of the sick person with oil blessed for the purpose by the bishop every year on the Thursday before Easter.

EXUVIÆ, a Latin word used in natural history to designate the cast-off coverings of animals, as the outer skins periodically shed by many reptiles, the shelly coverings of crustaceous animals, as the lobster and the crab, and the integuments frequently cast off by insects. In the case of the toad, the exuviae are rarely seen from the fact that the animal, as soon as he has succeeded in freeing himself from the old skin, rolls this into a little ball, and instantly swallows it. The process of casting off the covering that has served its purpose is with most of the animals an operation requiring much effort, and attended with no little discomfort. The snake, when the old cuticle becomes dead, and begins to loosen at the head, is partially blinded by its opacity. He becomes sluggish in his movements, and often rubs the sides of his mouth against hard bodies; and when at last the skin is sufficiently detached to be stripped off, and the

part around the mouth is started back, he coils the posterior portion of the body about the head in front of the old skin, and tightening the coil presses the skin backward, turning it inside out, until, as the coil unwinds by running out toward the tail, the whole body is freed from its covering. The lobster and crab in casting their shells, which they do for the most part annually, are exposed to great danger until the new one is formed. They skulk in retired places, only venturing out when the pangs of hunger compel them to seek for food. The operation must of necessity be a very difficult one, the portion of the body contained in the claws being drawn out so as to leave the shells of these complete and attached to the shell of the body. It is said that the lobster pines before casting till the flesh of the claws wastes away, and is no larger than a goose quill. The cast-off feathers of birds and the hair shed by other animals, as also the scurf skin of man, are exuviae. In geology, the term is applied to all fossil remains of animals, as shells, bones, &c.

EYALET, a word of Arabic origin, applied by the Turks to the great administrative divisions of the empire, governed by pashas who are termed *vali* or viceroys. Each eyalet is subdivided into *lieas* or *sandjaks*, under the rule of *kaimakans* (lieutenant-governors), and these again into *cazas* or districts. Beside the tributary provinces of Wallachia, Moldavia, and Servia, which form 8 eyalets, European Turkey is divided into 15 eyalets, Asiatic Turkey into 18, and the provinces in Africa into 8.

EYOK, **HUBERT AND JAN VAN**, the founders of the Flemish school of painting, born at Maas-eyk, in the bishopric of Liège, Hubert in 1366, and Jan about 1370. The taste for painting was hereditary in the family, their father having practised the art. The two young men removed to Bruges (whence Jan is frequently called Jan van Brugge), with a view of improving their skill, that town being at the time the great focus of the wealth and activity of the Low Countries. After transferring their residence from Bruges to Ghent, the two brothers were employed in the execution of an altarpiece with folding doors, in the church of St. Bavon at Ghent. Hubert died in 1426, before the completion of this work, and Margaret their sister, who also excelled as a painter, followed him soon to the grave. Jan, after having finished the painting in 1432, returned with his wife to Bruges. He died about 1445, but the accounts of the personal history of the family are conflicting. As far, however, as the artistic achievements of Jan van Eyck are concerned, records of history and of art are unanimous in his praise. Alexander von Humboldt says in his "Cosmos:" "The historical paintings of the brothers Van Eyck present us with the first instances of carefully executed landscapes. Neither of them ever visited Italy, but the younger brother Jan enjoyed the opportunity of seeing the vegetation of southern Europe, where in the year 1428 he accompanied the embassy which Philip the

Good, duke of Burgundy, sent to Lisbon, when he sued for the hand of the daughter of King John I. of Portugal. In the museum of Berlin are preserved the wings of the famous picture which the above-named celebrated painters—the actual founders of the great Flemish school—executed for the cathedral at Ghent. On these wings, which represent holy hermits and pilgrims, Jan van Eyck has embellished the landscape with orange and date trees and cypresses, which, from their extreme truth to nature, impart a solemn and imposing character to the other dark masses in the picture. One feels, on looking at this painting, that the artist must himself have received the impression of a vegetation fanned by gentle breezes. In considering the master-works of the brothers Van Eyck we have not advanced beyond the first half of the 15th century, when the more highly perfected style of oil painting, which was only just beginning to replace painting in distemper, had already attained to a high degree of technical perfection. The taste for a vivid representation of natural forms was awakened, and if we would trace the gradual extension and elevation of this feeling for nature, we must bear in mind that Antonio di Messina, a pupil of the brothers Van Eyck, transplanted the predilection for landscape painting to Venice, and that the pictures of the Van Eyck school exercised a similar action in Florence on Domenico Ghirlandaio and other masters." Apart from the great share of Jan van Eyck in the introduction of oil painting, he rendered invaluable services to the art by his improvements in linear and aerial perspective, and in painting upon glass. In his early efforts we find him adhering to the customary flat gold ground for the background of the picture; but as he advanced in his art, he adopted the more natural grouping, and a natural background. In the art of painting on glass, he is looked upon as the author of the mode of painting on whole panes with colors delicately blended, and yet so strongly fixed that obliteration was almost impossible—an object before accomplished only by joining together in mosaic several panes of small size, and of different colors. The faults of his style arose from the delicacy which prevented the study of the naked form; hence we find the extremities of the human body, and other parts where anatomical knowledge is requisite, frequently defective. Jan van Eyck's masterpiece is the principal picture in the altarpiece originally intended for the church of Ghent, representing the "Adoration of the Lamb," as described by St. John in the Revelation. This great composition, which contains over 300 figures, was removed to the Louvre, but is now divided, the 6 most important wings being in the royal museum of Berlin, another part in Paris, and part in the cathedral of St. Bavon at Ghent. Philip II. of Spain, disappointed in his desire to purchase the work, employed Michael Coxie to copy it. Part of one of his copies is now in Berlin, and a part in the Pinakothek at Munich,

and there is a copy of the whole in London. A picture painted by Jan van Eyck in 1486 after the death of his brother, representing the Virgin and Infant, is preserved in the sacristy of the cathedral at Bruges. The other works of this artist, and of his school, are most abundant in the various collections of that town, in Ghent, Antwerp, Berlin, Munich, Paris, Brussels, Dresden, and Vienna. Michelet says in his "History of France" that Philip the Good showed Van Eyck to foreign nations, as Philip IV. used to display Rubens, by sending him on embassies. Waagen published at Breslau, in 1822, *Ueber Hubert und Jan van Eyck*. The best source of information on the subject in English is the "Early Flemish Painters," by Crowe and Cavalcaselle (London, 1856).

EYE, the organ of the special sense of vision, lodged in man in a cavity on each side of the upper portion of the face, called the orbit. The orbits have the form of a quadrangular pyramid whose base is in front and its summit behind; their direction is horizontal, and their axes, directed backward and inward, would cross at or near the sella turcica of the sphenoid bone in the cranial cavity. They have 4 triangular surfaces, the upper formed by the orbital plate of the frontal and the lesser wing of the sphenoid bone; the lower by the palate behind, the upper maxillary in the middle, and the malar in front; the external by the sphenoid behind and the malar in front; the internal by the sphenoid behind, the ethmoid in the middle, and the lachrymal bone in front. This cavity has at its upper external portion a depression for the gland which secretes the tears, at its inner portion the commencement of the bony passage to the nose; at the summit is the round opening for the entrance of the optic nerve, the union of the sphenoidal, spheno-maxillary, and pterygo-maxillary fissures, and the commencement of the suborbital canal. Beside these bony enclosing cavities, the eyes are protected from dust and foreign bodies by the hairs of the eyebrows above, and in front by the movable lids, fringed with silken lashes. The globe of the eye is of a generally spherical shape, the anterior 5th being the segment of a circle smaller than that of the rest of the organ; the antero-posterior diameter, greater than the transverse, is 10 or 11 lines; differing from the axes of the orbits, the axes of the eyes are parallel. In front, the globe of the eye is in relation with the reflection of the mucous membrane of the lids; behind and all around, with the muscles, vessels, nerves, and a cushion of soft fat. The eye is composed of membranes and humors. Of the membranes of the eye the cornea has already been described under its own title; the others are the sclerotic, choroid, ciliary processes, iris, and retina. The sclerotic is the external membrane, forming the posterior $\frac{3}{4}$, the anterior 5th being formed by the cornea; it is white, firm, and resisting, opaque, thick, and composed of interlaced fibres. Beneath the sclerotic is the choroid, composed of small arteries and veins united by delicate areolar tis-

sue; it extends from the entrance of the optic nerve forward to the ciliary circle; both its surfaces are covered with a dark pigment, which gives the deep color seen in the interior of the eye. The ciliary circle or ligament is a grayish ring, a line or two wide, united by its larger circumference to the choroid, and by its lesser to the iris; the ciliary processes are membranous folds, 60 to 80 in number, extending from the choroid to the neighborhood of the opening of the pupil; they form by their union a ring behind the iris and in front of the vitreous humor, surrounding the crystalline lens like a crown. At a short distance behind the cornea is the circular, vertical, membranous curtain, the iris, pierced in the middle by the pupil; this curtain hangs in the aqueous humor, separating it into the anterior and posterior chambers of the eye; it presents anteriorly a great number of radiations converging toward the pupil, the muscular fibres for the dilatation of this opening, and is variously colored in different individuals; the posterior surface has a number of circular fibres for contracting the pupil, and is covered with a thick dark pigment layer called *urea*; both surfaces are lined with the delicate membrane of the aqueous humor; the greater circumference is connected with the ciliary ligament and processes; its movements are doubtless partly owing to its erectile and vascular tissue. Beneath the choroid is the retina, a thin soft expansion of the optic nerve, surrounding the vitreous humor and extending forward as far as the ciliary processes and crystalline lens; about 2 lines to the outside of the tubercle of the nerve it presents a circular dark spot and a small perforation discovered by Sömmerring; this is the immediate organ of vision, which receives the rays of light and transmits the visual impressions by the optic nerve to the sensorium. Of the humors of the eye, the crystalline lens has been described under that head; the others are the aqueous and vitreous humors. The aqueous humor is a limpid transparent fluid, varying in quantity from 4 to 6 grains, occupying the space in front of the lens which is divided into anterior and posterior chambers by the iris; it contains in solution a little albumen and the salts usually found in such secretions, for it is a secretion of the enclosing membrane; when lost by accident or in the operation for cataract by extraction, it is speedily formed again. The vitreous humor occupies the posterior $\frac{4}{5}$ of the globe of the eye, having the lens encased in its anterior portion; it consists of a transparent, gelatinous fluid enclosed in a great number of cells formed by the partitions of the hyaloid membrane, communicating with each other; in the operation for cataract by depression the lens is pushed backward and downward into this humor. The optic nerves are the 2d pair of cerebral nerves. The globe of the eye is moved by 6 muscles, arising from the contour of the optic foramen and its vicinity, and attached to the sclerotic coat; of these muscles 4 are straight, called the external, internal, supe-

rior, and inferior *rectus* muscles, moving the eye respectively outward, inward, upward, and downward; the first 2 are often permanently contracted, producing divergent or convergent strabismus, a deformity curable by the division of the contracted muscles, a simple and comparatively painless and bloodless operation; the superior oblique muscle passes through a pulley in the inner portion of the orbital process of the frontal bone, from which it extends to the posterior and external part of the globe, rotating the organ inward and forward; the inferior oblique passes from the internal and anterior part of the floor of the orbit to the external and posterior surface of the globe, rotating the eye outward and upward. The conjunctiva, the mucous membrane of the eye, is reflected from the lids and covers the anterior portion of the globe; it is in this membrane that the redness and swelling of ordinary ophthalmia have their seat. The eye is frequently destroyed by accident or disease; in cases of removal of the organ artificial eyes are used to remedy the deformity; these are made of glass and enamel, and when having the natural size, shape, coloration of iris, form of pupil, projection of cornea, tint of sclerotic, and vascularity, it is often very difficult to detect the real from the artificial organ, especially when the accurate fitting of the latter allows it to be moved by the muscles acting in sympathy with the sound eye.—Without here treating of the laws of refraction, of the aberration of sphericity, and of other optical principles involved in vision, it will be sufficient to say that the rays from an object are first modified by the convex cornea, pass across the aqueous humor through the pupil-opening of the iris, thence through the dense crystalline lens and the vitreous humor, and are by these media of different densities and shapes converged at the proper focal distance on the retina. All rays beyond those necessary for perfect vision are absorbed by the pigment layer of the choroid, which answers the purpose of the black interior of optical instruments; the iris, like the telescopic diaphragm, shuts off the rays from the circumference of the lens, thus correcting the aberration of sphericity, contracting or dilating the pupil according to the brilliancy or dimness of the illumination of the object, or its distance from the eye; it is well known that the pupil of a cat in a bright light becomes diminished to a vertical slit. As the rays are crossed in the lens, an inverted image is formed on the retina, though the mental perception is of an erect image. Not only spherical but chromatic aberration is corrected sufficiently for all practical purposes in healthy eyes by the different refractive powers of the media and by the different curves of their surfaces, so that the image on the retina is well defined and free from false colors. The power by which the eye adapts itself instantly to great variations in the distances of objects is supposed to depend on a change of place in the crystalline lens, by the action of the ciliary processes and muscle

which radiates from the ciliary ligament; the reasons for this belief have been given in the article CRYSTALLINE LENS. The physiology and defects of vision will be more properly treated in the article VISION; for recent observations by Kölliker on the structure of the different layers of the retina, the reader is referred to the works of Dr. Carpenter on the principles of human and comparative physiology. The pupil is diminished by the action of muscles deriving their nervous influence from the 8d pair, but is dilated through the influence of the cervical portion of the sympathetic nerve. The movements of the eyeballs, whenever voluntary, are always harmonious, but not necessarily symmetrical; though one eye cannot be elevated and the other depressed at the same time, one may be turned outward and the other inward when the axes of the eyes are turned toward an object on either side of the head. The muscles of the eyeball are moved principally through the 3d pair of nerves, the *motores oculorum*, but the superior oblique have special nerves, the 4th pair, and the external recti the 6th pair; the sensibility of the eye is derived from the ophthalmic branch of the 5th pair; by the ophthalmic or ciliary ganglion the sensory branches of the 5th pair, the motor branches of the 3d pair, and the sympathetic filaments are united together. The vascular supply of the globe of the eye is derived from the ophthalmic branch of the internal carotid artery.—The complicated eye of the mammal and bird becomes more simple in reptiles and fishes, losing the eyelids, and in the articulates generally losing all that is anterior to the vertebrate crystalline lens, as well as mobility, the latter loss being supplied by the multiplication of the organs or facets. The mammalian eye is constructed to suit the circumstances of the life of the animal; of large size in ruminants and rodents, it is small in moles, bats, and cetaceans, and in the latter flattened anteriorly as in fish; they are generally placed laterally, but in the nocturnal species they are directed forward as in man; the lachrymal caruncle at the inner angle has in man only a rudiment of a nictitating membrane, which is more developed in some mammals, but remarkably in birds; the sclerotic is thicker in animals whose eyes vary much from a sphere, especially posteriorly, this membrane in a whale with an eye of the size of an orange being an inch thick behind; the choroid, dark in man, in the carnivora, ruminants, and other orders, reflects vivid metallic colors, remarkably brilliant at night, from the depths of the organ. In animals and man destitute of the usual coloring matter of the surface, or in albinos, the iris is pink, from the color of the blood circulating in its vessels; during foetal life, until just before birth, the pupil is closed by a membrane. The foramen of Sömmerring is said not to exist in any mammals below the quadrumana; the tear gland is found in all except cetacea. In birds the sclerotic becomes more or less strengthened

by cartilage, and in the neighborhood of the cornea is provided with a series of bony plates, arranged in a circle, and overlapping each other; but the chief peculiarity consists in the *pecten*, folded like a comb or fan, and projected forward toward the lens; it is vascular like the choroid, though not connected with it, and is dark with pigment; its use is not satisfactorily ascertained, but it is regarded by Owen as destined to push forward the lens by its erectile tissue; others suppose that its purpose is to absorb superfluous rays of light. Many species of reptiles have osseous pieces in the sclerotic; snakes have no movable lids; the chameleon has a single circular lid. In fishes the eyes are generally large, the sclerotic thick, and in some (as the tunny) osseous anteriorly; they have neither lids, except the most rudimentary, nor lachrymal glands; the cornea is very flat, and the lens dense; around the entrance of the optic nerve there is a very vascular, horse-shoe shaped organ, between the layers of the choroid, called the choroid gland or muscle; this probably pushes the retina toward the lens by its vascular erectility, and perhaps by muscular action, in the adaptation of the organ for vision at different distances. The organs of vision in insects consist of simple or of compound eyes, the first occurring chiefly in larvæ, the latter in perfect insects; they are wholly absent in some larvæ, and both forms coexist in the perfect state of many. The simple eyes (*ocelli* or *stemmata*) consist of a convex cornea, behind which is a lens, lodged in an expansion of the optic nerve, and surrounded by a variously colored pigment layer; they vary in number from 2 to more than 100, and are situated on the head. The compound eyes are made up of simple eyes so closely placed that their facets or corneæ are contiguous; behind each cornea is a transparent pyramid whose interior apex is received into a kind of vitreous body, surrounded by the nerve and the choroid; there are sometimes many thousand facets in these eyes, which may cover nearly the whole head, and hairs may project at their angles. In the arachnids the eyes are simple, and the orders have been characterized by their number, situation, and direction; they are most numerous in the scorpions. The sense of sight is present in almost all crustacea; their simple eyes consist of a cornea with a lens and pigment layer; a usual form is that of many simple eyes, placed close together, and covered by a common cornea; sometimes there is a faceted cornea under the simple one; the highest forms have compound faceted eyes, in many situated at or near the end of 2 peduncles movably articulated to the cephalo-thorax and concealed in special fossæ; these facets are very numerous, and behind each is the usual lens and pigment. The eyes of cephalopods are very large and highly developed, resembling in some respects the vertebrate organ; there is generally an ocular bulb, and a capsule constituted by a cartilaginous orbit and a fibrous continuation of the cutaneous envelope, which takes the place of a cornea; semi-

lunar folds containing muscular fibres cover the eye like lids; in front of the globe is a space analogous to an anterior chamber, containing a serous fluid, and in the octopods communicating externally; internally this chamber is closed by a kind of pupil; its serous membrane has a silvery lustre; in some species the lens is in direct contact with the water in which they swim; there is an iris, sclerotic, vitreous liquid, a spherical brownish lens formed of concentric layers, a ciliary body, and pigment layer; in the nautilus the eyes are placed on a projecting stalk, but in others are generally deeply sunk in the head. In the cephalophora (including pteropoda, heteropoda, and gasteropodous mollusks) eyes are generally present, never more than 2 in number and comparatively small; they are almost always connected with the tentacles, either at their base, sides, or extremities. In acephalous mollusks, eyes are very common and numerous, occupying the borders of the mantle or confined to the orifices of the tubes, and are either pedunculated or sessile. In the annelids the eyes are generally either wanting entirely, or are merely able to distinguish light from darkness; but the leeches have from 2 to 10 undoubted eyes. In the helminths there appear to be no eyes, only pigment spots containing no light-refracting body. Below these are found in the radiata various eye specks and pigment dots which doubtless in some cases are true eyes, but authors are not yet agreed as to the light-refracting powers of most of these organs. The eye of the blind fish of the Mammoth cave, Kentucky, though unable to form a distinct image, can doubtless distinguish light from darkness through the areolar tissue and skin which cover it; Prof. J. Wyman has found in it a lens, sclerotic, choroid, retina, and optic nerve, and it is therefore constructed on the vertebrate plan, rather than the invertebrate to which it has generally been compared; the parts in connection with the nervous system are developed, while those which are formed by invagination of the integuments are mostly absent; some authors are of opinion that the stimulus of light for several generations would retransform this eye into an ordinary organ of vision.

EYE STONE, the operculum or calcareous mouth-piece of certain species of small univalve shells. The stony-like substance, of $\frac{1}{4}$ inch or less in its largest dimensions, presents a form like that of a turtle, a convex surface upon a plane base; and being placed on a smooth plate in a weak acid, as lemon juice, the evolution of carbonic acid gas from the carbonate of lime, of which it is composed, lifts it up and causes the stone to move about as if alive. A similar effect resulting from chemical decomposition is sometimes observed in animal bodies (see **DEATH**); and loaves of bread, Humboldt remarks, have been observed to move in like manner in the oven, whence the ovens have been called enchanted. He found the little opercula, called *pedras de los ojos*, or eye stones, regarded as great mysteries by the inhabitants

coast of Venezuela near Cumana. They find them in great quantities on the beach of the Araya, and made use of them to extract or any foreign substance from the purpose for which they are still collected, exported, and are kept by druggists. Being placed under the lid of the eye, the stone is about by the motion of the organ, and the particles it comes in contact with adhere to it and are finally removed with it.

ES, a term used in gardening to signify axillary buds in plants. At the origin of a bud with the stem or branch, the cellular tissue becomes filled with an intenser vitality, a new set of foliar organs is formed for an increase, generally for the succeeding year. These aggregations of young leaves form a new and common axis, and enveloped by modified leaflets called scales, constitute the bud of the plant; and they are selected, when matured sufficiently, to serve the same purpose as in rearing new individuals, or in the operation of engrafting by the process of inoculation upon some kindred plant. In the exocorm every new leaf sends down its woody fibres into the alburnum; and a similar process is performed in the facility with which certain leaves, as of the *gloxinia*, *hoya*, &c., emit roots, they are separated from the plants and planted in the soil. By such an arrangement made, a new axis or stem is created between the bud of the petiole or leaf stalk and the tops of the newly formed roots, and presently a leaf is formed at the place of junction. In the same manner the ripened leaf bud or eye, detached from the branch, can be used for propagation, by cutting out the eye with a very sharp knife, reserving a piece of wood and bark as a shield, and then planting it in properly prepared soil. To facilitate the operation, it is

better to have some gentle heat applied to it; and the eyes of many kinds of plants set in a moderate hot-bed take root readily in a few days or weeks. In this way the rarest of the grape can be reproduced, the new plant retaining all the peculiar virtues of the stock; whereas if their seeds had been sown, a most varied progeny would have appeared. Some gardeners prefer this mode of propagation by eyes to that of layering or of cuttings, averring that the stem of the newly formed plant is handsomer, straighter, and every way better. It has been found that exotically rooted plants root more easily from eyes than do our domestic species and varieties, probably because the wood of the latter is harder and firmer, or the pith in proportion to the size of the stem.

There seems to be no natural impediment to rearing any kind of plant from eyes if the requisite conditions can be discovered. The potato crop in some parts of Great Britain is entirely raised from eyes, and advantage is taken of the position of the eyes upon the stem to secure early and successive crops. It has been ascertained that eyes cut from the extremity of the potato will mature the

soonest, those from the middle part next, and those from the butt or end next the root will come to maturity last. Here the same phenomenon organically exists in the fact that the potato tuber is really an enlarged subterranean stem, and one part of it matures its buds sooner than the others; so that the more mature and more dormant the eye may be at the time of selecting it for propagation, the surer and speedier the development under favorable circumstances. Certain abortive branches, called knaurs, often appear on the olive, beech, poplar, cedar, and many other trees, which, possessing the nature of eyes, can be employed for propagation; and similar excrescences have occurred upon the horse-shoe geranium (*pelargonium zonale*), from which plants have easily been reared.

EYLAU, or **EILAU**, a town of Prussia, 26 m. S. S. E. from Königsberg, on the Pasma; pop. 2,900. It is surrounded by lakes, contains an old castle, and has manufactories of cloth, hats, and leather. Here on Feb. 7 and 8, 1807, was fought a battle between the French under Napoleon, 85,000 strong with 350 guns, and the Russians and Prussians, 75,000 strong with 460 pieces of artillery. About 50,000 men perished, and both sides claimed the victory. In this battle Napoleon was nearly made prisoner by a Russian division, but was saved by his own presence of mind and the heroism of his little body guard of 100 men.

EZEKIEL (Heb., whom God strengthens), a son of Buzi, the 3d of the great Hebrew prophets, and contemporary with Jeremiah and Daniel, lived in the 7th and 6th centuries B. C. He was still young when he went into captivity with the nobility of the land, who followed King Jehoiachin to Babylon. There, on the banks of the Chebar, supposed to be the Chaboras in Mesopotamia, in the 5th year of his exile, he began his prophetic career by a vision which singularly contrasts with the majestic simplicity of that of Isaiah. He declared to his fellow exiles the misfortunes which were besetting and threatening Jerusalem and the country of Judah. At times he found words of consolation, and yielded himself to hopes of a better future. In the 25th year of his exile he prophetically described the new temple which was to rise in Jerusalem after the redemption of his people. This is one of the last prophecies remaining from him, and there is no account of him beyond the 27th year of the captivity of Jehoiachin. According to a doubtful tradition he was assassinated by one of the exiled princes, and during the middle ages his tomb was pointed out between the Euphrates and the Chebar, and was the goal of many pilgrimages by Persian Jews. More than any other Old Testament writer Ezekiel deals in visions and symbols. He never wearies of adding poetical and minute details, and of drawing out images into allegories. The same genius predominates through the entire book which bears his name, which is occupied with prophecies concerning both Jews and Gentiles. Many

of the visions, especially those of the first chapter, seemed to the early rabbis so obscure, that they forbade the Jewish youth to read them till they had attained the age of 30 years.

EZRA, a celebrated Jewish scribe and priest, lineally descended from Aaron, and, according to Josephus, high priest of the Jews who were left in Babylon. Under his guidance, the second expedition of the Jews proceeded from Babylon to Palestine, under the reign of Artaxerxes I., about 458 B. C. The important services rendered by Ezra to his countrymen on that occasion, and also in arranging and settling the canon of Scripture, are specially acknowledged by the Jews, so that he is counted among the most eminent of the servants of God, and even regarded as the second founder of the nation. Josephus states that Ezra died at Jerusalem, and was buried there with great magnificence; according to others, he returned to Babylon and died there, at the age of 120 years. Ezra is said by some

of the rabbis to have introduced the present square Hebrew characters, and, in conjunction with some of the elders, to have made the Masora, the punctuation and accentuation of the Bible. Beside the book of Ezra, this eminent priest and scribe was supposed to have been the author of the two books of Chronicles, and some writers attribute to him also the books of Nehemiah and Esther, though they differ in style from his acknowledged writings. The book of Ezra contains an account of the favors bestowed upon the Jews by the Persian kings, the rebuilding of the temple, the mission of Ezra to Jerusalem, and the various regulations and reforms introduced by him. In ancient manuscripts there are 4 books of Ezra, viz., the one just spoken of, the book of Nehemiah, and the 2 books which in the English version are called 1st and 2d Esdras, and placed among the apocryphal books.

EZZELINO. See Ghibellines.

F

F, the 6th letter of the English and Latin, the 20th of the Arabic, and the 23d of the Persian alphabet, indicates a labio-dental sound, produced by the passage of the expired air between the lower lip and the upper incisive teeth, while the glottis and larynx are almost at rest. Quintilian calls this sound "scarcely human," since it is a mere afflatus, and is wrongly placed among the semi-vocals. Its sonorous parallel is the softer sound of V (as in English), in producing which the glottis and larynx are engaged. F is represented in ancient Greek both by the ϕ (*ph*) and the digamma, in corresponding words; but the sound of the former was less harsh and rather aspirated than blowing (*efflatus*), and the latter sounded almost like our V. The figure of the Latin F arose from the doubling of the Greek Γ . The emperor Claudius is reported to have used it inverted (ⱥ) to represent V. As a numeral sign for 6, the stigma was employed by the Alexandrines, as one of the 3 $\epsilon\pi\iota\sigma\eta\mu\alpha$, instead of this digamma, which is named $\beta\alpha\upsilon$ or *vau*. The shape of the stigma (ⱥ) is an inverted Oscic and Umbric F (ⱦ). We find the prototype of our cursive *f* on ancient Hebrew coins; but in the present so called Hebrew, as in the Syriac, Sabæic, Palmyrenic, and some other kindred writings, the *vau* takes the place of F, and indicates the sounds of *v* and *u*. F occurs in the same place also on the Idalian tablet of Cyprus, in Lycian, also in Tuarik (Berber), and in some other writings. In the Cyrillic the *phert* and *phie* (ϕ) correspond to it as the 27th letter, in Glagolitic (Bukwitsa) as the 23d, and in Russian as the 27th. F is the first Rune, and it is represented hieroglyphically by a horned snake, from which the Coptic *fai* is derived. It is often vicariously converted into other letters or sounds, espe-

cially into labials, as in the following examples: Lat. *frater*, *frango*, *fagus*, Eng. *brother*, *break*, *beech*; Lat. *pes*, *pugnare*, *porculus*, Eng. *foot*, *fight*, Ger. *Ferkel* (little pig); Lat. *ferrum*, *filius*, *folium*, *fugere*, *formosus*, *fabulari*, *fames*, *furari*, Span. (since the 14th century) *hierro*, *hijo*, *hoja*, *huir*, *hermoso*, *hablar*, *hambre*, *hurtar*; Lat. *floccus*, *fons*, Ital. *bioccolo*, *bonte*; Lat. *fabulari*, *fame affici*, *fanum*, *foedus*, Wallachian *hebleire*, *hemisire*, *han*, *hed*; Lat. *foris*, *fagaster*, Fr. *hors*, *hêtre* (obsolete *haître*, beech tree). The Greek ϕ the Italians, Spaniards, and Portuguese uniformly replace by *f*. Compare Macedonian *Bryges*, *Berenice*, for $\Phi\rho\upsilon\gamma\epsilon\varsigma$, Βερενίκη , Germ. *Freye* and *St. Veronica*; *vates*, *prophetes*, and *fari* (speak); Lat. *vulgus*, Ger. *Volk*, Eng. *folk*; *Ioppa*, Arab. *Jaffa*, &c. A few instances of greater alternations, viz., with gutturals (owing to the affinity of the digamma with the spiritus, and to yet deeper reasons), may suffice: Ger. *Shacht*, Eng. *shaft*; Holland. *achter*, Eng. *after*; Germ. *lichten*, *leicht*, Eng. *lift*, Lat. *levis*; Germ. *kriechen*, Eng. *creep* and *crafty*. In French, final *f* is mute in some words. In English and French it alternates with *v* in grammatical forms, as *wife*, *wives*; *natif*, *nativa*. The Greek θ sometimes becomes *f* in Russian, as *Theodoros*, *Fedor*; Gothic *thliuhan*, Germ. *flichen*; Gr. $\theta\upsilon\pi\alpha$, $\theta\epsilon\pi\alpha$, Lat. *forea*, *fera*; Swedish *doft*, Eng. *dust*, &c. Very peculiar are the transformations of the Latin *fl* (also *pl*) into Spanish *ll* and Portuguese *ch*; as *flamma*, *llama*, *chama*, &c. The Devanagari, and most graphic systems of eastern Asia derived from it, have no F. The sound exists in the Chinese and Japanese languages. Most American languages are guttural, and lack the sounds of *f*, *b*, *d*, some even *r* and *s*.—As a numeral, Baronius states that F is equivalent to 40, and F to 40,-

000. It signifies 80 in Arabic, and 10,000 in Armenian. Its substitute *ph* stands for 500 in Russian and Georgian; while the Phœnician, Chaldaic, and Syriac *vau* designated 6. As an abbreviation, *F* stands for *filius*, *fecit*, Flavius, Fahrenheit, &c.; for *forte* in music, and *ff* for *fortissimo*. *F* is marked on the French coins of Angers, on the Prussian of Magdeburg, and on the Austrian of Hall in the Tyrol. In music, it denotes the 4th diatonic interval, or the 6th string on the piano in the chromatic scale, and is called *fa* in the solfeggio.

FABER, FREDERIO WILLIAM, D.D., a Roman Catholic priest of the congregation of the Oratory of St. Philip Neri, and a voluminous spiritual writer, born in England, June 28, 1815. After studying at Harrow, he was graduated at Oxford, in 1836, and was elected to a fellowship in University college. After his ordination as a minister of the establishment, he was appointed to the rectorship of Elton in Northamptonshire, a position which he filled with marked ability until his conversion to the Catholic faith, which was formally consummated, Nov. 17, 1845. His published writings up to that time were as follows: "Tracts on the Church and the Prayer Book" (1839); "A Sermon on Education" (1840); "The Cherwell Water Lily, and other Poems" (1840); "The Styrian Lake, and other Poems" (1842); "Sights and Thoughts in Foreign Churches" (1842); "Sir Lancelot, a Poem" (1844); "The Rosary and other Poems" (1845); and several papers in the "Lives of the English Saints," published under the editorship of the Rev. Dr. Newman. Immediately after his submission to the Roman church, Dr. Faber began to study and prepare for the reception of holy orders, and was ordained priest in 1847. He had with him several young men who had followed him into the church, and were anxious to devote themselves to the conversion of their countrymen, and for a time he thought of founding a new order under the patronage of St. Wilfred. But he afterward concluded to join his forces with those of Dr. Newman, who had just transplanted the Oratory of St. Philip Neri to England, and in 1848 he received the habit of that congregation. Since that time he has won a high reputation as an earnest and eloquent preacher and writer, and a poet. His spiritual books find many Protestant as well as Catholic readers, and have been translated into several languages. His published writings since his conversion are as follows: "Catholic Hymns," and an "Essay on Beatification and Canonization" (1848); "The Spirit and Genius of St. Philip Neri" (1850); "Catholic Home Missions" (1851); "All for Jesus" (1854); "Growth in Holiness" (1855); "The Blessed Sacrament" (1856); "The Creator and the Creature" (1857); "The Foot of the Cross, or the Sorrows of Mary," "Sir Lancelot" (being his former poem rewritten), and "Ethel's Story Book" (1858); and "Spiritual Conferences" (1859). He is at present superior of the Oratory at Brompton, London.

FABER, GEORGE STANLEY, an English theological writer, born Oct. 25, 1773, died at Sherburn hospital, near Durham, Jan. 27, 1854. He studied at the university of Oxford, where he became a fellow and tutor of Lincoln college, was appointed Bampton lecturer in 1801, and in the same year published his discourses under the title of *Horæ Mosaicæ* (2d. ed., enlarged, 1818). He took the degree of B.D. in 1803, married, gave up his fellowship, and for 2 years assisted his father, the rector of Calverley in York, as curate. He subsequently occupied various vicarages, in 1831 was made prebendary of Salisbury, and in 1832 appointed to the mastership of Sherburn hospital. He wrote a large number of works, most of which, particularly those on prophecy, in which he holds that the inspired predictions apply not to individuals but to governments and nations, have had a wide popularity. Among the most important are: "Dissertation on the Mysteries of the Cabiri, or the Great Gods of Phœnicia" (2 vols. 8vo., Oxford, 1803); "Dissertation on the Prophecies" (2 vols. 8vo., London, 1805; supplement, 1 vol., Stockton, 1806); "Difficulties of Romanism" (8vo., 1826); "Papal Infallibility" (8vo., 1851); "The Revival of the French Emperorship anticipated from the Necessity of Prophecy" (12mo., 1853; new ed., New York, 1859).

FABIUS, the name of one of the most celebrated patrician *gentes* of ancient Rome, which boasted of a lineal descent from Hercules and the daughter of the Arcadian Evander. In the earliest times of the Roman republic we find the *Fabia gens* among the wealthiest and most influential of the noble families of the commonwealth. Thus for 7 consecutive years (485–479 B. C.) members of that family were elected to the consulship. They seem to have been haughty and violently opposed to a democratic form of government. Disgusted by the rising influence of the plebeians, they withdrew with their vassals and followers to the Veientian frontier. There, in a battle fought with the Veientes in 477 near the Cremera, 300 of them with several thousand of their followers were slain. One boy only is said to have remained of the family, and to have become the ancestor of all the illustrious Fabii who subsequently appear in Roman history. Among these, QUINTUS FABIVS RULLIANUS obtained by his heroic achievements in war the surname of Maximus (the greatest). From 325, in which year he defeated the Samnites in disobedience to the command of a superior officer, and hardly escaped the penalty of death on that account, until 292, his military career was a series of brilliant victories over Samnites, Umbrians, Etruscans, and Gauls. Five times he was elected consul. He was the first Roman general who carried the arms of Rome beyond the Apennine range into the country of the Gauls, whom he defeated at Sentinum, in 296. Many of his exploits, however, have probably been embellished by popular tradition, and perhaps by historians who belonged to

the Fabia gens.—Livy suggests and Polybius asserts that it was not Q. Fabius Rullianus upon whom the cognomen of Maximus was originally conferred, but his great-grandson **QUINTUS FABIVS MAXIMVS VERRUCOSVS**, who, by his prudent generalship in the second Punic war, saved the Roman commonwealth from imminent ruin. He had been twice consul (233 and 228), and had given proof of his military talents in a brief war with the Ligurians. But it was only when Hannibal had invaded Italy, and the armies of Rome were melting before him, that Fabius obtained an opportunity to develop his talents to the fullest extent. In 217, after the defeat at Lake Thrasymenus, he was appointed pro-dictator by the people. Perceiving that to oppose to a victorious enemy a newly enlisted and disheartened army would be certain ruin, he wisely resolved upon avoiding all open battles, and to weaken the enemy by tiring him in useless marches and countermarches. Keeping together his little band in a compact body, he moved his camp from highland to highland, where the Numidian horses and the Spanish infantry of Hannibal could not follow him, watched the enemy with unrelaxing vigilance, cut off his stragglers and foragers, and compelled him to weary his allies by heavy exactions. This cautious manœuvring, on account of which he was called *Cunctator* (the cautious, the delaying), was misinterpreted by his own lieutenant Minucius, and, through his representations, by the Roman senate and people, as cowardice or imbecility. The command therefore was divided between Fabius and Minucius; but the latter, advancing rashly against the enemy, was speedily entrapped, and would have been destroyed had not Fabius hastened to his rescue. Then only the masterly inactivity of Fabius began to be appreciated. Though he laid down the dictatorship after the expiration of 6 months, he continued his strategy as consul, and it was imitated by some generals succeeding him for several years; and when, in 216, the consul Terentius Varro once more, heedless of the wise counsels of Fabius, ventured on an open field battle at Cannæ, he was overwhelmingly defeated. In 209 Fabius was elected consul for the 5th time, and in that year recaptured Tarentum from the enemy. During the latter years of the war the more energetic plan of action proposed by Scipio prevailed over the advice of Fabius. Just about the time when Hannibal was leaving Italy Fabius died at an advanced age, 203 B. C.—**CAIVS FABIVS PICTOR** was the earliest Roman painter. In 302 B. C. he painted a battle piece in the temple of Salus. The painting was preserved till the time of the emperor Claudius, when the temple was destroyed by fire.—His son **NUMERIVS FABIVS PICTOR** is mentioned by Cicero as an author of Greek annals, but is probably mistaken for his nephew (a grandson of the painter), **QUINTVS FABIVS PICTOR**, the first prose writer of Rome (*scriptorum antiquissimus*), who served in the Gallic war, 225 B. C., as also in the second Punic

war. He was the author of a history of Rome from its foundation to his own time. Of this work, which probably was written in Greek and was highly valued by later writers, no fragments remain.

FABRE, FRANÇOIS XAVIER PASCAL, a French painter, born in Montpellier, April 1, 1766, died March 12, 1837. He was a pupil of David, and produced in 1787 a painting representing the "Execution of the Children of Zedekiah by order of Nebuchadnezzar," for which he received the great prize of the academy, and was sent as a pensionary to Rome. He was believed to have been secretly married to the countess of Albany, who on her death in 1824 made him her sole heir, and bequeathed to him valuable MSS. which had been left to her by Alfieri. Fabre gave them to the city of Florence.

FABRE D'ÉGLANTINE, PHILIPPE FRANÇOIS NAZAIRE, a French revolutionist and author, born in Carcassonne, Aude, Dec. 28, 1755, perished on the guillotine at Paris, April 5, 1794. In gratitude for a wild rose of gold (*églantine*) which was awarded to him in early life at the floral games at Toulouse, he adopted that name. He wrote a variety of plays for the theatres of Paris, a few of which, as *Le Philinte de Molière*, *L'intrigue épistolaire*, &c., were favorably received. On the outbreak of the revolution he associated himself with Danton, whose secretary he became in 1792. He was one of the members of the convention, where, however, he played but a secondary part. He was accused of venality, and eventually doomed to share the fate of Danton. While ascending the guillotine his literary fame was foremost in his mind, and he distributed some of his writings among the populace. One of his comedies, *Les précepteurs*, was produced for the first time 5 years after his death, and received with great applause. Two volumes of his writings were published in 1801 under the title of *Œuvres posthumes et mêlées*.

FABRETTI, RAFFAELLO, an Italian antiquary, born in Urbino in 1618, died in Rome in 1700. At the age of 18 he received the degree of doctor, and repaired to Rome, where he made himself profoundly acquainted with the literature and art of the ancients. After filling a diplomatic mission in Spain, he became treasurer of Pope Alexander VII., and under the 3 succeeding popes he held various offices at Rome, Madrid, and Urbino. His first archaeological works, entitled *De Aquæductibus Veteris Romæ*, and *De Columna Trajani*, excited a general interest. His interpretation of certain passages of Livy involved him in a violent discussion with Gronovius. In a learned work upon ancient inscriptions he made known the treasures discovered by him in the catacombs of Rome. His rich collection of antiquities is still seen in the ducal palace of Urbino.

FABRIANO, FRANCESCO DI GENTILE DA, an Italian painter of the Roman school, born in Fabriano, in the Papal States, about 1370, died in Rome in 1450. Michel Angelo said that his name Gentile, the noble or delicate, was

in harmony with the character of his works. In 1417 he painted in the cathedral of Orvieto a Madonna, which still exists, and which was so much admired that the artist received the title of *magister magistrorum*. He then went to Venice, where he obtained great success, and was invited to Rome, where his paintings in the church of St. John of Lateran, which his infirmities did not permit him to finish, made him esteemed the first painter of Italy. His manner resembles that of Fra Angelico. He was the master of Jacopo Bellini.

FABRICIUS, CAIUS, a Roman statesman, flourished in the 1st quarter of the 3d century B. C. He is celebrated in the history of the republic for his virtue and integrity. While consul in 282 B. C. he defeated the Lucanians, Bruttians, and Samnites, and enriched the public treasury with more than 400 talents from the spoils of the enemy, remaining poor himself. In 280 he served as legate in the campaign against Pyrrhus, king of Epirus, to whom he was sent at its close with an embassy, to ask the ransom or exchange of some Roman prisoners of war. The meeting of the two distinguished men at Tarentum has perhaps been embellished by the historians of Roman antiquity, who seem to dwell with particular fondness on the last examples of olden virtue, in that period of commencing decay. Fabricius is represented to have withstood not only the most splendid offers of the victorious king, who knowing his poverty tried to bribe him into his service, but also the threatening aspect of an elephant seemingly let loose upon him. In reward of his integrity the king allowed the captives to repair to Rome for the celebration of the Saturnalia, on promise of returning after the festival. In 279 Fabricius fought in the battle of Asculum, which, though nominally a victory, was regarded by Pyrrhus himself almost as a defeat. In the next year he commanded again as consul, and exposed to his enemy the treachery of his physician, who offered to poison him, upon which Pyrrhus is said to have exclaimed: "It is easier to turn the sun from its career, than Fabricius from his honesty," and to have freed all his captives without ransom. When Pyrrhus evacuated Italy, Fabricius was engaged in subduing his allies. As censor in 275 he deprived P. Cornelius Rufinus of his seat in the senate, for having in his household 10 pounds weight of silver plate. Like Curius Dentatus, he spurned the presents of the Samnite ambassadors, and died so poor that the senate had to provide marriage portions for his daughters. He was buried within the walls of Rome, the prohibitory law of the 12 tables having been suspended in his honor.

FABRICIUS, GEORGE, a German scholar, born in Chemnitz, Saxony, April 24, 1516, died in Meissen, July 18, 1571. His edition of Horace (2 vols., Basel, 1555) is still esteemed at the present day. He wrote Latin poetry with great purity, and was so pious that in his sacred poems he would employ no words which had

the slightest flavor of paganism, and censured those who had recourse to the pagan divinities to ornament their verses. Baumgarten-Crusius wrote a sketch of his life and writings.

FABRICIUS, or FABRIZIO, GIROLAMO, surnamed from his birthplace AB AQUAPENDENTE, an Italian anatomist and surgeon, born at Acquapendente, in the Papal States, in 1537, died in Padua, May 21, 1619. A most distinguished pupil of Fallopius, he succeeded him as professor of anatomy and surgery at the university of Padua, which position he held for 50 years. His most remarkable discovery was that of the membranous folds (which he called valves) in the interior of veins. Several of them had been observed by Vesalius and other anatomists, but Fabricius was the first to demonstrate in 1574 the presence of these valvular folds in all the veins of the extremities. William Harvey, who was his pupil, acknowledged himself indebted to his teachings for the discovery of the circulation of the blood. His writings comprise dissertations on the formation of the foetus, the structure of the oesophagus, stomach, and body, and the peculiarities of the eye, ear, and larynx; treatises on the egg and on veins, &c. Great honors were bestowed on him by the Venetian government, and a new and large anatomical theatre was constructed for his accommodation. He left to his niece a fortune of over \$150,000, and his beautiful villa on the Brenta is still known under the name of *Montagnuola d'Acquapendente*. The first edition of his surgical works appeared at Padua in 1617. A complete edition of his anatomical and physiological works was published by Bohn in Leipsic in 1687, followed in 1737 by that of Albinus of Leyden, containing a biographical sketch of Fabricius, and the prefaces of the different treatises, which Bohn had suppressed.

FABRICIUS, JOHANN ALBERT, a German bibliographer, born in Leipsic, Nov. 11, 1668, died in Hamburg, April 30, 1736. He studied philosophy, medicine, and theology, and in 1713 became librarian to J. F. Mayer at Hamburg. In 1699 he was appointed to the professorship of rhetoric and moral philosophy in the gymnasium of that city, which he retained until his death. The extent of his learning in almost every department of knowledge, especially in philology, was remarkable. His most celebrated works are *Bibliotheca Latina* (Hamburg, 1697; 5th ed. 1721; new edition by Ernesti, Leipsic, 1773-'4); *Bibliotheca Græca* (Hamburg, 1705-'8; continuation and new edition by Harless, 1790-1809, provided with an index in 1838); *Bibliographia Antiquaria* (Hamburg, 1718; new edition by Schaafhausen, 1760); *Bibliotheca Ecclesiastica* (Hamburg, 1718); and *Bibliotheca Media et Infima Aetatis* (5 vols., Hamburg, 1734; supplementary vol. by Schöttgen, 1746; new edition by Mansi, Padua, 1754).

FABRICIUS, JOHANN CHRISTIAN, a Danish entomologist, born in Tondern, Schleswig, Jan. 7, 1743, died in 1807. His academic studies were pursued at Copenhagen, Leyden, Edin-

burgh, and finally at Upsal, where he enjoyed the instructions of Linnæus. A similarity of tastes and temperament brought master and pupil into the closest intimacy, and to Fabricius we are perhaps indebted for the most interesting biographical notices of the great Swede. No pupil of Linnæus has more thoroughly applied his method, and even his forms of expression, to the development of a special branch of science, and none has enjoyed a more brilliant reputation. It was during a scientific excursion with Linnæus that the idea of classifying insects according to the formation of the parts which constitute the mouth first occurred to him; and the approval and encouragement of his master, to whom he explained his views, gave the first impulse to his entomological studies, and to the development of the system of classification with which the name of Fabricius is now identified. Linnæus himself declined to apply the system to his new edition of the *Systema Naturæ*, only because he conceived himself too old to change his method. In 1768 Fabricius took the degree of doctor of medicine, and soon after was appointed professor of natural history in the university of Kiel, where he published in 1775 his *Systema Entomologiæ* (4 vols. 8vo., Copenhagen), in which he for the first time made public his method. The publication of the work opened a rich field of industry and research to entomologists, and no one explored it with more enthusiasm than the author, who during the remainder of his life was constantly employed in developing and perfecting his system, for which purpose he made tours over all parts of Europe. His *Genera Insectorum* (8vo., Kiel, 1776), *Philosophia Entomologica* (8vo., Hamburg, 1778), *Species Insectorum* (2 vols. 8vo., 1781), *Mantissa Insectorum* (2 vols. 8vo., Copenhagen, 1787), *Entomologia Systematica* (4 vols. 8vo., Copenhagen, 1792-'94), and other works, show how complete and extended were his investigations in this branch of science. His later works, however, are inferior to his first, in consequence of the arbitrary and uncertain characters he was obliged to apply to the genera, as the number of species increased under his hands. He also published essays on botany and natural history, in both of which he was well informed, accounts of travels in Norway, Russia, and England, and a variety of treatises, historical, political, and economical, relating to Denmark, the latter being prepared by him in his capacity of councillor of state and professor of rural and political economy at Kiel. He died of grief, it is supposed, occasioned by the bombardment of Copenhagen, and the political misfortunes of Denmark.

FABRONI, ANGELO, an Italian biographer, born in Marradi, Tuscany, in 1732, died in Pisa, Sept. 22, 1803. His chief work is his *Vitæ Italarum Doctrina Excellentium qui Sæculo XVII. et XVIII. floruerunt*, which, in the compass of 20 volumes, 2 of which were added after his death, contains 167 well written biographies of the most eminent Italian scholars and authors of the 17th and 18th centuries. He

wrote also biographies of Cosmo de Medici and Pope Leo X., beside several miscellaneous and theological works.

FABYAN, or FABIAN, ROBERT, an ancient English chronicler, born in London about 1450, died in 1512. At first a merchant, he became an alderman and sheriff of London, and wrote a general chronicle of English history, which he called the "Concordance of Stories," from the fabulous exploits of Brutus in Great Britain to the reign of Henry VII. It is a tedious narrative of the external features of transactions, without discrimination in the selection or taste in the treatment of subjects. It was first published after the author's death (folio, 1516), and has since reappeared in numerous editions, the last of which is that by Sir Henry Ellis, accompanied by notes and a learned introduction ("Chronicles of England and France," royal 4to., London, 1811). On account of its free animadversions on the Catholic clergy, Cardinal Wolsey is said, on very doubtful authority, to have caused the destruction of a portion of the first edition, copies of which are now rare curiosities, only 3 perfect specimens being known.

FACCIOLATO, or FACCIOLATI, JACOPO, an Italian philologist, born in Torreglia, near Padua, Jan. 4, 1684, died Aug. 27, 1769. Cardinal Barbarigo, noticing his talents, sent him to the ecclesiastical seminary of Padua, where he took orders and speedily rose to be professor of philosophy, and finally head of the institution. He afterward filled the chair of logic in the university of the same city, and was charged with the task of continuing the history of that establishment which Papadopoli had begun. The king of Portugal invited him to direct the college of young nobles at Lisbon, but he refused on account of his advanced age. Beside several good editions of the classics and various works on grammar, ethics, theology, and even some poetry, he published revisions of the *Lexicon* of Schrevelius, the *Thesaurus Ciceronianus* of Nizolius, and the vocabulary of 7 languages known as the *Calepino* (2 vols. fol., 1731), in which he received much assistance from his pupil Forcellini and others. It was at the conclusion of the last named work that Facciolato and Forcellini conceived the idea of the great Latin dictionary which was published 40 years later, after the death of both, under their joint names, but which was almost entirely the work of the latter. (See FORCELLINI.)

FACIAL ANGLE. In the latter part of the last century, Professor Camper of Berlin proposed a new method of viewing the skull, by which it was supposed important results would be arrived at, which immediately attained a wide popularity. "The basis on which the distinction of nations is founded," says Camper, as quoted by Prichard, "may be displayed by two straight lines; one of which is to be drawn through the meatus auditorius to the base of the nose, and the other touching the prominent centre of the forehead and falling thence on the most advancing part of the upper jaw bone, the head

being viewed in profile. In the angle produced by these two lines may be said to consist not only the distinctions between the skulls of the several species of animals, but also those which are found to exist between different nations; and it might be concluded, that nature has availed herself at the same time of this angle to mark out the diversities of the animal kingdom, and to establish a sort of scale from the inferior tribes up to the most beautiful forms which are found in the human species. Thus it will be found that the heads of birds display the smallest angle, and that it always becomes of greater extent in proportion as the animal approaches more nearly to the human figure. Thus there is one species of the ape tribe in which the head has an angle of 42° ; in another animal of the same family, which is one of those simiæ most approximating in figure to mankind, the facial angle contains exactly 50° ; next to this is the head of the African negro, which as well as that of the Kalmuck forms an angle of 70° ; while the angle discovered in the heads of Europeans contains 80° . On this difference of 10° in the facial angle the superior beauty of the European depends; while that high character of sublime beauty which is so striking in some works of ancient statuary, as in the head of Apollo and in the Medusa of Sissocles, is given by an angle which amounts to 100° . It will be readily seen that the facial angle is a measure only of the relative projection of the forehead and the upper jaw, and that it is no measure of the capacity of the cranium itself. A protruding upper jaw will diminish the angle; a prominence of the lower part of the forehead, though the latter may have neither height nor width, will increase it; it may differ greatly in skulls which have the same capacity, and may be inferior in a skull of superior capacity. With these obvious objections to the facial angle as a measure of intellectual ability in particular cases, a general relation may still be traced between the relative development of the anterior part of the cranium, as compared with that of the upper jaw, and the amount of intellect, and thus the facial angle has a certain degree of significance. The facial angle of the Caucasian race averages about 80° , that of the Mongolian and of the American Indian about 75° , while that of the negro is but 70° . From measurements of the skulls of the superior order of apes, their facial angle has been put down as from 60° to 64° , and thus it has been argued that the negro was not only a link in the chain of creation between the ape and the white man, but that he absolutely approximated more closely to the former than to the latter. Professor Owen has proved that these measurements are founded on error, that they have been taken from young animals in whom the jaw had not yet received its full development, and that in the adult chimpanzee the facial angle is no more than 85° , while in the adult orang it is but 80° , thus establishing a wide difference between the negro and the most highly organized of the apes.

FACTOR (Lat. *facere*, to do or make) origi-

nally had almost the same meaning as agent (Lat. *agere*, to act). But while agent was used to represent every one who acted in any way in the stead of another, factor became limited to those who so act in mercantile transactions. Factor is then a mercantile agent, herein being like a broker; but the difference between them is principally this: a broker acts for his principal in reference to mercantile property which the principal retains in his hands; while the factor has possession of the goods sent to him for sale, or takes possession of those which he buys for his principal. From this difference others have grown; and the most important of these is, that the broker buys and sells as agent, while the factor may buy and sell in his own name, the party dealing with him not always knowing whether the factor or some one else owns the goods. In the United States the word factor is seldom used by merchants, because, in our practice, the phrase commission merchant has taken its place, and means much the same thing. But the word factor is retained as a law term, and the law of factors derives its importance from its being the law of commission merchants. Beside regular commission merchants, any one intrusted with the possession of property belonging to another, and authorized by the owner to dispose of it, may be a factor, as a supercargo. So a common carrier may be a factor; and while he acts as such, he is responsible only as a factor, that is, only for injuries or losses caused by want of due care; but when he has sold goods as factor, and has received the money which it is his duty to bring home as carrier, his obligations as carrier revive, and he is now liable for any loss not caused by the act of God or the public enemy. A factor is a general agent, and as such binds his principal.—The most general duty of a factor, as of every agent, is to obey the instructions he receives. But he is considered by the law merchant as an agent having much discretion, and an equal responsibility; while therefore he is bound to obey definite and positive instructions, he is not bound to pay such regard to mere intimations or wishes, because he may well believe that, whatever his principal might desire or consider expedient, if he did not give positive directions it was because he preferred leaving the decision to the discretion of his factor. And even if he have positive and precise instructions, his departure from them will be justified if it was caused by an unforeseen emergency, and if he acted in good faith, and certainly for the actual advantage of his principal. If, however, a factor buys goods for his principal and sends them to him in distinct violation of an order, his principal may reject the same, and may return them to his factor; or, if the nature of the goods and the circumstances of the case render it certainly expedient, he may sell the goods for his factor, and remit to him or credit him with the proceeds; but he must not cause any injury to his factor by his delay or negligence.

A factor generally acquires no right to his commissions until the service by which he is to earn them is wholly rendered. But if he performs an important part, and is prevented without his fault from completing his service, and still more if the principal be in fault, it would seem from adjudged cases, as well as from principle, that he may have a reasonable compensation. Nor has he any claim for compensation unless he conducts his business with proper care and skill, and he is liable in damages for any loss his principal sustains by his want of care and skill; nor can he claim any compensation for any illegal or immoral service. A factor cannot delegate his power and right, except so far as he is authorized to do so, either expressly, or by the established usage, or by the peculiar circumstances of the case. In the absence of positive instructions, it is the duty of the factor to obey and conform to the common usage of that business, or such common usages of merchants as are properly applicable to that business; and he can, in general, bind his principal only within that usage. He has, as has been said, a considerable discretion, but is bound to use his discretion with reasonable care, and with perfect good faith. Thus, if he hastens a sale improperly, and without reasonable cause or excuse, the sale is void; as, for example, if he hurries a sale, clearly against the interest of the principal, for the purpose of realizing at once his own advances, such a sale would be considered a fraudulent sacrifice of his principal's property. Whether the factor is bound to insure the property of his principal, must depend upon the circumstances of each case. There is no general rule requiring him, as factor or commission merchant, to insure; but he would be under an obligation to do this if he were so instructed, or if a general, well established, and well known usage required it of him, and particularly if there had been antecedent acts or usages between him and his principal, from which his principal might reasonably have expected that he would effect insurance, and therefore omit doing this himself.—It is a very important question, and one not absolutely determined, how far and under what circumstances the principal has the right of revoking the authority he has given to his factor. In general, he may certainly do this before the factor has made any advances upon the goods; and may then demand them, paying of course whatever legal claims the factor may have, not for his commissions, but for expenses properly incurred about the goods, and for any especial services he has been called upon to render. The more difficult question is whether, if a commission merchant has made advances upon goods, he has not now acquired an interest in them and an authority over them, which his principal cannot defeat by revocation. And this must depend upon the familiar principle of the law of agency, that an authority coupled with an interest cannot be revoked, while any naked authority is always revocable at the pleasure of

him who gave it. In *Hunt vs. Rousmanier*, 8 Wheaton, 201, Chief Justice Marshall held that an interest which can protect a power from revocation must be an interest in the thing itself about which the authority is to be exercised, and not merely an interest in that which is produced by the exercise of that power. And in subsequent cases, it seems to be the prevailing doctrine in the United States, that a factor by advances upon goods acquires an interest in the goods themselves, and that his authority over them is therefore irrevocable. In England, however, in a case tried before the court of common pleas, in which the leading American authority was cited, it was expressly overruled, and the authority held to be revocable. Hence, in England, a factor who has made advances upon goods has nevertheless no power to sell them or any part of them if positively prohibited by his principal; while in the United States he may sell so much as will cover his advances and charges, the principal having no power of disposal over more of the goods than the surplus or residue after the factor's advances are repaid. The factor, however, is not obliged to sell, but after demand and reasonable delay, may have his action against his principal for his advances.—Another question has been much agitated; that is, what power a factor has to pledge the goods consigned to him. They are placed in his hands primarily for sale; and in regard to the sale, while bound to much care and entire good faith, he has a very wide authority; but it should seem that he can have no power to pledge the goods (in the absence of express instructions), excepting so far as that power grows out of the placing of the goods in his hands, and his relation to his principal as a general agent. By placing the goods in his possession, the principal may be said to give to his factor the power of acting as an owner, to the injury of others. It is on this ground that in England, and in many of the United States (especially Maine, Massachusetts, Rhode Island, New York, and Pennsylvania), such a factor, whether called commission merchant, consignee, agent, or otherwise, is deemed to be the true owner, as to sale, pledge, or other disposition of the property, while the party with whom he deals acts in good faith. A factor, whether he be a commission merchant or not, may make a special contract with his principal, to guarantee all sales made for him. In continental Europe, sometimes in England, more rarely here, such a factor is said to act under a *del credere* commission. With us he is commonly, and perhaps universally, said to act under a guarantee commission. The meaning of this is, that in addition to the usual commission (or that agreed upon) for the sale of the goods, he receives a further commission, in consideration of which he guarantees the payment by the purchaser of the price of the goods. He therefore agrees with his principal to pay the debt of the purchaser, if the purchaser does not; and this would seem to make him only a surety. The

question is important; for if by his contract he becomes a principal debtor to the owner who is his own principal, then the owner can demand payment of him and let him look to the purchaser. But if he is only a surety for the purchaser, then the owner must look to the purchaser in the first place, and only in his default can he come to the factor as guarantor; and this latter rule seems now to prevail very decidedly both in England and the United States. But while a guarantee commission merchant is held to be a surety, it seems to be also held that he does not come within the statute of frauds, as one who promises to pay the debt of another. A guarantee commission merchant has the same claim on his principal for his advances as if he made no guarantee. If he takes a note from the purchaser of the goods, this note is the property of his principal, and he guarantees the note; and if he takes payment in depreciated paper, he must make it good. If money be paid, and he remits it in some customary and proper way, or in such way as may be specially directed by the owner, he is not responsible for its safe arrival. He may, however, make a bargain to guarantee the remittance; and if he makes such a bargain, he may charge a commission for this guarantee; but if he has a right to charge this commission, he is equally liable whether he in fact charges this commission, or does not. Even if he have no *del credere* or guarantee commission, he may still be liable to his principal, not only for his neglect or default, but by certain acts which seem to assume this liability; as if he sells the goods of several principals to one purchaser, on credit, and takes a note payable or endorsed to himself, and gets it discounted. It has already been remarked, that a factor may buy, sell, sue and be sued, demand, collect, receive, and receipt for money, all in his own name, and as a principal, while a broker can do all this only in his own name and as an agent. This difference between them springs from the possession of the goods by the factor—for possession is one of the principal *indicia* of ownership—and the non-possession of them by the broker. There is, however, a still more important difference between them, founded on the same circumstance; this is, that the factor has a lien on the goods for his advances, charges, and commissions, whether they were agreed upon or are only customary, and a broker has not. But if a factor voluntarily transfers the goods to the owner, or to the owner's order, he cannot reclaim them as his security, but retains only his personal right to demand his advances and charges from the owner. If the owner be insolvent, the factor takes then only his dividend; whereas if he still holds the possession, the other creditors can have the goods only by discharging the factor's claims in full. Therefore the factor and his principal may have claims against a purchaser which may seem to conflict; for the principal may demand his price, while the factor claims his advances and charges. In

general, it may be said that if a purchaser pays in good faith to either, without notice of the other's claim, he will be protected against the other. But if the owner demands his price, the purchaser cannot set off against this, or claim to deduct, a general debt to the purchaser from the factor, unless the factor sold the goods as his own, under circumstances which gave him a right so to sell them, and the buyer believed they were his own; in which case the buyer may charge against the price, or indeed pay the whole price, by the indebtedness of the factor to him. And if before the goods are delivered, or any payment made, the buyer is notified that the goods belong to some third person, that is, some one neither the principal nor the factor, the buyer may refuse to take them; but if he takes them, he cannot set off against the price a debt due from the factor. On the other hand, if the factor has a lien on the goods, and has not lost this lien by parting with the possession of the goods, the buyer cannot set off against this lien any debt due to him from the principal, although the principal be named at the sale as the owner of the goods.—An important distinction is made between a foreign factor and a domestic factor. A foreign factor is one who transacts business for his principal in a country in which the latter does not reside; while a domestic factor acts in the same country in which the principal resides. Although every factor may act in his own name, yet in the case of a foreign factor, the law goes much further, and considers the factor as in almost all respects a principal. The reason of this is obvious. A person dealing at home with a factor whose principal resides abroad, has no means of knowing who the principal is, or what goods are his, or by what title they are his, or for what purpose they are in the factor's hands, excepting as the factor may choose to tell him. He can have no access, or certainly no easy access, to the foreign principal, for the purpose of remedy or enforcement; and, on the other hand, cannot be presumed to have bought or sold on the credit of a person thus unknown and inaccessible. It is but fair, therefore, that the factor should be, as to the purchaser, the principal; and it is equally fair that the factor should be, in such case, the only principal. These, however, are but presumptions of law. The parties may make what agreement they please, and their agreement will be enforced if shown by any admissible evidence; that is, their intention may be expressed, or it may be inferred from any circumstances which distinctly indicate it, and would then be carried into effect. In the absence of such evidence, that is, in the case of an ordinary transaction with a foreign factor, the buyer may sue the factor, and cannot sue the principal, although the principal may recover from a buyer a price not yet paid to the factor. The rule that the party dealing with the factor looks to him only, seems to be well settled, if he knew that he was dealing with the factor of a foreign principal, and reserved no right or

claim against that principal. Whether he could sue the principal, if he did not know him at the time of the transaction, but discovered him afterward, is not so certain; for there are authorities which limit the rule to the former cases, and in the latter give the party a concurrent remedy against the factor and the principal. In general, the principal, although foreign, may sue a party dealing with him through a factor. It seems now settled that, for the purpose of this distinction, the states of the Union are foreign to each other. It is a general rule, that a principal does not lose his property by any act of his factor, as long as he can trace and identify his goods, either in the factor's hands, or into the hands of any person who holds by representation of or derivation from the factor, but only in the factor's right, and not in his own independent right, as purchaser, pledgee, or otherwise a transferee in good faith and for value. And when a principal finds his property encumbered by an act of the factor, as a pledge, or the like, he may always recover his property by paying the amount or charge for which it is thus given in security. The most important and most frequent application of this rule is in cases where the factor has become insolvent, and has made fraudulent transfers of the property, or has put it in the hands of consignees as a part of his own funds. In some of the United States a fraudulent disposition by a factor of the property of his principal is an indictable offence, and is punished with severity.

FACULTY, in universities, a body of professors appointed to give instruction in the sciences and arts, and to confer degrees in them. The ordinary faculties are those of theology, law, medicine, and the arts, the last including literature and philosophy.

FAED, THOMAS, a Scottish artist, born at Burley Mill, in the stewartry of Kirkcudbright, in 1826. His father's mill was his first studio, and his earliest subjects were the rustic groups from the neighboring hamlets. In 1843 he went to Edinburgh, where his elder brother, John, was painting with success, and for some years was a pupil in the school of design of that city. After executing the well-known group of "Scott and his Friends at Abbotsford" and other works, he repaired in 1852 to London, where he has since resided. In 1855 his "Mitherless Bairn" was exhibited at the royal academy, where its pathos and beauty elicited the highest praise from all classes of visitors. His "Home and the Homeless," exhibited in 1856, and the "First Break in the Family," in 1857, have earned for him the reputation of one of the best living delineators of homely grief and natural emotion.

FAENZA (anc. *Faventia*), a city of Italy, in the Papal States, 19 m. S. W. of Ravenna, on the Lamone, at its junction with the canal of Zanelli; pop. about 20,000. It is the seat of a bishopric, and has a fine cathedral, theatre, and city hall, and several splendid private palaces. The beauty of the city and its suburbs

has gained for it the name of the Florence of Romagna. Its formerly celebrated manufactures of a peculiar earthenware, called from this place *faience*, have recently declined in importance, and its chief industry at present consists in manufactures of paper and silk twist, and in an active commerce in the products of the territory, which are taken by canal from Faenza to the Po. In Roman times this city was the scene of the defeat of Carbo and Norbanus by Metellus, the general of Sylla, 82 B. C. It was taken by the Goths in the 6th century, and by the emperor Frederic II. in 1240. It was successively subject to Venice and Bologna, and was finally united to the Papal States by Pope Julius II. in 1509.

FAGEL, a family of Dutch statesmen. I. **KASPAR**, born in Haarlem in 1629, died Dec. 15, 1688, succeeded John de Witt as grand pensioner, and took a prominent part as a bitter opponent of the encroachments of Louis XIV. and a zealous champion of the cause of the prince of Orange, for whose accession to the British throne he prepared the public mind of Protestant Europe. II. **FRANS NICOLAAS**, a nephew of the preceding, died in 1718, distinguished himself at the battle of Fleurus, at the defence of the fortress of Mons, of which he was the commandant, and in various other memorable engagements. III. **HENDRIK**, born at the Hague in 1706, died in 1790, was secretary of the states-general. He exerted a great influence in the elevation of William V. to power, and was a most devoted champion of the house of Orange. The translation of Lady Montagu's letters into Dutch is attributed to him. IV. **HENDRIK**, grandson of the preceding, died at the Hague, March 24, 1834, acted first as secretary of state, and in 1793 was sent to Copenhagen for the purpose of prevailing upon the king of Denmark to join in the war against France. In 1794 he signed the treaty of alliance between the Netherlands, Prussia, and Great Britain. During the rule of the French in Holland, he followed the royal family into exile, and returned in 1813.

FAHRENHEIT, GABRIEL DANIEL, a German physicist and mechanist, born in Dantzic about 1690, died in Amsterdam in 1740. He was originally engaged in mercantile business, but his predilection for the natural sciences led him at length to abandon it, and to travel in pursuit of knowledge. After visiting various parts of Germany, France, and England, he established himself at Amsterdam as a maker of philosophical instruments. Here some of the most eminent natural philosophers of the day became his friends and instructors. Fahrenheit improved the areometer, and made some progress with the design of a hydraulic machine for the draining of marshes, which he left unfinished at his death, but is chiefly distinguished for the changes which he made in the thermometer. These changes were first carried out in 1720, and have added much to the accuracy and value of that instrument. They consisted in the substitution of mercury for spirits of wine; in the

adoption of a cylindrical instead of a mere globular bulb, and of a new graduated scale divided into 212° , ranging from the extreme point of cold observed by him in Iceland in 1709, which corresponded with that produced by a mixture of pounded ice and sal ammoniac, and which he erroneously supposed to be the lowest natural temperature, to the boiling point of water. (See THERMOMETER.) This thermometer since its first introduction has been in general use in Holland, Great Britain, and the United States. Its constructor was elected a member of the royal society of London in 1724, in whose "Philosophical Transactions" for that year are papers by him on several interesting subjects.

FAIR, a meeting held at stated times and places for purposes of trade. Such meetings on a small scale or in small country towns come more appropriately under the category of markets, while the term fair generally implies a commercial gathering of greater magnitude, although it is sometimes applied to assemblies for other purposes. Thus we hear of agricultural fairs, where the cattle and the agricultural produce of the district are exhibited by farmers and dealers; or of charity and fancy fairs held for benevolent or social purposes. Fairs for commercial purposes have been held under different names in all times and in all countries, and are probably coeval with commerce itself, since, especially before the era of railways and steamboats, some rallying point of the kind was required for the general interchange of commodities. Such commercial gatherings were known in most of the states of antiquity, especially in the provinces of Rome. The French chroniclers attribute the legal institution of their fairs or *foires* (Lat. *forum*) to the times of King Dagobert, although they doubtless existed long before. Fairs were then as now not solely devoted to trade, but were also calculated to promote social enjoyment. Fairs were established in Flanders toward the close of the 10th century.—The priory and hospital of St. Bartholomew's in Smithfield, London, founded at the beginning of the 12th century, had the privilege of holding a fair of 3 days, which became of great importance. It was no mere gathering of tumblers and mountebanks, although such might be found with the idlers crowding around them, but a great assemblage of the business community of the kingdom. The long rows of booths stretched out on the level greensward displayed the beautiful silk fabrics and embroideries of the middle ages, and the delicate filigree work of the London goldsmiths, with merchandise of a more common description. With the rapid growth of London, the fair increased in celebrity during the latter part of the 12th century and the whole of the 13th, when many foreigners (probably Flemings) swelled the number of visitors. The principal articles of trade were wool and woollen goods, but the transactions in other articles were also of considerable importance. During the 15th century the fair,

although declining, continued to have a considerable attendance; but by the close of Elizabeth's reign it had become little more than a resort for pleasure seekers. In the following reign it was a mere riotous gathering, frequented by the refuse of London and its suburbs. Toward the close of the 17th century a merry-andrew showed his contempt of the solvency of the government by pretending to singe a pig with exchequer notes and roast it with the tallies. Sir Robert Walpole is said to have visited the fair to study the drift of popular feeling; and nothing could throw more light on the state of public opinion than a collection of ballads sung there, and a list of the puppet shows. During the 18th century the fair was one of the lions of London, and was a scene for the display of popular political feeling, as it had already been in the times of Elizabeth, when the trained monkey would leap over his chain at the mention of the queen's name, but gibber and sit still at that of Philip of Spain. Charles James Fox in his blue coat and buff waistcoat became a great favorite with the crowds at the fair. It displayed its sympathy with the French revolution in 1792, but with the manifestation on occasion of the trial of Queen Caroline (1820) the popularity of the fair came to an end. It was revived to some extent on the accession of Queen Victoria, but in 1838 all its shows were prohibited, and accordingly the giants, dwarfs, real live serpents, whirligigs, swings, rope-dancers, fire-eaters, conjurers, and wild beasts have long since disappeared, and nothing now remains of the once famous fair but a few stalls for the sale of gingerbread. (See "Memoirs of Bartholomew Fair," by Henry Morley, London, 1859.) Fairs, however, are still flourishing in England to some extent, but they are chiefly agricultural. A fair is held at Weyhill, in Hampshire, Oct. 10 of every year, where there is a greater show of sheep than at any other fair in Great Britain. At the August fair at Ipswich more than 100,000 lambs are annually sold. At the same place a great butter and cheese fair is held in September. The greatest horse fair in England is that annually held in August at Horncastle, in Lincolnshire. Several thousand horses are exhibited here, and dealers and amateurs resort hither from all parts of Britain and the continent, and of late from the United States. Yorkshire has also an important horse fair, particularly for Yorkshire hunters. Suffolk horses are exhibited at the celebrated Woodbridge Lady-day fair. Bristol, Exeter, and many other English cities, towns, and hamlets, have their fairs. A great cheese fair is held in April at Gloucester. The October gathering at St. Faith's near Norwich is the principal English fair for Scotch cattle. Fairs were held at Greenwich at Easter and Whitsuntide, which attracted large crowds of visitors from London to partake in the many amusements that were to be found there, also to enjoy the fresh air and the fine scenery from the park and its neighborhood; but Greenwich fair was suppressed in 1857 by the police,

it having become the resort of vile and dissolute persons, and the inhabitants having complained of it as a nuisance. Walworth, Camberwell, and Peckham fairs have also been suppressed within a few years. The most important mart in Scotland for cattle and sheep is Falkirk fair or tryst. The largest fair in Ireland for the sale of cattle and sheep is held from Oct. 5 to 9 annually at Ballinasloe, in the counties of Galway and Roscommon. About 12,000 head of cattle and 90,000 sheep, the largest proportion of which are raised in Connaught, are annually brought to this fair.—In France, the fair of Caen is still celebrated for its trade in linen and carriage horses. At Alençon there is an annual fair for the exhibition and sale of saddle horses. The fair of Guibray is held annually in August in a suburb of that name in the town of Falaise, and was founded in the 11th century by Robert, duke of Normandy. The average transactions amount to from \$3,000,000 to \$4,000,000. About \$300,000 of this amount is in goods manufactured at Rouen, and in hides and leather, and the rest in other French commodities. A large horse fair is also held at Guibray, where the value of the animals disposed of frequently exceeds \$300,000. But Beaucaire in the south is the most important fair in France. It begins on July 1 and ends on July 28, the bulk of the business being done during the last week. Although decreasing in importance, it is still visited by 100,000 merchants from all parts of Europe, Barbary, and the Levant, and every kind of merchandise is to be found here, from the most brilliant Indian cashmere to the commonest piece of cloth. Most conspicuous among the various representatives of French industry are the cloth manufacturers of Elbeuf, and the silk, ribbon, and lace manufacturers of Lyons, St. Étienne, Avignon, Nîmes, and Paris. Guadeloupe, Martinique, and Algiers are also represented, and the French trade in sugar, coffee, indigo, spices, &c., finds here an important outlet. The fair held during the middle of September in the park of St. Cloud is as numerously attended by the inhabitants of Paris as was that of Greenwich by the Londoners. The fair abounds with crockery-raffling booths, gingerbread stalls, weighing machines with the inscription: *Avant et après dîner voyons combien nous pesons*, and with other shows. Conspicuous among the shows of the fair of 1858 was "the taking of the Malakoff," and among the visitors were many Zouaves with their shaved heads, baggy breeches, and yellow gaiters.—The annual fairs in Amsterdam, Rotterdam, and other cities of Holland, are scenes of great popular rejoicings. For several days and nights the streets are paraded by joyous crowds, and the usual sobriety of the Dutch yields on this occasion to the most boisterous and uproarious demonstrations of joviality. Theatres and shows of all kinds form the staple amusements, and among the many refreshments sold there most peculiar to Holland are wafer-cakes, a sort of thin cake baked in an iron mould, of which the consumption is enormous.—The principal fair of Italy is

that of Sinigaglia, in the Papal States, which is annually held in July and August, and attended by traders from all parts of central and northern Europe, north Africa, and the Levant. Among the various products of Italian industry which change hands here, silk is most important. Fairs of less consequence are held in other parts of Italy, as well as in Spain and Portugal. The most famous fair of Madrid is annually held on May 15, at the hermitage of San Isidro del Campo, when the grand pilgrimage and festival of San Isidro draws thither crowds of the population. The great Hungarian fairs are held chiefly at Pesth. Four times during the year, in March, May, August, and November, the industrial products of Hungary are brought here for sale. Scarcely less important for the commerce of eastern Europe, and more interesting for the traveller and observer of national customs, are the fairs of Debreczin.—The fairs of the greatest European importance, however, are those of Germany. They originated there, as in many other countries, through religious festivals, which called a large concourse of people together. Hence fairs were called *Kirchmessen*, church fairs, the German word *Messe* (fair) being derived from mass. There are 4 towns in Germany whose fairs enjoy a great reputation, although many fairs are held elsewhere. The most prominent fairs are those of Leipsic, Frankfort on the Main, Frankfort on the Oder, and Brunswick. The Leipsic fairs date from the 15th century, and are the most celebrated. They are held 3 times annually, at New Year's, Easter, and the feast of St. Michael. The New Year's fair is comparatively unimportant. The Easter fair is celebrated for the book trade which centres in Leipsic, and the value of the books which change hands here frequently exceeds \$6,000,000. The total value of the goods exchanged is estimated at \$50,000,000; the number of visitors at 60,000. People from all parts of the world congregate here, and many Orientals may be seen in their native costume.—In central Russia, 265 m. E. N. E. of Moscow, the world-famed fair of Nijni-Novgorod is annually held for 8 weeks, beginning July 1. The fair was formerly held at Macariev, but in 1816, when that town was destroyed by a fire, it was removed to Nijni-Novgorod. It is visited by from 300,000 to 400,000 dealers. There are more than 3,000 distinct stalls for the sale of goods. These stalls are laid out in regular quarters, a particular quarter being allotted to every special class of merchandise. In one silks are on sale, in another tea, in another furs. One of the most imposing quarters is that where the Siberian iron is heaped up in ponderous piles. The vessels engaged in taking in and out cargoes are so numerous, that the waters of the Oka and the Volga rivers, at the confluence of which the town is situated, are literally covered by the mass of shipping. The total value of the goods brought to the fair amounts on an average to \$50,000,000. At the fair there of 1858, $\frac{1}{7}$ more goods were brought than in 1857, and not more than $\frac{1}{4}$ remained unsold. The total value

amounted to 95,000,000 rubles, of which 69,000,000 were in Russian produce, 10,000,000 in European and colonial, and the remainder in produce from China, Persia, and other parts of Asia. In Siberia, an annual fair is held in Kiakhta, near the Chinese frontier, which is the great emporium of the trade between Russia and China. Here Russian furs, cattle, lamb-skins, broadcloths, coarse linen, bullion, and woollen goods and iron wares are bartered for Chinese tea and silks, and other produce of the celestial empire. Large caravans of Russian and Chinese traders meet every year in December at this fair, which has existed since 1727, and has powerfully contributed to promote the commercial intercourse between the two nations. There are also many small fairs held on the borders of China and Siberia, where the Chinese barter tea, silks, and a few other articles for some of the valuable furs of the Cossacks. Mr. Atkinson, the Siberian traveller, was present at one of these fairs, and speaks of the intense gravity with which the little bands of traders assembled in these wild and desolate regions enter upon their mercantile transactions. There are many other fairs in Russia. The total value of goods brought to all Russian fairs in 1854 was estimated at \$150,000,000, and the value of goods sold was \$100,000,000.—The chief fairs of Turkey are those of Yenidge, Vardar, and Serres, the former commencing on Dec. 3 and continuing for about 8 weeks, and the latter six March 21, for 3 or 4 weeks; of Okri (May 8), Varna (May 28), Philippopoli (Aug. 27), and Eski Agra (Nov. 10), each of which lasts a fortnight; and those of Yatar Bazari (Sept. 16) and Tshaltadeh (Nov. 6), which last 10 days. Conspicuous among the various traders assembled there are the Greeks and Armenians. But the greatest fair in the East is held at Mecca during the time of the annual pilgrimages. Although it has declined from its ancient magnitude, the average concourse of pilgrims and visitors still amounts to 100,000.—The largest Indian fair is held at the vernal equinox at Hurdwar, in Saharunpoor, a famous resort of pilgrims of North Hindostan. No fewer than 200,000 to 300,000 persons congregate there every year, and every 12th year the number of pilgrims and visitors frequently exceeds 1,500,000. This fair is the great focus for the produce of Nepal, the Punjab, Afghanistan, and Bokhara, chiefly consisting of horses, cattle, camels, Persian dried fruits, spices, drugs, shawls, &c.—Apart from their great commercial interest, all these fairs present curious social and national characteristics. Eastern life unfolds itself nowhere with greater picturesqueness than at the fairs held during the pilgrimages at Mecca in Arabia and at Hurdwar in Hindostan. Nowhere is religion blended so intimately with commerce as during these annual congregations in the East, when Brahmin merchants, dervises and hawkers, series of trade intermediaries, and fantastic and lively groups of men, women, and children, all decked

out in the many colors of their national costumes, and presenting the most motley contrasts of characteristics. So we find Chinese and Russian life represented with daguerreotypic accuracy at the fair of Kiakhta, in Siberia, while Nijni-Novgorod eclipses probably all other fairs in the picturesque variety of Russian and oriental costumes and habits which it exhibits.—According to Prescott's "History of the Conquest of Mexico," fairs were held in the principal cities of ancient Mexico every 5th day (there having been no shops), which were thronged by a numerous concourse of persons. "A particular quarter was allotted to each kind of article. The transactions were conducted under the inspection of magistrates appointed for the purpose. The traffic was carried on partly by barter, and partly by means of a regulated currency of different values. This consisted of transparent quills of gold dust; of bits of tin, cut in the form of a T; and of bags of cacao, containing a specific number of grains." Fairs were regularly held at Azcapozalco, not far from the capital, for the sale of slaves. The gatherings in the market of Tlascala were a sort of fairs, where pottery which was considered as equal to the best in Europe formed one of the principal articles of trade, and every description of domestic produce and manufacture was brought there for sale. But the greatest fair was held in the city of Mexico. The visitors there were estimated at from 40,000 to 50,000. The city then swarmed with a motley crowd of strangers, the causeways were thronged, and the lake was darkened by canoes filled with traders flocking to the great *tianguex*. The most perfect order reigned throughout the vast assembly. A court of 12 judges sat in one part of the *tianguex*, clothed with absolute power, which they exercised with great vigor. In Prescott's "History of the Conquest of Peru" it is stated that the ancient incas instituted fairs for the facilitation of agricultural exchanges. They took place 8 times a month in some of the most populous places, where, as money was unknown, a rude kind of commerce was kept up by the barter of products. These fairs afforded so many holidays for the relaxation of the industrious laborer.—In the United States, the most important fairs are those of the U. S. national agricultural society, of the state agricultural societies, of the Franklin institute at Philadelphia, mechanics' institute at Boston, American institute at New York, and of various other public institutions. These are, however, merely competitive exhibitions of animals and industrial products, and have no commercial character. An anti-slavery fair is annually held at Boston, which is attended by many of the opponents of the system of slavery; and fairs for various charitable and religious purposes are frequently held in all parts of the country, at which the greatest possible variety of articles are brought together by donation or by purchase, and the proceeds of their sale applied to some specified object.

FAIR HAVEN, a village of New Haven co., Conn., on both sides of Quinepiack river, which separates New Haven from East Haven, 2 m. from the state house; pop. about 4,000. The chief business is transacted on the Quinepiack river, which expands into a bay extending up from New Haven harbor. There are 4 ship yards. Thirty vessels are owned in Fair Haven, with a tonnage of 4,500. Some are in the Mediterranean and in the West India trade; and during the winter season most of the others are engaged in the oyster trade to the Chesapeake and Delaware bays, &c., and in the summer in the coasting trade. Beside the oysters brought from the south, vast beds are planted in the shallow waters at the mouth of the Quinepiack and in New Haven harbor in the spring, and taken up the succeeding season. Fair Haven is supposed to be more extensively engaged in the oyster trade than any other place in the United States. One concern disposes of more than 200 cargoes during a season, averaging from 2,500 to 3,000 bushels each. About half as many more are sold by other parties, or taken up from the beds, so that in all about 750,000 bushels of oysters are used in the trade. Kegs are manufactured in the place in vast quantities to meet the demand of the oyster trade. Fair Haven, as well as New Haven, is extensively engaged in the manufacture of carriages. It contains 5 churches, 3 Congregational, 1 Episcopal, and 1 Methodist. The growth of the place has been rapid within the last few years; and from being merely a place of trade and resort, it has become an elegant and tasteful village, with many private residences, surrounded by extensive yards and gardens.

FAIRBAIRN, WILLIAM, an English civil engineer and machinist, born in Kelso on the Tweed in 1789. He received the rudiments of his education at Newcastle, where he was employed in a coal pit, and was brought up as an engineer at the Percy main colliery, where he remained 7 years. In 1817 he commenced business as a machine maker in Manchester. For upward of 20 years his firm was the most important of the kind in Manchester, and among the improvements he introduced may be mentioned simpler contrivances for driving the machinery of factories, modifications in the valves of steam engines, the double-flued boiler, the use of ventilated buckets in water wheels, the invention of the riveting machine, &c. In 1830-'31, his attention having been drawn to the advantage of iron as a material for building ships, he constructed a small iron vessel, which was successfully launched, and is believed to have been one of the first of its class in England. Subsequently he constructed at Millwall many vessels of the largest size of the same material. He was also one of the first to attempt buildings of iron. As a member of the British association for the advancement of science he has contributed to its "Transactions," as well as to those of other learned scientific bodies, the results of many interesting experiments on the comparative

strength of hot and cold blast iron, from which the best form of section for iron beams and the strength of various materials under specific conditions have been determined. His experience in the iron manufacture caused him to be consulted with regard to the construction of the tubular bridge over the Menai strait; and in connection with Mr. Hodgkinson he engaged in a number of experiments, the result of which has been to introduce into general use wrought iron plate girders in ordinary building operations as well as in railway engineering. He has published a series of lectures, under the title of "Useful Information for Engineers." He delivered lectures in 1858 on the "Resistance of Tubes to Collapse," on the "Floating Corn Mill for the Navy," on the "Progress of Mechanical Science," &c.

FAIRFAX, a N. E. co of Va., separated from Md. and the district of Columbia by the Potomac river; area, 430 sq. m.; pop. in 1850, 10,682, of whom 3,250 were slaves. The Occoquan river touches it on the S. W. On the bank of the Potomac, in this county, and 15 m. below Washington city, stands Mount Vernon, the residence of George Washington. The surface of Fairfax co. is generally hilly. The soil in some places is sandy, and in others is nearly worn out; but there are many fertile and well cultivated districts, producing good crops of grain and hay. Cattle are raised extensively. In 1850 the county yielded 207,581 bushels of Indian corn, 56,156 of wheat, 122,758 pounds of butter, and 4,420 tons of hay. There were 16 churches, 1 newspaper office, and 355 pupils attending schools and academies. Formed in 1742, and named in honor of Lord Fairfax, who owned a large part of N. E. Virginia. Value of real estate in 1856, \$4,363,267. Capital, Fairfax Court House.

FAIRFAX, EDWARD, an English poet of the Elizabethan period, the translator of Tasso's "Jerusalem Delivered," born in Denton, Yorkshire, died in 1633, in the parish of Faystone. His father, Sir Thomas Fairfax, was one of the military adventurers of the time, passed his youth in European wars, and was at the sack of Rome in 1527; but the son was studious in his youth, lived in the country, and loved the society of books. The translation of Tasso's epic, by which alone his name is remembered, was made in his youth, and dedicated to Queen Elizabeth, and was long enthusiastically admired. After long neglect its popularity has revived in the present century, and several recent editions have appeared in England and the United States. The last American edition was in 1835. He also wrote a prose work on demonology, still in manuscript, a "History of Edward the Black Prince," the manuscript of which was destroyed by fire at Whitehall, and a few eclogues.

FAIRFAX, THOMAS, baron, grand-nephew of the preceding, a parliamentary general in the civil wars of Charles I., born in Denton, Yorkshire, Jan. 1611, died Nov. 12, 1671. He studied

John's college, Cambridge, and, after the service of his ancestors for many generations, in military adventure in foreign campaigns. He served as a volunteer in Holland, under the command of Lord Vere, whose daughter he afterwards married, returned to England in 1634, and lived in retirement till the breaking out of the war in 1642. With a wife inclined to Presbyterianism, and a father actively and openly disaffected to the king, Fairfax did not choose to become a champion of the parliament; but, an admirer of monarchy in the abstract, he took up arms only in defence of parliamentary rights against a single oppressive monarch. When the king retired northward, he thought about raising a guard for his person at York. Fairfax presented himself to him at the head of a multitude of 100,000, praying that he should desist from raising an army against his son, and would return and hearken to his counsel. The first hostilities took place in the north, where Fairfax and his father, who were now respectively Sir Thomas and Ferdinando

Lord Fairfax, were the most powerful adherents of the parliament; and accordingly the latter received a commission as general of the forces in the north, while his son was appointed general of horse under him. They were denounced as traitors by the earl of Newcastle, the royal commander in those parts, who in turn proclaimed a traitor by the parliament.

The first attempts of the Fairfaxes were unsuccessful; they were defeated in several encounters, and completely routed in an attack on the royalist forces under the earl of Newcastle at Atherton Moor. The first parliamentary success of 1644 was the relief of Nantwich in Cheshire, besieged by Lord Byron with a army of Irish. This was effected by Sir Thomas Fairfax, who marched from Lincoln in the depth of winter, and engaged and defeated Byron with great loss. In this battle, the future restorer of the monarchy, was taken prisoner by the parliamentarians. He returned into Yorkshire, and in conjunction with his father defeated at Selby Colonel Mordaunt, the royalist governor of York, and then led the Scotch army, which to the number of 10,000, under the command of Lord Leven, crossed the Tyne. The forces of Leven and Mordaunt, united with the earl of Manchester's

army, in which Cromwell was major-general, proceeded to besiege York, where the royalists had betaken themselves; but hearing of successes gained by the enemy, they broke off the siege and took up their position at Marston, 8 m. from the city. Here on July 3 they were attacked by the cavaliers, under their leaders, among whom was Prince Rupert. The brilliant general dashed in upon the Scots on the left, and quickly drove them off the field. Sir Thomas Fairfax on the opposite wing gained temporary success; but the victory was decided only by the steady valor of the republicans under Cromwell. This defeat was a blow from which the royal cause never recovered. York

was immediately forced to surrender, and Sir Thomas quickly reduced the remaining royalist fortresses north of the Trent. The passage of the self-denying ordinance in 1645 obliged the contending parliamentary generals to lay down their commissions; and Sir Thomas Fairfax, who not only for his services, but as a representative of the nobility and of the Presbyterian interest, was entitled to the generalship, received from parliament the appointment of commander-in-chief of the forces. He immediately repaired to London, was presented to the house of commons by 4 members, was complimented by the speaker, and received from him his commission. The privilege was given him of selecting his own subordinate officers, subject only to the approbation of parliament; and on April 3 he departed for Windsor, where he had appointed the general rendezvous, and where with the assistance of Cromwell, who was his lieutenant-general, he set about new-modelling the army. On June 14 the hostile forces met at Naseby. The royalists were commanded by the king in person, supported on the right and left by Prince Rupert and Sir Marmaduke Langdale. In the parliamentary army, Cromwell was opposed to Langdale on the right, Fairfax faced the king in the centre, and Ireton encountered Rupert on the left. The charge of Prince Rupert as usual could not be resisted by those who were opposed to him, and he quickly changed his side of the engagement into a chase, detached himself from the main body, and did not reappear on the field of battle till Fairfax and Cromwell had pierced the royalist ranks in all directions, and the day was lost. The personal valor of Fairfax was especially signalized in this battle. He was constantly in the thickest of the fight, and rode about bareheaded after his helmet was beaten to pieces. He now quickly recovered Leicester, Langport, Bridgewater, and Bath. Bristol soon surrendered, and the speedy reduction of the kingdom followed, Fairfax and Cromwell having to this end divided their forces. In the politics of the dominant party Fairfax had now to play the difficult part of a sincere advocate of monarchical power. He seems to have been led on by Cromwell, and to have been the instrument of projects whose depth he could not fathom. In 1648 he marched against the last remains of the royalist party, and annihilated it at Colchester. His own influence declined as that of Cromwell and the Independents increased; and though his loyal instincts recoiled from the judicial trial of royalty, he was unable to prevent it. His own name was even placed first on the list of regicide judges; but he refused to take part in the tragedy, and was at a distance while the judgment was pronounced and the fatal blow struck. He however accepted the command of all the forces of England and Ireland under the new government, put down the Levellers in Oxfordshire, and composed the troubles in Hampshire. When in 1650 the Scots declared for Charles II., he refused to march against them, and laid down his

commission. He retired to his country seat at Nun-Appleton, Yorkshire, where he passed his time in study and in rural occupations, and prayed for the reestablishment of the royal family. At the first signal given by Monk, which offered a hope of its restoration, he issued from his retreat, followed by a body of gentry and an Irish brigade which his reputation had attracted from the ranks of the Independent army. Monk having entered England, Fairfax took possession of York, Jan. 1, 1660. Being elected to parliament, he gave his consent to the restoration of the monarchy which he had done so much in destroying, and was at the head of the committee appointed to wait upon the king at the Hague. He presented to King Charles the horse on which he rode to his coronation, after which he went back to peaceful occupations in retirement. Lord Fairfax was a friend of learning, and in his youth devoted much attention to antiquarian studies. During the siege of York, when a tower containing many ancient documents was blown up, he rewarded the soldiers for bringing him as many as could be found, and employed Roger Dodsworth to copy them, settling upon him an annuity of £40 for life; they now make a part of the *Monasticon Anglicanum*. When he took possession of Oxford, June 24, 1646, the first thing he did was to set a guard over the Bodleian library, which otherwise might have been destroyed. He wrote a narrative of his career from the commencement of the war, not intended for the public eye, but which was published in 1699 under the title of "Short Memorials of Thomas, Lord Fairfax."

FAIRFAX, THOMAS, 6th Baron Fairfax of Cameron, a British nobleman, born about 1690, died at Greenway Court, near Winchester, Va., in 1782. He was educated at Oxford, subsequently held a commission in the horse guards, and enjoyed a reputation as a wit and man of letters, having in the latter capacity contributed some papers to the "Spectator." A disappointment in love induced him to abandon the gay world, and almost to forswear female society; and, probably under its influence, he visited Virginia in 1739 to look after the large estates he had inherited from his mother, the daughter of Lord Culpepper, governor of the province between 1680 and 1683, and which the latter had acquired partly by a grant from Charles II., and partly by purchase. They comprised upward of 5,700,000 acres lying between the Potomac and Rappahannock rivers, on both sides of the Blue Ridge, including a great portion of the Shenandoah valley. Lord Fairfax was so pleased with the physical and social aspects of Virginia, that he resolved to pass the remainder of his life there. He erected a beautiful seat called Belvoir, near Mount Vernon, on the Potomac, where he lived in the style of an English country gentleman, engaging in fox-hunting and other field sports, and dispensing an elegant hospitality. In 1748 he made the acquaintance of George Washington, then a youth of 16, and, impressed with his energy and talents, employed

him to survey his lands lying west of the Blue Ridge. This was the commencement of an intimacy between Fairfax and Washington, which survived all differences of opinion on political subjects, and terminated only with the death of the former. So favorable was the report of Washington, that his employer soon after took up his residence at Greenway Court, situated in the midst of a manor of 10,000 acres, about 12 miles from Winchester, where during the remainder of his life he lived in a state of baronial hospitality. He was an untiring lover of the chase, living for half the year among his dogs and horses, and was in the habit of entertaining his fox-hunting companions with great liberality. Washington, who acquired from him his taste for hunting, was frequently his guest until the commencement of the revolutionary war, and regarded his opinions with deference. During the panic on the Virginian frontier after the defeat of Braddock, Fairfax organized a troop of horse, and, as lord lieutenant of Frederic county, called out the local militia; and when advised that his residence was exposed to attacks from hostile Indians, although in his 66th year, he positively refused to leave. During the revolutionary war he adhered to the royal cause, but so popular was he with his neighbors that he continued to live unmolested in Greenway Court. The surrender at Yorktown deeply wounded his national pride, and, according to tradition, was the immediate cause of his death, which happened soon after. The generosity of Lord Fairfax is exemplified in the surrender of his large estates in England to his brother, and in his frequent gifts of lands to his poor neighbors in Virginia.

FAIRFIELD, the name of counties in 3 of the United States. I. A S. W. co. of Conn., bounded N. E. by the Housatonic river, S. E. by Long Island sound, and W. by the state of New York; area, 647 sq. m.; pop. in 1850, 59,775. It has excellent harbors all along the coast, and contains several important commercial ports. The Housatonic is navigable by steamboats, and supplies valuable water power. The surface of the county is considerably diversified; in the N. and W. it is hilly; in the S. and E. nearly level. The soil is good, and produces grain, potatoes, and hay. In 1850 it yielded 850,000 bushels of Indian corn, 276,916 of oats, 281,158 of potatoes, 38,238 of buckwheat, 72,010 tons of hay, and 1,086,786 lbs. of butter. There were 128 churches, and 9,051 pupils attending public schools. The county is traversed by railroads from New York to New Haven, and from Bridgeport to Albany. Capitals, Fairfield and Danbury. II. A central district of S. C., bounded S. W. by Broad river, and N. E. by the Wateree; area, 680 sq. m.; pop. in 1850, 21,404, of whom 14,246 were slaves. It is traversed by 2 railroads, connecting it with Charleston and other points, has an uneven surface, and a fertile soil, suitable for cotton, grain, and potatoes. In 1850 it produced 18,122 bales of cotton, 529,461 bushels of Indian corn, 30,233 of wheat, 47,277

ta, and 65,569 of sweet potatoes. There are 87 churches, 2 newspaper offices, and 992 attending schools and academies. Capital, Finnsborough. III. A central co. of Ohio, a surface diversified by hills, plains, and glacial lands, and a soil of great fertility; area, 1,000 sq. m.; pop. in 1850, 80,264. It is intersected by the Ohio and Hocking canals, and the Cincinnati and Cincinnati railroad, and is drained by the head stream of Hocking river, and several small creeks. Limestone and freestone are abundant. In 1858 there were produced 1,858,862 bushels of Indian corn, and 87 of wheat. In 1850 there were 93 churches, 5 newspaper offices, and 6,140 pupils attending public schools. Capital, Lancaster.

FAIRFIELD, formerly the shire town of Fairfield co., Conn., situated on Long Island Sound, and on the New York and New Haven railroad, 22 m. from New Haven and 54 from New York; pop. about 4,000. Since Bridgeport has become a city at the termination of the Housatonic and Housatonic railroads, it has lost much of the business which formerly resided in Fairfield; and to accommodate the needs of the county buildings and offices have been transferred to Bridgeport. The village is half a mile from the sound, principally on a broad street, and in the vicinity are several hotels for the accommodation of visitors during the summer. The village of Greenfield, in which Dr. Timothy Dwight resided, is in the township. About 1½ m. E. of Fairfield is Black Rock, one of the finest harbors in Connecticut, accessible for large vessels at low ebb of the tide. Ship-building is carried on at this place. About 2 m. W. of Fairfield, at the mouth of Mile river, is the borough and town of Southport, in which are a bank, several churches, and educational institutions. Much of the business and enterprise of Fairfield is centred in this borough. Fairfield was settled in 1639 by 8 or 10 families from Windham and was incorporated in 1646, when it took its present name, having previously borne the name Uncowa. In 1779 it was burned by the British under Gov. Tryon.

FAIRFIELD, a post village and capital of Johnson co., Iowa, situated on Big Cedar creek, connected by a plank road with Burlington, 10 m. distant; pop. in 1858 estimated at 1,500. A prosperous trading place, and one of the important interior towns of the state. It is the seat of a branch of the state university, contains a female seminary, 2 newspaper offices, and a land office.

FAIRHAVEN, a township of Bristol co., Mass., on Buzzard's bay, 55 m. S. E. from Boston; pop. in 1855, 4,698. The principal village, which the township is named, is built on the left bank of the mouth of Acushnet river, opposite New Bedford, with which it is connected by a bridge and a ferry. The river extends between the two places into a fine harbor about 1 m. wide. The whale fishery is the principal business of the town, and in 1855

there were engaged in it 46 vessels belonging to Fairhaven, with an aggregate burden of 15,532 tons, and a complement of 1,324 hands; capital employed, \$1,620,894; sperm oil imported, 95,628 galls., valued at \$150,829; whale oil imported, 662,622 galls., valued at \$392,613; whale bone imported, 248,448 lbs., valued at \$94,917. The town also contained 2 cotton mills, 1 brass foundry, 1 paper mill, and 2 soap, candle, and oil factories; capital employed in manufacturing, \$108,700; annual product, \$233,168; hands employed, 111. In 1858 it had 11 churches (2 Baptist, 1 Christian, 1 Congregational, 1 Friends', 3 Methodist, 2 Second Advent, and 1 Unitarian), a high school, a bank, and a savings bank. A branch of the Cape Cod railroad terminates here, by which, as well as by the New Bedford branch of the Boston and Providence railroad, Fairhaven communicates with Boston.

FAIRIES. Whether the fairy mythology arose spontaneously in Europe in the age of the troubadours, or was a relic of ancient Celtic and druidical superstition, or belonged to the old paganism of Scandinavia and northern Germany, passing thence southward, especially through the Normans, or was derived from the Orient through the Spanish Moors and the crusaders, are questions which antiquaries and critics have not been able fully to determine. The fays or fairies (Fr. *fées*, Ger. *Fee*, It. *fata*), under manifold names and with various local or national diversities, may be traced in the popular traditions and romantic literature of Europe from the 12th century, appearing first in the *Nibelungenlied* and the romances of chivalry. It is probable that they were originally an invention of Celtic fancy; but if so, the conception of their nature and functions was modified and enriched in the early middle ages by admixture from foreign sources, chiefly from the Scandinavian myths of *dvergjar* or dwarfs, and the Persian and Arabian fictions of peris, djinns, and other genii. The Hindoo-Persian tale of the "Garden of Knowledge," written in India by Ynâyel-âllah about 1650, contains peris, who nearly resemble the fairies of western romance. Even the classic *dii campestres*, the sylphs, satyrs, and fauns, may have been blended with them. In the most limited sense of the term, the fairies are hardly distinguished from the elves, except that they belonged more peculiarly to the British isles and to France, and the latter to the Teutonic nations. They were freakish little creatures of preternatural power, familiar to rustics long before they were celebrated in romance. In the most general sense, they embrace nearly all the characters of the romantic mediæval mythology, as the elves, dwarfs, trolls, norns, nisses, kobolds, brownies, necks, stromkarls, undines, nixes, salamanders, goblins, hobgoblins, poukes, banshees, kelpies, pixies, moss people, good people, good neighbors, men of peace, wild women, and white ladies. Fairies appear in the romances of Arthur and the round table, especially in *Isle de Triste*, the latest of them, and in

greater brilliancy and power in those of Charlemagne and his paladins. The earliest of the romances of chivalry probably is that of Lancelot du Lac, one of the knights of the round table; and the wonderful beauty and skill of the fairy Viviana, the lady of the lake, who had learned the art of enchantment from Merlin, are famous in the annals of female treachery. Lancelot, educated by her, conceived an ardent passion for Genevra, the wife of King Arthur, and drew upon himself all kinds of misfortunes by disdaining the fairy Morgana. The fairies of early romance seem to have been only mortals endowed with supernatural powers, and they did not assume their manifold grotesque characteristics as distinct species till some of the related elements of various mythologies had been confounded in the popular mind.—The dwarfs and elves figure as diminutive creatures in the Eddas and the whole body of Scandinavian sagas, the former being often violent and malignant, the latter sportive, fond of dancing, visible only to children born on Sunday, often useful, and sometimes mischievous. The 3 great norns named Udr, Verthandi, and Skuld (past, present, and future) were the Scandinavian Paræ or destinies, ruling the events of life. The nisses were domestic fairies of Norway, resembling the kobolds of Germany and brownies of Scotland, fond of frolicking by moonlight and driving in sledges in the winter, and skilled in music and dancing. Every church had its nis, called the kirkegrim, that looked after propriety of manners, and punished misconduct. The rivers and lakes of northern Europe were inhabited by necks, stromkarls, and other beings similar to mermen and mermaids, or to the kelpies of Scotland, who were commonly renowned as musicians, playing on harps the melody of which operated on all nature, and who would teach their art to any person that presented them with a black lamb.—Among the numerous objects of German popular superstition are dwarfs and elves, wild women, kobolds, and nixes or water spirits. The dwarfs are called also the still people and the little people, and have their abodes underground and in the clefts of mountains, visiting the surface of the earth only by night; they can make themselves invisible and pass through rocks and walls, and are generally silent and beneficent to men. The “little wights” are a species of dwarfs of southern Germany, about $\frac{1}{2}$ of an ell high, appearing as old men with long beards, dressed like miners in leather aprons, and bearing lanterns and a smith’s tools. They announce the death of a miner by knocking 3 times. The forests of Germany are haunted by numerous kinds of dwarfs, little larger than elves, gray and old-looking, hairy and clad in moss. Their great enemy is the wild huntsman, who chases them by night with a pack of ghostly hounds. The German wild women, like the elf maids of Scandinavia, are beautiful and devout, with fine flowing hair, and their chief haunt is the famed mountain Wunderberg, on the moor near Saltz-

burg. This mountain is said to be hollow, and to contain palaces, churches, monasteries, gardens, and springs of gold and silver. Beside the wild women there live in it little men, who guard the treasures, and go forth at midnight to the cathedral of Saltzburg, where they perform their devotions; giants, who used to frequent the church of Grödich and exhort the people to a pious life; and the emperor Frederic Barbarossa, with golden crown and sceptre, and a knightly retinue, whose gray beard has twice encompassed the table at which he sits, and when it has a third time grown round it the end of the world will take place. The fair maiden who figures in the legend of the Oldenburg horn was a wild woman. Kobolds are fairies that become domestic servants. When about to attach himself to a family, the kobold throws chips into the house and dirt into the milk vessels. If no notice be taken of this, he comes and stays in the house. Famous among kobolds are Hinzelmänn, whose history was written by Feldmann; Hödeken, or Little Hat, so named because he always wore a little felt hat down over his face; King Goldemar, the intimate friend of Neveling von Hardenberg; and the naked mannikins, who till the present century were believed to perform domestic exploits at Cologne. The nixes inhabit lakes and rivers; the male is like a man, except that he has green teeth and always wears a green hat; and the female appears uniformly as a beautiful maiden. They have a magnificent subaqueous abode, whither they sometimes convey mortals; on sunny days they comb their golden locks in the branches of trees; and they may be seen dancing on the surface of the water previous to the death of a person by drowning. They figure in multitudes of German stories.—The *fata*, or Italian fairies, first appear prominently in literature in the *Orlando innamorato* of Boiardo. There the Fata Morgana (the Morgana fairy) is mentioned, the powerful sister of King Arthur and pupil of Merlin, famous for her enchantments, for the tricks that she played her sister-in-law Genevra, and for being believed to be the cause of the mirage of the strait of Messina, to which her name is given. There also figures the beautiful Silvanella, who raised a tomb over Narcissus, and then dissolved away into a fountain; the white and black fairies, the protectresses of Guidone and Aquilante; and Alcina, the sister of Morgana, who carried off Astolfo. Some of these reappear in the *Orlando furioso* of Ariosto, but the *Amadigi* of Bernardo Tasso presents the fairies in greater number and splendor than elsewhere in Italian poetry. They are styled indifferently *maga*, *incantrice*, or *fata*, and prominent among them are Morganetta, Nivetta, and Carvilia, the 3 daughters of Morgana. All the fairies and witches, according to Ariosto, are subject to the redoubtable Demogorgon, who has a splendid palatial temple in the Himalaya mountains, where every 5th year he summons them to appear before him and give an account of their actions.—The most celebrated Spanish

is the *duende* or *trago*, a domestic sprite, mentioned in Spanish literature. Calderon's comedy *La dama duende* is founded on the tricks of a lady who personates the *duende* to the mystification of her lover and of her family.—The fairy lore of France resembles that of England, and corresponds in many respects with that of Germany. The *fées* or fairies, the *lutins*, *gobelins*, or goblins, answer to the *hobgoblins* and *nisses*. The former are sometimes in person, dance in circles or fairy by night, haunt solitary springs and grottoes, and gallop strange horses, sitting upon their backs and tying together locks of the mane to their stirrups, always bring luck by their presence, and, like the fairies of most countries, are believed to preside at births, to love young men, to give them presents, and to steal away, leaving instead their own fairy offspring, which were called changelings, and were formerly most beautiful in countenance and most susceptible of propensities. In the 12th and 13th centuries the forest of Brezeliande, near Quentin, in Flanders, was thought to contain the tomb of Merlin, and to be a chief seat of the fairies. The white ladies were Norman fairies, and the malignant. They were supposed to be attached to certain great families, in whose interests they interfered, sometimes for good, sometimes for evil. The white lady of Avenel in Walter Scott's romance of "The Monastery" is an instance of this kind. The *lutins* or *goblins* were playful and malicious elves, teasing children and maidens, twisting their limbs into inexplicable knots when they were asleep, and delighting to perplex peasants and driving them into difficulty. Melusina, the renowned of French fairies, was married to Raymond, count of Lusignan. She was, however, truly described as *ange par la figure et serpent par le reste*, and exacted from her husband an oath that he would never see her on Saturday. After having borne to him several children, she was at length surprised by him on a bath on Saturday, transfigured into a serpent, her true shape, when she flew from the bath with wailing and lamentation, in obedience to the decree of destiny that she should flit about the earth in pain and suffering, as a spectre of punishment, until the day of doom. It was believed that she appeared near the castle of Lusignan in mourning dress, and uttering piercing lamentations, whenever a lord of Lusignan or a king of France was about to die. The traditions concerning her were collected by Jean d'Arras in the close of the 14th century. One of the chief articles of accusation against the countess of Orleans was that she resorted to a visit to the fairies to see her visions; and in Flanders there are still fountains regarded by the natives as sacred to the fairies, and believed sometimes change into gold or diamond the moment that is inserted into them.—The fairies of the north were first called elves, and, though mentioned before in romances, assumed their most prominent place in poetry in the

reign of Elizabeth. Chaucer, in his "Wife of Bathes Tale," charged the monks and friars with having expelled the fairies from the land by their vigilance:

In olde dayes of the king Artour,
Of which that Bretons speken gret honour,
All was this land fulfilled of faerie;
The elf-queene with her joly compaignie
Danced ful oft in many a grene mede.
This was the old opinion as I rede;
I speke of many hundred yeres ago.
But now can no man see non elves mo,
For now the grete charitee and prayeres
Of limitoures and other holy freres,
That serchen every land and every strete,
As thikke as motes in the sonne-beme,
Blessing halles, chambres, kicheneas, and boures,
Citees and burghes, castles highe, and toures,
Thropes and berues, shepenes and dairies,
This maketh that there ben no faeries.

Somewhat later, in the reign of Henry VI., fairies form much of the machinery of the metrical romance of "Sir Launfal," one of the knights of the round table, written by Thomas Chestre. The fairies of the "Faery Queen" of Spenser and those of the "Midsummer Night's Dream" are not the same. The former are stately beings, typical of the moral virtues, with traits borrowed from the Italian fairy mythology, dwelling in enchanted castles, surrounded by courts of knights and ladies, and ruling over extensive kingdoms. Shakespeare adopted the elves and pixies of popular superstition, with their diminutive stature, fondness for dancing, love of cleanliness, and child-stealing propensities, formed them into a community ruled over by Oberon and Titania or Queen Mab, and gave immortality to "that merry wanderer of the night," Puck, alias Robin Goodfellow, alias Hobgoblin. The "Mad Pranks and Merry Jests of Robin Goodfellow" (printed by the Percy society, 1841) was originally published in the age of Shakespeare, and furnishes the first records of this mischievous son of a fairy, who "from hag-bred Merlin's time" had been famous for his pranks. Corresponding to him are the Rubezahl or Number Nip of German fairy lore, the Cluricaune of Ireland, the Eulenspiegel of Germany, and the Howleglass or Owlespeigle of Scotland. Ben Jonson refers to Mab as

the mistress fairy,
That doth nightly rob the dairy;
And can hurt or help the churning
As she please without discerning.
She that pinches country wenches
If they rub not clean their benches,
And, with sharper nail, remembers
When they rake not up their embers;
But if so they chance to feast her,
In a shoe she drops a tester.

Drayton and Herrick excel among the minor English poets in their happy use of the fairy mythology.—The mediæval fairy lands are of 3 kinds: those that are placed in the ocean, like the castle and isle of Avalon, the abode of Arthur, Oberon, and the fairy Morgana, most fully described in the old French romance of *Ogier le Danois*; those that lie within the earth, like the palace of Pari Banon, one of which is finely described in the old English romance of "Orfeo and Heurodis;" and those which are situate "in wilderness among the holtis hairy,"

like Oberon's realm of Mommur, one of which appears in the romance of "Sir Thopas."—The popular superstition of the middle ages attributed many natural phenomena to the agency of the fairies. In Ireland and Scotland they were believed to shoot at cattle with arrows headed with flint stones, and thus to bewitch them; and the small arrow heads of the aboriginal Irish are known to country people and antiquaries as elf arrows. The *ignis fatuus* was termed the elf fire, other luminous appearances fairy sparks, moles or other defects on the person fairy nips or elvish marks, and a matted lock of hair in the neck an elf lock.—The earliest collection of European fairy stories in prose was the Italian *Notti Piaceroli* of Straparola (Venice, 1550). The best Italian collection is the *Pentamerone* of Giambattista Basile (Naples, 1637; translated from the Neapolitan by W. E. Taylor, London, 1856). It is full of learned allusions and keen satire, and designed for the amusement only of grown persons. Near the end of the 17th century the *Contes des fées* of Perrault and Madame d'Aulnoy, and their successors, gave vogue to fairy stories throughout Europe, written chiefly for the instruction and amusement of children. The "Arabian Nights' Entertainments," introduced into Europe by Galland about the beginning of the 18th century, contributed much to their popularity, and were quickly followed by various imitations of the Arabian, Persian, Turkish, and Mongol tales. The "Tales of the Genii" by James Ridley, the *Fables et contes Indiens* of Langles, and the later *Contes Chinois* of Remusat are examples. The "Nour-jahad" of Mrs. Sheridan was an imitation of them, and the eastern tales of Count Hamilton were written partly to ridicule them. The abbé de Villiers also satirized them, and Wieland made his Don Sylvio von Rosalvo the Don Quixote of fairy literature, which he sought to banish as Cervantes had expelled the romances of chivalry. The best later imitations are some of the tales of Tieck, Musäus, and Novalis, and especially La Motte Fouqué, and the romance of the caliph "Vathek," by Beckford. The German fairies are rarely terrible for a long time, and in stories where the indignation of the reader is strongly excited, the effect is soon neutralized by some touch of pleasantry or kindly stroke of fate. The dwarfs, who are the incarnation of malignity, are made ridiculous rather than formidable. Even death takes the kindly form of a generous godfather, in contrast with the weird mournful banshee of the Irish legends. Around the inveterate simpleton or sluggard there gather in the German imagination a host of ridiculous blunders and adventures, the special work of delighted fairies. The Irish fairy tales have the wild, imaginative character common to most of the Celtic legends. Nor is the intercourse with the fairy powers so easy and comfortable as in the German tales; there is not the same genial intimacy and happy understanding, nor can it always be presumed amid overwhelming diffi-

culties that satisfactory conclusions are near. Three Teutonic legends, resembling many fairy stories, have acquired an almost national character in England—"Jack the Giant-Killer," "Jack and the Bean Stalk," and "Tom Thumb." The plucky Jack, who employs brains as well as fists, is an old English school-boy ideal of valor and enterprise. The tale of the diminutive Tom Thumb, who was not unlike the pigmy of the Greek poets of the weight of one obolus, and wearing lead in his shoes from fear of being blown away by the wind, illustrates the advantages of skill and activity over mere size and strength, and the mishaps natural to his want of harmony with the general order of creation.—The best works on the subject are Keightley's "Fairy Mythology" (enlarged ed. 1850); Scott's "Essay on the Fairy Superstition" in the "Minstrelsy of the Scottish Border;" Croker's "Fairy Legends and Traditions of the South of Ireland" (1825); Dalyell's "Darker Superstitions of Scotland" (1838); "Russian Popular Tales," translated from the German of Dietrich, with an introduction by Grimm (London, 1857); Dasent's "Popular Tales from the Norse" (1859); *Les fées du moyen âge*, by Maury (Paris, 1843); and the *Kinder- und Hausmärchen* (1812; 6th ed. 1851), and other publications of the brothers Grimm.

FAIRY CIRCLE, a frequent phenomenon in fields and meadows in Great Britain, once attributed by the peasantry to the feet of fairies in dancing their rondels. A fairy ring or circle is either a bare circular path about a foot broad, enclosing a grass plot about 7 yards in diameter, or a spot of different dimensions, with a circumference of grass, which is higher, sourer, and greener than the surrounding grass. Shakespeare mentions the elves that

By moonshine do the green-sour ringlets make,
Whereof the ewe not bites.

Various theories have been invented to account for these circles. Waldron not only ascribed them to the fairies, but said he had seen similar circles in the snow, in which the impressions of tiny feet were visible. Aubrey supposed them to be caused by the efflux of a fertile subterranean vapor. Priestley and others considered them the effect of lightning; and Waller, after a thunderstorm, observed one of them which from the color and brittleness of the bordering grass seemed to be newly burned bare. Others have thought them to be caused by moles or similar animals burrowing underground. Dr. Wollaston accounted for them by the growth of a species of agaric, which so absorbs all nutriment from the soil as for a time to destroy the herbage. Dr. Carpenter also thought them occasioned by masses of fungous vegetation.

FAKIR (Arab. *fakhar*, poor), the name of a mendicant order in the East Indies, like the dervises of Persia and Turkey. The origin of fakirism in India is traced back to mythical times, when a powerful rajah having banished his son, the latter is fabled to have resolved to

lead a vagabond life in the world, to beg his bread, and to make proselytes to his own manners and customs. The first condition of an Indian mendicant monk is poverty. He wears a rent robe, such as the Mussulmans pretend the ancient prophets wore. In 9 things, according to Hassan al Bassri, he is like a dog: he is always hungry; he has no sure abiding place; he watches by night; he never abandons his master, even when maltreated; he is satisfied with the lowest place; he yields his place to whoever wishes it; he loves whoever beats him; keeps quiet while others eat; and accompanies his master without ever thinking of returning to the place which he has left. The number of Mussulman and Hindoo fakirs in India is estimated at more than 1,000,000; beside whom there are many other religious ascetics. Some fakirs live isolated, go entirely naked, and sleep upon the ground with no covering. They never use wood for making fire, but employ instead the dried dung of cows; regarding this as an act of devotion, since the cow is in India a sacred animal. They carry a cudgel on which are hung rags of various colors, and they traverse the country begging and instructing credulous people in religion. It is dangerous both to his life and money for an unprotected person to meet them. The second class of fakirs is composed of those who unite into companies. These are clothed, wearing a fantastic and many-colored robe. They choose a chief, who is distinguished by having a poorer dress than the others, and who has a long chain attached to one of his legs. When he prays he shakes his chain, and the multitude press around him, and embrace his feet, and receive his counsels and precepts. He has formulas for the cure of the paralytic, and especially of sterile women. Some of the fakirs have almost a military organization. They bear the lance and other arms, display a banner while on the march, sound a horn and beat a drum on their arrival at a station and also on their departure. There is one class of fakirs which is highly honored. They are the children of poor parents, who live in retirement in mosques, devoted to the reading of the Koran and the study of laws, till they become qualified for the duties of *mollahs* or doctors of theology.

FALAISE (anc. *Faleria*), a town of France, department of Calvados, 22 m. S. S. E. of Caen, on the river Ante, built upon cliffs, commanded by an old Norman castle and surrounded by a picturesque country; pop. in 1856, 8,138. It has a college, library, and equestrian statue of William the Conqueror, who was born here. The celebrated fair of Guibray, instituted in the 11th century, is annually held here in August in a suburb of that name.

FALCK, ANTONIUS REINHARD, a Dutch statesman, born in Utrecht in 1776, died in Brussels, March 16, 1843. He studied at the university of Göttingen, and on his return home applied himself to the law. Subsequently he held certain municipal offices, and from 1802 to 1806 he was

secretary of the Dutch embassy at Madrid. In 1808 he was appointed by King Louis secretary-general of Indian affairs. In 1818 he was instrumental in bringing about the revolution which led to the establishment of a provisional government, of which he was appointed secretary. In the following year, when the prince of Orange was proclaimed king of the Netherlands, Falck became the leading spirit of the new government. From 1814 to 1818 he acted as chief secretary of state, and in the latter year he was intrusted with the departments of public instruction, commerce, and colonial affairs. In 1816 he reestablished the academy of Brussels, and the reforms in the primary schools and the university were due to his zeal in the cause of education. The contest, however, which soon broke out between Belgium and Holland resulted eventually in Falck's withdrawal from the administration. He reentered the diplomatic service, was employed on several missions to the court of Vienna, took a part in the negotiation of a commercial treaty between England and Holland, and in 1824 became ambassador at London. During the negotiations which terminated in the separation of Belgium from Holland, his services were again called into requisition, and in 1840 he became Dutch ambassador at Brussels. He wrote an essay on the influence of Dutch civilization upon northern Europe, especially upon Denmark, which was published in 1817 in vol. i. of the "Transactions of the Third Class of the Royal Institute of Holland."

FALCON, a bird of prey, belonging to the order *accipitres*, family *falconidae*, sub-family *falconina*, and to the typical genus *falco* (Linn.). This sub-family contains the following genera, in addition to *falco*, of which about a dozen species are described: *hypotriorchis* (Boie), with as many species; *ieracidea* (Gould), with 2 species, found in Australia; *tinnunculus* (Vieill.), with a dozen species; *ierax* (Vigors), with 6 species, in India and its islands; and *harpagus* (Vigors), in South America, with a single species, characterized by having the lateral margin of the bill armed with 2 distinct teeth on each side. The birds of these genera may all be called falcons, from the common characters of a short bill, much curved from the base to the tip, with its sides more or less furnished with serrations called teeth; the cere covering the nostrils, which are rounded or linear; the wings lengthened and pointed, the 2d and 3d quills generally the longest; the tail lengthened and rounded; toes long and slender, and claws curved and acute. The birds of the genus *falco*, which only will be treated in this article, are called noble birds of prey, because in proportion to their size they are the most courageous and powerful; they are also more docile, and were formerly much used in the sport of falconry to pursue and kill game, returning to their masters when called. The pigeon hawk (*H. columbarius*, Linn.), and the sparrow hawk (*T. sparverius*, Linn.), though both falcons, will

be described under these names. The falcons are found throughout the world, regardless of climate; they are powerful and rapid fliers, hovering over their prey and darting perpendicularly upon it; they pursue birds chiefly, but attack also the smaller quadrupeds. The common or peregrine falcon (*F. peregrinus*, Linn.) has a large and round head, a short thick neck, a robust body broad in front, stout short tarsi, covered with imbricated scales largest in front, the tibial feathers covering the knee, long and strong toes and sharp claws. The plumage is compact and imbricated, the feathers rounded on the back, broad on the breast, long and pointed on the sides; between the eye and bill and on the forehead they are bristly. The bill is blackish blue at the tip and pale green at the base, the iris hazel, the feet bright yellow, and the claws black. The head and hind neck in the adult male are grayish black tinged with blue, the rest of the upper parts dark bluish gray with indistinct dark brown bars; the quills dark brown, with transverse reddish white spots on the inner webs; the grayish brown tail has about 12 blackish bars, diminishing in breadth and intensity from the tip; the throat and front of neck white; a broad triangular mark of blackish blue extends downward on the white of the cheeks from the corner of the mouth; the sides, breast, and thighs are reddish white, with transverse dark brown spots; the under wing feathers are whitish, with transverse darker bars. The length is about 16½ inches, the extent of wings 30, bill 1½, tarsus 1½, and middle toe 2½ inches. In old males the tints of the back become lighter, sometimes ash-gray; the young males are darker, with rufous tips and edges to the feathers, and the tail is blacker, with reddish white tips and bars; there is considerable variety at the different ages in the birds of the United States and of Europe. The adult female, as in birds of prey generally, is nearly ½ larger than the male, being about 20 inches in length, 36 in extent of wings, with the beak, tarsus, and toes longer; the color of the upper parts is deeper brown, with the tips of the secondaries and tail whitish; the transverse markings run higher up on the breast, and are broader and of deeper hue on the other parts; the color below is more yellowish, and the vent feathers are reddish. This falcon, which is also called the great-footed and the duck hawk, according to Audubon, was formerly rare in the United States, which it now can hardly be said to be. It flies with astonishing rapidity, turning in its course in the most surprising manner. A favorite prey is the duck, which it seizes on the wing, on the surface of the water, or on land; when within a few feet of its victim, it stretches out the legs and claws and drops upon the trembling bird almost perpendicularly; if light, it flies off with it immediately to some quiet place; if too heavy, it kills and devours it in the nearest convenient place. It has been known to attack a mallard on the wing, and even to pounce upon a wound-

ed teal within a few yards of the sportsman. Pigeons, blackbirds, water fowl, and beach birds, and even dead fish, are eaten by this falcon. Turning the bird it has caught belly upward, it clears off the feathers from the breast and tears the flesh to pieces with great avidity. This species is solitary, except during the pairing of the breeding season, which is in very early spring; it is found in all parts of the United States and in Cuba, coming to the south in the winter months. The nest is made of coarse sticks, generally on the shelf of some precipitous rock; Audubon is of opinion that they breed in the United States; they are common on the shores of Hudson's bay and arctic America in the summer, according to Richardson; the eggs are rounded, of a reddish brown color, with irregular markings of a darker tint. The peregrine falcon is distributed over temperate Europe, where the country is mountainous and the sea coast precipitous. This bird, when in full plumage and good condition, for its compact muscular form, great strength, boldness, and ferocity, may be taken as the very type of a bird of prey; it is among birds what the lion and tiger are among mammals; fearless in attack, swift in pursuit, strong and cruel, it justly claims the first rank among the noble birds of prey. Before the invention of gunpowder, these birds were very frequently trained to pursue herons and various kinds of game, and falconry was a favorite sport of kings and nobles; even now falcons are occasionally used for this purpose in Great Britain. Birds of prey have been trained to the chase from remote antiquity; the custom is mentioned by early writers, but it was not till the time of Huber, in 1784, that the distinction between birds of high and low flight, which had long been understood in practice, was shown to exist in the anatomical structure of the wings and talons. The falcons belong to the former division; from their long and slender and entire wings, when they wish to rise in the air vertically they are obliged to fly against the wind, though obliquely they easily mount to great elevations, where they sport rapidly in all directions; they carry the head straight; their claws are long, supple, sharp, and their grasp is firm; they seize their prey at once if small and slow, but strike repeatedly with their talons to weaken and arrest the flight of heavier and swifter birds, and with great precision attack the vital part at the hollow of the back of the head or between the shoulders and ribs. These birds have been called rowers from their mode of flight. The ignoble birds of prey, as the goshawk and other hawks, are called sailers; their wings are shorter and thicker, with their surface interrupted by the unequal lengths of the quills, and they fly to best advantage with the wind, sailing with the wings extended and motionless, allowing themselves to be carried along by the wind; their talons being shorter, less powerful, and straighter than in the falcon, they strike with less force and precision, and when they have seized a bird or a quadruped compress it

to death or strangle it with their claws; their beaks are not toothed, and they can seldom penetrate the skulls of the larger birds; they prefer to hunt in thick woods, while the falcons pursue their prey high in the air. Falcons and hawks are best trained from the nest; they have bells attached to their feet, jesses of soft leather to the tarsi, and hoods on the head which prevent them from seeing while they allow them to eat; birds taken after they have left the nest, or which have been caught in snares, are the most difficult to train, and confinement, hunger, fatigue, and purgatives are employed to subdue them to a point necessary for lessons; they are taught to leap upon the hand of their master to receive food, which is placed on a rude representation of the bird or animal which they are to be taught to pursue; from an effigy they are advanced to living animals, with more or less length of tether, until left at perfect liberty. The larger and older the bird, the more difficult the training, and the most ignoble are generally the most rebellious; in the order of docility these birds are the merlin, the hobby, the common falcon, and the jerfalcon (all noble birds), and the ignoble hawks are the least docile, though the goshawk is said to be very easily trained. They are fed with beef and mutton, deprived of all fat and tendon, and scrupulously cleaned of all dirt; they are taught to pursue other birds of prey, the heron, the crow, the pie, the hare, larks, quails, partridges, and other game. Descriptions of the lordly sport of falconry can be found in the romances of Walter Scott and other delineators of the days of chivalry. (See FALCONRY.) The falcon is a very long-lived bird; there is a tale that one belonging to James I. in 1610, with a gold collar bearing that date, was found at the cape of Good Hope in 1793, and though more than 180 years old, was said to be possessed of considerable vigor; the natural term of life of this species, however, must be much less than this. As an example of their speed, may be mentioned the falcon of Henry IV. of France, which flew from Fontainebleau to Malta, 1,000 miles, in a day; and many similar instances are on record.—The lanner (*F. lanarius*, Linn.) seems to be an undoubted species of northern Europe and Asia, and intermediate between the jerfalcon and the peregrine; it is about $1\frac{1}{2}$ feet long, with wings $\frac{2}{3}$ as long as the tail; its colors resemble those of the young peregrine, and the name even has been applied to immature birds of this species; but Mr. Gould in his "Birds of Europe" figures and describes it as distinct. It has not the black spot on the cheeks, and the markings of the breast are longitudinal instead of transverse; it would doubtless be a superior bird for training.—The Iceland or jerfalcon (*F. gyrfalco*, Linn.) is the largest of the genus, and varies much in its appearance at different ages. In the adult the head is nearly white, the feathers of the crown having hair-brown shafts, those of the nape having the brown more extensive; the under parts are white, the breast, thighs, and tail coverts pure white, but the sides

and abdomen are often spotted and lined with brown; the upper parts have the centre of the feathers hair-brown, with a white margin; the greater coverts, secondaries, and quills are barred with brown and edged with white, and the 2 central feathers of the otherwise white tail are barred with brown; the bill is pale bluish gray, with the upper tooth and the lower notch strongly developed; the legs and feet are colored like the bill. Some specimens are almost entirely white. The length is from 20 to 24 inches, the extent of wings a little over 4 feet, the bill $1\frac{1}{4}$ and the tarsus 2 inches; according to Audubon, in the immature state, as observed by him in Labrador, the female, though the longer and heavier bird, has the extent of wings less by an inch than the male; the weight of the male is a few ounces less, and that of the female a few ounces more than 3 lbs. The form is that of a very powerful bird, the tail being larger in proportion than that of the peregrine, and the tarsi feathered $1\frac{1}{4}$ inches downward. It ranges over the northern regions of Europe and America; Iceland is one of its favorite resorts, so much so that the bird has received one of its most common names from this island; it is found along the precipitous shores of Norway and Sweden, and in Greenland, the arctic regions, and the Hudson's bay district, extending as far south as Labrador, where Audubon found it breeding; it is rare in Great Britain, and is a northern and maritime species, especially frequent near the breeding places of sea fowl. In manner, flight, and cry, it resembles the peregrine, being if possible more daring. In falconry this species was highly prized, and extraordinary prices were formerly paid for them; they were brought chiefly from Iceland and Norway. There is still much uncertainty about the varieties of this bird; naturalists generally make but one species, but the falconers are of opinion that the Iceland and the Norway birds are distinct species; if the latter be true, the American bird may also prove different from any of the European species. Audubon describes and figures a pair of immature birds which he obtained in Labrador in August. The general color of the plumage in this condition is brownish gray above, the feathers having a narrow paler margin; the upper tail coverts, quills, and tail are tipped, spotted, and barred with brownish white; the throat is brownish white, with 5 streaks of brown, and the lower parts generally are of the former color, longitudinally patched with dark brown; the under tail coverts are striped alternately brown and white. The female has the same colors, except in having the 2 middle tail feathers spotted with white like the others, these in the male being without the spots. The nest found by Audubon was about 2 feet in diameter, flat, made of sticks, sea-weed, and mosses. The eggs, according to Mr. Yarrell, are dull white, mottled all over with pale reddish brown. They feed in Labrador on puffins, grouse, partridges, ducks, hares, and other animals of this size, and

also on fish. Mr. Hancock ("Annals and Magazine of Natural History," vol. xiii., 1854, p. 110), who described the Greenland falcon (*F. Groenlandicus*, Hanc.) as a distinct species, says it is never dark-colored like the young of the Iceland falcon, its plumage from the nest being whiter than the mature livery of the latter, and not unfrequently as white as that of the adults of its own species. The mature Greenland bird is distinguished from the young by the cordate and arrow-head markings of the back and scapulars; the young have above large oblong spots, with long narrow dashes on the head and lower parts, the marking from dark gray becoming with age almost black; the cere, feet, and toes also change from light livid blue to pale yellow. Like other falcons, it gets the mature plumage at the first moult. In fact, the Greenland falcon may be said to have a white plumage with dark markings, and the Iceland bird dark plumage with white markings; whether they are distinct species or not will be determined by the definition of what constitutes specific characters. Both species occur in America; the Greenland bird probably does not breed in Iceland, and is only occasionally seen there, driven from its more northern haunts by severe weather; the Iceland bird sometimes breeds in Greenland. The weight of evidence seems to be in favor of these birds being distinct species.—Other falcons, which have been trained to pursue game, are the *H. subbuteo* (Linn.), *H. asalon* (Gmel.), and *T. alaudarius* (Briss.), which will be described respectively under the popular names of HOBBY, MERLIN, and KESTREL.

FALCONER, WILLIAM, a British poet, born in Edinburgh in 1730, died by shipwreck in Dec. 1769. He was the son of a barber, and when very young, having received but the first rudiments of an education, was sent to sea. At the age of 18 he became second mate in the *Britannia*, which was shipwrecked off Cape Colonna, on the coast of Greece. Falconer was one of the 3 who survived the wreck, which afterward became the subject of his principal poem, the "Shipwreck." This was published in 1762, after he had been for a time a diligent student, and had suffered also another disaster at sea. Soon afterward the duke of York procured him the appointment of midshipman in Admiral Hawke's ship, the *Royal George*, which was laid up in 1763. He now married, compiled a "Universal Marine Dictionary" (republished in 1815, enlarged and modernized by W. Burney, LL.D.), and wrote several poems, including a political satire directed against Lord Chatham, Wilkes, and Churchill. In 1769 he again went to sea, in the frigate *Aurora*, bound for India, which, after touching at the cape of Good Hope, was never heard from again.

FALCONET, ÉTIENNE MAURICE, a French sculptor, born in Paris in 1716, died in 1791. He was a pupil of Lemoine, and early gained distinction by a statue of Milo of Crotona, which opened for him the doors of the academy of the fine arts. Many of his works were destroyed

at the time of the revolution. None of them, however, were equal in merit to the immense bronze equestrian statue of Peter the Great, which he executed at St. Petersburg, by order of Catharine II., in 1776.

FALCONRY, the art of training falcons or other birds of prey for the chase, the sport itself being called in English hawking, in French *le vol*. A falconry is also the place where such birds are kept. The practice of hawking is of very ancient date in Europe, and of yet more remote antiquity in Asia. Both Asia Minor and China present many legends concerning it. Pliny has been thought to allude to a custom of the Thracians, by which hawks were employed to catch other birds; but the meaning of his words is doubtful. We have no mention of it among the Romans till after the time of Vespasian. It was certainly in existence in the 4th and 5th centuries. In Britain it appears to have been a favorite recreation in the reign of Ethelbert, king of Kent, A. D. 760. King Alfred had his falconers, and a book on falconry is still extant, attributed to Edward the Confessor. Harold II. is represented in the Bayeux tapestry as visiting the court of Duke William of Normandy with a hawk on his fist. The Domesday book makes frequent mention of falconries and eyries for breeding. In the time of Henry II., William Knot, the king's tenant, paid his rent at the exchequer in 3 hawks and 3 jerfalcones. King John was devoted to the sport. Geoffrey Fitzpeine gave him 2 good Norway hawks to obtain permission for a friend to export cheese. Nicolas, a Dane, was to give the king a hawk every time he came trading to England. A letter of Henry III. (1249) to the king of Norway, asking him for hawks, yet remains. Froissart says that when Edward III. invaded France, he was accompanied by 30 mounted falconers. At this time it was felony to steal a hawk, and taking its eggs, even on one's own ground, was punished by imprisonment for a year and a day, with fine at the king's pleasure. Elizabeth reduced the term of imprisonment to 3 months, but the offender was compelled to find security for 7 years, or be imprisoned till he died. The sport died out in England in the time of the Stuarts. In France, falconry was most practised in the time of Francis I., 1515-'47. He was the first who appointed a "grand falconer of France;" the predecessors of that functionary were simply called "the king's falconers." The grand falconer of Francis I. had an annual revenue of 4,000 florins, and had under him 50 gentlemen and 50 falconers, the whole establishment costing annually 40,000 florins. Under Louis XIV. the institution was yet more expensive. Louis XVI. tried to reduce the expense of the royal falconry, but without success; but finally the revolution swept it away. In Germany the sport was honored in the reign of the emperor Frederic II., and in the 14th century fiefs called *Habichtshaken*, or hawk tenures, were granted on condition of payment in trained hawks. The sport retained

its existence in Germany till toward the close of the 18th century. In Italy falconry was a favorite pastime, and every student of Italian literature must remember Boccaccio's tale of the "Falcon." In the East, the Persians are skilful in training falcons to hunt all manner of birds, and even gazelles.—While it flourished in Europe, hawking was the principal amusement of lords and ladies. Knights courted ladies by attention in the hawking field, flying their birds, and restoring them to their mistresses' wrists. Herons were the most honorable quarry, and were therefore held in estimation second only to birds of prey. A knowledge of the management of hawks was an essential piece of noble education. Quite as much as "to winde the horn," it was necessary to know a hawk from a hernshaw. The vocabulary of hawking was as extensive as its ordinances, and several of its terms have been adopted into the language. Hawks' legs were their arms; their talons, pounces; wings, sails; the long feathers of the wings, beams; tail, the train; breast feathers, the mails; crop, the gorge. A cover for the bird's head was the hood. When the hawk fluttered to escape, it bated; to sleep was to jouk; to stretch one wing back was to mantle; to shake itself was to rouse; to recross its wings again was to warble; to tear the feathers from its prey was to plume; to raise its prey aloft before descending was to truss; to descend on its prey was to stoop; to fly off after crows was to check. A living prey was quarry; when dead, pelt. Taming a bird was called reclaiming, by the French *affaitage*; and an old, stanch, pattern hawk was called a make-hawk. No rank was excluded from the enjoyment of hawking, but each condition of men must confine themselves to their peculiar grade of hawk and quarry. As the hawk tribe do not breed freely in captivity, the birds of chase were either taken young from the eyry, or were caught in springes. (See FALCON.) Various attempts have been made in England, in recent times, to revive the sport of falconry, but the enclosure of farms, equally with a change in public taste, is against it. The sinecure office of grand falconer of England is hereditary in the family of the duke of St. Albans.—Mr. Atkinson, in his work on "Oriental and Western Siberia" (London, 1858), describes a species of falconry in use among the Kirghiz. The party whom he accompanied set out with an eagle and a falcon, and had not gone very far before they discovered several large deer. In an instant the eagle was unhooded, and his shackles removed, when he sprang from his perch, and soared up into the air. Having risen to a considerable height, he seemed to poise himself for about a minute, and giving 2 or 3 flaps with his wings, swooped off in a straight line toward his prey. He went with great rapidity; his keepers followed him at full gallop, and were about 200 yards off when the eagle struck his prey. The deer gave a bound forward, and fell. The eagle had struck one talon in his neck, and the other into

his back, and with his beak was tearing out the animal's hair. The Kirghiz sprang from his horse, slipped the hood over the eagle's head and the shackles upon his legs, and removed him from his prey without difficulty. The keeper mounted his horse, the eagle was placed on his perch, and he was ready for another flight. No dogs are taken out when hunting with the eagle, as they would be destroyed; and the Kirghiz assert that he will attack and kill the wolf. Foxes are also hunted in this way. The wild goat and the smaller kinds of deer are also taken in considerable numbers.—Among the most noted treatises on falconry is one written by Frederic II. of Germany (1209-'50), annotated by his son Manfred, and republished with several other treatises by J. G. Schneider in 1788 (2 vols., Leipsic). Others are: the famous "Boke of St. Albans," by the lady Juliana Berners (fol., 1481), containing the "Treatyses perteynyng to Hawkyng, Huntynge, and Fysshynge with an Angle;" *Hieracosophion, vel de Re Accipitraria*, a poem in 8 books, by De Thou (1584); *La fauconerie*, by Charles d'Esperon (Paris, 1605); Latham on "Falconry" (1615-'18). The most recent works on the subject are "Falconry in the British Isles," by Salvin and Brodrick (London, 1855), and "Falconry, its Claims, History, and Practice," by G. E. Freeman (London, 1859).

FALERII, an ancient city of Italy, one of the 12 Etruscan cities, situated a few miles W. of the Tiber, and N. of Mount Saracte. It was the capital, and perhaps the only city of the Falisci, a people of Pelasgic origin, whose territory extended from the Tiber to Lake Vigo, and who in the early ages of Rome were reckoned among the most dangerous enemies of the republic. It is first mentioned in Roman history in 437 B. C., when the Falisci lent their support to the Fidenates, who had revolted against Rome. It was besieged by the Romans in 394 B. C. The inhabitants were said to have been at length induced to surrender less by force of arms than by the example of the Roman general Camillus, who refused to profit by the treason of a schoolmaster that proposed to deliver up to him the children of the principal men. The Falisci rose in rebellion against Rome in 293, and again in 241, when they were punished by the destruction of their town. The inhabitants were removed to a less defensible site, where a colony was established named Junonia Faliscorum, from a famous temple of Juno. The latter site is now occupied only by a farm house and a ruined church, but a large portion of the ancient walls, with their gates and towers, still exists.

FALERNUS AGER, a district in the northern part of Campania, extending from the Massican hills to the bank of the Volturnus, and from which the ancient Romans obtained one of their choicest wines. The Falernian wine was red, very spirituous, and most powerful when from 15 to 20 years old. Its excellence is celebrated by the Roman poets, particularly by Horace. It was declining in quality in the time of Pliny,

from want of care in the cultivation, and the vineyards disappeared in the 6th century.

FALIERI, MARINO, 56th doge of Venice, and the most celebrated of the several doges of the same family, born in 1274, beheaded in Venice, April 17, 1355. In 1346 he rendered eminent services to the republic as commander-in-chief at the siege of Zara, in Dalmatia, where he achieved a victory over the king of Hungary. Subsequently he was Venetian ambassador at Genoa and Rome. In 1354 he was summoned home from Rome, and called upon, although 80 years old, to preside as doge over the government of Venice. His administration began under sinister auspices, the entire Venetian fleet of 61 vessels being within a month captured by the Genoese, with a loss to the former of 4,000 men killed, and nearly 6,000 prisoners. Hardly had the new doge succeeded, Jan. 5, 1355, in concluding a 4 months' truce with Genoa, when a contest broke out in his own palace, which proved fatal to himself. A young nobleman of Venice, Michele Steno, enamored of one of the dogessa's maids of honor, on occasion of one of the balls given during carnival at the palace, took liberties with the young lady which, although excusable under the excitement of the season, gave umbrage to the doge, who was a man of great irascibility of disposition, and who ordered Steno to leave the palace. The young man, exasperated by this treatment, avenged it by writing upon the chair of the doge the following words: *Marino Falieri dalla bella moglie, altri la gode ed egli la mantiene* ("Marino Falieri's beautiful wife is supported by him, but enjoyed by others"). The doge's wrath knew no bounds, and as the senate and the councils refused to treat the affair as a question of state, and the criminal court sentenced Steno to only a brief term of imprisonment and a year's exile, he determined to wreak vengeance by exterminating the whole body of the nobility, who were hated by the populace as tyrants. The day fixed for the consummation of this design was April 15, 1355, but the conspiracy was discovered on the evening previous; the doge was arrested, and after a full confession of his guilt, he was sentenced to death and beheaded upon the great stairs of the ducal palace. As soon as his head had fallen, the president of the council of ten stepped upon the balcony, brandishing a blood-stained sword in his hand, and exclaiming that justice had been executed upon a great culprit. In the council hall of the palace, where the portraits of the doges of Venice are religiously preserved, a black drapery covers the spot intended for that of Falieri, bearing the ominous inscription: *Spazio di Marino Falieri, decapito*. The fate of the doge has been a favorite theme with poets. Byron made it the subject of a tragedy, in the notes to which a full account is given of the history of Falieri.

FALK, JOHANN DANIEL, a German philanthropist and author, born at Dantzic in 1768, died Feb. 14, 1826. His passion for knowledge

overcame all the difficulties with which the poverty and ignorance of his parents surrounded him in early life, and he entered the university of Halle, where he produced several satirical poems, which attracted the notice of Wieland, who introduced him into the literary circles of Weimar. After Goethe's death Falk published an account of his personal intercourse with him (*Goethe aus näherem persönlichem Umgange dargestellt*, 2d ed., Leipsic, 1836). A selection of Falk's writings appeared in 1818, and a new collection of his satirical works in 1826. He wrote for the *Taschenbuch*, or "Album," of which he was the editor, an article on the inefficient condition of the hospitals in Berlin, which induced the government to reform them. In 1813 he founded at Weimar a charitable institution for the education of poor children, which bears to this day the name of *Falkisches Institut*.

FALKIRK, a municipal and parliamentary borough of Scotland, in the county of Stirling, on a commanding eminence, 24 m. W. of Edinburgh; pop. in 1851, 8,752. It has a fine parish church, several churches of dissenting congregations, and 22 schools, attended by 1,100 pupils. There are in Falkirk, and in the connected villages of Grahamston, Bainsford, and Carron, printing establishments, tanneries, breweries, a manufactory of pyroligneous acid, the immense iron works of Carron, a foundery employing 500 men, and branches of the banks of Scotland and of England. Its chief celebrity, however, is due to its cattle fairs, the most important in Scotland, which take place annually in August, September, and October, each lasting from 2 days to a week. The last is the largest of the 8. These *trysts*, as the Scots call the fairs, have flourished more than 200 years. Falkirk was a place of note in the 11th century. The ancient parish church, built by Malcolm Canmore in 1057, was demolished in 1810 to give place to the present one. Here Edward I. in 1298 conquered William Wallace, and in 1746 the young pretender, Charles Edward, defeated the English army under Gen. Hawley. Formerly the Scotch bagpipe players had an annual assembly at Falkirk.

FALKLAND, a royal borough of Scotland, in the county of Fife, at the foot of East Lomond hill, 22 m. N. of Edinburgh; pop. in 1851, 1,330. It is an old town, consisting mostly of a single street, ill built, and so commanded by the Lomond hill that the sun never shines upon it in the winter. Its royal castle was an ancient fortress of the Macduffs, but was forfeited to the crown in 1424, and became a favorite rendezvous of the kings of Scotland on hunting excursions. James V. and VI. enlarged and embellished it. Cromwell ruined the park to get timber for a fort at Perth. The palace was held by the famous Rob Roy in 1715. This town gives the title of viscount to the English family of Cary.

FALKLAND, AMELIA FITZCLARENCE, viscountess, an English authoress, born Nov. 5, 1803, died in London, July 2, 1858. She was

the youngest of the 5 daughters of William IV. by Mrs. Jordan, and was married, Dec. 7, 1880, to Viscount Falkland. She was a lady of considerable literary attainment. Her last work, "Ohowchow," appeared shortly before her death.

FALKLAND, LUCIUS CARY, viscount, an English politician and man of letters, born in Burford, Oxfordshire, in 1610, killed Sept. 20, 1643. His father, Sir Henry Cary, who was made Viscount Falkland in the peerage of Scotland in 1620, held various offices under James I., among which was that of lord deputy of Ireland, which caused Lucius to commence his education at Trinity college, Dublin, where he acquired a thorough knowledge of Latin and French. Returning to England at 18, he studied at St. John's college, Cambridge. When only 19 he was imprisoned by order of the privy council, because he had warmly resented his removal from command of a company; but his imprisonment lasted only a few days. At the same age he came into possession of the estate of his maternal grandmother, wife of Chief Baron Tanfield, worth above £2,000 per annum. He married Letitia Morrison, a marriage that gave his father much offence, as the lady's fortune was small. He visited Holland, with the view of entering upon a military life; but he did not succeed, and returned to England, where he substituted letters for arms. Taking up his residence at Great Tew, a few miles from Oxford, he began a severe course of study, resolving not to visit London until he had acquired Greek. The death of his father in 1633, by which he became Lord Falkland, forced him to break his resolution, as he had to visit the capital on business. His fortune was not increased, the family estate being mortgaged to its full value. Resuming his country life, which he continued for 6 years longer, he had for his associates learned men from Oxford, and others from London. His house was as free to them as to himself, and it is stated that they required no invitation to take possession of the apartments regarded as their own. To those who needed assistance Falkland readily afforded it, and in the most delicate manner, and it was justly said that he seemed to hold his estate in trust "for worthy persons who needed assistance, as Ben Jonson and others." Among his friends were Chillingworth, Waller, Edward Hyde, Cowley, Sandys, Morley, Sheldon, Hammond, John Hales, and Sir F. Wenman. It was at Great Tew that Chillingworth wrote his book against the Jesuit Nott, and in the society there its points were debated, he sometimes giving way to the judgment of his friends. Falkland wrote himself, both in prose and verse. He studied theology deeply, and occurrences in his own family led him to publish a "Discourse of the Infallibility of the Church of Rome." He was the author of other works, now little known. In 1639 he joined the army with which Charles I. meant to fasten Episcopacy upon Scotland, but had no opportunity to distinguish himself. He was chosen a member of the

short parliament, in April, 1640, for Newport, Isle of Wight. He was elected to the long parliament from Newport, and shared deeply in the determination to establish the government on a constitutional basis. When the impeachment of the earl of Strafford was proposed, however, he wished the house to proceed with deliberation; but the country party knew that to give the earl time was to give him victory, and hence Falkland's proposition was not entertained. Falkland was a strenuous advocate of the bill of attainder, even when it was opposed by Pym and Hampden, who preferred proceeding by impeachment. He moved the impeachment of the lord keeper Finch. He distinguished himself in the attacks that were made on ship money, and on the judges who had pronounced the levying of it legal; and in those which were directed against the church. Indeed, from his first actions and words, he seemed to be as thorough a reformer as the most eminent members of the country party; and his change of position will ever furnish matter for historical students to discuss. Macaulay attributes his change to fastidiousness, which caused him to find reasons against any cause that he espoused. Forster thinks it was owing to his quickness, impetuosity, and impatience, and says his spirit was in all things too much on the surface. His friend Hyde mentions his "notable vivacity;" and he never did things by halves. Be the cause what it may, he left the reform party, and he who had said the bishops were stark mad, and therefore should be sent to Bedlam, was soon heard to complain that they who hated the bishops hated them worse than the devil, and they who loved them did not love them so well as their dinners. Mr. Forster expresses the opinion that Falkland was far more an apostate than Strafford, inasmuch as his heart was really with the parliament from the first, which Strafford's never was; and that he desired peace so ardently only because he was by no means devoted to the cause for which he fought. In the memorable debate on the Grand Remonstrance, Falkland was the second speaker, following Hyde, and against the remonstrance. His course on this occasion, with his earlier opposition to the abolition of the church, had the effect of leading the king to make him the offer of the post of secretary of state, which he accepted, Sir J. Colepepper being made chancellor of the exchequer. To them and to Hyde he committed his affairs, and they wished to govern constitutionally, and would have done so but for the king himself, who broke his pledge to them when he sought to arrest the 5 members. Of the exact part which Falkland had in the government scarcely any thing is known, but he and his two associates began to receive marks of hostility in the commons, and there was a plan formed to seize them, which they prevented by never being all present there at the same time. Falkland wrote the royal answer to the parliament's 19 propositions, and then joined the king at York. He signed the king's declaration that he did not

mean to make war on the parliament, which was as sincere on his part as it was false on that of the monarch. The 8 ministers advised Charles to return to London, and to appear in parliament before he could be expected; but he would go no further than to allow a second message to be sent to London, one of the bearers of which was Falkland. Shortly afterward Falkland was removed from the commons, and placed on the list of those whom the parliamentary commander was ordered to exclude from mercy. He behaved with gallantry at the battle of Edgehill, and had his advice been taken the king would have won a complete victory. In some negotiations that followed, he labored earnestly for peace. The campaign of 1643 was for a long time favorable to the king, and Falkland accompanied him to Bristol, and thence to the siege of Gloucester. He recklessly exposed himself to the enemy's fire, and perhaps courted death. The advance of the parliamentary army compelled the king to raise the siege. In the first battle of Newbury, Falkland placed himself at the head of Sir John Byron's regiment. Receiving an order to charge a body of foot, he advanced between hedges lined with musketeers, and received a ball in the stomach, from which he died instantly. The body was found the next day, and buried in Great Tew church. He left a wife and 3 sons. Among the best works which treat of him is Forster's "Historical and Biographical Essays" (London, 1858).

FALKLAND ISLANDS (Fr. *Malouines*; Sp. *Malvinas*), a group in the S. Atlantic, belonging to Great Britain, and consisting of about 200 islands, 300 m. E. from the entrance to the strait of Magellan, between lat. 51° and 53° S., long. 57° and 62° W.; area, about 6,000 sq. m.; pop. in 1855, 420. All but two are very small. East Falkland is about 90 m. long, 40 m. broad, and 3,000 sq. m. in area; West Falkland, separated from the former by a channel from 2½ to 18 m. wide, called Falkland sound, is 80 m. long, 25 m. broad, and about 2,000 sq. m. in area. The other principal islands are Great Swan, Saunders, Pebble, Keppel, Eagle, Weddell, and Lively. The coasts are very irregular, in some places rocky and precipitous, in others low. Bays and inlets are numerous, and East and West Falkland are nearly divided by several deep indentations. There are few rivers, the San Carlos, 30 m. long, discharging itself off the N. W. coast of East Falkland, being the largest. There are many fresh water ponds and brooks. The surface of the islands is broken by ridges of bleak hills, the highest of which are in East Falkland, though the average elevation of West Falkland is greater than that of the former. Mount Usborne, one of the Wickham hills, in the E. island, is 2,300 feet above the sea; the other summits are from 800 to 2,000 feet high. The country south of the Wickham hills is a level plain. The whole aspect of the group is dreary and uninviting. The commonest geological formation is quartz, which in some places is seen covering the bottoms of the valleys, broken into

sharp fragments, and disposed in level sheets or streams like rivers of stone. Sandstone and clay slate also occur. The soil of such portions as have been explored is mostly peat or sandy clay covered thinly with vegetable mould. The valleys of the streams are exceedingly rich. The climate is like that of England, but more equable. The temperature of summer ranges from 45° to 70° F., and that of winter from 30° to 50° F. The mean temperature of the year is 47°. Severe and destructive snow storms are occasionally experienced. There are no trees on the islands. The most important production is grass, which grows to a great length and possesses remarkably nutritious properties. A variety called tussock, much prized by graziers, is now becoming scarce. Three or four kinds of bushes are found; the common garden vegetables of England thrive; barley and oats are cultivated, but wheat is raised with difficulty. The fauna comprises the warrah or wolf fox, which is peculiar to this archipelago, and is the only quadruped indigenous to the islands. Other animals have been left here by Europeans, and the number of wild cattle sprung from stock thus introduced in East Falkland alone is estimated at 35,000 or 40,000. Horses, sheep, wild hogs, rabbits, seals, and wild fowl are found, and many French and American vessels are employed in whaling off the W. coast of W. Falkland. There is little commerce, the exports consisting of hides, tallow, salted beef, seal skins, and fish oil, and the imports of timber, lime, bricks, flour, sugar, coffee, and British manufactured goods. The value of imports in 1854 was £21,100, and of exports £18,600. The fisheries and the guano deposits on W. Falkland are considerable sources of wealth. A British colony called Stanley has been established at the head of Port William inlet on the N. E. coast of E. Falkland. It has an excellent harbor, and is the only settlement in the whole group. The main object of the British government in keeping up the establishment here is to afford ships a place of call for water and fresh provisions. In 1855, 53 vessels, 10 of which were American and 40 British, touched at the port. The islands were discovered by John Davis, Aug. 14, 1592, and were visited by Strong in 1690, who called the sound mentioned above Falkland, and the islands afterward took the same name. The French planted a colony on Berkeley sound, East Falkland, in 1764, and the English established themselves at Port Egmont, West Falkland, 2 years later. The French in 1767 ceded their settlement to the Spaniards, who drove away the English in 1770. They afterward restored Port Egmont to the British, and some time later the islands were abandoned by both parties. Buenos Ayres took possession of East Falkland in 1820 and founded a colony there in 1823, but subsequently gave it up to the British.

FALL OF BODIES. See GRAVITY.

FALL RIVER, a city and port of entry of Bristol co., Mass., situated on Mount Hope bay, an arm of Narraganset bay, at the mouth of

Taunton river, 53 m. S. S. W. from Boston; pop. in 1855, 12,680. Fall river, from which it is named, is a small stream rising in a chain of ponds connected by a narrow channel, and covering an area of 5,000 acres. They lie about 3 m. from the bay, and receive the outlets of several other sheets of water which embrace an area of 2,000 acres more. The river which carries off the overflow of these ponds has a descent of 180 feet in less than half a mile, and joins the Taunton near its mouth. Its remarkable advantages as a mill stream have been increased by building a dam at the outlet of the ponds, which gives the water an additional fall of about 2 feet, and its lower banks are entirely built up with manufactories. The water power never fails, and damage is rarely if ever done by freshets. The city stands on high ground, with well shaded streets, handsome churches, and many granite buildings, the stone being obtained from large quarries in the neighborhood. The granite is of excellent quality, and was used in constructing the fortifications at Newport. The city is lighted with gas, and in 1858, beside a handsome granite town house and market, contained 18 churches (2 Baptist, 3 Christian, 2 Congregational, 1 Episcopalian, 1 Freewill Baptist, 1 Friends', 3 Methodist, 1 Presbyterian, 1 Roman Catholic, 1 Swedenborgian, 1 Unitarian, and 1 Universalist), a high school, an athenæum, 2 weekly newspaper offices, 4 banks with an aggregate capital of \$1,250,000, and 2 savings banks. It is eminently a manufacturing place, its industrial activity being devoted chiefly to the production of cottons, linens, printed calicoes, iron ware, and machinery. The following table shows the state of manufactures in 1855:

Articles manufactured.	No. of establishments.	Value of manufactures.	Capital.	No. of hands employed.
Cotton and cotton yarn..	8	\$1,229,250	\$1,865,000	1,711
Calico, printed.....	2	1,830,000	280,000	850
Linen.....	1	240,000	865,000	550
Iron ware, iron, and nails	4	781,600	855,000	424
Machinery.....	3	200,000	105,000	150
Brass.....	1	14,000	6,000	7
Coches, wagons, &c....	3	24,000	13,000	30
Soap.....	2	50,000	7,500	10
Flour.....	2	670,000	150,000	36
Gas.....	1	15,000	40,000	10
Miscellaneous.....	25	282,890	79,550	225
Total.....	62	\$4,786,740	\$2,716,050	3,508

An establishment for the manufacture of enamelled cloth was commenced in 1857, with a capital of \$25,000. Ship-building is carried on to a small extent, and during the year ending June 30, 1858, 4 vessels were launched, having an aggregate burden of 633 tons. The harbor, formed at the mouth of Taunton river, is safe, commodious, easy of access, and deep enough for ships of the largest class. It was at one time in contemplation to make it the site of a government dry dock and naval depot. The registered, enrolled, and licensed tonnage of the port, June 30, 1858, was 14,598, of which

6,991 tons were employed in steam navigation, 13,721 tons were engaged in the coasting trade, and 46 in the cod fishery. The foreign commerce during the same year was as follows: vessels entered, 37, tonnage 6,841; vessels cleared, 19, tonnage 3,396; value of imports, \$80,213; value of exports, \$5,788. A daily line of steamers connects Fall River with Newport, Providence, and New York, and the Old Colony and Fall River railroad gives it communication with Boston. Fall River was formerly a part of Freetown, and was incorporated as a separate township about 1802. Its name was soon after changed to Troy, but in 1834 its old appellation was restored. It received a city charter in April, 1854.

FALLING STARS. See METEORS.

FALLMERAYER, PHILIPP JAKOB, a German historian and traveller, born in Tschötsch, near Brixen, in the Tyrol, Dec. 10, 1791, served as a sub-lieutenant in the Napoleonic wars of 1813-'15, after which he became a professor at the college of Augsburg and the lyceum at Landshut. From 1831 to 1836 he travelled in the Orient, resided in the southern part of France for 4 years, made a second tour through Asia Minor in 1840, published the results of his ethnological and historical researches in *Fragments aus dem Oriente* (2 vols., Stuttgart, 1845), visited Palestine and Syria in 1847, was a member of the German parliament in 1848, obtained a professorship at the university of Munich, but was dismissed in 1849 on account of his liberal views, and has since then led a retired life at Munich. The most important of his historical writings are: *Geschichte des Kaiserthums Trapezunt*, "History of the Empire of Trebizond" (Munich, 1831), and *Geschichte der Halbinsel Morea im Mittelalter*, "History of the Peninsula of Morea during the Middle Ages" (2 vols., Stuttgart, 1830-'36). In this work he maintains that the present inhabitants of Greece have little or no affinity of race with the ancient Hellenes, but are chiefly a branch of the Slavic family. Many of his essays published in the Augsburg *Allgemeine Zeitung* belong to the best writings of their kind which have ever appeared in Germany. His works exhibit a rare combination of profound scholarship and philosophical depth with the faculty of presenting the results of scientific researches in a perspicuous and graceful form.

FALLOPPIO, or FALLOPIUS, GABRIELLO, an Italian anatomist, born in Modena about 1523, died in 1562. He was one of the 3 naturalists who, according to Cuvier, contributed to the revival of the study of anatomy in the 16th century, the other 2 being Vesalius and Eustachi. He was a pupil of Vesalius, and after travelling through the various countries of Europe, he was for a time professor of anatomy at Ferrara, and afterward for several years at Pisa. In 1551 he was appointed to succeed Vesalius as professor of anatomy and surgery at the university of Padua, where he also devoted himself to the study of botany, and became director

of the botanical garden. He published in 1561 his principal work, entitled *Observationes Anatomicae*, which was one of the best anatomical treatises of his century, and has been several times reprinted. He gave an exact description of the structure of the ear, one of the canals of which still bears his name. He also first indicated the use of the 2 ducts extending from the womb to the ovaria, on each side of the fundus, which are called from him Fallopian tubes. After a short but brilliant career, in which he became distinguished as a professor, botanist, and surgeon, as well as anatomist, he died and left his chair to Fabricius, his pupil.

FALLOUX, FRÉDÉRIC ALFRED PIERRE, vicomte de, a French author and statesman, born in Angers, May 11, 1811. He first made himself known by a history of Louis XVI. (Paris, 1840; 2d ed., 1843), and by his *Histoire de St. Pie V.* (2 vols., Paris, 1844; 3d ed., 1858), the former of which showed his legitimist, the latter his Catholic sentiments. In 1846 he was elected a member of the chamber of deputies, where he took his seat among the legitimists. After the establishment of the republic he warned the inhabitants of La Vendée against civil war, and exhorted them to have confidence in the new government. On Dec. 20, 1848, he was made by Louis Napoleon minister of worship and public instruction, which post he resigned in Oct. 1849, on account of his health. After the *coup d'état* of Dec. 2, 1851, he refused to be a candidate for the legislature, and retired from public life. In 1855 he became assistant editor of the *Correspondant*, the leading review of the Catholic party. In this capacity he took an active part in the violent controversy which the *Correspondant*, in the name of the moderate section of the Catholic party, sustained against the *Univers* daily newspaper. Falloux published on behalf of his friends the pamphlet *Le parti Catholique*. He succeeded M. Molé as a member of the French academy (March 26, 1857), and published in the same year *Souvenirs de charité*.

FALLOW DEER. See BUCK, and DEER.

FALLS, a central co. of Texas, intersected by Brazos river and drained by many small creeks; area, 795 sq. m.; pop. in 1858, 2,875, of whom 1,225 were slaves. Most of the surface is occupied by rolling prairies, the soil of which is a rich black loam, adapted to wheat and other varieties of grain. The river bottoms are still more fertile, and produce good crops of Indian corn and cotton, with plenty of oak, pecan, cedar, cottonwood, and other timber valuable for building purposes. Limestone underlies a large part of the county, and a vast ledge of it crossing the bed of Brazos river causes the falls from which the county derives its name. Formed from Milan and Limestone counties in 1850. Value of real estate in 1858, \$153,512. Capital, Marlin.

FALMOUTH, a parliamentary borough and seaport of Cornwall, England, beautifully situated on the S. W. side of a harbor on the chan-

nel, at the mouth of the river Fal, 45 m. S. W. of Plymouth; pop. in 1851, 4,958. It is built on a steep acclivity, reaching to the water's edge, and consists mainly of one long narrow street. It has many good stone houses, and a plentiful supply of water in the N. and S. quarters, where the ground is arranged in terraces. The harbor is one of the finest in Great Britain, and may be entered at all times. It is defended on the W. by Pendennis castle, and on the E. by St. Mawes castle, both built by Henry VIII., and improved by Elizabeth. In 1644 Pendennis castle afforded shelter to the queen Henrietta Maria when embarking for France, and in 1646 to Prince Charles on his departure for Scilly. It underwent a long siege by Cromwell, traces of whose encampment near by are still visible. The castle now contains barracks, storehouses, magazines, &c. An obelisk in the grounds of Lord Wodehouse's estate (Arwinick, once the seat of the ancient family of Killigrew), adjoining the town, is dedicated to the memory of Sir Walter Raleigh, who visited the harbor in the reign of Elizabeth on his return from the coast of Guinea, and first called attention to its great advantages, which had till then been altogether overlooked. There is a good quay, accessible by vessels of heavy burden. The entrance is about 1 m. wide, and the bay, which runs 6 or 7 m. inland, is a favorite resort of British vessels in time of war. Before the introduction of mail steamers it was a principal station for the Spanish, Portuguese, and American packet service, and carried on an extensive trade with those countries. It is still the only bonding port for tobacco, except Plymouth, in Devonshire and Cornwall. It exports pilchards, which are taken off its coast, tin, and copper, and imports timber, hemp, tallow, rum, sugar, grain, wine, and fruits. It has large ship-building yards, roperies, breweries, and a flourishing trade in maritime supplies. The number of vessels registered as belonging to the port in 1856 was 118, tonnage 11,159; number of vessels entered during that year 940, tonnage 85,970; number of vessels cleared 839, tonnage 25,517. The royal Cornwall polytechnic society, the first institution of the kind established in England, founded in 1838 for the encouragement of the sciences, art, and industry, meets annually at Falmouth.

FALSE IMPRISONMENT. The jealous watchfulness of the common law of England for the protection and preservation of personal liberty is nowhere proved more distinctly than in the provisions of the law respecting what is technically called false imprisonment. They are in their extent and fulness quite peculiar to that law; and while the principles on which they rest, and some of the rules derived from them, may be discerned even in the Saxon times, they have certainly been developed and systematized in later ages, as the worth of personal liberty became more accurately estimated and the means of preserving it better understood. False imprisonment, in the law of England and the Unit-

of States, may now be defined as any intentional and unlawful restraint of a person. As to the kinds of false imprisonment, it may be: 1, the restraint or arrest of a person under color of law, by means of an illegal or insufficient process; 2, such restraint or arrest, by means of a legal instrument, but at an illegal time, as on Sunday or any other day generally prohibited, or at any time which is illegal and unauthorized in respect to the person restrained; 3, without color or pretence of law, as when one confines another to his room or house without legal authority to do so. False imprisonment may be with force or wholly without force; as if one, without touching another, by words only, or even by gestures only, compels him, by fear, to abstain from going where he has a right to go, or to go where he wishes not to go and is under no obligation to go. It is false imprisonment to confront a man in the street, and, without touching him, constrain him to arrest his course or change it against his will.—The remedies for false imprisonment are threefold: 1, an action for trespass *vi et armis*, when the party imprisoned may recover damages, including, if the jury see fit, not only compensative damages, but perhaps exemplary damages, to deter the guilty party and others from a repetition of the offence; 2, the writ of *habeas corpus*, or of *replevin*; 3, false imprisonment of any kind is an offence at common law, for which the guilty party may be indicted, and on conviction severely punished; and in some of the United States there are various statutory provisions respecting certain kinds of false imprisonment.

FALSE PRETENCES. Any one who acquires property by means of false pretences has no legal title to it, and it may be recovered by the party from whom it was thus obtained, and who is still the legal owner. (See FRAUD.) But beside this civil remedy the statutes of England and of the United States make the obtaining of property by false pretences an indictable offence. The expressions in our state statutes are various; in general, however, any one who by means of false pretences, and with a fraudulent design, obtains possession of money, merchandise, goods, or wares of any description, becomes liable under the statute. It has been held in New York, under its statute, that obtaining a party's signature to or an endorsement of a note by false pretences was an offence within the statute. It is impossible to define precisely the false pretences which expose one to this punishment. It is obvious that they cannot be slight suggestions which are without foundation, or open and obvious falsehoods by which no man in his senses would be deceived. They must be, in the first place, intended to produce an injurious effect; and in the next place, they must be such as would be likely to deceive a person of ordinary discretion, who is to a reasonable extent on his guard. If the pretences or misrepresentations are numerous, and most of them are honest, but some one of them is at once material, false, and fraudulent, the offence is committed: and this is

so, although the statements which were true exercised the principal influence in obtaining the property for the guilty party, provided it would not have been given him but for the statement also which was false. It may be remarked that no false pretences made after the contract was completed will constitute the offence, even if they were made before the property was delivered, unless the delivery or execution was at first withheld, and then brought about by the false pretences. At common law the nearest provision to this of the modern statutes was one which exposed to indictment and punishment as a cheat a person who obtained possession of money or goods by means of what were called false tokens, by which was meant forged papers, or other counterfeit symbols or evidence of ownership or authority. Language similar to this ancient rule is used in some of our statutes, as in those of Pennsylvania. The first statute against false pretences in England was 80 George I., ch. 24; and this has been followed by the different states of the Union, more or less exactly. The most common instances of indictments under these statutes are for the obtaining of goods by buyers under false pretences as to their responsibility or resources; and it was mainly to suppress these that the statutes were intended.

FALSETTO, an Italian word signifying a little false, and applied in music to that high register of a man's voice which resembles a female's, and is therefore not strictly his own, but a false or assumed voice. It extends about 4 or 5 notes above the natural voice.

FALUN (Sw. *Fahlu*), a Swedish province, including Dalecarlia, bounded N. by Ostersund, E. by Gefleborg, S. by Wästerås and Örebro, W. by Carlstad and Norway, comprises part of the S. mountain region of Sweden and a part of the famous copper mine region, whence it is also called Kopperbergs-Laen, or copper mountain province; area about 12,000 sq. m.; pop. in 1855, 158,755. Almost the whole province belongs to the basin of the Dal, which drains it directly by the E. and W. Dal, and by many tributary streams. Cultivation is chiefly confined to the valleys, which are rocky, and better adapted for pasture than for agriculture. The N. produces only hay, but rye, barley, and oats are produced in the S. and S. E.; potatoes are much cultivated, and butter and cheese are made in considerable quantities. But the chief wealth of the country proceeds from its wood, which furnishes timber, fuel, potash, and rosin, and from its copper and iron mines and various quarries, especially of porphyry, which is made into many very beautiful articles. The lakes (the principal of which, Lake Siljan, covers 50 sq. m.) and rivers abound with fish. Mr. Brace, in his "Norse-folk" (New York, 1857), speaks in the highest terms of the excellent moral and industrial character of the people.—**FALUN**, capital of the above province, is situated on the W. shore of Lake Runn, 130 m. from Stockholm, 73 m. from Gefle, in about lat. 60° 35' N., long. 15° 35' E.; pop. in 1855,

4,618. The houses are low and almost entirely of wood. The copper mines situated W. of this town are among the oldest and most celebrated in Europe. The mines produced in former times upward of 3,000 tons, but declined to 1,900 tons in 1690, to 1,230 in 1716, and now hardly exceed 400 tons annually. The external opening, made by the falling in of ancient galleries, is about 300 feet deep, and 1,200 feet long by 600 wide. The descent to the bottom of this is by easy stairs, whence steep ladders lead to the pits, the lowest of which are about 1,300 feet from the surface. The excavations extend many miles under ground, forming several magnificent chambers, where banquets were given to Bernadotte and his queen, and Prince Oscar (the present king), on which occasions the mines were brilliantly illuminated. The region about Falun is associated with the wanderings and adventures of Gustavus Vasa, but the statement that he had worked in the mines has been contradicted by the later Swedish historians. According to Geijer, his experience as a laborer was confined principally to the threshing flail and woodman's axe. The mines are owned by a company of 300 shareholders, and the same company has the monopoly of iron and other works in the vicinity. Beside copper, small quantities of gold, silver, and lead are obtained from the ore. Connected with the mines are a school of practical mining, a model room, a large scientific library, and a mineral and geological museum.

FALUNS, in geology, a term used by Lyell to designate a group of miocene strata in the valley of the Loire, which abound in corals, shells, and other marine fossils. The word was provincial with the agriculturists of Touraine, being applied to the materials of these beds, which they used for fertilizing the soil.

FAMAGOSTA, or FAMAGUSTA (anc. *Arsinoë*), a city on the E. coast of the island of Cyprus, 18 m. from Nicosia. Its walls, fortresses, towers, and edifices are now in ruins, and its harbor blocked up with sand; and it contains not more than 200 inhabitants. This city was founded by Arsinoë, sister of Ptolemy Philadelphus, king of Egypt. It was fortified by Guy de Lusignan, who was crowned king of Jerusalem in the 12th century. It was taken by the Genoese in 1372, and by the Venetians in 1489, under whose rule it became one of the principal commercial cities of the Levant, and received new fortifications. It sustained a memorable siege in 1571, by Selim II., by whom it was taken and nearly destroyed, and an earthquake in 1735 completed its ruin.

FAMILIAR SPIRITS. See DEMONS.

FAMILY, a natural division of animals or plants, characterized by their form as determined by structural peculiarities. In order to arrive at the precise signification of the term as at present understood, it will be well to define the higher animal groups. Taking then the animal kingdom, the highest division is that introduced by Cuvier, the 4 great groups or branches of

radiata, *articulata*, *mollusca*, and *vertebrata*, characterized by 4 different plans of structure. Below these are the classes; in the *vertebrata*, for instance, the fishes (divided into 4 by Agassiz), amphibians, reptiles, birds, and mammals; these are characterized by the manner in which the vertebrate plan is carried out, as to the ways in which life is maintained and the different means employed in establishing those ways. The classes are divided into orders; for instance, the mammals are placed by Agassiz under 8 orders, *marsupialia*, *herbivora*, and *carnivora*, characterized by the degree of the complication of their structure within the limits of the class. Orders are divided into families, characterized, as above stated, by their form as far as determined by structure; and below these come genera and species. By form here must not be understood different figures having a common character, as expressed by the radiated form, for example, of the lowest branch of the animal kingdom, the word in this case evidently meaning plan; as far as mere form is concerned, a holothurian resembles a worm more than it does a star-fish, yet the first and third belong to the same class of radiates, while the second belongs to the branch of articulates. As form is not characteristic of branches, neither is it of classes in the animal kingdom; the whale in form resembles a fish more than a mammal, the bat is like a bird, the eel is like an ophidian reptile; yet the whale and the bat belong to the class *mammalia*, and the eel to the class of fishes. To begin at the other end of the scale of divisions, and using form in the sense of definite figure, as commonly applied to man and well known animals, it will be seen that it is not a characteristic of species nor genera; the numerous species of monkeys, cats, seals, bats, porpoises, owls, parrots, humming birds, gulls, ducks, tortoises, snakes, lizards, frogs, sculpins, and sharks, to say nothing of invertebrates, could not be distinguished from each other by their forms alone; in like manner the different genera of natural families do not vary appreciably in their general form, as will be conceded on examining the genera of the *urvida*, the *phocida*, the *falconida*, the *fringillida*, the *chelonida*, the *geckotida*, the *colubrida*, &c. Ascending to orders, what similarity of form is there between the kangaroo and the *ornithorhynchus*, the elephant and the hog, the cat and the seal, the ostrich and the grouse, the tortoise and the sea turtle, belonging respectively to the same orders in their classes? In all systems of zoology we find animals grouped together under divisions terminating in *ida* or *ina*, which are the nearest approaches to natural families. The terminations *ida*, *oida*, and *ina* are used promiscuously by authors as indicating families, and in many cases in defiance of the rules of etymology. For instance, in *urvida*, *equida*, and *bovida* we have a Greek termination to a Latin root; in such cases the termination *ina* should be substituted, making *urcina*, *equina*, *bovina*; on the other hand, *delphinida* and *elephantida*

would be proper, being wholly Greek. Though it would be of advantage in most respects, to correct such errors, it would introduce considerable confusion by having some family names ending in *ina* and others in *ida*, the latter being in some cases unquestionably the best. The former termination also has been employed by Gray and other systematists to express divisions intermediate between families and genera, or sub-families; as *felina*, *canina*, *mustelina*. According to the rule of Prof. Agassiz, however, the latter would represent families equivalent to the *felida* of most naturalists. From the conflicting opinions of naturalists on what shall constitute ordinal and family characters, the confusion is very puzzling to the student; hence the importance of adopting definite characters for the separation of the divisions of animals. Prof. Agassiz, in his "Essay on Classification" (chapter ii.), has endeavored to introduce order into the zoological chaos, and with far greater success than any of his predecessors; the definitions here presented are taken from his work, and, if they could command the general consent of naturalists, would soon lead the way to a natural classification of animals. The first glance at an animal, which gives us an impression of its form, affords a very correct idea of its family relationship, whether a deer, a squirrel, a pigeon, a duck, a crocodile, a frog, or a shark; it is not the mere outline, however, which is characteristic of families, but the form as determined by the peculiarities of internal structure. Among families may be mentioned as examples the *cebida* or American monkeys, *felida* or cats, *ursida* or bears, *phocida* or seals, *balanida* or whales, *leporida* or hares, *bovida* or oxen, *equida* or horses, and *elephantida* or elephants. On this principle, taking cryptogams and dicotyledons as 2 of the 4 branches of the vegetable kingdom, *algæ*, lichens, and ferns would be examples of classes; *diatomaceæ* and *fuci* of orders; and palms, *conifera*, *composita*, &c., of natural families. There must also be admitted some intermediate divisions into a natural zoological classification, based upon cases of special development of certain systems of organs, which will require the establishment of sub-orders, sub-families, sub-genera, and perhaps sub-species or varieties.

FAN, an implement used to produce coolness by agitating the air. Its origin is to be traced to remote antiquity, and is ascribed by some historians to Kan-si, daughter of a Chinese mandarin, and by others to the sibyl of Cumæ, who is said to have used a fan during the delivery of her oracles. But long before the days of the sibyl the artists of Egypt painted the fan, and on the walls of the tombs at Thebes, the king is represented surrounded by his fan-bearers, who bore the instrument as standards in war, while in times of peace they waited upon the monarch in the temple, refreshing him with the fans, and at the same time driving away the insects from the sacred offerings. The fashion spread from Persia to Judæa, and

in Greece we find traces of fans as early as 500 B. C. The wings of a bird joined laterally and fastened to a delicate handle constituted a fan of most beautiful appearance. The fan of the priest of Isis, at the time when the worship of that divinity began to prevail in Greece, was in the form of a semicircle, made of feathers of different lengths, pointed at the top and waved by a female slave. In one of the tragedies of Euripides a eunuch is introduced, who states that, in accordance with Phrygian custom, he had used his fan for the purpose of protecting Helena against the effects of the heat. In Rome fans became popular among the ladies, and were used at dinner parties, where slaves with fans stood behind their guests. The Roman poets, Ovid, Terence, and Propertius, frequently allude to their use, and the pictures upon the ancient vases also indicate the wide prevalence of the fashion. Among the relics of Queen Theodolinda (who was married in 588 to Autharis, king of the Lombards), in the cathedral of Monza, is her fan, or *flabellum*, of painted leather, with a massy metallic handle enamelled. In the middle ages, the fans made of eagle or peacock feathers, in various forms, and fastened with a handle of gold, silver, or ivory, were a lucrative article of trade in the Levantine markets, whence they were exported to Venice and other Italian cities. Catharine de' Medici introduced them into France. The fan which she brought could be folded in the manner of those of the present day. After having been favorably received by the court of Henry II., they became objects of great luxury during the reigns of Louis XIV. and Louis XV. No toilet was considered complete without a fan, the cost of which frequently exceeded \$70. Picturesque landscapes, the most exquisite paper of China, the most elegant taffeta of Florence, precious stones and diamonds, all were in turn put in requisition to enhance the appearance and the value of the fan. One of the ladies of the court of Louis XV. wrote of it in ecstasy to one of her friends: *Il y a tant de façons de se servir de ce précieux colifichet, qu'on distingue par un coup d'éventail la princesse de la comtesse, la marquise de la roturière. Et puis, quelles grâces ne donne pas l'éventail à une dame qui sait s'en servir à propos! Il serpente, il voltige, il se reserre, il se déploie, il se lève, il s'abaisse, selon les circonstances.* ("There are so many ways of using this precious toy, that by a stroke of the fan one may distinguish the princess from the countess, the marchioness from the parvenue. And then, how much grace does a fan lend to a lady who knows how to use it skilfully! It winds like a serpent, flutters like a bird, folds and unfolds, rises and droops, according to circumstances.") Manufacturers of fans soon became numerous in Paris; and even previous to 1673, when a charter was granted to them by Louis XIV., they had organized themselves into a corporation. In England, fans existed in the times of Richard II. and Henry

VIII. In Shakespeare's "Merry Wives of Windsor" an allusion to fans is made by Falstaff to Pistol. A superb fan set with diamonds was presented to Queen Elizabeth on New Year's day. Among the articles received by Cortes from Montezuma were 5 fans of variegated feathers, 4 of them with 10 and one with 18 rods embossed with gold, and one fan, also with variegated featherwork, with 87 rods plated with gold. In Spain, fans were at an early day special favorites with ladies, and the Spanish lady, as well as the ladies of Spanish extraction in the new world, are inimitable in their management (*manejo*) of the fan (*abanico*). They carry on conversations with it, and a book might be written to explain the code of signals by which they express their feelings with the fan. Benjamin Disraeli says, in "Contarini Fleming": "A Spanish lady with her fan might shame the tactics of a troop of horse. Now she unfurls it with the slow pomp and conscious elegance of the bird of Juno; now she flutters it with all the languor of the listless beauty, now with all the liveliness of a vivacious one. Now, in the midst of a very tornado, she closes it with a whirr that makes you start. Pop! in the midst of your confusion, Dolores taps you on the elbow; you turn round to listen and Catalina pokes you in your side. Magical instrument! In this land it speaks a particular language, and gallantry requires no other mode to express its most subtle conceits, or its most unreasonable demands, than this delicate machine. Yet we should remember that here as in the north it is not confined to the delightful sex. The cavalier also has his fan, and that the habit may not be considered an indication of effeminacy, learn that in this scorching clime, the soldier will not mount guard without this solace."—The best and cheapest lacquered fans are produced by the natives of China, chiefly at Canton, Su-Chu, Nanking, and Hang-Chu. Those made of ivory and bone and of feathers are destined chiefly for the European and American markets. The fans which the Chinese use for themselves are of polished or japanned bamboo, covered with paper, and vary in price, according to the quality of the frame and the design of the leaf, from 20 cents to 30 cents per dozen. The state fan which is used on great occasions in China and India at the present day is precisely of the same semicircular form and pointed top which was in fashion among the ancient Greeks. In Japan the fan occupies a most important position. There it is, as it were, the national emblem, and is to be seen on all occasions, among all classes of society, and in the hands of men, women, and children. Where the European takes off his hat in token of politeness, the Japanese performs the same courtesy by waving his fan. In the schools of Japan diligent scholars receive fans in reward for their zeal. A gentleman of Japan, in distributing alms to a beggar, puts the money upon his fan. When a criminal of rank is sentenced to death, his doom is proclaimed to him by presenting

him with a fan, and his head is taken off while he bows and stretches out his hand to receive the fatal gift. Fans were used for allegorical purposes in the mythology of Greece, and the Egyptian custom of employing them in temples and for religious purposes has also been perpetuated in the ritual of the modern Greek church, which places a fan in the hands of its deacons. Fans are to this day used in Rome on various public occasions, especially at the *festa di cattedra*, when the pope is escorted by two men who hold feather fans with ivory handles in their hands, but without using them. The fan of the dey of Algiers had a historical importance. It is related that on April 23, 1828, when the French consul, M. Deval, called at the palace to present his respects on occasion of the great festival which is celebrated on that day in Algeria, his highness put to him some question about a negotiation then pending between the two countries. The evasive answer of the consul exasperated the dey to such an extent that he made a contemptuous movement with his fan, and (according to some accounts) struck him with it in the presence of the other European consuls, and requested him to leave the country. The dey refusing to give satisfaction for this insult, the French government blockaded Algiers, and the protracted hostilities which ensued, and eventually resulted in the conquest of Algeria, may thus be traced to a stroke of a fan.—Next to China, France is most celebrated for the manufacture of fans, but beautiful fans are also made in the United States, in England, at Brussels, Geneva, Vienna, and at various other places. Fan-making in France presents an interesting instance of the subdivision of labor, no fewer than 20 different manufacturing processes being required to produce a fan which sells for less than 8 cents. They are chiefly manufactured in the department of Oise, give employment to over 1,000 persons, and the annual sales of fans in Paris amount to about \$1,000,000. In France, the fan is occasionally used by gentlemen at the theatres, having first appeared on a warm summer evening of 1828, during the representation of *Corisandre* at the comic opera. Hence the name of *Corisandre*, applied in France to fans used by gentlemen. Although fans are employed generally in Spain, Italy, and wherever the season or the fashion commands their use, they are among civilized nations probably at the present day in greatest use in the new world, in Mexico, in Cuba, and all over the West Indies and the United States. The multiplicity of fans gives in warm weather a remarkably picturesque appearance to churches and public assemblies in the United States. During the summer it is common in America to see gentlemen using fans as well as ladies, and in places of public amusement fans are often distributed among visitors.

FANARIOTES, or PHANARIOTES, the Greeks who reside in the Fanar or Phanar district of Constantinople, and whose ancestors settled there after the capture of that city by Moham-

med II. (1458). Originally employed as translators of public documents and as secretaries and stewards of distinguished personages, they gradually acquired by their wealth, as well as by their abilities and intrigues, great political, financial, and social importance in Turkey. In the 17th century, under Mohammed IV., the office of dragoman of the divan was for the first time intrusted to a Greek, and has since been uniformly conferred upon Fanariotes. Nicolaos Mavrocordatos, one of the most eminent among them, was appointed hospodar of Moldavia in 1700, and of Wallachia in 1711, and was succeeded in this office by other Fanariote families (Musuri, Ypselante, Callimachi, Sutzo, Maurogani, Hantzerli, and Karadja), until, more recently, the privilege was confined to only 8 families (Musuri, Callimachi, and Sutzo), and their power in the Danubian principalities was abolished altogether at the Greek revolution of 1821. They were the principal bankers of Constantinople, and as such dispensers of an extensive patronage in the bestowal of public offices. Their influence was great, but their cupidity impaired their reputation. The Greek merchants continue, however, to monopolize the commerce of Constantinople, and many among them are Fanariotes.

FANEUIL, PETER, the founder of Faneuil hall in Boston, an American gentleman of fortune and liberality, born of a French Huguenot family in New Rochelle, N. Y., in 1700, died in Boston, March 8, 1748. The project of erecting a public market house in Boston had already been discussed for some years, when in 1740 Mr. Faneuil offered, at a public meeting, to build a suitable edifice at his own cost as a gift to the town; but so strong was the opposition to market houses that, although a vote of thanks was passed unanimously, the offer was accepted by a majority of only 7. The building was commenced in Dock square in September of the same year, and finished in two years. It comprised a market house on the ground floor, and a town hall with other rooms (an addition to the original plan) over it. In 1761 it was destroyed by fire; in 1768 it was rebuilt by the town; and in 1775, during the British occupation of Boston, it was used for a theatre. In 1805 it was considerably altered and enlarged. During the revolutionary period it was the usual place of meeting of the patriots, and from the stirring debates and important resolutions which were often heard within its walls, it gained the name of the cradle of American liberty.

FANNIN, a N. E. co. of Texas, separated from the Indian territory by Red river, and drained by Sulphur fork of that stream, and by Bois d'Arc creek; area, 900 sq. m.; pop. in. 1858, 1,143, of whom 1,495 were slaves. It consists principally of highly fertile prairie lands, producing grain, cotton, and good pasturage. In 1850 the county yielded 117,462 bushels of Indian corn, 874 bales of cotton, 96,224 lbs. of butter, and large numbers of horses and cattle. There was 1 newspaper office, and the public

schools contained 273 pupils. Value of real estate in 1858, \$992,080. Named in honor of Col. James W. Fannin. Capital, Bouham.

FANNIN, COL. JAMES W., an officer of the Texan revolution, born in N. Carolina, killed at Goliad, March 27, 1836. He held the commission of captain, when, in Oct. 1835, Gen. Stephen F. Austin, who had just been made commander-in-chief of the Texan forces, appointed him and Capt. Bowie to reconnoitre near Bexar, and select a fit site for a camp. The two officers marched at the head of 90 men to the mission of Concepcion, 1½ m. from Bexar, where, early in the morning of Oct. 28, they were surprised and surrounded by a party of 400 Mexicans. A sharp action ensued, in which the Mexicans were finally driven off after losing 60 men and a piece of artillery, while the Texans had but one of their number killed. Soon afterward the chief command was intrusted to Gen. Houston, who at once promoted Fannin to the rank of colonel of artillery, made him an inspector-general, and ordered him to recruit at Velasco, at the mouth of the Brazos. Meanwhile an unauthorized expedition under Dr. James Grant had marched against Matamoras, on the right bank of the Rio Grande, and measures were taken by the general council of the provisional government to reënforce them. To this course both the government and the commander-in-chief were opposed, and a quarrel followed, which resulted in the deposition of the governor and the virtual superseding of Gen. Houston by the delegation of independent authority to Col. Fannin. The council empowered Fannin, under the title of "agent," to collect and organize a force, to appoint subordinates, and to borrow money. Accordingly he issued a proclamation, Jan. 8, 1836, calling upon volunteers to rendezvous at San Patricio (the nearest Texan settlement to Matamoras), where he expected to meet them, after having effected a junction with Grant at Refugio. On reaching Goliad, however, he received a message from Col. Travis, who, being hard pressed at San Antonio de Bexar by Santa Anna, had retired into the Alamo fort near that town, and unless speedily relieved would be forced to capitulate. With 300 men and 4 guns, Fannin set out for the Alamo 8 days after receiving the message, but an accident which happened to his artillery train induced him to return to Goliad, whence he resumed his march to Refugio. Here he heard of the destruction of Grant's party, and the rapid approach of the Mexicans, whereupon, retracing his steps to Goliad, he proceeded to put that town in a state of defence. On March 18, in obedience to orders from Gen. Houston, who was now acting under a commission from the convention of the newly formed republic, he began to fall back toward Victoria, but was intercepted the next day at the Coleta river by a Mexican force under Gen. Urrea. Hastily throwing up a breastwork of wagons, baggage, and earth, the Texans defended themselves with spirit until night interrupted the

fighting, Col. Fannin being among the wounded. The battle was renewed on the 20th, but the Mexicans having received a reinforcement of 500 men, with artillery, a capitulation was signed, by which it was agreed that the Texans should be treated as prisoners of war, and as soon as possible sent to the United States. Having surrendered their arms, they were then marched to Goliad, where on the 26th an order was received from Santa Anna requiring them to be shot. At daybreak on the following morning the prisoners, 357 in number (the 4 physicians and their 4 assistants being spared), were marched out of the fort under various pretexts, and fired upon in divisions. Fannin was the last to suffer. Many attempted to escape, and were cut down by the cavalry, but 27 are believed to have eluded pursuit.

FANNING, DAVID, a loyalist and freebooter of North Carolina during the war of the revolution, born of low parentage in Wake co., N. C., about 1756, died in Digby, Nova Scotia, in 1825. He seems to have been a carpenter, but neglected his trade to lead a vagabond life, trafficking with the Indians, and being connected for some time with the notorious Col. McGirth on the Pedee. When Wilmington was occupied by the British under Major Craig in 1781, Fanning, having been robbed by a party of men who called themselves whigs, attached himself to the tories, collected a small band of desperadoes, and, mounted on a horse whose reputation soon equalled his own, scoured the country at the head of his followers, laying waste the settlements and committing frightful atrocities, but doing such good service to the British that Major Craig rewarded him with the royal uniform, and gave him a commission as lieutenant-colonel in the militia. He now extended his operations. By the rapidity and secrecy of his movements he succeeded in capturing many prominent whigs, whom he either conducted to the British headquarters, or, if they had incurred his personal resentment, hung upon the nearest tree. At one time, having collected 80 or 40 men, he dashed into the village of Pittsborough, where a court was then in session, and carried off the judges, lawyers, officers, and some of the citizens; 8 weeks later he captured Col. Alston and about 80 men in his own house; a few days after he made a descent upon Campbellton, and this exploit was soon followed by a similar one at Hillsborough, when he took prisoner Gov. Burke with his whole suite and a number of the principal inhabitants. His name was a terror to the whole country; he was excepted in every treaty and enactment made in favor of the royalists, and was one of the 3 persons excluded by name from the benefits of the general "act of pardon and oblivion" of offences committed during the revolution. On the other hand, his romantic mode of life and personal daring, displayed many times in battle, drew around him numerous followers, whom he disciplined with great strictness. He is said to have commanded at

one time a force of 200 or 300 men. When the whigs began to gain the ascendancy in North Carolina, he went to Florida, and afterward to St. John's, N. B., where he assumed a respectable deportment, and became member of the assembly. About 1800, however, he was sentenced to be hanged for rape, but escaped from prison, and afterward received a pardon. The close of his life was passed in infamy.

FANNING MACHINE (called in England a winnower, and in the U. S. patent office reports a fanning mill, fanning machine, grain winnower, or winnower, indiscriminately), a contrivance for separating grain from the chaff and dirt with which it comes from the threshing machine. It consists of a frame surmounted by a hopper for the delivery of the grain to a series of vibrating sieves, through which it falls in a shower more or less broken by the number, texture, and vibration of the sieves, as it is being subjected to an outward current of air caused by the revolution of a system of radial fans arranged on a shaft in the rear and lower section of the framework. This machine was first introduced into England from Holland in the early part of the 18th century, and it is not known to have been used in the United States prior to its manufacture by Mr. David Byram of Dutchess co., N. Y., in 1780.

FANO, a seaport and episcopal town of the Papal States, on the Adriatic, near the mouth of the Metauro, 29 m. N. W. of Ancona; pop. 6,860. It is surrounded by old walls, built by the emperor Augustus, in whose honor was erected here a triumphal arch of white marble which is still standing. Few cities of central Italy surpass it in artistic treasures or richness of the surrounding soil and scenery. The cathedral is adorned with 16 frescos by Domenichino, representing events in the life of the Virgin. Many of the 13 other churches, and several public buildings and private mansions, contain paintings by the great Italian masters, marbles, statues, and fine monuments. There are numerous convents, a Jesuits' college, a public school, and a library. The manufactures are chiefly of silk stuffs and twist, and the trade is in corn, oil, &c. The port was once much frequented, but is now choked up with sand, and visited only by small coasting vessels. Fano occupies the site of the ancient Fanum Fortuna, so called from a temple of Fortune built by the Romans, and commemorative of their victory over Hasdrubal on the river Metaurus, in the 2d Punic war. It was the scene of a victory by Narses over the Goths under Totila.

FANSHAWE, SIR RICHARD, an English poet and diplomatist, born at Ware Park, Hertfordshire, in June, 1608, died in Madrid, June 16, 1666. He studied in Jesus college, Cambridge, and in the Inner Temple. Abandoning the law for literature, he went abroad to study manners and languages, and on his return home became secretary to the embassy at Madrid, where he remained till 1638. Upon the outbreak of the civil war, he declared for the crown, and was

made secretary to the prince of Wales. In 1648 he was appointed treasurer to the navy under Prince Rupert, and 2 years later he was made a baronet, and was sent to Madrid to represent to Philip IV. the necessitous condition of his sovereign, and to implore the assistance of Spain. He was taken prisoner at the battle of Worcester, but being released passed several years in retirement, translating the "Lusiad" of Camoëna, and upon the death of Cromwell joined Charles II. at Breda. He was appointed master of requests and Latin secretary to the exiled monarch, and after the restoration was elected one of the representatives of the university of Cambridge in parliament, and was sent upon diplomatic missions to Madrid and Lisbon, in which he negotiated the marriage of Charles with the infanta Catharine of Portugal. Beside his version of the "Lusiad," he wrote a translation of the *Pastor Fido* of Guarini and of the "Odes" of Horace, and a few short original poems. The "Original Letters and Negotiations of Sir Richard Fanshawe, the Earl of Sandwich, the Earl of Sunderland, and Sir William Godolphin" (8vo., London, 1724), is a valuable contribution to history. The "Memoirs of Lady Fanshawe," written by herself, with extracts from the correspondence of her husband, edited by Sir N. H. Nicolas, was published in London in 1880.

FANT, ERIK MIKAEL, a Swedish historian, born at Eskilstuna in Sudermanland, Jan. 9, 1753, died in Upsal, Oct. 23, 1817. He was educated at the university of Upsal, and passed the greater part of his life there as assistant librarian and professor of history. His most important work is the collection entitled *Scriptorum Rerum Suecicarum Medii Aevi*, of which, however, he had only completed one volume at the time of his death.

FANTASIA, in music, a species of composition in which the writer gives free play to his imagination, and which deviates accordingly from the ordinary forms of musical composition. Its chief characteristics seem to be sudden thought and immediate execution.

FANTEE, or FANTI, a country of the Gold Coast, W. Africa, bounded N. by Assin and Dublin, E. by Agoona, S. by the ocean, and W. by Wassaw, lying near lat. 5° 30' N., long. 1° W. It is watered by several rivers, is said to be fertile and populous, and has several important trading stations along its coast. The inhabitants are remarkably cleanly in their persons, are more muscular than the Ashantees, and may be distinguished from other African tribes by small scarifications on the back of the neck and the upper part of the cheek bones. Their heads are high and round, and their color is a dull brownish black. The dress of both sexes consists of a single piece of cloth wrapped loosely around the body. They pay a nominal obedience to chiefs called caboceers, beside whom every village has its local magistrate. They formerly governed or influenced a seaboard district extending about 100 m. along the

coast. About 1807, becoming involved in a war with the king of Ashantee, they obtained the active interference of the English, who had a small fort in one of their towns; but this alliance, while it plunged the British into a disastrous quarrel, proved of no benefit to the Fantees, whose territory after a long struggle was formally added to the Ashantee empire. (See ASHANTEE.)

FARADAY, MICHAEL, an English chemist and natural philosopher, born in London in 1794. The son of a smith, he received but little instruction in his youth, and was apprenticed to a book-binder. His tastes were averse to the trade, but led him to the study of books, the construction of machines, and the performance of chemical experiments. Hearing a course of lectures by Sir Humphry Davy in 1812, he sent to him a copy of the notes he had taken, and requested his assistance to enable him "to escape from trade and to enter into the service of science." Davy received the application favorably, and in March, 1813, appointed Faraday chemical assistant in the laboratory of the royal institution. In the autumn of the same year Faraday, as secretary and scientific assistant, accompanied Davy in travelling, which was continued till April, 1815. He then returned to the royal institution, with which he has ever since been connected, becoming professor of chemistry in 1833. His earlier researches were eminently of a practical character. He investigated the manufacture of steel and the character of its alloys with silver and platinum. In 1827 he published the first edition of the work on "Chemical Manipulation," of which the 2d edition appeared in 1836. It contained full descriptions of the apparatus, and was the only practical guide for the various operations of the laboratory. Experimenting upon gases, as carbonic acid and others, which were regarded as permanent in form, he succeeded by employing intense cold and pressure in liquefying and even solidifying them. In 1830 he published a valuable paper "On the Manufacture of Glass for Optical Purposes," and introduced a new variety, which he formed of silica, boracic acid, and oxide of lead. He was early interested in electrical researches, assisting Davy in 1820 in prosecuting those first entered upon by Oersted on the relations of electricity and magnetism; and in 1821 he performed for the first time the remarkable experiment, developing the close connection of those two forces, of causing a magnet floating on mercury to revolve continuously round a conducting wire, and again a conductor to rotate round a fixed magnet. The magnet, still more wonderfully, was made to revolve with great rapidity when an electrical current was passed over half its length. In 1831 the first of the series of papers afterward collected and published in separate form under the title "Experimental Researches in Electricity," appeared in the "Philosophical Transactions." They were continued in this and in other scientific journals, and were finally col-

lected in 8 vols. 8vo. (London, 1839, 1844, and 1855). They contain the results of series of original and systematically conducted investigations, extended through many years in one of the most obscure fields of physical research; and they abound in brilliant discoveries, the credit of which no one contests with Faraday. The most important of these researches relate to electro-chemical decomposition; the induction of electric currents from other currents and from magnets, leading him to the discovery of magneto-electricity; the influence of the magnet on all bodies, leading to the division of magnetics and diamagnetics, and the optical changes induced by magnetism. His experiments showing that the amount of any compound substance decomposed by an electrical current is proportional to the quantity of electricity employed, and that the elements separated in the same time are in the proportion of their atomic weights, make it highly probable that electricity is the same force as chemical affinity, and that it is generated by chemical action only. The fact which he discovered, that just enough electricity is generated by the oxidation in the battery of one atom of zinc to decompose one atom of water, is additional proof of the same conclusion. He proved, moreover, the identity in the nature of electricity, whether derived from the battery, the frictional machine, thermal or magnetic action, or animal bodies; and explained the wonderful differences in its manifestations resulting from its development in intensity or in quantity. Prof. Faraday holds the highest rank among popular lecturers as well as among original experimenters. He has made it a practice to give lectures one evening in the week not exclusively for the benefit of the classes of the institution; and the interest he has excited in these causes them to be regarded among the attractions of London in the winter season. He makes them interesting by perfect ease and simplicity of manner, while wholly absorbed in his subject, and by his talent of clearly explaining its principles, at the same time that he is skilfully conducting the experiments that illustrate it. Few scientific men have received so many distinctions from learned societies and institutions. They have, however, failed to tempt him from the post into which he was installed by his early patron, or to deprive him of the natural modesty and artlessness of character that secure to him an esteem more desirable than that called forth by the highest talents. The queen of England allotted to him in 1858 a residence at Hampton court, and since 1885 he has received a pension of £300 a year.

FARAFREH, or **FERAFRA**, an oasis in the Libyan desert, Africa, about 100 m. N. N. W. of the oasis of Dakhel. It contains a town with some traces of ancient Greek and Roman structures, and a few small villages. The inhabitants are engaged in the manufacture of cotton yarn, coarse woollen fabrics, and earthenware, and in cultivating various small tracts of arable land.

FAREL, **GUILLAUME**, a French reformer, born

near Gap, in Dauphiné, in 1489, died in Neuchâtel, Sept. 18, 1565. His friend and instructor Lefèvre d'Étaples is thought to have drawn him toward the new doctrines, and he embraced them with the same ardor with which he had clung to the old. He began to preach at Meaux, returned to Paris in 1523, went thence to Basel the next year, became intimate with Zwingli, Haller, Grebel, and other reformers, quarrelled with Erasmus, and was banished from Basel, all within a few weeks, and then retired to Strasbourg, where he was intimate with Bucer. Preaching afterward at Montbéliard and other places, his intemperate zeal drew him into many troubles, and did some damage to his cause. One day he interrupted a Catholic procession in honor of St. Anthony by snatching the statue of the saint from the priest who bore it and throwing it into the river. To escape the consequences of his rashness he fled, and travelled in Alsace and Switzerland. In 1532, with Antoine Saunier, he represented the reformed churches in the synod convened by the Vaudois of Piedmont at Chanforans, and on his return to Switzerland was invited to a conference with the Catholics at Geneva, where the controversy became stormy, blows were interchanged, and the magistrates had to interfere. He was ordered to leave the city, returned in 1533, was again banished, came back in 1534 with letters from the seignory of Bern, and in 1536 persuaded Calvin to aid him in the organization of the reformed church at Geneva. The party of "Libertines" gaining the upper hand in the election of 1538, Farel and Calvin were banished, and visited Bern, Zürich, and Basel. Farel then proceeded to Strasbourg, and organized the Protestants there amid much opposition. In March, 1543, a body of troops under Claude de Guise fell upon a congregation gathered around him at Gorm in France. Farel was wounded, and narrowly escaped with his life. He then settled as pastor at Neuchâtel. In 1557 he was sent to the Protestant princes of Germany to ask their assistance for the Vaudois, and soon after he incurred the displeasure of Calvin and others by marrying at the age of 69 a young girl. In 1561 he preached at Gap with all the violence of his youth, and was thrown into prison, from which his followers released him. He visited Calvin on his death bed. His writings are numerous, but mostly of temporary interest.

FARINA (Lat. *farina*, flour), the fine flour obtained by grinding and sifting any kind of grain. The name is also applied to the starch obtained from roots and grains. Corn starch is often called *farina*; and a number of very simple nutritious preparations have been distinguished by this name coupled with some high-sounding epithet.

FARINELLI, **CARLO BROSCHI**, an Italian singer, born Jan. 24, 1705, died in Bologna, July 15, 1782. The extraordinary beauty of his soprano voice was attributed to the fact of his having been emasculated. He was a favorite pupil of Porpora, and his brilliant success at the

principal theatres of Italy justified the high anticipations of that maestro. In 1784 he repaired to London. Porpora had engaged him for the Lincoln's Inn Fields theatre, where he soon created an excitement, to the great detriment of Handel, who was at that time the lessee of the Haymarket. He performed 3 years in England, and netted every year a clear income of \$25,000. In France his success was equally great, and the brilliant court of Louis XV. seemed for a time to be completely carried away by the bewitching voice of the Italian singer. In Madrid he exercised such a magnetic influence upon Philip V. that he succeeded in dissipating the melancholy with which that king was afflicted. He became the king's chief favorite, and after his death was similarly honored by Ferdinand VI., while at the same time he received an annual salary of \$10,000, under the condition that he should renounce singing in public, and reserve the fulness of his genius for the royal ears. He prevailed upon Ferdinand to organize a theatre in the palace, for which he engaged eminent artists from Italy, and of which he became the director. For nearly 25 years he ruled the court of Spain, not only by the charms of his voice, but gradually by his influence in political affairs. In 1759, on the accession of Charles III, Farinelli fell into disgrace, and 3 years later was ordered to leave the kingdom. He then took up his abode at Bologna, where he used his colossal fortune in building for himself a splendid palace in the vicinity of the town, in which he passed the rest of his life amid the treasures of art and the delights of music.

FARINI, CARLO LUIGI, an Italian political writer, born in the Papal States, Oct. 22, 1822, studied medicine in Bologna, became at an early age interested in liberal political movements, and was frequently banished from the Papal States. In 1848 he was appointed by Rossi director-in-chief of the sanitary and prison department in Rome, but removed to Tuscany on the advent of Mazzini; while after the French intervention his purpose of resuming his office was frustrated by the papal authorities. He then went to Turin, where he was cordially received by the Sardinian government, and took a part in the publication of the *Risorgimento*. In 1850 he officiated for 9 months as Sardinian minister of the interior, and afterward became a member of the board of health. He is now (1859) a member of the Sardinian parliament, and conspicuous for his advocacy of liberal constitutional principles. An English translation of his principal work, *Il stato Romano*, which gives a history of the Roman states from 1815 to 1850, has been prepared under the auspices of Mr. Gladstone, and published in London in 1859. He is preparing a history of Italy to serve as a continuation of that of Botta, and in May, 1859, addressed a series of letters to Lord John Russell on Italian affairs which attracted considerable attention.

FARMER, HUGH, an English theologian, born in Shropshire in 1714, died in London, Feb. 5,

1787. He was educated in the academy at Northampton under Dr. Doddridge, and became pastor of a dissenting congregation at Walthamstow, Essex, where he wrote several theological treatises, which were issued after his removal to London in 1761. In his "Inquiry into the Nature and Design of our Lord's Temptation in the Wilderness," published in that year, he argued that the whole scene was but a vision prefiguring the future trials of Jesus in his ministry. In his "Essay on the Demoniacs of the New Testament" (1775), he maintained that they were not really persons under demoniac possession, but that this cause was assigned for their maladies by the popular superstition. In his "Dissertation on the Miracles" (1771), he affirms them to be absolute proofs of a divine mission.

FARMER, JOHN, an American genealogist, born in Chelmsford, Mass., June 12, 1789, died in Concord, N. H., Aug. 13, 1838. After having been for 10 years the teacher of a school, he applied himself to studying the early settlement of New England, and his "Genealogical Register," published in 1829, is thought to contain the names of nearly all the first European settlers in that region. A new and enlarged edition of this work, by James Savage of Boston, is now (1859) passing through the press. Mr. Farmer superintended an edition of Belknap's "History of New Hampshire," to which he added many valuable notes; and he contributed various papers to historical and antiquarian societies, and to periodicals.

FARMERS-GENERAL, in France, financial and privileged associations which before the revolution of 1789 took upon lease various branches of the public revenue, as the imposts upon salt or tobacco, or the town dues. This system of managing the taxes originated in the 13th century, when Philip the Fair, in consideration of certain sums paid to him, several times permitted Lombard bankers and Jews to collect the taxes. The rigors exercised in collecting these imposts, the exactions, cruelties, imprisonments, and even executions, often caused popular rebellions; yet in the reign of Louis XIII. the farmers-general had become a power in the state, and often transferred their own leases to still more unscrupulous subordinates. An association of 40 (afterward of 60) farmers-general was formed in 1720, to which the government for an annual payment of 55,000,000 livres yielded the privilege of levying the taxes on articles of consumption; and on the renewal of this privilege in 1726, 80,000,000 livres annually were paid. In 1774 the farmers paid 185,000,000 francs for this right, and in 1789, 180,000,000, and yet made immense fortunes. Their severity had so exasperated the public mind that one of the first acts of the constituent assembly in 1790 was to suppress their association. In 1794 all the farmers-general then living were brought before the revolutionary tribunal; they were condemned, and of the entire number, 28, including Lavoisier the chemist, were executed May 8, 1794, and the remaining 3 some days afterward.

FARMINGTON, the shire town of Franklin co., Maine, on Sandy river, 30 m. N. W. from Augusta; pop. in 1850, 2,725. It is abundantly supplied with water power, and contains a number of manufactories. The industry of the inhabitants is also largely directed toward grazing. The principal village, called Centre village, has about 100 dwelling houses, several factories, an academy, a bank, and the county buildings. There are two other villages, called Farmington Falls and Upper village. The town contains 26 public schools and 6 churches, 2 Baptist, 1 Congregational, 1 Methodist, and 2 Union. It was settled in 1776, and incorporated Feb. 1, 1794.

FARMINGTON, a township of Hartford co., Conn., 10 m. W. from Hartford, and 30 m. N. from New Haven; pop. in 1850, 2,630. It lies in the western portion of the alluvial valley extending from New Haven to Northampton and onward. The town contains 8 villages, Farmington village, Plainville, and Unionville. The water power at Unionville is not surpassed by any in the state. Unionville and Plainville are the seats of extensive manufacturing establishments, especially of clocks, paper, &c. The railroad from Hartford to Waterbury and the canal railroad pass through Plainville, and the Collinsville branch through Unionville. Farmington was the first town settled in Connecticut colony, after the 3 original towns of Wethersfield, Hartford, and Windsor.

FARNE, FEARNE, or FERN ISLANDS, several small islands and rocks in the German ocean, from 2 to 5 m. distant from the English coast, and nearly opposite Bamborough in the co. of Northumberland. On the largest of them 2 lighthouses have been erected. In rough weather the passage between the isles is very dangerous, and several disastrous shipwrecks, attended with great loss of life, have occurred here.

FARNHAM, ELIZA W., an American philanthropist and author, born at Rensselaerville, Albany co., N. Y., Nov. 17, 1815. Her maiden name was Burhans. In 1835 she went to Illinois, and in 1836 was married there to Thomas J. Farnham. In 1841 she returned to New York, and employed herself in visiting prisons and in lecturing to women till the spring of 1844, when she accepted an appointment as matron of the female department of the state prison at Sing Sing, that she might prove the possibility of governing such an institution by the power of kindness alone. She filled that position for 4 years, and met with eminent success. While at Sing Sing she published "Life in Prairie Land," and edited an edition of Sampson's "Criminal Jurisprudence." In 1848 she removed to Boston, and was connected for some time with the institution for the blind in that city. In 1849 she went to California, where she remained till 1856, when she returned to New York, and published a volume entitled "California Indoors and Out." For the next 2 years she devoted herself to the study of medicine. In 1859 she organized a society to aid and protect destitute women in emigrating

to the West, and went at different times to the western states with large numbers of these persons. The same year she published a work under the title of "My Early Days." She subsequently returned to California.

FARNHAM, THOMAS J., an American traveller, husband of the preceding, born in Vermont in 1804, died in California in Sept. 1848. He was by profession a lawyer, but in 1839 he organized and headed a small expedition across the continent to Oregon. He went to California the same year, and took an active and efficient part in procuring the release of a large number of Americans and English who had been thrown into prison by the Mexican government. In 1842 he published "Travels in Oregon Territory;" in 1845, "Travels in California and Scenes in the Pacific;" and in the same year, "A Memoir of the North-West Boundary Line."

FARO, a river of Africa, an affluent of the Benoowe, discovered June 18, 1851, by Dr. Barth, at its point of junction, about lat. 9° 25' N., long. 12° 30' E. The natives informed him that it had its source in Mount Labool, 7 days' march to the south. At its junction it was 600 yards broad, but generally not exceeding 2 feet in depth. The current is extremely violent, approaching a rate of 5 miles an hour, a fact indicating that the mountainous region from which it issues is not far distant.

FARO, or PHARO, a game of chance at cards, said to derive its name from the figure of the Egyptian king Pharaoh, which was formerly upon one of the cards. It may be played by any number of persons, who sit at a table generally covered with a green cloth. The keeper of the table is called the banker. The player is called punter (from Ital. *puntare*), who receives a *livret* or small book from which to choose his cards, upon which he may at his option set any number of stakes, which are limited in amount in accordance with the capital of the banker. The banker turns up the cards from a complete pack, one by one, laying them first to his right for the bank and then to his left for the punter or player, till all the cards are dealt out. The banker wins when the card equal in points to that on which the stake is set turns up on his right hand, but loses when it is dealt to the left. The player loses half the stake when his card comes out twice in the same stroke. The last card but one, the chance of which the banker claims, but which is now frequently given up, is called *hocly* (a certainty). The last card neither wins nor loses. Where a punter gains, he may either take his money or *paroli*; that is to say, double his chance by venturing both his stake and gains, which he intimates by bending a corner of his card upward. If he wins again, he may play *sept et le ca*, which means that after having gained a *paroli* he tries to win seven fold, bending his card a second time. Should he again be successful, he can *paroli* for *quinze et le ca*, for *trente et le ca*, and finally for *soixante et le ca*, which is the

highest chance in the game. Faro was formerly in vogue in France, England, and Europe generally, and still retains its popularity in various parts of the world. A variety of this game is also much played by gamblers in the United States. One hundred faro banks are said to exist in the city of New York alone; there are also banks in almost all other American cities. The method of play in the United States is as follows: The dealer, with a large array of cheques at his right hand, representing \$1, \$5, and \$20, and so on upward, takes his seat at the centre of a table with 18 cards, representing a complete pack, affixed to it at convenient distance to mark distinctly the bet placed on each. Persons who wish to play exchange at pleasure money for such amount of cheques as they desire to risk, and place the amount they intend to stake on any particular card upon the table. The dealer then produces a pack of cards and shuffles them (the option of shuffling resting also with any of the players who call for it), has them out, and then places them in a box, from which one by one he deliberately slides them. The banker loses when the card equal in points to that on which the stake is set turns up on his right hand, but wins when it is on the left. But it is in the power of the player, by placing a small copper on the amount he places on the card, to reverse the chance. This, which is called "coppering," enables the player in fact to bet on whichever card he pleases. The dealer stops between each two cards while new bets are being made as cheques change from one card to another, and thus the game proceeds to the close of the pack, when a fresh deal is made, and the same process is gone through. The bank wins on "splits," which is supposed to be the only odds in its favor, but it possesses others in its superior amount of capital, and in the inclination of most players to stake heavier in the effort to recover back than to support good luck. In Germany the cards are not dealt from a box, but nailed to a pine board and torn off one by one by the dealer. Here the dealer is generally assisted also by one or two croupiers, who attend to the playing and receiving, guarding against errors and shuffling the pack.

FARÖE, FÄRÖE, or FÆRÖ ISLES (Dan. *Færøerne*), a group of islands belonging to Denmark, and situated in the Atlantic ocean to the N. of Scotland, about 170 m. N. W. from the Shetland Isles, and 350 m. S. E. from Iceland; lat. 61° to 68° N.; long. 6° to 8° W. They are 22 in number, of which 17 only are inhabited; area, 495 sq. m.; pop. in 1855, 8,651. The principal of them are Stromøe, the largest and centre of the group, 27 m. long and 7 m. broad, having about 2,200 inhabitants; Osterøe, 20 m. long and 10 m. broad, pop. about 1,200; Suderøe, Sandøe, Vaagøe, and Bordøe. The others are very small. The Farøe islands are formed by a group of conical elevations. Their coasts are in general very steep, often rising precipitately to lofty heights, or abruptly broken by deep inlets. The whole archipelago abounds with whirlpools and rapids, making its navigation difficult.

The islands are covered with basaltic mountains, amid which are numerous little lakes and streams. The most elevated peaks are Skellingsfeld, on Stromøe, 2,480 feet high, and Slattare-tind, on Osterøe, whose height is 2,804 feet. The climate, though mild for so northern a latitude, is extremely moist and variable. Snow rarely lasts for more than 8 days, so that the cattle pass the winter as well as summer in the open air. The furious hurricanes which prevail cause an almost total absence of trees, and peat and coal are used for fuel. The principal wealth of the inhabitants consists in cattle and a peculiar breed of sheep. The native horses are of small stature, but robust and active. The islanders support themselves chiefly by fishing and by bird-catching, prosecuted by scaling the precipitous rocks on the shore. The houses are all constructed of wood, roofed with birch bark obtained from Norway, over which is spread a layer of turf. The principal articles of diet are milk, fish, fowl, mutton, and barley. Bread and salt are luxuries. The population, descendants of the old Northmen, are a vigorous and laborious race, of loyal and religious character. The language is a dialect of the Norse, but the official language is the Danish. It is the custom of the men before attempting to climb dangerous cliffs to bare their heads and sing psalms. The longest day of summer here is 24 hours, and the shortest of winter 4 hours. Monks from the Scottish isles first founded in the Farøe group a few hermitages. In the 9th century fugitive Norway pirates established themselves under Grimr Kamban. The islands became Danish when the Danes conquered Norway in 1380. During the 18th century they were notorious as the seat of smugglers. They were occupied by the English from 1807 to 1814. The administration is composed of a Danish *amtmand* or bailiff, who is commander of the armed force, and a *landvoegt*, who is director of the police; and they are represented in the legislature of Denmark by a deputy appointed by the king. Commerce with the Farøe islands is a monopoly of government, and Danish ships are permitted to approach them only between May and September. Capital, Thorshavn, on the W. side of Stromøe; pop. about 750.

FARQUHAR, GEORGE, a British comic dramatist, born in Londonderry, Ireland, in 1678, died in London in April, 1707. After a brief and irregular career at Trinity college, Dublin, he appeared in his 17th year as a comedian upon the Dublin stage. While performing a part in the "Indian Emperor" of Dryden, he accidentally inflicted a serious wound upon his antagonist in fencing, which caused him to renounce the boards for ever. He went to London in 1696, obtained a commission in the army, and began to apply himself to dramatic composition. He lived gayly and licentiously, and during the 10 years before he sank a victim to anxiety and ill health he produced 7 comedies, superior in vivacity and ease of style, and in clear and rapid development of intrigue, to any

that had before appeared in England. The last and best of these was the "Beaux Stratagem," which still keeps the stage. He also left a volume of "Miscellanies," consisting of poems, essays, and letters. His works have much of the smartness and indecacy which was fashionable in his time, but they are written in better language and are less designedly vicious than the plays which preceded the revolution of 1688. He was married to a lady who had deluded him by spreading a report that she possessed a fortune; but he pardoned the deception. He passed a troubled though merry life, and left 2 daughters in indigence, whom in a brief and touching note, written shortly before his death, he recommended to the kindness of his friend the actor Wilks. A complete edition of his works appeared in London in 2 vols. 12mo. in 1772.

FARRAR, JOHN, LL.D., an American mathematician, born in Lincoln, Mass., July 1, 1779, died in Cambridge, May 8, 1853. He was graduated at Harvard college in 1803, and afterward studied divinity at Andover; but having received the appointment of Greek tutor at Harvard in 1805, he laid aside his intention of entering the ministry. In 1807 he was chosen Hollis professor of mathematics and natural philosophy in the same college. The standard of mathematical education was then low in American colleges, and he set himself the task of raising it to the European level. In 1818 he published for the use of his pupils a translation of Lacroix's "Elements of Algebra," speedily followed by selections from Legendre, Biot, Bézout, and others. These works were at once adopted as text books by the college, and by the United States military academy. He also contributed to the scientific periodicals and to the "North American Review." For 13 years, from 1811 to 1824, he was recording secretary of the American academy, its vice-president in 1829-'30, and member of the committee of publication from 1810 to 1825. His principal papers in the "Memoirs" of the academy are: "Observations on the Great Comet of 1811;" "Abstract of Meteorological Observations made at Cambridge from 1790 to 1813;" "Abstract of Meteorological Observations made at Andover;" "Account of the violent and destructive Storm of September 23, 1815;" "Account of a singular Electrical Phenomenon, observed during a Snow Storm accompanied with Thunder." In 1833 Bowdoin college conferred on him the degree of LL.D., and in 1836 he resigned his chair in consequence of a painful illness, which eventually caused his death.

FARREN, ELIZA, countess of Derby, an English actress, born in Liverpool in 1759, died April 23, 1829. Her father, a native of Cork, who was successively a surgeon, an apothecary, and an actor, at his death left his family in great indigence, and Eliza was forced to appear on the stage. She made her début in Liverpool in 1773, and in London in 1777, where she played successively at the Haymarket, Covent Garden

and Drury Lane. Although a very graceful and lively actress, she owed her reputation chiefly to her remarkable beauty, which received the homage of the most illustrious men of the time, such as Fox and the duke of Richmond. She was esteemed as much for her virtues as her beauty, and became, May 1, 1797, the wife of the 12th earl of Derby, then a widower, the grandfather of the present British premier.

FARS, or FARSISTAN (anc. *Persis*), a S. W. province of Persia, bounded N. by Irak-Ajemi and Khorassan, E. by Kerman, S. by Laristan and the Persian gulf, W. by the Persian gulf and Khuzistan, lying between lat. 27° 40' and 31° 52' N., and long. 49° 30' and 55° 20' E.; greatest length about 300 m., breadth 250; area, 55,000 sq. m.; pop. estimated at 1,700,000, including various tribes, Turkomans, Banjans, Persians, and a small number of Jews. It is divided into the Germaseer and Seerhud, or warm and cold regions. The former extends inland from the coast, its surface being a sandy plain, wholly dependent for vegetation on the periodical rains. The latter comprises the more elevated region belonging to the great range of mountains which extend from the Caucasus to the gulf, and forms the watershed between the rivers that flow to the sea and to the salt lake of Bakhtegan. This portion of the province consists of fertile valleys, generally 8 to 10 m. in width by 15 to 100 in length. A few of these valleys, as Shiraz, Kazeroon, and Merdesht, are cultivated, but many are wooded and uninhabited. Eastward the country is more open, sandy, and ill supplied with water. The chief rivers are the Firuzabad, Tabris, Nabon, and Tab (anc. *Arosis*), flowing into the Persian gulf, and the Bundemeer (anc. *Araxes*), falling into Lake Bakhtegan. Another salt lake near Shiraz supplies the province with salt. The general products of the country are tobacco in large quantity, wine, rice, dates, opium, linen, cotton, silk, cochineal, and roses for the manufacture of attar. Iron and lead mines exist, as also quarries of marble and alabaster. Borax and naphtha are among the chemical products. Cattle and sheep husbandry is neglected, but attention is given to the raising of horses, camels, and asses, for use and export. The commerce is chiefly with India. The government of the province is vested in a prince of the sovereign's family, with governors of districts. Several interesting ruins exist. Thirty miles N. of Shiraz are the remains of Persepolis, one of the most celebrated and magnificent cities of antiquity. The district of Fessa is supposed by some antiquaries to represent the ancient Pasargada, and to contain the tomb of Cyrus. In the valley of Kazeroon are the remains of Shahpoor, a city older than the days of Alexander, and refounded by Sapor. The famous sculptured rocks, called by the Persians Nakhsh-i-Rustam, are in the plain of Darabgerd. Lady Sheil, in her "Glimpses of Life and Manners in Persia" (London, 1856), enumerates about 20 different tribes in the province of Fars, the most numerous and troublesome of

whom are the Kashghai or Kashkai and the Mamasenee. The English consul, Mr. Keith Edwin Abbott, who visited Fars subsequently to Lady Sheil (in 1850), derived some new information from the Eel Begghi himself, under the hereditary authority of whose family the tribes of Fars have been for some generations past. He estimates the total number of families of the various tribes at from 20,000 to 22,000, exclusive of the Mamsenni, who number about 2,000 families. Inoculation is said to have been known among the tribes of Fars for centuries. The cow-pox, however, is unknown among them. Among the principal towns are Shiraz, the capital; Jehroom, the principal market for tobacco, and a good market for English cotton goods; Kazeroon, occupying more space but less populous than Jehroom, with excellent opium produced in the vicinity; Darab or Darabgerd, possessing 50 years ago about 100,000 date trees, which, owing to the neglect of cultivation, are now reduced to 30,000; Behbahan or Babahan; and Bushire, the chief port in the Persian gulf, which, during the late war between Great Britain and Persia, surrendered to the English under Gen. Outram in Dec. 1856.

FARTHINGALE (Fr. *vertugadin*, It. *guardinfante*), a petticoat spread to a wide circumference by hoops of willow, whalebone, or iron, introduced into England under this name in the reign of Elizabeth. Gentlemen at that time wore trunk hose or breeches, and ladies wore farthingales, which in the reign of Anne were also termed tub petticoats. They appeared in France early in the reign of Louis XV. under the name of *vertugadins* and *paniers*, or basket petticoats, the law of their structure being that their greatest diameter should equal the height of the lady. Their abandonment was effected near the close of the same reign by Mlle. Clairon, who ventured to appear upon the stage without them, but they again became fashionable under Marie Antoinette. The crinoline petticoats now in fashion throughout Christendom resemble farthingales.

FASCES (Lat.), in Roman antiquity, a bundle of rods in the middle of which was an axe, carried by lictors before the superior magistrates as a symbol of authority.

FAST (Sax. *fastan*, to keep), abstinence from food, especially as a religious observance, applied also to the period of such abstinence. Religious fasting was common among the oldest nations of the Orient, being from the earliest times one of the mortifications of the fakirs of India, and in practice among the ancient Egyptians by those who devoted themselves to the worship of Isis. The Greeks and Romans had periodical fasts, some of which were ordained specially for priests or women. From the time of Moses the Jews made the day of expiation a day of fasting, and their public fasts afterward became numerous. The modern Jews have 6 fast days annually, of which the day of expiation (*Yom kippur*) is the most strictly observed. All other days are commemorative

of national calamities. Fasting was early observed as an act of devotion by Christians, and the Lenten fast is esteemed by the Greek, Roman Catholic, and some Protestant churches, a tradition from the age of the apostles. The Greek church enjoins fasting on Wednesday and Friday of each week and on numerous commemorative occasions, and its 4 great fasts are the 40 days preceding Christmas, the 40 days of Lent, from Monday after Whitsuntide to Peter and Paul's day (June 29), and from Aug. 1 to Aug. 15. The Roman Catholic church makes a distinction between fasting and abstinence, flesh but not fish being prohibited for food on fast days. These are the 40 days of Lent, the 4 Ember days, the Wednesdays and Fridays of the 4 weeks in Advent, and the vigils or eves of the great ecclesiastical festivals. The church of England observes the Lenten and Ember days, and also the 3 Rogation days before Holy Thursday, every Friday except Christmas day, and the vigils of certain festivals. The month of Ramadan is observed as a period of fasting by Mohammedans. In some of the New England States it has been usual for the governor to appoint by proclamation a day in the spring to be observed by fasting, humiliation, and prayer, when religious services have generally been conducted in the churches.

FASTI, in Roman antiquity, registers of the days, months, and other divisions of the year, corresponding with our modern calendars. The term is variously derived from *fas*, divine law, and *fari*, to speak, as it properly designated those days of the year on which legal business could without impiety be transacted, or legal judgment be given by the magistrates. The *fasti calendares* or *sacri*, the chief division of these registers, contained the enumeration of all the days, divided into months and weeks of 8 days, according to the *nundinæ* (the days of each of the latter being designated by the first 8 letters of the alphabet), the calends, nones, and ides. Days on which legal business could be transacted were marked by F, as *fasti*; those from which judicial transactions were excluded by N, as *nefasti*; and days on which the assemblies of the comitia were held by C. Primarily these registers are said to have been intrusted by Numa as sacred books to the care of the *pontifex maximus*, and for nearly 4 centuries the knowledge of the calendar continued to be in exclusive possession of the priests, one of whom regularly announced the new moon, and the period intervening between the calends and the nones. On the nones the *rex sacrorum* proclaimed the various festivals to be observed in the course of the month, and the days on which they would fall. This knowledge, which must have greatly extended the influence of the priests, who seemed to regulate the year and its affairs as if according to revealed divine wisdom, was first made public (304 B. C.) by Cneius Flavius, a scribe to Appius Claudius the Blind, who, having acquired sufficient information from the pontifical books, exhibited a table of the fasti in the forum, for

which he was rewarded by the gratitude of the people with the dignity of curule ædile. From this time forward such tables of stone or marble became common. Beside the above mentioned divisions of time, with their notation, they generally contained the enumeration of festivals and games, which were fixed on certain days, astronomical observations on the rising and setting of the stars and on the seasons, and sometimes brief notices about religious rites, as well as of remarkable events. In later times flattery inserted the exploits and honors of the rulers of Rome and their families. The rural *fasti* (*rustici*, distinguished from the *urbani*) also contained several directions for rustic labors to be performed each month. Ovid's celebrated *Libri Fastorum* may be considered as what we would call a companion to the almanac, being a poetical illustration of the Roman year as remodelled in his time by Julius Cæsar. A different kind of *fasti* were those called *annales* or *historici*, also *magistrales* or *consulares*, a sort of chronicles, containing the names of the chief magistrates for each year, and short accounts of remarkable events noted opposite to the days on which they occurred. Hence the meaning of historical records in general attached to the term *fasti* in poets, while it is used in prose writers of the registers of consuls, dictators, censors, and other magistrates belonging to the public archives. Several specimens of *fasti* of different kinds have been discovered in the last 3 centuries, none of which, however, is older than the age of Augustus. The *fasti Maffeani*, the complete marble original of which was long preserved in the Maffei palace at Rome, but finally disappeared, are now known by a copy of Pighius; the *Verriani*, known as the Prænestine calendar, comprising only 5 months, are historically no less remarkable. The latter appear to have contained ample information about festivals, and details of the honors bestowed upon, and the triumphs achieved by Cæsar, Octavianus, and Tiberius. A most remarkable specimen of the second class was discovered in 1546 in the *forum Romanum*, in large fragments, and is known under the name of *fasti Capitolini*. New fragments of the same tablets were found in 1817 and in 1818. Originally they contained the records of Rome from the expulsion of the kings to the death of Augustus. Several modern writers, as Sigonius, Reland, and Baiter, have published chronological tables of Roman magistrates under the title of *fasti*.

FAT OF ANIMALS. See ADIPOSE, ALIMENT, and CANDLE.

FATA MORGANA, or castles of the airy Morgana, a form of mirage occasionally seen by observers standing on eminences on the Calabrian shore, and looking westward upon the strait of Messina. It occurs in still mornings, when the waters are unruffled by breeze or current, and the sun, rising behind the mountains of Calabria, strikes down upon the smooth surface at an angle of 45°. The heat then acts

rapidly upon the stagnant air, the strata of which but slowly intermingling present a series of mirrors which variously reflect the objects upon the surface. The tides must have operated to raise up the surface into a convex form, as sometimes occurs at this locality. Objects upon the Sicilian shore opposite, beneath the dark background of the mountains of Messina, are seen refracted and reflected upon the water in mid channel, presenting enlarged and duplicated images. Gigantic figures of men and horses move over the picture, as similar images in miniature are seen flitting across the white sheet of the camera obscura. It sometimes happens that the sky above the water is so impregnated with vapor that it surrounds these objects with a colored hue. The wonderful exhibition is but of short duration. Its appearance is hailed with shouts by the populace, who call attention to it by the cry of "Morgana, Morgana!" The phenomenon is not peculiar to this locality, though the configuration of the coast and the meteorological conditions of the region concur to render its exhibition more frequent and also more beautiful here than elsewhere. The description of Minasi, which was published at Rome in 1773, is commonly quoted as the best account of this mirage. (See "Nicholson's Journal," 4to., vol. i., p. 225, &c.)

FATES. See PARCÆ.

FATIMITES, or FATHIMIDES, the descendants of Fatima, the daughter of Mohammed, a powerful Arab dynasty which ruled for 2½ centuries in Egypt and Syria, while the Abbasside caliphs reigned at Bagdad. They claimed as their founder Ismael, the 6th of the 12 imams who were descended from Ali and Fatima, but this claim was disputed, and they were variously said to have first appeared in Persia, in Egypt, and at Fez, and to have been descendants of a Jew, a locksmith, and an eastern sage. They first attained to empire under Abu Mohammed Obeidallah, who in the year of the hegira 296 (A. D. 909) announced himself in Syria as the *mahady*, or director of the faithful, foretold by the Koran, and expected as the Messiah by a clan of heterodox Mussulmans. Denounced by the caliph, he fled to Egypt, and traversed the whole of the north of Africa to Sedjelmessa, where he was imprisoned. He was delivered and recognized as a messenger from heaven by Abu Abdallah, who had just overthrown the African dynasties of the Aglabites and Medrarites. He made himself master of northern Africa from the straits of Gibraltar to the border of Egypt, and his successor conquered the island of Sicily. Moez, the 4th caliph, wrested Egypt from the Abbassides in 970, founded Cairo, fixing his residence in its present suburb of Fostat, and conquered Palestine and a large part of Syria. Aziz, his successor (975-996), consolidated and extended his conquests, embellished Cairo with many monuments, and married a Christian woman, whose brothers he made patriarchs of Alexandria and Jerusalem. His son Hakem (996-1021) was preëminently distinguished for

ambition and cruelty, persecuting alike Christians, Jews, and orthodox Mohammedans, and giving the first impulse to the crusades by his tyrannical course at Jerusalem. Declaring himself a manifestation of God, he became near the close of his reign the founder of a new religion, now represented by the Druses of Syria, who expect his reappearance as their Messiah. From his time the power of the Fatimites declined. On the death of Adhed, the 14th caliph, in 1171, the dynasty was extinguished, and a new one established by the great Saladin, who had accompanied an army sent thither by the sultan Moureddin some years before, to settle a dispute between rival claimants to the viziership.

FATIO DE DUILLERS, NICOLAS, a Swiss geometer and religious enthusiast, born in Basel, Feb. 16, 1664, died in Worcestershire, England, in 1753. He was educated at Geneva, and at the age of 18 wrote a letter to Cassini, in which he proposed a new explanation of the rings of Saturn; in 1685 he gave new developments to the theory of zodiacal light propounded by Cassini; and settling in England, he bitterly attacked Leibnitz, whom he accused of having stolen from Newton the discovery of the differential calculus. In the latter part of his life he became one of the most ardent defenders of the prophets of the Cévennes, and claimed for himself inspiration and the power to raise the dead. Shaftesbury ridiculed him in his letter on enthusiasm; and Fatio, with two associates, was exposed in the pillory in London, in Sept. 1707, "for abetting and favoring Elias Marion in his wicked and counterfeit prophecies." He subsequently went to Asia, intending to convert the world, but returned to England and lived in retirement till his death.

FAUCHER, LÉON, a French political economist, born in Limoges, Sept. 8, 1803, died in Marseilles, Dec. 14, 1854. While a youth he supported his mother and defrayed the expenses of his education by employing his nights in designing embroidered work. Subsequently he proceeded to Paris to gain a livelihood by teaching, and at the same time to pursue the studies of moral and political science. After the revolution of 1830 he was successively editor of the *Temps*, the *Constitutionnel*, and the *Courrier Français*. He was chosen a member of the chamber of deputies for Rheims in 1846, and attaching himself to the opposition party, took a prominent part in debates on all questions touching upon political economy. He was elected by the department of Marne as one of its representatives in the national assembly of 1848 became minister of the interior, Dec. 29, and held the office till May 14, 1849. He was again appointed minister of the interior, April 10, 1851, and was succeeded by M. de Thoiry, Oct. 26, 1851. He was instrumental in preparing the law of May 31, 1850, restricting the limits of suffrage; but he declined to accept office under Louis Napoleon after the *coup d'état*. After withdrawing from politics, he devoted himself to the interests of the *Crédit foncier*, in the

organization of which he took a prominent part. Admitted to the academy of moral and political science in 1849, he gave to that body a fund of 20,000 francs, for the purpose of awarding every 8 years a prize of 3,000 francs to the author of the best memoir on political economy, or the best biography of French or foreign political economists, the subject to be suggested by the academy. On the free trade question he occupied a middle position, advocating a gradual reduction of duties, but deprecating all violent sweeping reform. He proposed the formation of a commercial league between France, Belgium, Spain, and Switzerland, under the name of "southern league," as a counterpoise to the German *Zollverein*, and published his views on the subject in a pamphlet in 1842. Among his remarkable earlier efforts was an essay in the *Revue des deux mondes* on the relations of property in France, and a pamphlet in 1838 on prison reform. His principal work, *Études sur l'Angleterre*, a description of the social, industrial, and political institutions of England, appeared in 1845. His remarks on the production of the precious metals, and the withdrawal of gold from circulation in several countries in Europe, were translated into English in 1852, by Mr. Thomas Hankey, jr., for some time governor of the bank of England.

FAUCIGNY, a N. E. province of the duchy of Savoy, belonging to the administrative division of Annecy; area, about 850 sq. m.; pop. in 1857, 108,986. Capital, Bonneville. Faucigny is one of the most elevated districts in Europe, being partly covered by the Pennine Alps. The valleys of Chamouni and of the Giffre belong to it. The most beautiful Alpine flowers abound on the mountains; the valleys are fertile and well cultivated. The chief occupation of the inhabitants consists in the rearing of cattle.

FAULT, in geology, a displacement of strata, interrupting their continuity. Faults are frequently met with in working coal beds in the English mines, the miner coming unexpectedly in his progress against an abrupt wall of other strata. The angle this makes with the plane of the bed he is working indicates whether he must look up or down for its continuation on the other side of the dislocation, always looking for this on the side of the obtuse angle. Beds are thus heaved from a few feet to several hundred or even thousand feet. Faults of great extent are rarely met with in the United States, though some have been noticed in Pennsylvania and Virginia. (See ANTHRACITE, vol. i. p. 647.)

FAUNA, the assemblage of animals naturally belonging to a continent, region, or district limited by geographical or physical boundaries, whether of land or water; also, in geology, the remains of animals found in any particular formation. Among the animals constituting the fauna of a country we find certain types occurring nowhere else, as the sloths in South America, the ornithorhynchus in Australia, the hippopotamus in Africa, the tiger in Asia, the walrus and polar bear in the arctic re-

gions; others have a more extended range, as the marsupials of Australia, represented in America by the opossum; others occur in almost all parts of the world, as the bats, which show different species in America, Europe, and Asia. The ultimate distribution of the species of a fauna is intimately connected with the temperature, nature of the soil, and character of the vegetation; this is most strikingly proved by the arctic fauna, which includes animals common to America, Europe, and Asia, continents whose species in the temperate and tropical zones are entirely different. The flora of a country, which is the natural combination of plants, like the fauna, has peculiar characters more resembling others as we go toward the pole, and widely different in the regions of the equator. In the geological faunæ we find evidence of the same laws of distribution in localities best suited to special forms of life, in many cases coinciding with the present animals; the edentata of Brazil and the marsupials of Australia of former epochs belong to the same types, though of different genera and species, as the existing animals. The distribution of faunæ is interesting not only in their relation to palæontology and zoology, but to some of the highest and most disputed points of ethnology. Agassiz and others have shown that the natural provinces of animals coincide remarkably with the natural range of distinct types of man. The 4 great primary divisions of animals, viz., vertebrata, articulata, mollusca, radiata, are found together in every part of the present ocean as well as of the ancient waters; on land we find the first 3 divisions only, the last being entirely aquatic. The distribution of the classes is more limited; though the radiata are with one exception (*hydra*) marine, some mollusks are marine, others fluviatile, others terrestrial; the same is true of articulates and vertebrates. Every natural province has its peculiar animals and plants, though the limits of such provinces are as yet not sufficiently well ascertained to be of much advantage in classification. The unequal distribution of these faunæ is well displayed in a sketch by Agassiz in Nott and Gliddon's "Types of Mankind," which may be regarded as an approximation to a natural arrangement of zoological provinces, whether his conclusions in regard to their relation to human types be accepted or not. Prof. Agassiz divides the globe into 8 realms, as follows: 1. Arctic realm, corresponding to the arctic circle, or rather to the isothermal line of 32° F., within which the forests disappear; inhabited by Esquimaux and other hyperborean nations, and by a fauna common to the 3 northern continents; its characteristic animals are the white bear, walrus, reindeer, seals, large cetaceans, palmiped birds, numerous fishes (especially the *salmonidæ*), and a variety of worms, crustacea, mollusks, echinoderms, and medusæ; no reptiles form part of this fauna; the vegetation is of the most meagre description, consisting of mosses, lichens, and a few gramineous and flowering plants and dwarf

birches. 2. The Asiatic, inhabited by Mongolians, comprises the Mantchoorian, Japanese, Chinese, central Mongolian, and Caspian faunæ, whose limits are sufficiently explained by their names; among its animals are the musk deer, the yak, the Bactrian camel, the wild horse and ass, and peculiar species of bear, antelope, and goat. 3. The European realm, inhabited by the most cultivated races, comprises the Scandinavian, Russian, central European, southern European, north African, Egyptian, Syrian, and Iranian faunæ; the unity of this realm is shown by the range of its mammals and birds, and by its physical geography; its animals represent chiefly the same genera as those of Asia, but of different species, embracing the best known and many of the originals of the domesticated species; the nations of men bear a very striking relation to these circumscribed faunæ. 4. The American realm, inhabited by the American Indians, comprises the Canadian, middle states, southern states, Rocky mountains, northwest, Californian, Central American, West Indian, Brazilian, pampas, Cordilleras, Peruvian, and Patagonian faunæ; among the characteristic animals are the sloths and armadillos, opossum, bison, distinct species of monkeys, deer, bears, goats, and sheep, the humming and mocking birds, 3-toed ostrich, the alligator, gar-pike, &c. (Realms 2, 3, and 4, lie within the temperate zone, included between the isothermes of 32° and 74° F.) 5. The African realm, inhabited by negro races, comprises the Saharan, Nubian, Abyssinian, Senegalian, Guinea, tableland, cape of Good Hope, and Madagascar faunæ; among the animals are the chimpanzee, hippopotamus, lion, zebra, gnu, giraffe, African elephant and rhinoceros, 2-toed ostrich. 6. The Malayan realm, including the Dukhun, Indo-Chinese, and the island faunæ, corresponding to the Malay and Telingan races of man; among its animals are the orang-outang, Indian elephant, rhinoceros, and tapir, and the arnee ox. 7. The Australian realm, characterized principally by the marsupials and monotremes, and by the absence of monkeys, ruminants, carnivora, pachyderms, and edentates. 8. The Polynesian realm, inhabited by the South sea islanders, with numerous local faunæ, each group of islands having many animals peculiar to itself.—The human race is distributed all over the earth; the scomberoid fishes have an equally wide distribution in the sea. Fishes, though inhabiting a medium which allows the freest migration, are circumscribed within local limits; those of the two sides of the Atlantic, except a few northern ones, are specifically distinct, and their distribution is principally influenced by the line of temperature established by the average of the greatest cold during the 30 coldest days of the year. That the terrestrial and marine faunæ do not necessarily correspond in the same latitude, and on the same continent, is proved by the facts in regard to the southern portion of the United States. The peninsula of Florida is inhabited by terrestrial and fluviatile animals,

and is covered with land plants, the same as those of the adjoining states of Georgia, Alabama, Mississippi, &c., which are with few exceptions those of a temperate or at most sub-tropical zone; while the marine fishes and invertebrates, and the algæ, are essentially tropical. Some of the most remarkable examples of limited distribution of animals in local faunæ, are the oranges of the Sunda islands, the gorilla of the west coast of Africa near the Gaboon river, the rhinoceros and elephant of southern Africa and Asia, the tapir of South America and of the East Indies, the camel and dromedary, the ostrich of Africa and of South America, the cassowary and apteryx of Australia, the proteus of Carinthia, and the blind fish and crawfish of the Mammoth cave, Kentucky.

FAUNS, in Roman mythology, rural divinities, descended from Faunus, king of Latium, who introduced into that country the worship of the gods and the labors of agriculture. The poets ascribed to them horns, and the figure of a goat below their waist, but made them gay and less hideous than the satyrs. Fauns, like satyrs, were introduced upon the ancient stage in comic scenes. The cabalistic mythology also admits the existence of fauns, whom it regards as imperfect creatures. It supposes that God had created their souls, but, surprised by the Sabbath, had not time to finish their bodies. Hence these unfinished beings seek to shun the Sabbath, on which day they retire to the deepest solitudes of the woods and forests.

FAUQUIER, a N. E. co. of Va., bounded N. W. by the Blue Ridge, and S. W. by Rappahannock river and one of its branches; area, 680 sq. m.; pop. in 1850, 20,868, of whom 10,850 were slaves. It has a diversified surface, a productive soil, and is rich in minerals. There are several gold mines which have been worked with profit, and beds of magnesia and soapstone have also been discovered. The staple productions are grain, wool, and hay. In 1850 the county yielded 562,959 bushels of Indian corn, 886,824 of wheat, 8,523 tons of hay, 210,711 lbs. of butter, and 72,825 of wool. There were 35 churches, and 923 pupils attending public and other schools. Value of real estate in 1856, \$9,755,586. Formed in 1759, and named in honor of Gov. Francis Fauquier of Virginia. Capital, Warrenton.

FAURIEL, CLAUDE, a French historian and writer upon belles lettres, born in St. Etienne, Oct. 21, 1772, died in Paris, July 15, 1844. In 1793 he became an officer in the army of the Pyrénées, but after a year's service renounced the military profession, and devoted himself to study. He was for 2 years secretary to Fouché, the minister of police, but resigned when in 1802 he saw Napoleon about to concentrate the government in his own hands. Meanwhile he had made acquaintance with many literary persons, had attracted the attention of Madame de Staël, had become associated with Condorcet and De Gerando, and was devoting particular attention to the oriental languages. He published

in 1810 a translation of the *Parthenais* of Baggesen, and soon afterward translations of 2 of the tragedies of Manzoni. The latter showed his esteem for Fauriel by dedicating to him his *Carmagnola*. He began a history of stoicism, for which he had collected many materials, but he wearied of the labor of writing, and the work was never finished. In 1824-'5 he published his "Popular Songs of Modern Greece," giving both the original text and a French version. In 1830 he was appointed to the professorship of foreign literature in the faculty of letters at Paris, created expressly for him by Guizot. In 1836 appeared his "History of Southern Gaul under the German Conquerors," in 4 vols. This work gained for him admission into the academy of inscriptions and belles lettres. He was one of the collaborators in the "Literary History of France," for which he furnished a remarkable notice of Brunetto Latini, beside many others. In 1837 he published a "History of the Crusade against the Albigensian Heretics, written in Provençal Verses by a contemporary Poet," to which he added a translation and introduction. After his death one course of his lectures was published under the title of a "History of the Provençal Literature," in which he developed his theory that this literature gave origin to the romances of Charlemagne and of the round table, and to the ideas of honor, love, and gallantry which modified the manners of the middle ages. An English translation of the first 22 chapters, which comprise the complete history of Provençal lyrical poetry, by Prof. G. J. Adler, has been announced for publication (New York, 1859.) Another course of his lectures was published, entitled "Dante and the Origin of the Italian Language and Literature."

FAUST, DR. JOHANN, a prominent character of the national and popular poetry of Germany. According to tradition, he was a celebrated necromancer, born about A. D. 1480 at Knittlingen, or Kundlingen, in Würtemberg, or, as others have it, at Roda in the present grand duchy of Saxe-Weimar, or at Saltwedel in the then principality of Anhalt. He is said to have studied magic at Cracow. Having mastered all the secret sciences, he was seized with gloomy dissatisfaction at the shallowness of human knowledge, and with an intense longing after a more elevated kind of mental and physical enjoyment. He conjured the Evil One, and made an agreement with him, according to which the devil was to serve Faust for full 24 years, obeying all his behests, and at the expiration of the term Faust's soul was to be delivered to eternal damnation. The contract, signed by Faust with his own blood, contained the following 5 conditions: "1, he shall renounce God and all celestial hosts; 2, he shall be an enemy of all mankind; 3, he shall not obey priests; 4, he shall not go to church nor partake of the holy sacraments; 5, he shall hate and shun wedlock." Faust having signed this agreement, Satan sent him a *spiritus familiaris* (Mephistopheles, Mephostophilis, or Mephistophiles), a

devil "who likes to live among men." Faust now began a brilliant worldly career. He revelled in all manner of sensual enjoyment, of which his attentive devil-servant, with an inexhaustible fertility of imagination, was always inventing new and more attractive forms. When remorse tormented Faust and surfeit led him to sober reflection, Mephistopheles diverted him with all kinds of curious devilries. Faust frequently joined in them, and applied his supernatural powers to the most astonishing feats of witchcraft. This period of his career is embellished by popular poetry with numerous comical tricks and miraculous feats. Disgusted at last with his life of dissipation, Faust yearned for the blessings of matrimony. Satan, afraid of losing him, appeared in all the terrors of fire and brimstone, and frightened him out of this purpose. But in order to satisfy his desire, he sent him from the lower regions the beautiful Greek Helena as a concubine. Faust lived with her, and she bore him a son, Justus Faustus. Finally, the term of 24 years drawing to its close, remorse and fear overpower him completely; as a last resort he seeks relief and salvation from priests, but nothing avails him. All flee from the doomed man. Midnight approaches; an unearthly noise is heard from Faust's room, the howling of a storm which shakes the house to its very foundation, demoniacal laughter, cries of pain and anguish, a piercing, heart-rending call for help, followed by the stillness of death. Next morning they find Faust's room empty, but on the floor and walls evidence of a violent struggle, pools of blood and shattered brains; the corpse itself, mangled in a most horrible manner, they find upon a dunghill. The beautiful Helena and her son have disappeared for ever.—That some such person as Faustus has existed is asserted in the most direct manner by writers who profess to have conversed with him. Among these eye-witnesses are Philip Melanchthon, the great reformer, and Conrad Gesner (1561), and even in Luther's "Table-Talk" mention is made of Dr. Faustus as a man irretrievably lost. But it is by no means certain that the real name of this man was Faustus. Joseph Görres maintains that a certain George Sabellicus is the only historical person in whom the original of Faust can be recognized. In his opinion Faustus was a fictitious name which Sabellicus assumed. Others have endeavored to show that George Sabellicus disappeared about the year 1516 or 1517, and that Faust was one of his pupils. Faust's death is presumed to have taken place in 1538. Tradition has connected with his name a great number of biographical traits and magical feats formerly ascribed to other reputed conjurers, such as Albertus Magnus, Simon Magus, and Paracelsus. "Faust," says Görres, "is rather a book than a person. All that is related of his wonderful magical powers has formed part of popular tradition for centuries before his time. Faust was, so to speak, merely the seal stamped upon the collection of all these traditions." This

opinion is essentially adopted by the brothers Grimm. Karl Rosenkranz says: "The popular history of Dr. Faust is merely a combination of a number of fables, all turning upon the same point, viz.: the attempt of man to rise to superhuman mental and physical power by a compact with Satan. Many things ascribed to Faust by popular belief are likewise related of other men whose profound knowledge or skill the mass were unable to comprehend. In this respect the fable of Faust may be compared to those of Fortunatus or the Wandering Jew." In its very earliest and crudest form the fable of Faustus appears as an illustration, however quaint and coarse, of a deep philosophical sentiment. The tragical fate of Faustus is represented to result from an irreconcilable conflict of faith and knowledge. In the second part of his *Faust*, Goethe has attempted a poetical solution of the legend. Through all vicissitudes he leads Faust to a point where at last he experiences the feeling of perfect happiness in devoting his intellectual faculties to the promotion of the welfare of his kind. Then he has attained the end which he has pointed out to Mephistopheles as the object of all his longings, and is removed from this life, not, however, to be lost, but to be saved by love, the "ever-womanly" that "leads us on high." Goethe's famous poem attempts to show that man's longing after knowledge may lead him into many errors and failings, but cannot destroy his better nature.—The first printed biography of Faust appeared in 1587, at Frankfort: *Historien von Dr. Johann Fausten, den weitbeschreyten Zauberer und schwarz Künstler*. In 1588 there appeared a rhymed edition and a translation into low Dutch; in 1589, a translation into French, *Histoire prodigieuse et lamentable de Jean Faust*; about the same time, an English version, "A Ballad of the Life and Death of Doctor Faustus, the great Conjurer;" and shortly after, "The History of the Damnable Life and Deserved Death of Dr. John Faustus." The latter version seems to have been the basis of Christopher Marlowe's drama, "Life and Death of Dr. Faustus," which in its turn was transformed into a German puppet play. It is from this puppet play, which has preserved its popularity in Germany for two centuries, that Goethe drew the first conception of his tragedy, a fact which explains the striking similarity between the opening monologue of Faust in Marlowe's and Goethe's poems. In 1599, G. R. Widmann published (in German) a "True History of the Horrid and Execrable Sins and Vices, also of many Miraculous and passing strange Adventures, of Dr. Johannes Faustus" (8 vols.). A new version appeared in 1674, bearing the title (in German), "The Scandalous Life and Horrible Death of the Notorious Arch-Necromancer Dr. Johann Faust." It was often republished, but replaced at last by an abridged edition of Widmann's version (1728). A great number of books on necromancy also pretend to give, from original manuscripts of Faust,

his cabalistic formulas, charms, talismans, &c. All of these publications, and also all important monographs bearing upon this subject, have been reprinted in the valuable collection of J. Scheible, *Das Kloster weltlich und geistlich* (Stuttgart, 1847). More than 250 different works on the legend of Faust are enumerated in Peter's *Literatur der Faustsage* (2 vols., Halle, 1849, 2d edition 1851).

FAUST, or FUST, JOHANN, an associate of Gutenberg and Schöffer in the first development of the art of printing, born in Mentz, died in Paris about 1466. He probably had no share in the invention of the art, and his connection with it commenced in 1450, when Gutenberg, having expended a fortune in experimenting, induced Faust to enter into partnership with him, and advance funds to establish the business of printing at Mentz, the latter having a lien on the materials as security. The only known productions of the press of Faust and Gutenberg are an indulgence granted by Pope Nicholas V. to Paulinus Chappe, ambassador of the king of Cyprus, of which 13 copies on vellum printed in 1454 remain, and 2 copies of a 2d edition printed in 1455, and an "Appeal to Christendom against the Turks," supposed to belong to the former year. The celebrated folio Latin Bible of the Mazarin library is also attributed to this period. This is a close imitation of the best writing, the rubricated capitals being written in by hand; and it is probably to this edition that is to be referred the well known though apocryphal story of Faust having been arrested at Paris on a charge of magic for selling, at a fraction of their usual price, copies of the Bible so exactly alike that they could not have been produced by human agency alone. A copy of this edition, the only one in America, is in the library of Mr. James Lenox, of New York; it cost about \$3,000. In 1455 Faust put an end to the partnership by suing Gutenberg for his advances, amounting apparently to only 1,600 florins, but swelled by charges of interest and expenses to 2,020. The suit resulted in his favor, and he took possession of the greater part of the stock in satisfaction of the debt. Faust then associated with himself Peter Schöffer, his son-in-law, who had been in their employment, and had perfected the process of making movable metallic types by the invention of the punch. The first complete result of this new invention was the *Rationale Divinorum Officiorum* of Durandus (large folio, 1459). Two editions of a Psalter, beautifully executed, had previously appeared with the imprint of Faust and Schöffer (1457 and 1459), but in these the large capitals were cut on wood. Copies of 9 other works from their press with date and imprint still exist, including a Latin Vulgate Bible (2 vols. large fol., 1462), and the *De Officiis* and *Paradoxa* of Cicero (small fol., 1466; a copy of this, the first printed classic author, is in the Astor library, New York), beside several not so authenticated, which from a close resemblance

are attributed to them. The quarrels between the archbishop Diether von Isenburg and Adolf of Nassau, which resulted in the sacking of Mentz by the latter in 1462, proved disastrous to Faust's establishment; his workmen were scattered, and the printing process, which had been kept as a secret in Mentz, was divulged by them in other countries. A short time afterward, however, Faust was enabled to resume his operations. He made several journeys to Paris, in the last of which he is supposed to have died there of the plague.

FAUSTIN I. See SOULOUQUE.

FAUSTINA, ANNIA GALERIA, daughter of Annianus Verus, prefect of Rome, and wife of the emperor Antoninus Pius, born A. D. 104, died in 141. She ascended the throne with Antoninus in 138, and though the emperor grieved at the profligacy of her life, his affection for her made him place her after death among the number of the goddesses, raise temples and altars to her, and have medals struck in her honor, exceeding in number and variety those in honor of any other Roman empress.—ANNIA, younger daughter of the preceding, wife of her cousin the emperor Marcus Aurelius, born A. D. 125, died in 175. She was the Messalina of her time, surpassing even the dissolute manners of her mother. The emperor was aware of her disorderly life, but loved her, notwithstanding the raileries and murmurs of the people and the advice of his friends. She accompanied him in an expedition to the East, and suddenly died at a village near the foot of Mt. Taurus. Aurelius mourned for her, ranked her among the goddesses, caused medals to be struck in her honor bearing the inscription of *Pudicitia*, and exalted the place where she died into a city with the name of Faustinopolis.

FAVERSHAM, or FEVERSHAM, a market town, borough, and parish of Kent, England, and a member of the cinque port of Dover, on a branch of the Swale, 45 m. E. S. E. of London; pop. in 1851, 4,595. It contains a handsome church, built of flint, with a light and graceful spire, several chapels, schools, and assembly rooms, and a theatre. The town has long been famous for the manufacture of gunpowder, and has also some factories of Roman cement. Its chief trade is in oysters. It is accessible to vessels of 150 tons burden.

FAVIGNANA (anc. *Ægusa* or *Æthusa*, an important Roman naval station), an island of the Ægades group in the Mediterranean, 8 m. from the W. coast of Sicily; pop. 4,000. It is about 5 m. long, and from 2 to 3 m. broad. The surface is low, with the exception of a range of hills running through the centre, on the culminating summit of which is the castle of Santa Catarina. There is a fine bay on the E., on which stand the town and fortress of San Leonardo. San Giacomo, the principal place, is on the N. coast. The island has several quarries, and extensive tunny and anchovy fisheries, in the produce of which, and in sheep, goats, poultry, &c., it has a flourishing export trade.

FAVRAS, THOMAS MARI, marquis of, a French conspirator against the revolution, born in Blois in 1745, hanged in Paris, Feb. 19, 1790. He entered the army in 1755, and after several campaigns was made first lieutenant in the Swiss guards of Monsieur (afterward Louis XVIII.), and in 1787 commanded a legion in Holland during the insurrection against the stadtholder. In 1790 he was apprehended as the ringleader of a plot to introduce an army of 30,000 men, Swiss and Germans, into Paris by night, which was to murder Bailly, Lafayette, and Necker, and to carry off the royal family and the seals of state to Peronne. He was supposed to be a secret agent of the highest personages, and suspicion was directed to Monsieur, who, alarmed by the public agitation, exculpated himself by a speech at the hôtel de ville. Favras was summoned before the Châtelet, and, while the populace showed the greatest fury against him, shouting "Favras to the lamp-post," he was condemned to be hanged; and he met his fate with unshaken fortitude. When told that no revelations would save his own life, he answered: "Then my secret shall die with me." His execution took place at night, by the light of torches, amid the jests of the crowd, and was the first example of the equality of revolutionary justice, capital punishment having formerly been inflicted on nobles by decapitation, and only on plebeians by hanging.

FAVRE, GABRIEL CLAUDE JULES, a French lawyer and politician, born in Lyons, March 21, 1809. From 1830, when he advocated the abolition of royalty, until the present day, he has been a consistent champion of republican principles, in the press, in the forum, and at the bar, where he has frequently been the defender of parties indicted by the government. After the revolution of Feb. 1848, he became secretary-general of the ministry of the interior, but resigned on being elected to the constituent assembly. He officiated for some time as under secretary of the ministry of foreign affairs, and was often heard in debate. He voted for the prosecution of Louis Blanc and Causidière, on account of the insurrection of June, 1848, and for proscriptive measures against political clubs and tumultuous assemblies in the street; but he proposed a preamble to the constitution, making it incumbent upon the state to assist those of the working classes who were unable to find employment, refused to join in the vote of thanks to Cavaignac, and opposed the expedition of Dec. 1848, to Rome. After the election of Louis Napoleon to the presidency (Dec. 20, 1848), he became his strenuous opponent, and after the flight of Ledru-Rollin (June 13, 1849), Favre was the acknowledged leader of the *montagne* party. After the *coup d'état* of Dec. 2, 1851, he was elected member of the general council of the departments of the Loire and Rhone, but refused to take the oath to the new constitution. In 1858 he created a profound sensation by his defence of Orsini, whose advocate he was, and by his boldness in

proclaiming on this occasion his enthusiastic love of free institutions. In the same year he became a member of the legislative body, and gave a new evidence of his moral courage on the outbreak of the war with Austria (April, 1859), by denouncing in that body the inconsistency of the violent overthrow of liberty at home and the attempt to establish it by force of arms abroad.

FAWKES, GUY, a British conspirator, born in Yorkshire, executed in London, Jan. 30, 1606. A soldier of fortune, he was serving in the Spanish army in the Netherlands, when early in 1604 the scheme of blowing up the parliament house with gunpowder, and thus destroying at a blow the king, lords, and commons, was conceived by Robert Catesby, a Roman Catholic of ancient and opulent family. It was intended thus to take vengeance for the severity of the penal laws against Catholics, a relaxation of which had been vainly expected on the accession of James. Fawkes was perhaps the 4th person admitted into the conspiracy, and returned to England in May, 1604, having been selected as a useful coadjutor by Thomas Winter, who had gone on a fruitless mission to solicit the intervention of the Spanish king in behalf of the English Catholics. Thomas Percy, one of the confederates, rented a house adjoining that in which parliament was to assemble, of which Fawkes, who was unknown in London, took possession as his servant, under the assumed name of Johnson. Parliament was soon after adjourned till Feb. 7, 1605, and on Dec. 11 preceding the conspirators secretly met in the hired house of Percy, and began to excavate a mine. Seven men were thus occupied until Christmas eve, never appearing in the upper part of the house, while Fawkes kept constant watch above. Parliament was again prorogued from Feb. 7 to Oct. 8, and the conspirators therefore dispersed for a time, but completed their arrangements between the following February and May. Their labor was lightened by hiring a vault immediately below the house of lords, which had just been vacated by a dealer in coals, into which they conveyed by night 36 barrels of powder, and covered them with faggots. They again dispersed, Fawkes proceeding to Flanders to confer with persons there with a view to securing foreign coöperation in the military and political movements that were to follow the explosion; and as money was needed to prepare for these, 8 wealthy gentlemen, Sir Everard Digby, Ambrose Rookwood, and Francis Tresham, were made privy to the plot. The meeting of parliament was again deferred to Nov. 5, and Fawkes was appointed to fire the mine with a slow match. The conspiracy was detected from the attempt of some one privy to it to save the life of Lord Monteagle, a Roman Catholic peer. Though it had been decided to convey no express information to the Roman Catholics who would be present, but only to prevent on general grounds as many as possible from attending, yet on Oct. 26 Lord

Monteagle received an anonymous letter entreating his absence from the parliament, and intimating a terrible danger. The letter was shown to several lords of the council, and afterward to the king, and resulted in a search through the neighboring houses and cellars on the night of Nov. 4, when Fawkes was seized just after issuing from the cellar, in which the powder was at once discovered beneath the faggots. Matches and torchwood were found in his pockets. Brought before the king and council, he boldly avowed his purpose, but not even the rack could extort from him any disclosure concerning his associates till they had announced themselves by appearing in arms. The failure of the plot was, however, complete, and Fawkes was arraigned, condemned, and executed, as were 7 of his confederates, while others were tried separately. The atrocious character of this conspiracy prejudiced the minds of the nation against the Roman Catholics, and led to the enactment of additional penal statutes against them. The anniversary of the plot, Nov. 5, was long celebrated in England and New England by the boys of the towns carrying about an effigy of Guy Fawkes which was finally burned in some public place. It was customary for the boys on these occasions to sing verses beginning:

Remember, remember, the fifth of November,
The gunpowder treason and plot.

This custom has entirely ceased in New England, though it is still maintained to some extent in the mother country. It was formerly a legal holiday in England, but has recently been abolished as such.

FAXARDO, DIEGO SAAVEDRA, a Spanish author and statesman, born in Algezares, in the province of Murcia, in 1584, died in Madrid in 1648. Having been graduated as a doctor of law at the university of Salamanca, he lived 40 years out of Spain, employed on various diplomatic missions for the government. His last mission was at the congress of Münster from 1643 to 1646 as representative of Philip IV. Finally, on being recalled in the latter year to Spain, he was appointed a member of the supreme council of the Indies. The first edition of his most successful work, *Empresas políticas, ó idea de un príncipe político Cristiano, &c.*, intended to instruct the infante of Spain, to whom it was dedicated, in the duties of government, appeared at Münster in 1646. He wrote the 2 first volumes of the "History of the Goths in Spain," which was continued through the reign of Henry II. by Alonso Nuñez de Castro. Faxardo's complete works were published at Antwerp in 1688, and a new edition at Madrid in 1789-'90.

FÁY, ANDRÁS, a Hungarian author, born at Kohany, in the county of Zemplén, in 1786. He studied law, was active as a member of the national opposition against the rule of Metternich, and wrote a series of works in prose and poetry, which procured him a place among the

classics of his country. His most noted work is his "Fables" (*Mesén*, Vienna, 1820; German translation by Petz, Vienna, 1821), in the style of those of Lessing. A collection of his works in 8 vols. appeared at Pesth in 1843-'4.

FAY, THEODORE SEDGWICK, an American author and diplomatist, born in New York, Feb. 10, 1807. He was admitted to the bar in 1828, but almost immediately afterward resigned his profession for a literary life, and became a contributor to the "New York Mirror," and subsequently one of its editors. In 1832 he published "Dreams and Reveries of a Quiet Man," a collection of articles which had from time to time appeared in the "Mirror." In 1833 he married, and soon after sailed for Europe, where he spent 3 years in travelling. Among the fruits of his observations abroad was the "Minute Book," a journal of travels. During his absence appeared also his first novel, "Norman Leslie" (New York, 1835), which had considerable success. In 1837 Mr. Fay received the appointment of U. S. secretary of legation at the court of Berlin, a position which he retained until 1858, when he was promoted to be resident minister at Bern, in Switzerland, where he still remains. In 1840 he published the "Countess Ida," a novel designed to bring into disrepute the practice of duelling, which was followed in 1843 by "Hoboken, a Romance of New York," written with a similar object. In 1851 appeared his "Ulric, or the Voices," a poem in 19 cantos (to which a 20th was added in the "Knickerbocker Gallery" in 1855), describing the struggles of the human soul with demoniac temptations. Among Mr. Fay's remaining works are "Sydney Olifton" (1839) and "Robert Rueful" (1844), two short tales, a series of papers on Shakespeare, and a variety of fugitive pieces in prose and verse. A "History of Switzerland" by him is announced.

FAYAL, one of the Azores, or Western Islands, in lat. 38° 30' N., long. 28° 40' W.; area about 27,520 acres, nearly one-half of which is under cultivation; pop. about 26,000. The surface is rugged, and in some parts mountainous. The climate is mild and healthful. The soil is in general very fertile. The principal vegetable productions are firs, palms, vines, pineapples, oranges, potatoes, cabbages, maize, and wheat. The chief object of agriculture is the vine, and the island has produced annually about 200 pipes of wine, and in good seasons from 8,000 to 10,000 pipes, the product of all the islands, have been exported from Fayal. The other most important exports are fruit, especially oranges, and corn. The imports are manufactured goods, cotton twist, flax, coffee, sugar, tea, tobacco, and soap. In 1859, the island was visited by a severe famine, occasioned by the failure of three successive crops. Fayal has the best harbor of all the Azorean group, and a considerable transit trade. About 170 American whalers touch here annually and land the oil of such fish as they have caught in their outward voyage, whence it is shipped for its destination. Capital, Horta, or

Villa Orta (sometimes improperly called Fayal), a handsome town on the S. E. side of the island, adjoining the harbor before mentioned; pop. 5,000 or 6,000. The steam packets of the British West India mail company regularly call at Horta.

FAYETTE, the name of counties in several of the United States. I. A S. W. co. of Penn., bordering on Maryland and Virginia, and bounded W. by the Monongahela river; area, about 800 sq. m.; pop. in 1850, 39,112. There are two mountain ridges: one called Laurel hill, stretching along the E. boundary of the county; and the other known as Chestnut ridge, a branch of the Alleghanies, traversing its central part. The rest of the surface is mostly undulating. The soil is fertile in the N. W. part, but elsewhere is better adapted to pasturage than to tillage. Iron and bituminous coal are abundant. In 1850 the productions were 696,092 bushels of Indian corn, 304,102 of wheat, 506,335 of oats, 22,096 tons of hay, and 558,555 lbs. of butter. The county contained about 150 mills and factories of various kinds, 84 churches, 10 newspaper offices, and 8,859 pupils attending schools. It is intersected by the national road, and accessible by steamboats on the Monongahela. Organized in 1783, and named in honor of the marquis de Lafayette. Capital, Uniontown. II. A W. co. of Va., bounded N. by the Great Kanawha and Gauley rivers, and N. E. by Meadow river; area, 770 sq. m.; pop. in 1850, 8,955, of whom 156 were slaves. It has a mountainous surface, with several considerable elevations, the highest of which are Gauley and Sewell mountains. Near the Kanawha or New river, which intersects the county, is a remarkable cliff, 1,000 feet high, called Marshall's pillar. The scenery of the county is exceedingly picturesque; the soil is generally good, and among the highlands particularly there are many open tracts of remarkable fertility. Iron ore is the chief mineral. The staples are grain, hay, cattle, and butter, and in 1850 the productions were 111,064 bushels of Indian corn, 8,414 of wheat, 56,037 of oats, 950 tons of hay, and 56,409 lbs. of butter. There were 6 churches and 96 pupils attending public schools. Value of real estate in 1856, \$801,272. Capital, Fayetteville. III. A W. co. of Ga., traversed by Flint river; area, 486 sq. m.; pop. in 1852, 8,800, of whom 2,268 were slaves. The surface is mostly level, and the soil, formed by the disintegration of primary rocks, is unproductive. Granite and iron are the principal minerals. The productions in 1850 were 318,113 bushels of Indian corn, 84,365 of oats, 54,456 of sweet potatoes, and 4,253 bales of cotton. There were 12 churches, and 300 pupils attending public schools. Capital, Fayetteville. IV. A N. W. co. of Ala., bordering on Mississippi; area, about 900 sq. m.; pop. in 1850, 9,681 of whom 1,221 were slaves. It has a moderately uneven surface, drained by numerous streams, and a productive soil, suitable for corn and cotton. In 1850 it yielded 2,920 bales of cotton. 326,844

bushels of Indian corn, and 65,931 of sweet potatoes. There were 42 churches, and 689 pupils attending public schools. Capital, Fayette Court House. V. A S. E. co. of Texas, intersected by the Colorado river, which is navigable during half the year as far as La Grange, the county seat; area, 1,025 sq. m.; pop. in 1858, 9,457, of whom 2,854 were slaves. The surface is undulating, and the soil, consisting of a black sandy loam, is highly productive. In 1850 it yielded 116,030 bushels of Indian corn, 1,194 bales of cotton, 4,830 lbs. of tobacco, and 36,255 of butter. There were 4 churches, 1 newspaper office, and 270 pupils attending public schools. Coal is the most important mineral production. VI. A S. W. co. of Tenn., bordering on Mississippi, and watered by Loosahatchie and Wolf rivers; area, about 550 sq. m.; pop. in 1850, 26,719, of whom 15,264 were slaves. It has a fertile, well cultivated soil, and in 1850 yielded larger crops of sweet potatoes and cotton than any other county of the state. The productions in that year amounted to 28,302 bales of cotton, 963,945 bushels of Indian corn, 113,595 of oats, 111,697 of sweet potatoes, and 143,792 lbs. of butter. There were 50 churches, and 1,246 pupils attending public and other schools. Capital, Somerville. VII. A central co. of Ky., and the second of the state in population, bounded S. by Kentucky river, and drained by some of its affluents; area, about 300 sq. m.; pop. in 1850, 22,735, of whom 10,889 were slaves. It has a rolling surface, and a fertile and well tilled soil, underlying which is an excellent species of building stone called blue or Trenton limestone. The staple productions are grain, hemp, cattle, horses, and swine. In 1850 the county yielded 1,579,598 bushels of Indian corn, 73,074 of wheat, 169,667 of oats, and 2,967 tons of hemp. There were 27 churches, 3 newspaper offices, and 1,675 pupils attending public and other schools. Capital, Lexington. VIII. A S. W. co. of Ohio, intersected by two lines of railroad; area, 414 sq. m.; pop. in 1850, 12,726. It has a level or undulating surface, and a fertile soil, consisting of deep black loam. Grain, hay, and cattle are the chief staples, and in 1858 the county produced 2,257,752 bushels of Indian corn, and 258,920 of wheat. In 1850 there were 21 churches, 1 newspaper office, and 2,090 pupils attending public schools. Capital, Washington. IX. An E. co. of Ind., one of the first of the state in population and improvements; area, about 200 sq. m.; pop. in 1850, 10,217. The surface is level or undulating, and the soil fertile. The chief staples are grain, cattle, and swine. In 1850 the productions were 945,614 bushels of Indian corn, 93,469 of wheat, 43,538 of oats, and 4,691 tons of hay. There were 27 churches, 2 newspaper offices, and 2,346 pupils attending public schools. Limestone is the principal rock. The Whitewater canal and a railroad connecting the county with Cincinnati, Ohio, intersect it. Organized in 1819. Capital, Connersville. X. A central co. of Ill., intersected

by Kaskaskia river; area, 640 sq. m.; pop. in 1855, 9,592. The surface is level, and occupied by alternate tracts of fertile prairie and good timber land. The productions in 1850 were 398,765 bushels of Indian corn, 18,277 of wheat, 88,427 of oats, and 146,188 lbs. of butter. There were 4 churches, 1 newspaper office, and 900 pupils attending public schools. The central railroad of Illinois passes through the county, and a number of small streams supply it with water power. Capital, Vandalia. XI. A N. E. co. of Iowa; area, 720 sq. m.; pop. in 1856, 8,357. It is drained by the head branches of Turkey river, is well supplied with water power, and has a healthy climate. The surface is undulating, and occupied partly by fertile prairies, and partly by forests. In 1856 the productions were 279,044 bushels of Indian corn, 94,560 of wheat, 64,386 of oats, 43,835 of potatoes, and 72,657 lbs. of butter. Capital, West Union.

FAYETTEVILLE, a post town and capital of Cumberland co., N. C., situated on the W. bank of Cape Fear river, at the head of natural navigation, 60 m. S. from Raleigh, and 100 m. N. W. from Wilmington; pop. in 1850, 4,648; in 1858, about 7,000. It is one of the largest towns in the state, the centre of an active trade, and the seat of manufactures of some importance. The Cape Fear river has been rendered navigable by means of locks and dams as far as the coal mines of Chatham co., and plank roads have been constructed leading to various parts of the interior. The pine forests which cover much of the adjacent country furnish large quantities of lumber, tar, and turpentine for exportation. The town has several turpentine distilleries, cotton factories, and grist mills. It contains a large United States arsenal of construction, covering about 50 acres of ground, and in 1850 had 3 newspaper offices and 3 banks. Fayetteville was settled in 1762, and before receiving its present name in 1784 was known successively as Campbelltown and as Cross Creek. In 1831 it was partly destroyed by a great fire, and nearly \$100,000 was subscribed for its relief by the people of the United States.

FAYOOM, FAYOUM, FAYUM, FAIOM, or FAIOM (Copt. *Phioum*, "the waters"), a valley and province of central Egypt, about 40 m. S. W. of Cairo, on the W. side of the Nile; length from E. to W. 38 m.; breadth 31 m.; pop. about 65,000. It is of oval form, and in all parts much lower than the Nile. It is well irrigated both by natural water courses and by a number of canals, the chief of which is the Bahr-Yussuf, or canal of Joseph. It was anciently the garden of Egypt, and is still prolific of corn, cotton, apricots, figs, grapes, olives, and roses. At the N. end is the Birket-el-Keroun, which was long erroneously thought to be identical with Lake Moëris. The principal town is Medinet-el-Fayoom (*Crocodilopolis*, afterward *Arsinoë*), near which several broken columns of red granite, carved in old Egyptian style, with lotus bud capitals, mark the long disputed site of the famous labyrinth described

by Herodotus. This remarkable monument formerly communicated with the brick pyramid of Howara, which stands a little N. of it, and which, before it was partly destroyed to furnish material for other buildings, was 348 feet square at the base. It is now about 300 feet square and 106 feet high.

FAZY, JEAN JAMES, a Swiss statesman, born in Geneva, May 12, 1796. He completed his education in France, wrote several treatises on political economy, and was extensively connected with journalism in Paris (and afterward in Switzerland) where his radical opinions involved him in difficulties with the French government. After his return to Geneva, he took an active part in the establishment of a new constitution, which was adopted June 7, 1842, and in the attempt of his party (Feb. 13, 1843) to overthrow the government. He afterward became a member of the great council, distinguishing himself as the principal champion of the introduction of trial by jury, which institution was adopted, Jan. 12, 1844. In 1846 the radicals became exasperated at the neutrality observed by the Genevese government in the conflict between the Catholic and Protestant cantons. A revolution broke out (Oct. 5), a provisional government was established (Oct. 9), and Fazy, who placed himself at its head, became the ruling spirit of the new grand council of Geneva. The constitution now in force in Geneva was completed by this council, the demolition of the fortifications of the city of Geneva was proposed, and carried into effect in 1850, a national institution for arts and sciences was founded, and Geneva was embellished under the direction of Fazy, who also gave a powerful impulse to the construction of railways and telegraphs. He insisted upon an unrelenting opposition to the Catholic league, and upon the unflinching application of democratic institutions in all the departments of the government; as a delegate of Geneva in 1847 he exerted himself in behalf of the new federal constitution, which was adopted Sept. 12, 1848. From Feb. to Dec. 1848, he was out of office, owing to disagreement with some of his colleagues; but with this exception he was uninterruptedly at the head of the Genevese government until Nov. 14, 1853, when a coalition of the moderate democrats and the old conservatives displaced him from power. But after having officiated in 1853 as vice-president of the federal council of states, he became its president in 1854, and in 1855 he was reinstated in his former position of president of the government of Geneva, which he continues to hold (1859). In the Neuchâtel question he firmly opposed the pretensions of Prussia, and he opposed in 1849 as well as in 1858 the attempts of the federal government to molest the political refugees in Switzerland.

FEATHER GRASS (*stipa pennata*, Willd.), a grass readily distinguishable by its elegant and feather-like awns. It grows in close, matted tufts, having very long, fine, wiry, dark green

leaves, numerous tall flower stalks with small florets, succeeded by an abundance of sharp-pointed elliptical grains, each of which is surmounted by the feathered awn or bristle of a foot or more in length. This is of a rich bird of paradise color, and gives a remarkable beauty to the plant. Gerardo, a famous herbalist in 1597, informs us that these awned seeds were worn in his time by "sundry ladies instead of feathers." It is this species which is the principal grass in those portions of the steppes of Asia called the *trura* or pasturing grounds, growing in immense quantities, and developing its woody root stocks above the soil, much to the annoyance of the mower. The seeds of this beautiful grass are frequently imported from abroad and sold in our seed shops, but they seldom vegetate.

FEATHER RIVER, a stream rising in the N. E. part of Plumas co., California, which flows S. W. and S. through a rich gold region, and empties into the Sacramento, 30 m. above Sacramento City; length about 180 m. It is navigable as far as Marysville, to which point steamboats ascend from San Francisco. The Middle and South forks, and Yuba river, are its principal tributaries.

FEATHERS, a complicated modification of the tegumentary system, forming the external covering or plumage of birds. Though chemically similar to and homologous with the hair of mammals, their anatomical structure is in some respects different. An ordinary feather is composed of a quill or barrel, a shaft, and a vane or beard consisting of barbs and barbules. The quill, the part attached to the skin, is a hollow cylinder, semi-transparent, composed of coagulated albumen, resembling horn both in appearance and chemical constitution; it is light, but strong, terminated below by an obtuse extremity pierced by an opening, the lower umbilicus, through which the primary nutritive vessels enter; above, it is continuous with the shaft, with which it communicates internally by an opening, the upper umbilicus; the cavity contains a series of conical shrivelled membranes, fitting one upon the other, that have formerly been subservient to the growth of the feather. The horny substance is generally arranged in longitudinal fibres internally, and in circular fibres externally; hence the greater ease of making a good pen after the external layer has been scraped off. The shaft is more or less quadrilateral, gradually diminishing in size to the tip; it is always slightly curved, convex above, and the concave lower surface, divided longitudinally by a groove, presents 2 inclined planes meeting at an obtuse angle; it is covered by a thin horny layer, and contains in its interior a white, soft, elastic substance, called the pith, which supplies strength and nourishment to the feather. The vane consists of 2 webs, one on each side of the shaft, each web being formed of a series of laminæ or barbs, of varying thickness, width, and length, arranged obliquely on the shaft, and composed of the same material;

their flat sides are placed close to each other, enabling them to resist any ordinary force acting in the direction of their plane, as the impulse of the air in the act of flight, though yielding readily to any force applied in the line of the shaft. The barbs taper to a point, but are broad near the shaft, and in the large wing feathers the convexity of one is received into a concavity of another; but the barbs are kept in place chiefly by barbules, minute curved filaments arising from the upper edge of the barb, as the latter does from the shaft; there are 2 sets, one curved upward and the other downward, those of one barb hooking so firmly into those of the next as to form a close and compact surface; in the ostrich the barbules are well developed, but are long, loose, and separate, giving that soft character conveyed by the term plume. The barbules are sometimes provided with a similar apparatus on their sides called barbicels, as in the quills of the golden eagle and albatross; these serve to keep the barbules in position, but are less numerous than the latter. In most feathers there is an appendage near the upper umbilicus of a downy character, called the accessory plume; small in the quills of the wings and tail, in some body feathers of hawks, ducks, and gulls it is of large size, in some species as large as the feather which supports it; in the emu 2 plummy feathers arise from one quill, and sometimes 3 in the cassowary, the additional plumes being these accessory feathers; in the ostrich there is no such additional tuft. There is, therefore, every gradation from a simple barrel and shaft, as in the cassowary's quills, to the feather with barbs, barbules, and barbicels; some feathers are all downy, like the abdominal ones of the eagle-owl; others have very little down, as the harsh plumage of the penguin; in the eider duck, and other arctic species, there is at the base of the common feathers a soft downy covering, securing warmth without weight, like the soft fur at the base of the hair of arctic mammals; young birds are covered with down before the development of feathers, the latter being guided through the skin by the former. In the chick the formation of down begins on the 8th day of incubation, and is continued until the hatching; 10 to 12 radiating filaments are formed at the same time in an epidermic sheath, which soon after birth dries and sets free the plumes, allowing them to spread out as a pencil of down; a stem is developed, and the downy filaments become the primary web of the feather. Feathers in some cases resemble stiff bristly hairs, as about the bill in most birds, and the tuft on the breast of the wild turkey. In the genus *dasylophus*, peculiar to the Philippine islands, we have remarkable instances of the modifications of the epidermic covering of birds. In *D. Osmiaii* (Fras.), the feathers of the crest, breast, and throat are changed at their extremities into ovoid horny lamellæ looking like shining black space of the true horny structure of the kind - is seen in

the Bohemian chatterer or wax-wing (*ampelis garrulus*, Linn.), in which some of the secondary and tertial quill feathers end in small, oblong, flat appendages, in color and consistence resembling red sealing wax, which are also expanded horny prolongations of the shafts of the ordinary feathers. In *D. superciliosus* (Cuv.), the only other species of the genus, the feathers over each eye are changed for three-fourths of their length into red silky hairs or bristles, the base of the feather having the usual appearance; each shaft seems to divide into several of these hair-like filaments, which are finer and more silky than the appendage on the breast of the turkey, and directly continuous with ordinary feather structure, while in the turkey there is a complete transformation of feathers into hairs in the whole extent. In most birds there will be found a number of simple hair-like feathers scattered over the skin after they have been plucked; they arise from short bulbs as slender rounded shafts. Feathers are developed in depressions in the skin lined by an inversion of the epidermis, which surrounds the bulb; they grow by the addition of new cells from the bulb, which become modified into the horny and fibrous stem, and by the elongation and extension of previously formed cells; like the hair, they originate in follicles producing epidermic cells, though when fully formed the cellular structure is widely departed from except in the medullary portion. They are, when first formed, living organized parts, developed from a matrix connected with the vascular layer of the skin, and growing by nutrient vessels; when fully developed, the vessels become atrophied, and the feathers dry and gradually die from the summit to the base, so that at last they become dead foreign bodies, as completely incapable of vital modifications as the perfect horns of the deer. The matrix which produces the feather, according to Owen, has the form of an elongated cylindrical cone, and consists of a capsule, a bulb, and intermediate membranes which give proper form to the secretion of the bulb; as the conical matrix sinks into and becomes more intimately connected with the true skin, its apex protrudes above the surface, and the investing capsule drops off to give passage to the feather which has been growing during this period; the capsule is made up of several layers, the outermost consisting of epidermic cells, and its centre is occupied by a soft fibrous bulb freely supplied with blood vessels from below and a nerve; between the bulb and the capsule are 2 parallel membranes, in whose oblique septa or partitions the barbs and barbules are developed, nearly in the same way that the enamel of the teeth is formed between the membrane of the pulp and that of the capsule, as has been remarked by Cuvier. For the complicated manner in which the stem is formed, the reader is referred to the article "Aves," by Prof. Owen, in the "Cyclopædia of Anatomy and Physiology." Suffice it to say

here, that the part to which the barbs are attached and the pith of the shaft are formed respectively from the outer and inner surfaces of the membranes of the compound capsule; the shaft and barbs at the apex of the cylinder become hardened first, and are softer the nearer the base of the matrix; the first formed parts are pushed forward by the cell growth at the base, the products of the bulb being moulded into shape by the membranes exterior to it; the successive stages of the growth of the medullary matter are indicated by a series of membranous cones or caps, the last formed of which cannot escape from the hardened and closed shaft, and constitute the light dry pith seen in the interior of the quill; these cones are originally connected together by a central tube, and the last remains of the bulb are seen in the ligament which passes from the pith through the lower umbilicus, attaching the quill to the skin. Feathers grow with great rapidity, and in some birds to a length of more than 2 feet; they are almost always renewed annually, and in many species twice a year; this amount of formative power demands a considerable increase of the cutaneous circulation, making the season of moulting always a critical period in the life of a bird. The plumage is generally changed several times before the bird is adult; but some of the falcons are said to assume the mature plumage after the first moult, as the Greenland and Iceland falcons.—Feathers serve to protect birds from injurious external influences, such as extremes of cold and heat, rain, &c., for which their texture and imbricated arrangement admirably adapt them; and they also furnish their principal means of locomotion, in the latter case being stronger, more compact, and longer than those which cover the body. They generally increase in size from the head backward, and have received special names according to the region of the body, which are important aids in describing and recognizing species. Some of these names, constantly used in the ornithological articles of this Cyclopædia, not readily understood from the words themselves, are as follows: the scapulars, above the shoulder blade and humerus, apparently on the back when the wing is closed; axillaries, long and straight feathers at the upper end of the humerus, under the wing; tibials, covering the leg; lesser wing coverts, the small feathers in rows upon the forearm; under coverts, lining the lower side of the wings; the largest quill feathers, arising from the bones of the hand, are the primaries; the secondaries arise from the outer portion of the ulna, and the tertiaries from its inner portion and the humerus; the bastard wing consists of the quills growing from the rudimentary thumb; greater wing coverts, the feathers over the quills; tail coverts, upper and under, those above and below the base of the tail feathers. The relative size of the quills on the hand and forearm, and the consequent form of the wings, are characteristic of the families of birds, and modify essentially

their powers of flight. The breadth of the wing depends principally on the length of the secondary quills, and its length on that of the primaries. Leaving out of view the proportions of the bones and the force of the muscles of the wings, when the primaries are longest at the extremity of the pinion, as in the falcons and swallows, causing an acuminate form of wing, we may know that the powers of flight are great, requiring comparatively little exertion in the bird; but when the longest primaries are in the middle of the series, giving rise to a short, broad wing, as in the partridge and grouse, the bird can fly only a short distance at a time, with great effort, and a whir well known to the sportsman. Not only the shape of the wing, but the close texture of its feathers, must be taken into account in the rapid strong flight of the falcon; the loose soft feathers of the wings in the owls, and the serrated outer edge of the primaries, while they prevent rapid flight, enable them to pounce noiselessly upon their vigilant prey. The structure of feathers affords some of the most striking instances of the adaptation of means to ends, and Paley early drew attention to the proofs they offer of creative wisdom and design.—Most birds, and especially the aquatic families, are provided with an oil gland at the base of the tail, whose unctuous secretion is distributed over the feathers by means of the bill, protecting their surface against moisture; the shedding of the water is not owing entirely to the oily covering, but also to a thin plate of air entangled by the feathers, and probably also to an actual repulsion of the particles of water by the feathers, as is seen in the leaves of many aquatic plants; the arranging of the plumes by the bill of the bird being rather to enable them to take down a large quantity of air, than to apply any repulsive oily covering.—The plumage of birds has an infinite variety of colors, from the sombre tints of the raven to the pure white of the egrets, and the gorgeous hues of the lory, toucan, trogon, and humming birds; the females have generally less lively colors, and the summer livery of both sexes is often different from that of winter. One of the most curious phenomena connected with feathers is the annual moult, and the change of color during that and the breeding season; moulting usually takes place after the young have been hatched, the whole plumage becoming dull and rough, and the bird more or less indisposed, with a temporary loss of voice in the singing species.—According to Mr. Yarrell, the plumage of birds is changed by the mere alteration of the color of the feathers; by the growth of new feathers without the loss of any old ones; by the production of new feathers in the place of old ones thrown off, wholly or in part; and by the wearing off of the light tips as the breeding season approaches, exposing the brighter tints underneath. The first two of these changes occur in adults at the end of spring, the third being partial in spring, and complete in autumn. Though the perfect plumage is non-vascular and epi-

dermic, the colors change, probably by some vital process, without the loss of a feather; when the winter livery succeeding the autumnal moult begins to assume its bright characters, the new color generally commences at the part of the web nearest the body, and gradually extends to the tip. Until within the last few years the changes of color in the fur of mammals (as in the ermine in winter), and in the plumage of birds in the season of reproduction, were supposed to be effected by the simple reproduction of the hairs and feathers; but this cannot be the case, as many facts go to prove that these changes occur at other times than the period of moulting, and without the loss of a hair or feather. It is well known that vivid emotions of fear or grief may turn the human hair gray or white in so short a period that there could be no change in the hair itself to account for it; and a case is on record of a starling which became white after being rescued from a cat. It has been maintained by Schlegel and Martin that many birds always get their wedding plumage without moulting. (For observations regarding this, see a paper by Dr. Weinland, in the "Proceedings of the Boston Society of Natural History," vol. vi. p. 88.) The fact being admitted, how can the change of color be explained in the mature feather, which has no vascular or nervous communication with the skin? The wearing away of the light tips, mentioned by Mr. Yarrell, is not only unphysiological, but in most cases does not happen. Dr. Weinland, from the examination of bleached specimens in museums, and of recent birds, expresses the belief that the brightness and fading of the colors are owing to the increase or diminution of an oily matter in the feathers; the microscopic examination of the web of feathers from the breast of a fresh merganser (*M. serrator*, Linn.) showed numerous *lacunæ* of a reddish oil-like fluid; some weeks after, the same feathers, having become nearly white from exposure to light, disclosed air bubbles instead of the reddish fluid; from this he concludes that the evaporation of the oily fluid, and the filling of the spaces with air, as in the case of the white water lily, produces the changes of color. If this fluid be oily, as there is good reason to believe, mere physical imbibition would be sufficient to introduce it into the dead feathers, as it is well known that fat passes through all tissues very readily, even through compact horn. In the season of reproduction, the nutritive and organic functions are performed with their utmost vigor, and the supply of fatty coloring matter would flow freely to the feathers; under the opposite conditions of debility, cold, or insufficient food, the oily matter would be withdrawn and the feathers would fade.—In regard to the value of feathers to man, it will be sufficient to enumerate the ornamental employment of the plumes of the ostrich, egrets, cranes, and peacock; the economical uses of the down of the eider duck and the plumage of the goose; the importance of the goose quill before the introduction

of steel and gold pens, and the adherence of many at the present day to the more perishable, less convenient, but softer-moving quill; not to more than allude to the consumption of the plumage of the gorgeous tropical birds in the manufacture of feather flowers, and the utility of the downy arctic skins as articles of dress in the regions of perpetual snow.

FEBRUARY (Lat. *Februa*, the festival of expiation and lustration, which was held on the 15th of this month), the second month in our present calendar, containing 28 days ordinarily, and 29 days in leap year. It was not in the Romulan calendar, but was added at the end of the year by Numa, and was first placed after January by the decemvirs in 452 B. C.

FEDERALISTS, a political party in the United States who claimed to be the peculiar friends of the constitution and of the federal government. Their opponents, the republicans, they called anti-federalists, and charged them to a certain extent with hostility to or distrust of the United States constitution and the general government. The republicans, however, strenuously denied the truth of these charges. The federalist party was formed in 1788. Its most distinguished leaders were Washington, Adams, Hamilton, and Jay; and the leading federalist states were Massachusetts and Connecticut, supported generally, though not uniformly, by the rest of New England; while Jefferson, Madison, Monroe, Burr, and Gallatin led the opposition. In the contests of the French revolution the federalists leaned to the side of England, the republicans to that of France. The former were defeated in the presidential election of 1800, when the republican candidates were elected, Jefferson president, and Burr vice-president. Their opposition to the war of 1812, and above all, the calling of the Hartford convention, completed their destruction as a national party. In 1816 Monroe, the republican candidate for president, received the electoral votes of all the states with the exception of Massachusetts, Connecticut, and Delaware, which gave 84 ballots against him, while from the other states he received 188 votes. At the next election in 1820 the federalist party was completely disbanded, Monroe receiving every electoral vote except one.

FEDERATION, or **CONFEDERATION**, a league or union of several sovereign states, generally under the direction of a supreme government. Federal unions were formed very early in history, and were common in antiquity, especially among the Greeks. The most famous of these, the Amphictyonic league, embraced 12 states or tribes, whose deputies met twice a year—at Delphi in the spring, and in the autumn at a temple near Thermopylæ. Similar leagues existed among the Greek colonies in Asia Minor. The Æolian federation possessed Lesbos, Tenedos, and other islands, and on the mainland 12 confederated cities, of which the chief were Cyme and Smyrna. The Ionian federation also comprised 12 cities, the principal of which were

Ephesus, Colophon, Miletus, Priene, Phocæa, Samos, Teos, and Chios, the last 8 being the capitals of islands of the same names. The Dorian league was composed of the 6 cities of Halicarnassus and Cnidus on the mainland of Asia Minor, Cos in the island of Cos, and Halysmus, Camirus, and Lindus in the island of Rhodes. Another famous Greek federation was the Achæan league, formed 281 B. C. by 4 cities, which were gradually joined by others, until in 191 B. C., when Sparta was admitted to the federation, it comprised nearly all the Peloponnesian states, together with several cities of northern Greece. The Phœnician cities, during nearly the whole of their national existence, formed a federation, of which the 8 principal members were Tyre, Sidon, and Aradus. In Italy, the most celebrated federation was that of Etruria, which existed from a very remote period, and embraced 12 cities. It flourished for several centuries, but finally yielded to the power of Rome about 280 B. C.—In modern times the first great federation was the German empire, which was formed in 843, and in 962 took the title of holy Roman empire of Germany. It lasted till 1806, when the last emperor, Francis, renounced the title of emperor of Germany, having 2 years previously taken that of emperor of Austria. Shortly before its dissolution several of the German states formed the confederation of the Rhine, under the protection of Napoleon I. This league fell with the French empire, and was succeeded in 1815 by the present Germanic confederation. By consolidating, or mediatizing, as it was termed, a multitude of smaller states, the number of German sovereignties was reduced from several hundreds to 38, embracing 34 monarchical states and the 4 free cities of Lübeck, Frankfort, Bremen, and Hamburg. The principal monarchical states of the confederation are the empire of Austria, and the kingdoms of Prussia, Bavaria, Hanover, Saxony, and Würtemberg. The federation of the Hanse towns, or the Hanseatic league, was formed in the 13th century by some of the maritime cities of Germany for the purpose of protecting their commerce against pirates and against the nobles and princes. At the height of its prosperity it comprised 85 cities. In the 14th and 15th centuries this federation was of high political importance, but it declined as order and good government advanced in the states of Europe. The last diet of the league was held at Lübeck in 1630, when the federation was dissolved. The Swiss federation, which has lasted for more than 5 centuries, now consists of 22 sovereign cantons, and its affairs are controlled by a diet of deputies chosen by the states. The United States of America afford the most striking example to be found in history of the successful working of a federation on a grand scale. The attempts to imitate them made by the Spanish American republics have proved failures, and have resulted for the most part in the abandonment of the federative system and the establishment of consolidated governments.

FEDOR (or FEODOR) I., IVANOVITCH, czar of Russia from 1584 to 1598, the last of the house of Ruric. His father, Ivan the Terrible, a monster of violence and cruelty, had broken the independent spirit of his nobles and cities by massacres unparalleled in history, and had aggrandized the state in wars with Poland, Sweden, and the Tartars. Fedor was weak, both in mind and body, and his brother-in-law Godunoff, member of the council of state, a man of enormous riches, of rare energy and ability, ambitious, enterprising, and unscrupulous, bore most of the cares of the government. The most remarkable events of this reign are the extension of serfdom; the establishment of an independent Russian patriarchate, consecrated by Jeremy, patriarch of Constantinople; the completion of the conquest of Siberia, which had been given to Ivan by the robber and adventurer Yermak; the surrender of Esthonia to Sweden; an incursion and defeat of the khan of the Crimea; the commencement of diplomatic relations with distant states, particularly with England; an attempt made to gain influence in Caucasia, and another to unite Poland and Russia by the proposed election of Fedor to the throne of Poland, in return for which the conquest and annexation to Poland of Moldavia, Wallachia, and Hungary were promised by Godunoff. In order to secure his own succession to the throne, Godunoff is believed to have hired assassins to murder the czar's young brother Demetrius, who was with his mother at Uglitch. The deed was followed by a series of horrible crimes and of revolts under the lead of false Demetrii, which convulsed Russia long after the death of Fedor.

FEE (Sax. *feh*, or more accurately *feoh*, compensation or payment). As landed estates were given by the northern conquerors of the Roman provinces to their nobles and soldiers as compensation or wages for military service, fee came to mean the estate itself. It was Latinized into *feudum*, or *feodum*, from which the word feudal arose, because it was this tenure of land which characterized what is called the "feudal system." The derivation and original meaning of this word are not certainly known, but what we have given is, we think, supported by the best reasons. In law, estate does not mean the land, but the title which a man has in the land; so the word fee is now used to signify, not the land held in fee, but the kind of estate which a man has in land, or the tenure by which he holds it. The word fee alone means an estate without qualification or limitation; hence the phrase fee simple means the highest estate held of any superior or lord, or by any tenure or service, or strictly speaking, by any tenure whatever; and the word simple means only that nothing is added to limit or condition the word fee. Hence an estate in fee and an estate in fee simple are the same thing. This is an absolute estate of inheritance; or an estate which a man holds, descendible to his heirs for ever. There is no event by which it must be terminated or de-

feated, and no limitation or restriction by force of which it must descend to a certain heir or heirs, in exclusion of the rest. A fee simple may be acquired by descent or by purchase. In law, purchase means every mode of acquiring land except descent; hence if land be given to a man, or devised to him, and he takes by gift or by devise, still he is said in law to take by purchase. The essential words in any instrument by which a man should take land in fee, whether by will or deed, are, to the grantee, or devisee, and "his heirs." For if land be given to a man without the word "heirs," he takes only an estate for his own life, and at his death (if there be no remainder over) it reverts to the grantor or his heirs; and at common law, there are no words which could supply the want of these "words of inheritance," as they are called, where there could be heirs. Thus, if land were conveyed or devised to a man "and his successors," he took only an estate for life; but if these words were used in a deed or devise to a corporation, they were the proper words to create a fee simple, because a corporation should have perpetual succession, but cannot have heirs. If land be granted or devised to A, B, and C, as trustees, then also the word successors would in general carry a fee. The ancient severity of the rule requiring words of inheritance is now relaxed somewhat in England, and more in the United States (in some of the states by statute), especially in respect to wills and trusts. In wills, any words distinctly indicating the purpose of the testator to devise all his estate and interest in a piece of land, are always held now to carry a fee simple; and in trusts, if one has land given to him with power to sell, this is held to be a power to convey in fee simple. In deeds it is always better to add the words of inheritance, but the word "assigns" is not necessary to give the power of transfer, although usually added. There may be a fee simple not only in lands, but in franchises and liberties; and in England, in dignities and the rights and privileges attached to them; and even in personal property, as in an annuity.—Fees may be less than fee simple, and they are so whenever not simple; that is, whenever the fee is in any way restrained or diminished. A qualified fee, technically so called, is one in which, by an original limitation, the land goes to a man and his heirs general, and yet is not confined to the issue of his own body; as if it be given him and to his heirs on the part of his father or a certain ancestor. A determinable fee is a fee which may continue for ever, but which may be determined by the happening of some event which is uncertain. Instances usually given of this are lands conveyed or devised to a man and his heirs until an infant shall attain a certain age, or until such a person shall be married, or shall have children. A conditional fee means either a fee to which at its origin some condition was annexed, which being performed will defeat the estate, or the performance of which is necessary to preserve the estate, or the per-

formance or occurrence of which is necessary to vest the estate. But these three phrases are not definable with exact accuracy, and are sometimes used one for the other. Fee tail is a law term of more precise meaning. It is derived from the Norman French word *tailler*, to cut, because it is a lesser estate of inheritance cut or carved out of the fee simple. The words which create a fee tail are to a man and "the heirs of his body," or to a woman and "the heirs of her body." By virtue of these words, the first taker, whether by devise or grant, takes only an estate for his own life, with a remainder in tail to the heirs of his body, which means his eldest son; and as he takes nothing else, he can give nothing else or more; and at his death his son comes into possession of a similar estate for his own life, with a remainder in tail to his son. Entailed estates were very common in England; but ways were devised long since, even there, for breaking them up. In Ireland and in Scotland they had more force and effect; and were found to be so offensive that by the recent legislation of the British parliament they may now be broken in those countries about as easily as in England. In the United States estates tail have had no practical existence since the revolution. In some of the states they are wholly unknown. In others they become at once, by force of statutory provision, estates in fee simple. In others a tenant in fee tail bars the entail by a simple conveyance in fee simple. In yet others, and they are numerous, they are simply abolished by statute, without any reservation whatever.

FEEJEE, **FILJ**, or **VITI ISLANDS**, a group in the south Pacific ocean, lying between lat. $15^{\circ} 30'$ and $20^{\circ} 30'$ S. and long. 177° E. and 178° W., including among others what were called by their discoverer, Tasman the Dutch navigator, Prince William's islands and Heeniskirk's shoals, and extending over an ocean area of about 40,000 sq. m. Some geographers class Feejee with the Tonga islands, entitling them both the Friendly islands. These two groups, however, differ from each other geologically, and the Feejeeans are dissimilar to the Tongans in physical conformation, language, and mythology. The Feejee islands were discovered in 1643, after which date they remained unvisited until Capt. James Cook lay to off an island in the windward group, to which he gave the name of Turtle island. In 1789 Capt. Bligh, in the launch of the *Bounty*, saw a portion of them, and in 1792, when in command of the *Providence*, passed among them. There are 225 islands, about 80 of which are inhabited. The population has been variously estimated at from 130,000 to 300,000. Two of the islands only are of considerable size, namely, Viti Levu (Great Feejee) and Vanua Levu (Great land). The former measures 90 m. from E. to W. and 50 from N. to S., and is supposed to contain at least 50,000 inhabitants. The latter is more than 100 m. long, with an average breadth of 25 m.; its population is estimated at 31,000. The most important and populous of the small-

er islands are Ovolau, on which most of the white residents live, Kandavu, Taviuni, Vuna or Somosomo, Koro, and Mban. The islands are mostly of volcanic origin, but there is no active volcano on the group. Coral isles are, however, not wanting. Earthquakes are frequent, and hurricanes periodical and destructive. The highest mountains are on Viti Levu, and reach an elevation of 4,000 to 5,000 feet. On Vanua Levu are 5 hot springs, the temperature of which is about 200° to 210° . The natives boil their yams in them in 15 minutes. The islands are very dangerous of access on account of the shoals and reefs by which they are surrounded. Hydrographical charts were made by the U. S. exploring expedition under Capt. Wilkes (1840), and Capt. Denham of the British ship *Herald* has recently been engaged in a more accurate survey than had before been made. From observations taken by Wilkes's expedition it was found that the temperature was very equable. The mean temperature at Ovolau during a period of 6 weeks was 77.81° ; the lowest was 62° , the highest 96° . The greatest extremes of heat and cold are experienced inland. A temperature of 121° was noted by a missionary in Vanua Levu. The mean temperature of the group has been estimated at about 80° . Considering the proximity of these islands to the equator, the climate is not so pernicious to white men as might be expected. It is debilitating, but not deadly. In December, January, and February the heat is oppressive. From April to November the prevalent winds blow from E. N. E. to S. E.; during the rest of the year the winds are variable. The north wind is very disagreeable; it is a hot blast rarefying the air and rendering respiration difficult. February and March are the months most feared by seamen; these are called the "hurricane months." The soil is a deep yellow loam; and the tropical climate and abundance of water cover the mountains up to their very summits with a luxuriant vegetation. Plants grow with marvellous rapidity. Turnips, radishes, and mustard after being sown 24 hours are above the surface, and in 4 weeks are fit for use. Of the bread-fruit tree there are 9 native varieties; of the banana, 6; of the plantain, 8; of the cocoanut, 3. The Tahiti chestnut and papaw apple are found wild, also shaddocks red and white, a bitter orange, many sorts of plums, and the Malay apple. The vegetation of the E. and W. Pacific seems to meet at this central point. The tea plant of China, the cocoanut, caraway, nutmeg, sugar cane, arrow root, capsicum, sarsaparilla, Cape gooseberry, and pineapples flourish. The chief edible roots are the yam and the taro, of which large quantities are raised. Considerable care is bestowed upon the cultivation of the yangona (kava), which yields the native intoxicating drink. The indigenous turmeric is copiously used by the women in coloring their persons. Cotton grows wild; so does the paper mulberry of which the natives make their tapa cloth. Two kinds of tomato and two kinds of nut are found. The *pandanus*,

whose root is sometimes entirely disconnected with the ground and leans upon a cluster of supplementary props, is the vegetable curiosity of Feejee. Many of the islands are well adapted for coffee. The botanists of the U. S. exploring expedition, on a very imperfect examination, arising from the impossibility of penetrating into the interior, gathered 650 species of plants. The coast fisheries are inexhaustible; turtle catching is the business of several tribes; 50 or 100 turtle caught in a season by one party is deemed successful work. The mountaineers, who live far from the sea-coast, and consequently cannot get fish, substitute snakes as an edible. There are few fowls and hogs. The native agricultural implements are a tool, lancet-shaped and about a yard long, made of hard wood, and used in clearing off the brushwood and coarse grass; a digging stick made of a young mangrove; a hoe for weeding, with a blade of tortoise shell or the valve of a large oyster; a large dibble, 8 feet long and 18 inches in circumference at 2 feet from the point; and a pruning knife made of a plate of tortoise shell lashed to the end of a rod. The Feejeeans were preëminent among Polynesians for their manufactures, as remarked by Capt. Cook. The greater portion of the processes are performed by women. The *masi* or cloth is made of the bark of the malo tree, which is steeped in water. The bark is then beaten on a flat log with a grooved mallet. Two lengths of the wet substance are generally beaten together, and are kept together by their gluten. Separate pieces are stuck together by the starch of the taro, and are then dyed. The women elaborate the borders. Floor, sail, and sleeping mats are made from the leaf of the dwarf pandanus, and a sort of rush. A missionary says: "The wicker-work baskets of Feejee are strong, handsome, and useful beyond any I have seen at home or abroad." Nets are made of the vine of a creeper or of sinnet. The fishing nets are weighted by shells. Sinnet is composed of the fibre of the cocoanut husk, and furnishes the native with his material for fastening and wrapping. The Feejees understand pottery, for which they employ red and blue clays tempered with sand. Lines and figures are traced on the vessels while moist, the work being done exclusively by women. Canoes were formerly built only by a certain caste, but of late this trade has been thrown open; they seldom exceed 100 feet in length. Before the introduction of the American hatchet and the blades and chisels of Sheffield, the only axe of the native mechanic was a hard stone ground to an edge; the spines of echini were his boring apparatus; with rats' teeth set in hard wood he carved and engraved; he still uses the mushroom coral for a file, and the pumice stone for general finishing purposes. The form of the houses in Feejee varies according to locality. In one island a village looks like a clump of square wicker baskets; in another, like rustic arbors; in a third, like oblong hay ricks; and in a fourth

the dwellings are conical. Some tribes dispense with centre and side posts, others employ them. The walls are from 4 to 10 feet high. The thatch, which is of wild sugar cane, is often continued to the ground so as to hide the side walls. The doorways are generally so low as to compel the visitor to stoop. The average size is about 12 feet square; the roof about 30 feet high. No one can erect a house without first obtaining, by purchase or otherwise, the permission of the chief of the district. The chief orders the work to be done by the carpenters of the tribe. These dwelling houses are generally regarded as tenable for 20 years. The inland tribes of Great Feejee export to the coast *yangona*, a liquor which they prepare by chewing a root and spitting the result into pitchers, and receive mats, cloth, and fine salt in exchange. The trade of Feejee with their neighbors, the Tongans or Friendly islanders, dates far back before the arrival of Tasman, and probably originated in the canoes of the Tongans being driven among the windward isles of Feejee by strong easterly winds. The scarlet feathers of a parrot caught in Somosomo were the leading article of export. The Tongans paid the Somosomans with articles of European manufacture and the loan of their women. In this way iron ware was first introduced into Feejee. The Tongans still procure from Feejee their canoes, spars, sails, pottery, and mosquito curtains, as well as sinnet and various sorts of food, and pay with whales' teeth, necklaces, inlaid clubs, cowries, Tonga cloth, axes, muskets, and their services in war. One consequence of this ancient connection with Tonga is that in several parts of Feejee there are tribes descended from Tongan forefathers, and called Tonga-Feejee. The Feejeeans never returned the visits of the Tongans, and up to this day there is but one instance recorded of a Feejee chief attempting to cross the ocean in his canoe to Tonga. The first commercial intercourse between Europeans and the natives began about 1806. Vessels of the E. I. company visited the N. E. part of Vanua Levu to procure sandal wood and tripang. They paid in iron hoop, spikes, beads, red paint, and similar trifles. The sandal-wood failed before long, and as the natives had not sufficient forethought to plant more, little now remains. Tripang and tortoise shell next became the chief articles of foreign commerce. This traffic has long been conducted chiefly by Americans from Salem, Mass. Tripang is picked up from the reefs to the annual value of \$30,000, and recently small lots of arrowroot, cocoanut oil, and sawn timber have been purchased from the islanders. Almost contemporaneously with the earliest visits of the East India trading ships, namely, in 1804, a number of convicts escaped from New South Wales and settled chiefly in the neighborhood of Mbeu or Rewa, the chiefs receiving them on condition of their support in time of war. These men, 27 in number at the time of their first arrival, were the means of acquiring for Mbeu and Rewa

political importance in Feejee which they enjoy. In a few years the greater part of a number had fallen victims to native revenge or feuds among themselves. Their leader, a man named Savage, was drowned and eaten in 1824. In 1824 only two, and in 1840, when Capt. Paddy Connor visited Rewa, only one survived, an Irishman, known as Paddy Connor; at the close of his life his children numbered 50.—The natives are above the middle height, sleek and plump, with stout limbs and short necks. Their complexion is darker than the copper-colored, lighter than the black races. Their hair is black, long, frizzled, and bushy, sometimes encircling on the forehead and joined by whiskers to a thick round or pointed beard, to which feathers are often added. They are almost free from tattooing; only the women are tattooed, and that on the parts of the body which are covered. The men dress in a sort of sash, white, brown, or figured masi, using generally about 6 yards. The women wear a *liku* or girdle band, made of the bark of a tree, the ends of a wild root, and some kinds of grass. The fringe is from 8 to 10 inches deep. The *tanu*, worn only by the men of the respectable classes, is a fine masi of one thickness only, and has a gauze-like appearance. This is the native costume, but when they become Christians both sexes adopt a fuller dress. They pierce the lobe of the ear and distend the hole. Both sexes paint their bodies, and seem to prefer red; they also besmear themselves with oil. In the toilet the hair is the most important part, and is dressed in the most grotesque forms, sometimes attaining the diameter of 5 feet. The native's barber is held in high respect, and his hands are not allowed to touch food. The hair is colored sometimes with two or more dyes. They are fond of music, and have invented the flute, the conch shell, the pandean pipes, a re-harp made of a strip of bamboo, and several sorts of drums. The singing is invariably a major key. They love to dance. The musicians perform on one note, the bass alternating in the air; they then sound one of the common chords in the bass cleff without the alteration. The Protestant missionaries forbid the sternal dances as immodest. The natives are fond of poetry. Their verses rhyme, but seldom serve a uniform measure. In chanting, the verse is repeated at the end of each line. Few go to excess. Girls are betrothed at a very young age, and often to old men. Brothers and sisters, first cousins, fathers and sons-in-law, mothers and daughters-in-law are forbidden to speak to each other or to eat from the same bowl. The latter prohibition extends to husbands and wives. The common people usually eat 3 meals a day, the chief 8 or more. As they abhor drinking after each other from the same cup, they hold the vessel about 10 inches from the mouth, and pour the stream down the throat. They eat with their fingers. Rheumatism is common among them; they relieve the pain by making deep incisions over the part

affected.—The islanders are divided into a number of tribes, each governed by its native chief. Of these 8 are paramount, and the rest in a state of vassalage more or less complete. The rule of the chief is absolute and patriarchal. A well defined system of customary law, however, regulates the subordination of one district to another. The king is assisted by a council composed of the elders and men of highest rank. The law of descent is curious. The successor of the king is his next brother, failing whom, his own eldest son or the eldest son of his eldest brother fills his place. But the rank of the mother often causes an infraction of this rule. The person of a pagan high chief is *taboo* or sacred. In some cases they claim a divine origin. Everything becomes consecrated which the supreme chief or king touches. He works at agricultural labor when otherwise unoccupied, and plait sinnet. He has always several attendants about his person, who feed him and perform the most servile offices. He has no throne, but squats on the ground like his subjects. A peculiar language is used when speaking of the chief. All his actions and the members of his body are hyperbolized. Respect is indicated by the utterance of a peculiar shout or chant called *tama*. This is uttered by inferiors on approaching a chief or chief town. It is necessary to crouch when a chief passes by. Standing in the presence of the chief is not allowed, and all who move about the house in which he is sleeping, or, if on their feet, advance bent, as in act of obeisance. No one may cross a chief behind his back. The inferior must pass in front of the superior. On the same principle, when at sea they may not pass the canoe of a chief on the outrigger side. If a chief stumbles or falls, his subjects must do the same. The best produce of the gardens, the best animals, and the best fish are presented to the chiefs. Pay-day is regarded as a high festival. Whales' teeth, women, and canoes are prominent articles of tribute. According to the native ideas of justice, the criminality of an act is in proportion to the rank of the offender. Murder by a chief is less heinous than petty larceny committed by a man of low rank. The most serious offences are theft, adultery, abduction, witchcraft, infringement of a taboo, disrespect to a chief, incendiarism, and treason. Theft is punished by a fine, repayment in kind, loss of a finger, or clubbing. The contumacious are punished by a fine, or loss of a finger, ear, or nose. The other crimes are punished by death, the instrument being the club, noose, or musket. Adultery is the crime most severely visited. The adulterer may be put to death, or he may be compelled to give up his own wife to the aggrieved party, or his property may be destroyed or taken away from him. The principle of vicarious atonement is acknowledged. A man sentenced to death will often surrender his father to suffer in his stead. There is also a species of pecuniary atonement or *soro*, of which there are 5 varieties. The *soro* with a whale's tooth, a mat, club, musket,

or other valuable, is the most common. Society is divided into 6 recognized classes: 1, kings and queens; 2, chiefs of large districts or islands; 3, chiefs of towns, priests, and ambassadors; 4, distinguished warriors of low birth, chiefs of the carpenters, and chiefs of the turtle catchers; 5, common people; 6, slaves by war. Rank is hereditary through the female line. The dignity of a pagan chief is estimated by the number of his wives. The rights of the *vasu*, or sister's son, constitute one of the peculiar institutions of Feejee. A *vasu* of rank can claim any thing in his mother's land, excepting the wives, home, and land of a chief. In the moral and intellectual state of the Feejeeans there is a wide distinction between the pagan and Christian natives. As the majority are yet pagans, their customs, laws, and religion may still be regarded as the national standards of Feejee. Capt. Wilkes says of them: "They are truly wretches in the strongest sense of the term, and degraded beyond the conception of civilized people. For the sake of decency, and to avoid shocking my readers, I have refrained from relating many things which happened under my own eyes." Foremost among their describable vices stands cannibalism; not only are prisoners taken in war consumed, but persons of the same tribe and village fall victims to the greed of their neighbors. The cooked human body is termed in the Feejee language *bakolo* or "long pig." As an English gentleman may send a choice haunch of venison as a complimentary present to another, so one Feejee chief will send a stalwart subject roasted entire like an ox, carefully trussed, and escorted by a procession to the residence of an ally. "It is our only beef," said Thakombau to the British Capt. Erskine. There is one district called Dreketi, where the inhabitants from generation to generation are all "preserved" to be consumed by their more powerful neighbors. The epicures of Feejee prefer the flesh of women to that of men, and deem the thick of the arm and the thigh the tit-bits of the *bakolo*. The flesh of white men is held in low repute; it is said to be comparatively insipid or obnoxiously tainted with tobacco. Their practice of appropriating the cargoes and eating the crews of vessels wrecked on their shores, has several times brought down upon them chastisement from ships of war belonging to France or the United States. In 1834 the chief of Viwa captured the French brig *L'aimable Joséphine*, and killed the captain and most of the crew. This crime was avenged by two French ships of war sent out to Feejee for that purpose. At Malolo, one of the smaller islands, Lieut. Joseph A. Underwood and Midshipman Wilkes Henry of the U. S. exploring expedition were murdered, July 24, 1840. The last affair of this sort took place in Oct. 1858. The marines and crew of the U. S. sloop of war *Vandalia* burned down a village and killed 14 and wounded 16 of the inhabitants of the island of Waya, in punishment for the murder and mastication of a New Yorker and two compan-

ions. A Feejeean is always armed, and war is his normal condition. The mountain fastnesses are well fortified by strong palisades and stone breastworks, pierced with loopholes. The arms chiefly used are clubs, spears, battle-axes, the bow, the sling, and the musket. A peculiar weapon is the missile club, which is worn stuck in the girdle, sometimes in pairs. It is a short stick, with a knob at one end, is hurled with great precision, and is a favorite weapon with assassins. The sick and aged are neglected, or if they become troublesome are buried alive or strangled. The relatives hold a wake over the intended victim while living and anointed for the sepulchre, and go into mourning after the entombment. The signs of mourning are the cropping of the hair and the joints of the small toe or little finger. Another remarkable custom is the *loloku* or strangling of the wives and next friends of the deceased. Abortion is practised to a great extent by medicated waters or mechanical means. Boys are circumcised on attaining puberty.—Feejee has no one mythology common to all the islands. The native religions are local; each island has its own gods, traditions, and superstitions. All the systems belong to the lowest types of polytheism, and all are impregnated with the filth and savageness which characterize the actual existence of the people. Some features the mythologies have in common; they retain the distinction between *dii minores* and *dii majores*, between gods and demigods. The latter class is made up chiefly of deceased chiefs and respected ancestors. Monsters and other objects of wonder are admissible to this class. Most of the gods are supposed to have jurisdiction only over the tribes, islands, or districts where they are worshipped. Each trade has its tutelary deities. The Feejeeans have no idols, but reverence certain stones as shrines of the god, and hold certain birds and fishes as sacred. Each chief has his *ambati*, or priest, who acts in concert with him, and helps him to govern his clansmen. The temple (*mbure*) is used for all public purposes, and is the only public building. There are priestesses, but few of sufficient importance to have a temple. The portion of food devoted to the god is eaten by the priest and old men. The priests are consulted as oracles. The responses are given after convulsions, supposed to be caused by the presence of the god. There are various modes of divination, all of the most childish character, such as by biting a leaf or pouring water down the arm. They have a strong belief in all sorts of apparitions, witches, ghosts, wizards, and the evil eye. They believe in a sort of fairies who dance on the hills by moonlight and sing songs. The future world in their opinion is much the same as the present. In a large number of the islands, a particular town in Vanna Levu is thought to be the entrance to the spirit world. The houses in this town are built with their doors opposite to each other, so that the shade may pass through without interruption. The inhabitants speak in low tones,

and if at a little distance communicate their thoughts by signs. The making of charms and amulets is a favorite occupation. Sneezing is ominous, and varies in its luck, according as it proceeds from the right or left nostril.—The first Christians resident in Feejee were a few Tongan emigrants and traders who had been converted in the Friendly islands. The horrible condition of Feejee moved the hearts of the British Wesleyan missionaries in Tonga in 1834, and two of their number were appointed to open a mission there. These two pioneers were the Rev. William Cross and David Cargill. They reached Lakemba, an island of the windward group, Oct. 12, 1835. They came furnished with letters of recommendation from King George of Tonga to the king of Lakemba, who received them kindly. One great advantage that the missionaries enjoyed arose from the fact that the Tongan tongue is well understood at Lakemba. The first part of St. Matthew's Gospel was translated into the Lakemba dialect and forwarded to Tonga to be printed, and a grammar and dictionary were commenced. The earliest converts in Lakemba were Tongan immigrants, who became class leaders and exhorters. In June, 1836, Christianity, or the *lotu* as it was called, was already of sufficient influence to prevent the massacre and eating of the crew of the *Active*, shipwrecked near Lakemba. Mr. Cross left Lakemba and opened the mission at Rewa, Jan. 8, 1838. In Dec. 1838, three more missionaries direct from England landed at Lakemba, and brought with them a printing press, type, and binding material. The first part of the "Conference Catechism" was printed at Lakemba in the native tongue in Feb. 1839, and St. Mark's Gospel not long after. Two more missionaries soon arrived, and it was determined to remove the printing press to Rewa, which was done in 1839. The influence of the missionaries was seen wherever they penetrated, in the cessation of cannibalism, war, and murder, and various other pagan practices. One custom lingered longer than others, that of polygamy. Many a man of rank who had changed his practices in every other respect refused to break up his domestic establishment and dismiss all his wives but one. In such cases the missionaries always refused the full privilege of church membership, however powerful the chief. At the same time they taught their converts to be obedient subjects in every thing except in following their chief to wanton and aggressive wars. As the Christians were more industrious and skilful than the pagans, the chiefs found their tribute increased, and this predisposed many of them to tolerate the presence of the missionaries and the spread of the *lotu*. Yet the persecution of the missionaries, native teachers, and converts was great. The converts found their houses and property destroyed by midnight attacks, and were often compelled to migrate in a body to seek the protection of a Christian or even a tolerant pagan chief. None of the missionaries ever fell vic-

tims to pagan wrath, though often in imminent peril, but several native teachers were sacrificed, and the mission premises were fired on one occasion. About 1843 the French Catholic missionaries commenced their operations in Feejee. The relations existing between them and their Protestant brethren are not so fraternal as could be desired. They are more tolerant of some of the native practices, such as dancing, than the Protestants. In 1857 there were 54,281 attendants upon the religious services conducted by the Wesleyan missionaries. In many of the circuits the Christians support their own pastors, who are natives either of Feejee or Tonga. By the latest accounts there are 8 Protestant missionaries in Feejee, and no fewer than 200 native teachers in the same islands and in Rotuma, an island a considerable distance to the north of Feejee. For the numerous children, chiefly half caste, of the white residents at Levuka, Ovalau, a school has been established by the mission society, where instruction is given in the native and English tongues.—The Feejee language has at least 15 dialects. The missionaries are acquainted with 7 of these, and books have been printed in 4 of them. In 1844 it was determined to make the dialect spoken at Mbau the standard dialect of Feejee, and with insignificant exceptions all the works since printed have been written in this dialect. The chief peculiarity of the Feejee as distinguished from the other Polynesian languages is the use of the combinations *mb* and *ng*. The missionaries in their vocabularies have used the Italian and not the English sounds of the vowels. The New Testament was completed in the Mbau dialect chiefly by the Rev. John Hunt. The British and foreign Bible society gave great pecuniary and other assistance to this work, and issued an improved edition of the same. The Rev. David Hazlewood published a grammar and a Feejeean-English and English-Feejeean dictionary in 1850. The same indefatigable missionary completed in a few years the translation of the Old Testament from the Hebrew. Mr. Calvert, for 17 years missionary in Feejee, is now (1859) in London, supported by the British and foreign Bible society, to assist in revising Mr. Hazlewood's translation of the Old Testament in its progress through the press.—See "Life in Feejee, or Five Years among the Cannibals" (Boston, 1851); Laury, "First and Second Missionary Visits to the Friendly and Feejee Islands" (London); Erakine, "Journal of a Cruise among the Islands of the Western Pacific" (London, 1853); Robert Young, "Journal of a Deputation to the Southern World" (London, 1855); Wilkes, "U. S. Exploring Expedition around the World" (New York, 1856); and Williams and Calvert, "Fiji and the Fijians" (2 vols., London, 1858.)

FEIJO, DIEGO ANTONIO, a Brazilian statesman, and from 1834 to 1838 regent of Brazil, born in Ita, in the province of San Paulo, in 1780. He distinguished himself in early life by his eloquence as a pulpit orator. When the relation of Brazil to Portugal began to agitate

the public mind, he devoted himself to politics, and after having been sent as deputy of his province to the cortes convened in Portugal, he became in 1821 and ever afterward remained an uncompromising champion of the national independence of Brazil. In 1822, when the Brazilian declaration of independence became known at Lisbon, Feijo was compelled to flee. After spending a short time in England in studying the political institutions of that country, he returned to his native country, and published a pamphlet in which he advocated the establishment of a South American republic after the model of the United States. He was soon chosen a member of the legislative assembly, and he exerted his influence in displacing Don Pedro from power. After the revolution of April, 1831, he held almost supreme power, although his office was only that of minister of justice. He dissolved the revolutionary army, organized a national guard, made stringent laws against political offenders, and subdued the unruly spirit in parliament and in the country at large. His official duties, however, changed his political convictions, and from a sturdy advocate of republicanism he became a conscientious champion of constitutional monarchy. He relinquished his office in 1832, and in the following year entered the Brazilian senate as a member for Rio de Janeiro; and for some time he edited a political journal in the province of San Paulo. In Aug. 1834, he was appointed bishop of Marianna, and in the same year was nominated for 4 years regent of Brazil. He entered upon his administration under the most auspicious circumstances, and enlisted the sympathies of the people by his apparent solicitude for the preservation of civil and religious liberty. Soon, however, he was suspected of anti-liberal tendencies. The suspicion received confirmation by his attempt in 1836 to withhold the privilege of trial by jury for offences of the press. The opposition against him finally assumed such formidable proportions that he was compelled to resign his office after having appointed a new prime minister in the person of Pedro d'Arango Lima, who succeeded him as regent on Sept. 12, 1838. Since then Feijo has taken no part in the public affairs of his country, excepting in 1842, when he appeared as the leader of a revolutionary attempt at San Paulo.

FELDSPAR (Germ. *Feld*, field, and *Spath*, spar, in the derivative feldspathic), an important mineral species, which includes a large number of varieties; also the name given by Dana to one of the sections of the anhydrous silicates. The mineral as commonly seen is the light-colored ingredient of granite, distinguished by its pearly lustre, and a hardness little inferior to that of the quartz with which it is intermingled. On the scale its hardness is 6. Its specific gravity is 2.4–2.6. It crystallizes in oblique rhomboidal prisms, which are sometimes found, as at the quarries at Middletown and Haddam, Conn., a foot long and 6 or 8 inches thick. In composition the

common feldspar is a silicate of alumina and potash, represented by the formula $\text{KO}, \text{SiO}_2, \text{Al}_2\text{O}_3, 3 \text{Si}_2\text{O}_5$, and consisting of silica 64.76, alumina 18.37, potash 16.87 per cent. Lime and oxide of iron are commonly present in small quantities, and a portion of the potash is often replaced with soda. In the variety called albite soda is substituted for the potash, and NaO takes the place of KO in the above formula. The composition is then silica 68.7, alumina 19.5, and soda 11.8 per cent. The two varieties are sometimes seen together as constituents of granite, as in that of which Pompey's pillar is made. Labradorite is a beautiful variety of feldspar of pearly lustre, and often exhibiting a play of blue, green, yellow, and red colors. In this lime and soda together replace the potash, the former commonly being present in the proportion of 10 to 12 per cent., and the latter 4 to 5; oxide of iron also about 1 per cent. Feldspar may be fused by the blowpipe on its edges into a white enamel. In its purer forms it is a valuable material for the construction of mineral teeth, being ground to powder, made into a paste with water, and baked, the substances used for coloring being first introduced. Labradorite is sometimes so beautiful from its chatoyant reflections, that it is employed in jewelry. By the decomposition of feldspathic rocks, the fine clays (as kaolin) are obtained, which are used in the manufacture of porcelain. The soil derived from this source is enriched by the potash or soda set free. The mineral is one of the ingredients of the various granitic rocks, and of trap, basalt, porphyry, and many others. In the last named it is in crystals disseminated through a feldspathic base. The appearance of scattered crystals of feldspar in granite gives it the name of porphyritic.

FELLAHS, the people in modern Egypt that cultivate the soil. Of the various races which exist in Egypt the Fellahs are the most ancient, and are probably the descendants of the old Egyptians. Although numerous invasions have introduced foreign elements among them, yet the original race, devoted to agricultural labor, has always at last absorbed the invading race, and still presents a physiognomy resembling that which is found upon ancient Egyptian sculptures. A patient and laborious population, they have held for ages the soil which the Nile fertilizes. The Fellahs are generally of large stature, with broad chests, muscular limbs, and black and piercing eyes. The conformation of the brain indicates an intelligent race, the facial angle being usually almost a right angle, though within the Delta the Arab type of countenance predominates. Those of the Delta, too, have an almost white complexion, while the others are copper-colored. The antique Egyptian type reappears most strikingly in the women, who, though slender and graceful, are remarkably strong. The dress of the Fellahs indicates misery and privation, being rarely more than a shirt, leaving bare the arms, legs, and breast. Their ordinary nourishment is

coarse bread, marshy water, and onions, to which they are sometimes able to add cheese, dates, beans, or rice. They live in huts about 4 feet high, the only furniture of which is a mat on which to sleep, a water jug, and a few kitchen utensils. They remain attached to the rudest agricultural methods, and use almost the same implements as their remote ancestors; yet the fruitfulness of the soil, which sometimes yields 7 crops annually, and the industry of the Fellahs, compensate for their lack of skill. Mehemet Ali failed in his efforts to introduce among them the implements of modern invention. They are able to endure the greatest fatigue, and to work through the whole day in a burning climate with but very little food, accompanying their labors with pious hymns; yet they are naturally indolent, and when subsistence has been secured, they cease work. The women share the heaviest labors of the men.

FELLATAHS. See **FOOLAHs**.

FELLENBERG, PHILIPP EMANUEL VON, a Swiss educator and philanthropist, founder of the institutions at Hofwyl, born in Bern, June 27, 1771, died there, Nov. 21, 1844. His father was a member of the government and a friend of Pestalozzi. His mother was a descendant of the Dutch admiral Van Tromp, and was remarkable for her noble character and her enthusiasm for liberty. This she imparted to her son, who after devoting several years to study at Colmar and Tübingen, travelled extensively with a view of familiarizing himself with the condition of the working and suffering classes. He was at Paris immediately after the fall of Robespierre, and there his early convictions became strengthened, that improved systems of education alone can protect society against revolutions. On his return to Switzerland, after taking part against the French, he was exiled when they had succeeded in taking Bern. He fled to Germany, and sent several friends to the United States, whither he had some intention of repairing. However, he was soon enabled to return to Switzerland, and was employed by the government in a mission to Paris, and in high military and political functions at home. He succeeded in quelling the insurrection of the peasantry in the Oberland, but as the government failed to fulfil the promises by which he had pacified them, he withdrew from public affairs. He now devoted himself entirely to his favorite educational projects. After officiating for some time as a member of the board of education in Bern, he became convinced that nothing could be accomplished by the government. He resolved therefore to devote his large fortune to the purchase of the estate of Hofwyl near Bern, and to the establishment of model institutions in accordance with the views of Pestalozzi. The principle of this system was to produce a harmonious development of all the various faculties of the pupil, so as to make him not only a learned, but also a good, wise, and religious man. Great attention was bestowed upon the development of the

body by gymnastics and games, by cold bathing, and by other healthful exercises. Fellenberg's aim was to elevate all classes by opening an institution alike to the poor and the rich, and by making agriculture not only the basis of his instruction, but also by elevating that profession to the dignity of a science. Apart from the agricultural school, he founded an establishment for the manufacture of improved agricultural implements. At the same time he laid the foundation of a scientific institution, which he desired to conduct in conjunction with Pestalozzi; but Fellenberg's Swiss system of economy was little in harmony with the generous but imprudent habits of Pestalozzi, who withdrew to the castle of Yverdon. Fellenberg proceeded with his task, and after having organized his scientific school, for which the first building was erected in 1807 (the number of professors increasing in a few years to 20, and the pupils to 80), the agricultural institution was opened in 1808, while he established in the same year a normal school. Although this became popular among the teachers of Switzerland, it soon gave umbrage to the government, and was eventually incorporated with the agricultural institution. This grew in importance as its advantages became known abroad. The emperor Alexander of Russia sent Capo d'Istria on a mission to examine the school, and was so pleased with the account which he received of it, that he conferred upon Fellenberg the order of St. Vladimir, and confided to him the education of 7 Russian youths, for whose use a Greek chapel was opened near the school. The great increase of pupils called for a constant enlargement of the buildings, which comprised altogether 7 distinct schools, to which a primary school was added in 1830, and still another school for children at a subsequent period. By these schools, and by his writings on the subject of agriculture and education, Fellenberg exerted a remarkable influence in Europe; and although the institutions which he founded were dissolved after his death, after having been conducted for several years by one of his sons, kindred institutions have sprung up in Switzerland and Germany, and the celebrated pauper colony of the Netherlands at Frederic's-oord, province of Drenthe, was founded in 1818 by a pupil of Hofwyl. Fellenberg was assisted in his benevolent labors by his wife, and by the greater number of their 9 children. See Hamm, *Fellenberg's Leben und Wirken* (Bern, 1845).

FELLER, FRANÇOIS XAVIER DE, a Belgian priest and author, born in Brussels, Aug. 18, 1785, died in Ratisbon, May 21, 1802. He was educated at the Jesuits' colleges at Luxembourg and Rheims, and after becoming a member of their order, he was employed as professor at Luxembourg and Liège. He subsequently applied himself in the former city to the study of theology until 1764, when the suppression of the Jesuits in France brought so many of them to the Netherlands, that, to make room for them, many young Belgian priests were sent to

other countries to continue their studies. Feller went to Tyrnau, in Hungary, where the Jesuits had an establishment. After having passed some time there, he travelled extensively in Hungary, Austria, Bohemia, Poland, and Italy, returned to the Netherlands in 1770, and was preacher in the college of Liège, when the order of Jesuits was suppressed in Belgium (1773). Henceforward he devoted himself to literary pursuits, but was compelled to leave Belgium after the invasion of that country by France (1794). He spent 2 years at Paderborn, Westphalia, and in 1797 retired to Ratisbon. He left a number of writings, chiefly on religious subjects. In his *Observations philosophiques sur le système de Newton* (3d and enlarged ed., Liège, 1788), he denies the existence of a plurality of worlds, and endeavors to prove that the movement of the earth, although so universally admitted, may still be open to doubt. This work involved him in a controversy with the astronomer Lalande. A 4th and enlarged edition of his *Catéchisme philosophique* appeared in Liège in 1805, and an edition printed from a copy which had been revised and annotated by Feller, in Lyons, in 1819. It was translated into German, Italian, and English. Madame de Genlis also prepared an abbreviated edition of it entitled *Catéchisme critique et moral*. Feller's principal work is his *Biographie universelle, ou dictionnaire historique*, which passed through many editions, and after his death was revised and continued under the direction of M. Charles Weiss and the abbé Busson, and brought down to 1848 (9 vols., Paris, 1847-'56). This biographical work is based upon that of Chaudon, but is more zealous and emphatic than that in the assertion of Roman Catholic views.

FELLER, HENRIETTA, a Swiss Protestant lady of Lausanne, who in 1835, after the death of her husband and of her only child, went to Canada, where she became celebrated by her educational and missionary labors. Although frequently interrupted in her benevolent enterprises by opposition and by the loss of the ample means she brought with her, her persevering efforts produced good results upon the education of the poor and the young of the French population of Montreal and St. John's. From the latter place she was expelled at the time of the first rebellion in Lower Canada, when she fled with 60 of her pupils and friends to Champlain, N. Y. After having returned to Canada in 1836, she removed to Grand Ligne, about 20 m. from Montreal. Here she opened her school at first in an open barn. By the assistance of the Rev. Mr. Gilman, a Baptist minister of Montreal, who collected funds for the establishment of a mission house, she was enabled to enlarge her institution, which contained in 1855 over 300 pupils.

FELLOWES, ROBERT, an English author, born in Norfolk in 1770, died in 1847. He was graduated at St. Mary's hall, Oxford, and in 1795 took holy orders. His speculations on theological subjects gradually led him, however,

to reject the doctrines of the established church, and to adopt the opinions which are given at length in his "Religion of the Universe," published in London in 1836. This work was preceded by a "Picture of Christian Philosophy" (8vo., London, 1800); "Religion without Cant" (8vo., 1801); "The Guide to Immortality" (3 vols. 8vo., 1804); "A Manual of Piety, adapted to the Wants and calculated for the Improvement of all Sects of Christians" (8vo., 1807); "A Body of Theology, principally practical, in a Series of Lectures" (2 vols. 8vo., 1807), &c. The general merits of these works are highly commended by Dr. Parr in his "Spital Sermon." Mr. Fellowes was an intimate friend of Dr. Parr and Baron Masères, the latter of whom left him the greater part of his large fortune, to be dispensed in literary and benevolent enterprises. He was one of the earliest advocates of the establishment of the university of London, of which he was a frequent and liberal benefactor.

FELLOWS, SIR CHARLES, an English traveller, born in Nottingham in 1799. In 1838 he made an extensive tour in Asia Minor, in the course of which he visited the valley of the river Xanthus and other parts of ancient Lycia previously unexplored by modern travellers. On his return to England he published a "Journal written during an Excursion in Asia Minor" (8vo., London, 1839), in which he gave descriptions of the superb architectural and sculptural remains of the cities of Xanthus and Tloa. The interest excited by the work induced the government to apply to the Porte for a firman, authorizing the removal of specimens of the ancient works of art described by Mr. Fellows. The latter, anticipating that permission would at once be granted, offered his services to the British museum to superintend the selection and removal of the marbles, and departed on a second tour through Lycia, in the course of which he discovered 18 other ruined cities. Having learned that the Porte declined to grant the firman, he returned to England, and published "An Account of Discoveries in Lycia, being a Journal kept during a Second Excursion in Asia Minor" (8vo., London, 1841). The government were stimulated to make another attempt to procure the desired firman, in which they were successful, and in Oct. 1841, Mr. Fellows sailed for Lycia as the agent of the British museum in superintending the removal of the works of art. After some little delay the expedition succeeded in transporting to England a number of cases of sculptures, which are now deposited in the "Lycian Saloon" of the British museum. A second expedition, also under the direction of Mr. Fellows, brought a number of additional marbles to England in 1844. For these services he received in 1845 the honor of knighthood. His remaining publications are: "Account of the Xanthian Marbles in the British Museum" (8vo., 1848), a pamphlet written to correct some misstatements; "Account of the Trophy Monument at Xanthus" (8vo., 1849); and "Coins of

Ancient Lycia" (8vo., 1855). In 1852 appeared an edition of his two journals in one volume, under the title of "Travels and Researches in Asia Minor, particularly in the Province of Lycia."

FELO DE SE. A man who commits felony against or upon himself, is a *felo de se*; and as felony is, in common law language, any capital offence, and murder is the only capital offence which a man can commit against himself, a *felo de se* is a self-murderer, or one who kills himself with malice aforethought. Indeed, the legal definition of a felony *de se* (or suicide) is said to include the doing of any unlawful and malicious act, although aimed primarily against another, whereby death ensues to the guilty person. In England, this crime was punished not only with forfeiture of goods and chattels, like other felonies, but, to mark the detestation of the law, and to deter others from a similar crime, the body was treated ignominiously, and buried in the open highway with a stake thrust through it. This very ancient rule fell into general if not entire disuse in England many years ago, but it was not repealed until the statute 4 George IV., ch. 51; and even then, to manifest the horror of the law at the act of suicide, it was ordered that the body (which might be placed in church yards or other consecrated grounds) should be buried at night, and without the performance of religious rites. (See Chitty's edition of Blackstone's "Commentaries," vol. iv. p. 190.) Suicide does not seem ever to have been made punishable as a crime by any statutory provisions of the United States; nor are we aware that the barbarous usages of England in relation to the burial of the corpse were ever practised here.

FELONY. The origin and the exact meaning of this common law term are both uncertain. There is about equally good authority for deriving it from the Saxon words *feh*, fee, and *lon*, price or pay, when its primary sense would be forfeiture or loss of fee; or from a single word *felen*, to fall or fail, when its meaning might be the falling of the guilty party into crime, or the falling of his land into the hands of his lord by forfeiture. It seems quite certain that in England, from the earliest times, felony was always attended by absolute forfeiture of land or of goods, or of both; and the definition of Blackstone (4 Bl. Com. 95) is, in accordance with this principle: "An offence which occasions a total forfeiture of lands or goods, or both, at the common law, and to which capital or other punishment may be superadded, according to the degree of guilt." But we understand Blackstone to mean, generally, by felony, all capital crimes below treason (p. 98); and Coke says (3 Inst. 15) that treason itself was anciently included within the meaning of felony. In those distant ages, a felon was to be punished: 1, by loss of life; 2, by loss of land; 3, by loss of goods; 4, by loss of blood, or attainder, under which he could have no heir, and none could ever claim through him. In more recent times, felony meant in practice any crime punishable

with death; and therefore when a statute declared any offence to be felony, it became at once punishable with death; and *vice versa*, a crime which is made punishable with death, becomes thereby a felony. Even in early times, felony was sometimes defined as any capital crime; although it is said that before the reign of Henry I. felonies were punished only by pecuniary mulct or fine, and that sovereign having ordered those guilty of felony to be hanged, about 1108, this has since been the law of England. (Tomlin's "Law Dictionary," word "Felony.") It cannot be doubted, however, that at common law the forfeiture incurred by the crime was the essence and the test of felony. In the United States there is little or no forfeiture for crime (see FORFEITURE); and in England capital offences are far less numerous than formerly. It may be said that in the United States the word, so far as it has any definite meaning, signifies a crime punishable with death or imprisonment. But in truth it has so little meaning which is capable of definition, and therefore so little which is capable of use, that it might be well to abandon the word altogether in legal phraseology, whether that of process or of statute.

FELT, a fabric of wool or fur, separate or mixed, manufactured by matting the fibres together without spinning or weaving. The fur of the beaver, hare, rabbit, and seal, camel's and goat's hair, and the wool of the sheep, are well adapted for this process. Felt is an ancient manufacture, supposed by Pliny to have been produced before woven cloth. Some, however, ascribe the invention of it to St. Clement, who, they say, found the carded wool, placed in his sandals to protect his feet on a pilgrimage, felted into cloth by the moisture and rubbing. It is also supposed that the material is the same as the *lana coacta*, used in ancient times for the cloaks of soldiers, and by the Lacedæmonians for hats. Early in the present century a piece of ancient felt was discovered with some other stuffs in a tomb at St. Germain des Prés, and a paper relating to them was presented by Desmarest in 1806 to the academy of sciences, in which he refers to the above statement of Pliny.—The production of a fabric from the loose fibres results from the tendency these have from their barbed structure to work together when rubbed, each fibre moving forward in the direction of its larger end without a possibility of progressing in the other direction. This peculiar structure of the animal fibre, so different from that of the smooth vegetable fibres, is readily perceived on drawing a filament of wool through the fingers, holding it first by one end and then by the other. Examined through a powerful microscope, the short fibre exhibits the appearance of a continuous vegetable growth with numerous sprouts, all pointing toward the smaller end. In a filament of merino wool as many as 2,400 of these projections or teeth have been found in a single inch; and in one of Saxon wool of superior felting quality there were 2,700 serrations in the same space. Southdown wool, which is not so much

esteemed for this use, contained only 2,080 serrations in one inch; and Leicester wool, which is not at all adapted for felting, only 1,860. The short curly fibres of wool, freed from grease and brought together, intertwine at once very closely and form a compact mat. By rubbing this with the hands, and moistening it with some soapy liquid, the matter is made more dense according to the pressure with which it is rubbed. At last the fibres can go no further without danger of fracture, and the fabric becomes hard and stiff. It may, however, be made thicker to any desired extent by adding more fibres and rubbing these in by separate layers.—Until within a few years felt has been chiefly employed for hats, either for the whole hat, as in those made of wool and of fur, or for the body alone, which is afterward stiffened and covered with silk. This, which is now but a branch of the felt manufacture, will be treated in the article HAT. The application of the material to various uses under modern improvements, mostly of American introduction, has given a new importance to the fabric, and the present article will treat especially of the manufacture of felt for articles of clothing and heavy cloths. By the old process for obtaining a felted web, the fur or wool was first assorted; to effect which various methods were employed. One of these was to blow the mixtures through a long wooden trunk, in which each sort, according to its greater or less gravity, falls at a less or greater distance within the trunk. Thus a selection could be made and the different qualities be mixed in desired proportions for the required fabric. The mixture was then placed upon a table and whipped with a bowstring, the vibratory motions of which threw the particles about, separating the knotty lumps and causing the lighter portions to fall, overspreading the table with the fibres lying in every direction. Being then covered with a piece of dampened blanket stuff and rubbed with the hand applied upon this, the fibres readily interlaced and formed a mat. This process has been almost entirely superseded in the United States by several ingenious machines for forming a mat, some of which, omitted here, will be noticed in the article HAT. The English invented an improved method, which is called the pneumatic process. Two air-tight chambers are built side by side, a portion of the partition between them being of wire gauze, which may be covered air-tight. In one of the rooms the woolly fibres are tossed by a sort of winnowing wheel, so as to be dispersed throughout the air. The air from the adjoining room being exhausted, and the communication through the wire gauze opened, the flocculent particles are carried with the rush of air against the gauze, and intertwining with each other as they crowd through the interstices, they are instantaneously matted together and form a web, which may afterward be made as dense as required.—In all the felted fabrics prepared by the old method, in which strength is an essential element, serious defects were experienced in the

unevenness of the texture, a liability to tear more easily in one direction than another, and in the tendency of the material to lose its shape by wear or by being wet. From these causes the goods had a poor reputation, and the common impression still is that they are far inferior to other woollen fabrics. To improve the quality of the article experiments were directed to careful selection of the materials employed, and it was found that every particle of cotton and all strange fibres must be scrupulously excluded from the wool; and then, to secure equal strength in every direction, the fibres must be so laid and intertwined as to cross each other with much regularity. To accomplish this has been the great difficulty. One of the first steps was to form gossamer-like sheets and apply these one upon another till they attained the required thickness; but these sheets, lying in the same direction, or not crossing each other regularly, lacked strength. Methods were then contrived by which each successive film, as it came from the doffer of the carding machine, was laid zigzag upon that before deposited upon the apron; and again, by a swinging or vibratory motion of the web, it was laid in lines crossing those of the web beneath at small angles. These improvements have been carried to their greatest perfection in the machines of the "New York Seamless Clothing Manufacturing Company." In 1848 Mr. S. M. Perkins of New York conceived the idea of uniting the edges of felted cloth by felting them together; and in 1851 he obtained a patent for the process. This was afterward improved by Messrs. L. W. Badger and D. W. Gitchell, to whom several patents were issued, the last in 1857, covering the whole ground of their peculiar operations. They commenced the manufacture in Winchendon, Mass., in 1855, and after carrying it on there 2 years removed to Matteawan, near the Hudson river, where the facilities admit of greater extension of the business. In their operations the wool, chiefly obtained from New York, Vermont, and Ohio, is assorted, cleaned, picked, and dyed by the ordinary methods; and being then passed through the common carding machine, it is delivered from its apron in the form of a web, usually 8 feet wide, and as thin as gossamer. This is passed between 2 horizontal rollers, and is then taken up by the apron of another machine called the "former," upon which it undergoes the operation called by the inventors "weaving in the wool," by which a bat is produced of any desired length, width, and thickness. The endless apron of the "former" runs at right angles to and under the first one. It has a length of 60 feet, but by means of 4 turns is made to occupy only 15 feet. Beside its forward motion, the carriage it is upon moves laterally up to the carding machine and back again, the distance being the width of the bat. In consequence of these two motions the web is laid diagonally across the lower apron in zigzag lines, and the motions are so adjusted that with each turn the angle made is a right angle.

The apron goes round, receiving these layers along its whole length, and the circuit being completed the next layers cross those first deposited; and the third set leave no space over the area of the bat uncovered. As many as 80 films are thus piled together, binding each other and making a strong fabric, and the number may be increased to give any desired thickness. In the operation the films are partially matted together, so that the bat coheres as one piece; indeed, it could not be carded again without repicking. It is then removed to the felting machine and partially hardened. In this machine the rubbing is effected by a slight forward and backward motion of a very heavy iron plate laid upon the bat, and steam is introduced to facilitate the operation. The bat thus produced is now ready for the very ingenious operations of the same inventors by which it is converted into articles of seamless clothing. It is first cut by skilful tailors in patterns half as large again as those used for the same garments in other materials. The edges that are to be joined are then beveled by a sort of combing process performed by hand, and being then laid together and cotton cloth being introduced into the openings for the pockets and the sleeves, in order to prevent the two surfaces coming in contact and uniting, the articles are again rubbed for a short time under the iron plate, when the pieces are found to be thoroughly joined with no trace of a seam. The garments are then fulled, as ordinarily practiced with woollen goods, and by this process they are reduced to the required size. The drying of felt cloth is effected as with ordinary woven cloth by exposure on tenter bars; but the seamless garments are dried upon hollow forms or models of sheet copper made in their exact shape, and heated by steam introduced within. In this way are manufactured a great variety of articles of wearing apparel, as coats, vests, leggings, gaiters, slippers, mittens, caps, &c., of remarkable strength and durability. The fabric is a very different article from that commonly known as felt. It is altogether as elastic and strong in one direction as another. It is soft and agreeable to wear, is nearly water-proof, and cannot become misshapen by being wet. Put to severe tests in our public ships, it has received the highest testimonials from Capt. Hudson, the commander of the Niagara, and other officers, as better adapted for withstanding hard usage and resisting the pelting of rain and sleet than any other material. It may be made of thickness adapted to any degree of cold, and hence is equally useful in protecting against the rigor of an arctic winter or the rains of the tropics. These qualities are rapidly bringing it into use in our naval service, and must soon establish a new reputation for the article felt. A singular feature in the new method of manufacture is the rapidity with which the crude material may be made into wearing apparel. The inventors assert that the wool growing upon a sheep's back may, by omitting the process of dyeing, be converted within 24 hours into a

finished garment ready for wear.—Felted cloth is also produced by a somewhat similar method to that described, at Norwalk, Conn., by the "Union Manufacturing Company." Layers of delicate web are piled across each other to form a bat upon a smooth metallic bed plate, and the pile is then subjected to the action of a large metallic beater, weighing 2 tons. The whole is thus consolidated into a compact felt. By using alternate dark and light webs, stripes and plaids are formed in the fabrics. Carpets are made of felt in Lawrence, Mass., and the colors are printed upon them as in calico printing. The heavy cloths serve a useful purpose as a covering to steam cylinders and boilers, and they have also been used to cover the roofs of houses, being rendered for this purpose water-proof by proper applications. The cloths serve also as linings of water-tight compartments in ships.—Further details on this subject will be given in the articles NORWALK, Conn., and WELLS, HENRY A.

FELTHAM, OWEN, an English author of the 17th century, died about 1680. No event of his life is known except that he resided for many years in the house of the earl of Thomond. He wrote "Resolves, Divine, Political, and Moral" (2d ed., 1628; 8d, and 1st complete ed., 1628; 10th ed., 1677), which has been highly admired for its exuberance of wit and fancy, fervent piety, and occasional subtlety of thought. Hallam, however, criticizes him as a labored, artificial, and shallow writer. Feltham is the author also of a few minor pieces in prose and verse. The latest edition of his "Resolves" appeared in London in 1839.

FELTON, CORNELIUS CONWAY, an American scholar and writer, born at West Newbury, now Newbury, Mass., Nov. 6, 1807. He was graduated at Harvard college in 1827. While in college he was distinguished for his literary tastes, and the wide range of his studies. In his senior years, he was one of the conductors of the "Harvard Register," a students' periodical. After leaving college, he was engaged for two years, in conjunction with two of his classmates, in the charge of the Livingston high school in Geneseo, N. Y. In 1829 he was appointed Latin tutor in Harvard college, Greek tutor in the following year, and college professor of Greek in 1832. In 1834 he was appointed Eliot professor of Greek literature, the duties of which place he has ever since continued to discharge. In 1838 he published an edition of Homer, with English notes and Flaxman's illustrations; which has since passed through several editions, with revisions and emendations. In 1840, a translation by him of Menzel's work on "German Literature," in 3 volumes, was published among Ripley's "Specimens of Foreign Literature." In the same year he gave to the public a "Greek Reader," containing selections in prose and verse from Greek authors, with English notes, and a vocabulary; this has since been frequently reprinted. In 1841 he published an edition of the "Clouds" of Aristophanes, with an introduction and notes; since revised

and republished in England. In 1843 he aided Prof. Sears and Prof. Edwards in the preparation of a work on classical studies, containing essays on classical subjects, mostly translated from the German. He assisted his friend Prof. Longfellow in the preparation of the "Poets and Poetry of Europe," which appeared in 1845. In 1847 editions of the *Panegyricus* of Isocrates, and of the *Agamemnon* of Æschylus, with introductions and English notes, were published by him; a 2d edition of the former appeared in 1854, and of the latter in 1859. In 1849 he translated from the French the work of Prof. Guyot on physical geography, called "The Earth and Man;" and in the same year he published an edition of the "Birds" of Aristophanes, with an introduction and English notes, which was republished in England. In 1852 he edited a selection from the writings of Prof. Popkin, his predecessor in the Eliot professorship, with an introductory biographical notice. In the same year he published a volume of selections from the Greek historians, arranged in the order of events. The period from April, 1853, to May, 1854, was spent by him in a European tour, in the course of which he visited Great Britain, France, Germany, Switzerland, Italy, and Greece; giving about 5 months to the last named country, visiting its most interesting localities, and carefully studying its architectural remains. In 1855 he revised for publication in the United States Smith's "History of Greece," adding a preface, notes, and a continuation from the Roman conquest to the present time. In the same year, an edition of Lord Carlisle's "Diary in Turkish and Greek Waters" was prepared by him for the American press, with notes, illustrations, and a preface. In 1856 a selection by him from modern Greek writers in prose and verse was published. Beside the above, Prof. Felton has compiled an elementary work on Greek and Roman metres, is the author of a life of Gen. Eaton in Sparks's "American Biography," of various occasional addresses, and of numerous contributions to the "North American Review," "Christian Examiner," and other periodical publications. A series of vigorous articles on spiritualism, which appeared in the "Boston Courier" in 1857-'8 is understood to have proceeded from his pen. He has delivered 3 courses of lectures before the Lowell institute in Boston, on subjects connected with the history and literature of Greece. The articles on Agassiz, Athens, Attica, Demosthenes, and Euripides in this Cyclopædia are by him. These literary labors have never interfered with the faithful discharge of his duties as an officer of instruction and discipline in the college; to which has been added during the last 3 years a share in the instruction of a young ladies' school, under the charge of Prof. Agassiz in Cambridge. Prof. Felton is a member of the Massachusetts board of education, and one of the regents of the Smithsonian institution. In the summer of 1858 he made a second visit to Europe, partly on account of his

impaired health, and partly to complete some investigations into the language, topography, education, &c., of Greece.

FEME, the ancient Norman French form of the word *femme*, woman, which, being introduced into the common law at the time of the Norman conquest, has remained there ever since, although now superseded generally in England, and almost universally in the United States, by the appropriate English word. Thus for *bera* and *feme*, *feme covert*, and *feme sole*, we now say husband and wife, married woman, and single woman.

FENCING, the art of attack and defence with any weapon (not a projectile) in which address is employed; therefore the wielding of the battle axe, mace, and such arms as cut or break by sheer force, does not come under the head of fencing. The small sword, having a point but no edge, is the weapon which demands the highest degree of adroitness in its application for attack and defence; hence the word fencing is understood to allude especially to the management of this sort of sword, and when any other arm, such as broadsword, bayonet, or stick, is used, the kind of weapon is specified, though its use is always in accordance with the same principles. Fencing was cultivated by the ancients. The Roman gladiators instructed the soldiery of that epoch, but as their weapons differed so materially from those of the present day, and as they defended themselves by shields and armor, rather than by the skilful management of the weapons themselves, the study of their methods can be of little advantage to us. During the middle ages fencing was neglected, probably in consequence of the perfection and completeness of the suits of armor worn by the combatants, from which circumstance battle axes and other ponderous weapons were much adopted. When, however, metal casing fell into disuse, fencing came again into vogue; and as in those times all gentlemen wore swords, the advantage of being "cunning of fence" was palpable. The peculiar state of society existing in Italy in the 16th century made such knowledge more needed there than elsewhere; consequently the Italians became the most expert fencers of that epoch, and were the teachers of the art to other nations. The next country which found the art to be a necessity was Spain, whose people imported it from Italy. In Spain the art was improved, and the amendments were accepted in Italy. From Italy fencing was also imported into France, where the court and gentry favored it so much that it quickly took a fresh development, and a new school was established, comprising not merely additions to the knowledge already possessed, but working in many particulars a radical change. Though the principal object in studying the art of fencing is to enable men to wield arms with advantage, the schools are not attended exclusively by military men. Literati, artists, men of leisure, and many professional

Following sedentary occupations, practise as a recreation and an exercise, and some of them attain the highest grade of perfection; for example, Alexandre Dumas handled as much skill a foil as he does a pen. Considered as a mere exercise, it is different from every gymnastics. While it demands no violent training of the muscles, and requires a total absence of rigidity of limb, it nevertheless demands in an extraordinary degree the whole use of man; for it is evident by the ease and grace with which fencers execute movements of extreme velocity that they must have a surplus of strength, otherwise such movements would be performed with awkwardness and great effort and difficulty. It also imparts to the fencer the most perfect delicacy of touch, with the grace and lightness of hand, for which reason it should be practised by artists and by surgeons.—The fundamental principle upon which the defence of the person by the use of the small sword is a peculiar application of the power of the lever, whereby the fencer who parries an attack causes the point of his adversary's blade to deviate from its course, and throws it aside from his body by the pressure of pressing or striking the feeble (part near the point) of his adversary's weapon by the forte (part near the handle) of his own. The surface of the front of the body is, in fencing language, divided by an imaginary line, vertical, and just below the breast, separating the upper from the lower portion; the upper portion is again subdivided by a perpendicular line, the right of which is termed the outside, the left the inside. There are (or rather there were) in the old school 8 parries, distinguished by the numerals *primo*, *secondo*, *terzo*, *quarto*, *quinto*, *sixto*, *settimo*, and *ottavo*, from which are taken the modern terms *seconde*, *tierce*, *carte*, &c. The instrument used for exercise is called a foil; it has a hilt similar to the small sword, which it is intended to represent; it has a guard of metal between the handle and the blade, the blade is of pliant steel, having at the end a button in place of a point. The parries are made with the weapon itself; the upper part of the body to the right is defended by the parry *quarto* or *tierce*, the upper part to the left by that called *quinto* or *carte*, and the lower line by *seconde*. In the old parries these are the chief; indeed the others are nearly obsolete, or used only in exceptional cases. When the fencer is on guard, the left of his person instead of the right is most exposed to his adversary, and the parries of *carte* and *tierce* are reversed. The fencer is expected to depend upon his sword for protection, rather than upon his agility; nevertheless he must be quick and active, his legs to be able to advance, retreat, or lunge. The knees must therefore be somewhat bent when the fencer is on guard, that he may be light and springy in his movements. His arms are directed solely at the body; any hit on the limb would be accidental rather than intentional, and in a fencing school would not be

accounted a hit. An attack or a *riposte* may be made by the mere extension of the arm, or accompanied by a lunge—that is, by advancing the body, stepping forward with the right foot without moving the left one. An engagement means the crossing of the blades. A *riposte* means the attack without pause by the fencer who has parried.—The early Italian and Spanish schools taught the management of the sword aided generally by the dagger or the mantlet; the shifting of the position of the fencer to the right or left was also called into requisition in avoiding an attack. But since the habit of wearing the dagger and mantlet has been abandoned, and the velocity of attack and riposte has become so great that the dagger and mantlet would be an encumbrance, and the shifting of the position would be fatal to him who relied upon it, the instruction in defence has been confined solely to the foil. The Italian foil is long, some 38 to 40 inches; the ancient were longer than the more modern; they are also much heavier and less pliant than the French foils, which are only 34 inches in length. The handle has just beneath the guard a ring in which the fencer inserts his fore and middle fingers to grasp firmly the weapon, which is further secured to the hand by a bandage; whereas the French use neither the ring nor the bandage. The guard to protect the hand is of metal in the Italian foil, and very large; in the French foil this is much smaller and lighter. The pure Italian school is in vogue only in lower Italy and Sicily, and the Neapolitan masters are justly celebrated for their adroitness in this particular method. The characteristic of the Neapolitan school (which more than any other partakes of the old Italian and Spanish) is to extend the arm so as constantly to present the point direct to the adversary's breast; the hand is kept in the centre of the person at nearly the elevation of the shoulder; the large guard between the handle and the blade serves somewhat the purpose of a little shield by causing the attacking point to glance off the hand of the fencer on the defensive, slightly bearing to the left or right (*carte* or *tierce*), according as he finds himself menaced. The arm being already fully extended has the tendency to keep an adversary at a distance, and also facilitates the lunge of the attacker. The fencer can also defend himself by a circle parry, which the Neapolitan makes by describing with the point a small circle 8 to 12 inches in diameter, for the purpose of catching up an adversary's point which may glide away from the engagement under the blade, menacing the lower line, or the upper one if it complete the disengagement. The arm and weapon being extended to the utmost presents a great temptation to try a *liement* (or leverage movement) upon it; but this being a weak point of the Neapolitan, he is always on the alert, and with a wonderful dexterity avoids the effect intended to be produced, and in his turn attacks with the greatest velocity. The Neapolitan throws his weight chiefly on the left leg

as he stands on guard. He is a very embarrassing adversary, but the study of that school does not impart a general knowledge of the use of the sword, which has such a variety of modifications; it is a peculiarity, or so to speak a single chapter, finely executed. The Venetian school, of those of upper Italy, resembles most the Neapolitan; the Piedmontese is mixed, partaking of the old French and the Neapolitan. The Spanish school is a modification of the Neapolitan, in which the attack is assisted by extraordinary gymnastics of the leg, the fencer at times throwing himself nearly on the ground and attacking much in the lower line. This, like every other peculiarity, when well executed, is very embarrassing to one not accustomed to it. —When the French established a method of their own, the deviation from the Italian model consisted in the fencer having a less extended sword arm, the hand (medium guard) at the height of the breast, the elbow slightly bent, and the point of the sword at about the height of the eye. The knees were a little more bent, but the body was kept back as if to get out of reach of attack. Among the additions to the defence may be especially noted the half circle (old style), having the hand about level with the shoulder and the point depressed to the height of the waist, protecting the lower line to the left (*carte*), and being consequently the opposite of *seconde*, which bore the adversary's blade to the right. A new mode of attack was also introduced, termed *coupé*, or the cutting over the point instead of disengaging under the blade. The objection to this mode of attack lay in its requiring less delicacy of execution than the disengagement, which latter exercise was therefore neglected by many, and some got so habituated to repeat *coupé* after *coupé*, rushing forward, as even to continue to deliver them after their attack had been parried and the riposte delivered. Here were also introduced the *battement* or sharp tap preceding an attack, the effect of which is to make the person thus attacked grasp his foil nervously and thus render his hand for the moment rigid and unsuited to parry with rapidity. The change of engagement has much the same effect. Some disarms were introduced, but they are practically useless except when the hit is given by the same blow, for an adversary who is seen to be disarmed cannot be touched. Lafaugère introduced the *couronnement*, which was made by raising the hand instantly after the parry (*carte* or *tierce*), and with the forte of one's own blade mastering the feeble of the adversary's, then (as the latter in this situation tries to close the line of the riposte) turning or sliding the blade round it without quitting it, and delivering the riposte in the opposite line to that of the parry. Lafaugère often riposted, rising erect on the right foot after the lunge, thus bringing himself very close to his adversary. —The school of Bertrand is remarkable for many radical improvements. Instead of the medium guard, he always closes the line of the engagement. He

keeps the point a little more out than the hand in *carte*, *tierce*, and *seconde*. While on guard he keeps the body equally weighing on both legs, and he bends the knees well so as to obtain greater elasticity of limb. He attacks always with an arm fully extended; yet so regular are his movements that there is no perceptible pause between the extension of the arm and the advance of the body in lunging; the onward movement of the point is continuous. His circle parries have a large sweep with the point to protect the whole person, but the hand does not participate in this sweep, the arm being immovable, and the wrist the pivot. The half-circle parry of Bertrand is made with the nail upward, the hand at the height and to the right of the forehead, the arm more than half extended, the point very slightly depressed and projecting leftward about as far as the line of the left shoulder, rather but not completely in the direction of the adversary. The blade in this parry catches up the attacking foil and exposes the entire body of the attacker to a riposte, which comes with incredible velocity, the point after the half-circle parry being very near to the breast of the opponent. The extreme velocity and precision of the riposte of Bertrand is one of the remarkable features of his school, and this he attains by making his pupils rely upon delicacy of touch, not on the eye. Bertrand said: "You must think and see with the ends of your fingers." —The instruction for the small sword is the basis of the attack and defence with every other weapon, because it gives to the fencer a just appreciation of the application of the principle of the lever in parries, and a regularity of movement, together with lightness of hand and velocity of execution; nevertheless almost every attack and parry with the broadsword is the reverse of those with the small sword. Instead of having the point further out than the hand on the side of the guard, the blade is kept across the body; instead of the touch being the guide, the eye principally directs the movements; instead of piercing with the point, the hit consists of a cut with the blade. These peculiarities being kept in view, the lines of parry are nearly similar to those of the small sword, the object being to prevent the cut from the adversary by stopping the action of his weapon by causing the feeble of his blade to be checked abruptly by the forte of one's own. The precise height therefore of the hand of him who parries must be regulated by his eye in conformity with the direction of the attack. The arms and legs are special objects of attack; they can be secured by the parry, or by rapidly and momentarily withdrawing from danger the limb menaced. The cut can be given as a blow, which tends to render the hand heavy; or with a light hand, which makes the cut razor fashion. There are also circle parries called *moulinets*, whereby the man who parries swings round his sword, describing a complete circle with the point, and having his own wrist

as the pivot for the movement. A swordsman armed with a broadsword would, if fighting against an adversary armed with a small sword, keep at a distance from the latter, and would main his limbs; whereas the latter would strive to thrust in his point whenever his opponent should raise his hand to strike. The use of the broadsword on horseback is but a variation of its application by a combatant on foot; the horseman is obliged to protect his horse as well as himself. Heavy cavalry are armed with long heavy swords, and hit heavily. The Turks have curved scymitars and adopt the razor cut; they also use swords weighted at the extremity, whereby they combine together the blow and the razor cut. The Germans have a long sword which they (students especially) manœuvre with an extended arm; it may be regarded as the Neapolitan school applied to the broadsword. The bayonet at the end of the musket is, when employed by a line of soldiers, a very formidable weapon; but for an isolated man it is, on account of the leverage it offers, of little use unless to defend himself against a mounted dragoon. The motion of the bayonets in line (the stock of the musket grasped by the right hand and the barrel steadied by the left) should be straight forward; any attempt to parry by leverage right or left would only cause a point to glance from one man into some other. The foot soldier isolated can parry head or body cuts and thrusts from sabre or lance, and can riposte by jerking forward or right or left the point, striking the horse if he miss the rider. Certain modern bayonets used for the rifle corps are very long, with a view to compensate in a measure for the shortness of the firearms at the end of which it is fixed. Such bayonets have beside their point an edge wherewith to cut. The lance is utterly worthless, except for cavalry, by whom it can be most efficiently employed in pursuing a routed foe; its use as a fencing weapon, therefore, requires little explanation. The knife or dagger requires quickness of hand and eye. The blow can be given by striking downward, straight forward, or upward; in the two latter cases the weapon is shifted from the ordinary grasp of the handle, so that the pommel rests in the palm of the hand and the stab is given with ease and force. The Spanish colonists employ their hats held in their left hands as shields, and also to mask the attack, concealing the knife behind the hat. The stick is a formidable weapon used to inflict blows, as with the broadsword; the ferrule end can as a point be most effectually driven into the face of an adversary. The quarterstaff is out of use; it was held in the middle and used not only in striking but in thrusting, when one end was suddenly driven forward like a bayonet.—There are few treatises on fencing. In 1536 Marozzo of Venice published the first work on the subject, and Grassi of Venice enlarged the principles already reduced to writing by his predecessor. St. Didier of Paris compiled them in 1578, after which Danet wrote in 1766; Laboessière of

Paris in 1818 (*Traité de l'art des armes*); after whom Lafaugère (teacher of the hussars of the guard) enriched rather than reformed the art in an elaborate work (*Nouveau manuel complet d'escrime*, Paris, 1837). Bertrand, who both enriched and reformed it, and is justly styled the father of the present school (teacher of the body guard of Charles X., and subsequently professor at the polytechnic school in Paris), has written nothing; but his pupil Hugh Forbes has compiled and arranged his principles in a work in English and in French, entitled the "School of Bertrand"—*L'école de Bertrand*.

FÉNÉLON, FRANÇOIS DE SALIGNAC DE LA MOTHE, a French prelate and author, born at the chateau of Fénélon, Périgord, Aug. 6, 1651, died in Cambrai, Jan. 7, 1715. He was the son of Pons de Salignac, count of La Mothe Fénélon, and a nephew of the marquis of Fénélon, under whose care he received much of his education. At the age of 12 he was sent to the university of Cahors, and a few years later he removed to Paris in order to complete his course of philosophy in the college of Plessis. He next entered the theological seminary of St. Sulpice, under the direction of the abbé Tronson, and about 1675 received holy orders. He wished at first to devote himself to foreign missions, but this design was overruled; and after 8 years passed as a preacher and catechist at the church of St. Sulpice, he was appointed by the archbishop of Paris superior of the society of *Nouvelles Catholiques*, established for the instruction of female converts. Meanwhile he cultivated the friendship of the abbé Fleury and of Bossuet, bishop of Meaux, and was a frequent guest at the brilliant reunions which took place at the bishop's country seat. The distinguished society into which he was thus thrown, the charm of his manners, and his eloquence in the pulpit, soon drew him into public notice. To enable him to meet his expenses, one of his uncles, the bishop of Sarlat, gave him a small living at which he was not required to reside permanently. It yielded him 3,000 francs a year, much of which he spent upon the poor, and this until 1694 was his only income. His first public service was in the capacity of missionary to the Protestants in Saintonge and Poitou, after the revocation of the edict of Nantes. He was presented to Louis XIV. by Bossuet, and the only favor he asked of the king in accepting the office was that no violence should be used within the field of his mission. Aided by the abbés de Langeron and Fleury, but still more by his own mild and amiable character, he succeeded in winning over large numbers of the Protestants, and soon tranquillized a population whom persecution had roused to a dangerous excitement. On his return to Paris in 1689 Louis appointed him preceptor to his grandsons, the dukes of Burgundy, Anjou, and Berry. The first, the heir prospective to the throne, was a young prince equally remarkable for the brightness of his intellect and the viciousness of his temper. Comprehending at once the character

of his pupil, Fénélon so wisely blended stern with gentle measures, that without breaking the youth's spirit he gained over him a control which seemed almost like fascination. The virtues which afterward illustrated the duke's short history, and the warm affection which he always cherished for his preceptor, are the best proofs of the abbé's skill and devotion. It was for the use of his royal pupils that Fénélon composed his "Dialogues of the Dead," "Direction for the Conscience of a King," "Abridgment of the Lives of Ancient Philosophers," and the "Adventures of Telemachus." But the success with which he discharged his important and delicate trust gained him for some time neither praise nor pecuniary reward. Louis, though not blind to his merit, was never his friend; but Mme. de Maintenon had long been one of his warmest admirers, and it was probably through her influence that he received in 1694 the rich abbacy of Saint Valery. Toward the close of this year he drafted the famous anonymous letter to the king, setting forth the disorders and abuses of his reign, which was first published by D'Alembert in his *Histoire des membres de l'académie Française*, and whose authenticity, after much dispute, was settled by the discovery of the original MS. in 1825. It is not probable that Louis suspected the author, for in the following February he nominated Fénélon to the archbishopric of Cambrai. The ceremony of consecration was performed in the chapel of St. Cyr, July 10, 1695, but the new prelate retained his connection with his pupils, with whom it was arranged that he should pass 3 months of every year. Honored by the king, beloved by the young princes, esteemed and consulted by the most influential person of the court, and holding high stations in the church and the palace, he was now at the height of his prosperity; but his disgrace was already preparing. With a natural tendency to all that is mild and spiritual in religion, he had long felt a sympathy for the doctrines of Mme. Guyon, whose system of "quietism" was attracting a large share of attention at court, and had gained proselytes in the king's household. She was charged with heresy, and demanded a commission to inquire into the matter. Bossuet and Tronson were appointed, and before their conferences were closed, Fénélon, having become archbishop, was added to the number. The decision, drawn up in 84 articles, 30 of which were composed by Bossuet and the others by Fénélon, conveyed a qualified censure of Mme. Guyon's doctrines, though it respected her character. Mme. Guyon, however, continued to disseminate her ideas, and Louis, who, like royal voluptuaries before him, aspired to be a theologian, caused her to be arrested. Bossuet composed his *Instruction sur les états d'oraison* to counteract the extraordinary effect which she had produced, and asked for his book the approbation of the archbishop of Cambrai. But Fénélon was unwilling to go further than he had already gone in opposition to a pious en-

thusiast whose errors he thought were rather those of too fervid language than of heretical opinion. After publishing an explanation of his course, with which the stern and uncompromising Bossuet was far from pleased, he gave to the world in 1697 his *Explication des maximes des saints*, which was judged to be little else than the advocacy of a mitigated quietism, and completed the separation between him and his former friend. A violent controversy was thus opened. Bossuet denounced him to the court as a fanatic; the king struck his name from the list of preceptors to the royal family, and ordered him to retire to his diocese; Mme. de Maintenon withdrew her favor, and his friendship for Mme. Guyon was even made a theme for the grossest calumnies. He refuted these slanders with little difficulty, and meanwhile sent the obnoxious book to Rome, where Louis used all his influence to obtain its condemnation. After a delay of 9 months Innocent XII. pronounced a mild censure of the *Maximes des saints*, but addressed at the same time to certain prelates who had been most severe in their attacks on the author the following caustic rebuke: *Peccavit excessu amoris divini, sed vos peccastis defectu amoris proximi* ("He has sinned through excess of divine love, but you have sinned through lack of love for your neighbor"). Immediately on receiving the sentence, in March, 1699, Fénélon hastened to declare his submission, and to publish the condemnation of his own book in a mandatory letter. In the following month his "Adventures of Telemachus," which had hitherto remained in manuscript, was given to the world by the dishonesty of a servant who had been employed to have the work copied, but who sold it to a bookseller without disclosing the author's name. The king having been told that it was from the pen of the archbishop of Cambrai, and probably sharing an unfounded suspicion then current that the book was a satire on the court, took measures to suppress it; but a few copies escaped seizure, and an imperfect edition was printed in Holland in 1699. Others followed rapidly, and for a long time the press was unable to keep up with the public demand. This event destroyed all hopes of restoration to royal favor, and for the rest of his life Fénélon devoted himself exclusively to the affairs of his diocese and to literary pursuits. It was now that his character was seen in its brightest light. He visited the peasants in their cottages, shared their humble fare, heard their complaints, relieved their wants, and made his palace an asylum for the unfortunate. His charities were enormous. When his diocese was traversed by hostile armies during the war of the Spanish succession, he was allowed to pass unhindered through the ranks of the enemy on his errands of benevolence. He removed the theological seminary of Valenciennes to Cambrai, and admitted no one to orders until he had himself examined him 5 times. Though in exile, he was not in retirement. Temperate and simple in his own tastes, he yet dispensed

a polished and profuse hospitality, and made his table a favorite resort of the most distinguished persons. When his pupil the duke of Burgundy became dauphin by the death of his father, he addressed to him a "Plan of Government," proposing the establishment of states general and provincial, with many reforms in public administration; and had the prince lived to reign, it is thought that Fénélon would have been his prime minister. The archbishop did not long survive his pupil.—Of the excellence of Fénélon's best work, the "Adventures of Telemachus," no better proof could be given than its general and lasting popularity. It is said that no book except the Bible and the "Imitation of Christ" has been so often reprinted. Hallam denies it the high character of an epic, but gives it the first place among classical romances; and although the abandonment of verse, according to the same authority, has produced too much diffuseness, its purity of language, poetic spirit, richness of incident, and high lessons of politics and morals, claim for it the lasting admiration of posterity. His controversial writings, which comprise works against the Jansenists and Gallicans, on quietism, &c., are distinguished by that devotion to the church and gentleness of temper which characterized his life. His spiritual works, a collection of which (*Œuvres spirituelles*, 5 vols. 12mo.) appeared at Amsterdam in 1731, are used by persons of all denominations. His sermons (12mo., 1744), written during his youth, hold no very high place among productions of their kind, though not without eloquent passages. Among his other works are a *Traité de l'éducation des filles* (12mo., 1687), written at the request of the duchess of Beauvilliers; *Traité du ministère des pasteurs* (1688); *Démonstration de l'existence de Dieu* (1713), after "Telemachus" his longest and most important work; *Dialogues sur l'éloquence en général, et sur celle de la chaire en particulier*, with a *Lettre sur la rhétorique et la poésie*, addressed to the French academy (1718). The only complete edition of Fénélon's writings is that begun at Versailles in 1820 and finished at Paris in 1830 (34 vols. 8vo.). An edition appeared at Paris in 1787-'92 (9 vols. 4to.), to defray the cost of which the assembly of the clergy of France appropriated 40,000 livres; but this collection does not contain the *Maximes des saints*, the *Mandements*, nor the writings on Jansenism and quietism. Of the English translations of "Telemachus" the most esteemed is that of John Hawkesworth, LL.D. (4to., London, 1768, and 12mo., New York, 1859). The following may also be mentioned: by Smollett (2 vols. 12mo., 1776); in verse, by M. A. Meilan (4 vols. 8vo., 1776); in verse, by Gibbons Bagnal (2 vols. 8vo., Hereford, 1791); in blank verse, by J. Youde (8 vols. 12mo., 1793); with notes, by Joseph Robertson (2 vols. 12mo., London, 1795). The "Dialogues concerning Eloquence in General" were translated by W. Stevenson (8vo., London, 1722); the "Treatise on the Ed-

ucation of Daughters" was translated, "with an Original Chapter on Religious Studies," by Dr. T. F. Dibdin (8vo., Cheltenham, 1805); and the "Lives of the Ancient Philosophers" by John Cormack (2 vols. 12mo., Edinburgh, 1803). The "Demonstration of the Existence of God" (12mo., 1754), and the "Dialogues of the Dead" (12mo., 1757), were published by the Foulises at Glasgow. A selection from Fénélon's writings, with a memoir of his life, by Mrs. Follen, appeared in 1831 (16mo., Boston). Fénélon is known to have translated the *Æneid* for his pupils, but it was never printed, and the MS. is lost. His life has been written by the chevalier Ramsay (the Hague, 1723), the marquis of Fénélon, grand nephew of the archbishop (1747), Y. M. de Querbeuf (published with the Paris edition of 1787-'92), Cardinal Bausset (3 vols. 8vo., Paris, 1808; translated into English by Mudford, London, 1810, and abridged by Charles Butler, London, 1810), Lemaire (Paris, 1826), Beauchot (Lyons, 1829), Roy (Tours, 1842), Célariér (Paris, 1844), Villemain, Lamartine, &c. The *Histoire littéraire de Fénélon, ou revue historique et analytique de ses œuvres*, by the abbé Gosse-lin, appeared in 1848.

FENNEO, an African canine animal, resembling a diminutive fox, belonging to the genus *megalotis* (Illiger). So vulpine is its look, that Mr. Gray, in his catalogue of the British museum, calls it *vulpes Zaarensis* (Skiöld.). When first described by Bruce the traveller, its zoological position was so ill determined that Buffon, who gives a good figure of the animal, called it *lanonyme*; it was referred to rodents and quadrumana by others; but Zimmermann, from the examination of the teeth, seems first to have detected its dog-like affinities, and placed it in the genus *canis*; but whoever discovered its true position, there can be no doubt that it belongs at the end of the canine family of digitigrade carnivora. From the enormous comparative size of the ears Illiger established the genus *megalotis*, which does not appear to differ much from *vulpes*; taking this well-selected name of the genus, and the name of its first scientific describer for the species, it may properly be called *M. Brucei* (Griff.). According to Bruce, the animal is 9 or 10 inches long, with a foxy snout, ears half as long as the body and broad in proportion; the color white, mixed with gray and fawn color; the tail yellow, dark at the end, long, with soft and bushy hair like that of a fox; the ears thin, and margined with white hairs. The dentition, general appearance, and habits are canine; the feet are 4-toed, with the rudiment of a 5th, and the nails are not retractile as Desmarest at first supposed. It inhabits northern Africa, particularly Abyssinia, Nubia, and Egypt. There seems to be a second species, nearly allied to but different from Bruce's fennec, the *M. Lalandii* (H. Smith); this is gray, with the hairs of the dorsal line longer and blacker than the rest, and the tufted tail black with a gray base. Rüppell gives the discovery of the first species to Skiölde-

brand, a Swede, whom Bruce accuses of supplanting him by an unworthy artifice; he calls the fennec *canis zerda* (Zimm.), and makes it 28 inches long, including the tail, which is 8 inches. It lives in holes which it digs in the sand of the deserts, and not in trees as is supposed by Bruce; it is shy, very quick in its motions, and solitary; its food consists mainly of insects, especially locusts, eggs, dates, and other sweet fruits, and probably small animals; its bark resembles that of a dog, but is more shrill; the internal orifice of the ears is said to be very small.

FENNEL (*faniculum*, Koeh.), a genus of umbelliferous plants, to which the British species (*F. vulgare*, Willd.), found on chalky cliffs in the southern parts of England, belongs. It is cultivated for the sake of the pleasant aromatic qualities of its leaves. It is frequently to be met with in old gardens in the United States, relics of the once prevalent taste for herb culture. Its leaves are singularly spread out into finely cut and almost hair-like segments; its flowers are yellow, and the stalks of the plant are glaucous. Once introduced into the garden, it propagates itself for years. A more attractive kind is the *finocchio* or Azorean fennel (*F. dulce*), an annual cultivated in Italy as celery is with us. Its seeds are sown thinly in a good spot of light, rich earth, not dry nor very wet, as it will not thrive in either extreme. When the plants have grown a little they should be thinned out so as to be 6 inches distant from each other. The earth is to be drawn up about the stems to blanch them for table use. It is considered advisable to sow fresh seeds every 8 weeks during the season, to insure a succession of the crop. Several other species of fennel are known, some of which are admired for their pungency. The seeds (or "half fruits") are flat on one side and convex on the other, seldom exceeding $\frac{1}{4}$ inch in length. They have a fragrant odor, and warm, pleasant taste. Their infusion in boiling water is used as a carminative, and, having no actively exciting qualities, is employed to disguise by its pleasant aromatic nature the flavor of disagreeable medicines, as senna and rhubarb.

FENTON, ELIJAH, an English poet, born in Shelton, Staffordshire, May 20, 1683, died in East Hampstead, Berkshire, July 13, 1730. He studied at Cambridge, but becoming a non-juror he was obliged to leave the university, after which he accompanied the earl of Orrery to Flanders as private secretary. On his return to England in 1705, he employed himself in school teaching. In 1710 Mr. St. John (afterward Lord Bolingbroke) persuaded him to give up his school under a promise of political employment, which remaining unfulfilled, Fenton found himself much embarrassed and in debt. Lord Orrery now confided to him the education of his son, and 6 years later Fenton became associated with Pope, who was then undertaking his version of the "Odyssey," and was in quest of assistants. According to Dr. Johnson, Fen-

ton translated the 1st, 4th, 19th, and 20th books of that poem. In 1728 a tragedy entitled "Mariamne," which he brought out, had an immense success, and gained him more than £1,000. In 1727 he published a new edition of Milton's works, to which he prefixed a brief but elegant life of the author. This was soon followed by a fine annotated edition of Waller.

FENTRESS, a N. co. of Tenn., bordering on Ky., and drained by several affluents of Cumberland river; area, 570 sq. m.; pop. in 1850, 4,454, of whom 148 were slaves. The surface consists principally of high table-lands of the Cumberland mountains, affording excellent pastures. Timber is abundant, and coal is found in various places. The staple productions are grain and hay. In 1850 the county yielded 180,000 bushels of Indian corn, 26,866 of oats, 87,008 lbs. of butter, and 7,097 of wool. There were 5 churches, and 480 pupils attending public schools. Capital, Jamestown.

FENWICK, GEORGE, proprietor of part of Connecticut, came to America in 1636 to take charge of the plantation of Saybrook, so called after Lords Say and Brook, who, with others, in 1632 had procured a patent for the territory from Robert, earl of Warwick. Returning to England, he came back again in 1639, and from that time, as one of the patentees, and agent for the others, superintended and governed the settlement of Saybrook till 1644, when he sold its jurisdiction and territory to the Connecticut colony, as his associates had given up their contemplated removal to America. He afterward returned to England, where he was appointed one of the judges for the trial of Charles I., and died in 1657.

FÉNYES, ELEK, a Hungarian geographer and statistician, born in Csokaj, in the county of Bihar, in 1807. He took up his abode at Pesth in 1836, and became associated with the principal agricultural and industrial institutions and publications of that city. In 1839-'40 he published an "Account of the Present Condition of Hungary and Annexed Provinces," which obtained a prize of \$500 from the national academy. This was followed by "Statistics of Hungary," which is highly esteemed both in Hungary and Germany. In 1847 he published a manual containing a synopsis of his principal works.

FERDINAND. The sovereigns of this name will be treated in the following order: Germany, Naples, Spain, Tuscany. Austria will be included under Germany, Sicily under Naples, and Aragon and Castile under Spain.

I. GERMANY.

FERDINAND I., emperor of Germany, a son of Philip I. of Spain, and younger brother of Charles V., born at Alcala, Spain, in 1503, inherited the duchy of Austria and other German possessions, was elected king of Hungary and Bohemia after the death of his brother-in-law Louis II. in the battle of Mohács (1526), and succeeded his brother Charles V., after his resignation, on the throne of Germany (1558). In Hungary, where he inaugurated the unpopular reign of the Haps-

burgs, and was acknowledged only by a part of the nation, he had to wage a long war against his rival, the national king Zápolya, and the Turks under Solyman, who advanced as far as Vienna (1529). In Germany he was tolerant to the Protestants. He died in 1564. Of his 15 children Maximilian (II.) became his successor.

—FERDINAND II., emperor of Germany (1619–'37), king of Bohemia (1617–'37) and Hungary (1618–'37), grandson of the preceding, and son of Charles, duke of Carinthia and Styria, born in 1578, died Feb. 15, 1637. He early imbibed a profound hatred of Protestantism, and vowed at Loretto its extermination. His bloody persecutions, and his disregard of statutes, charters, and promises, brought about the outbreak of the 30 years' war (1618), of which he survived the most memorable events, the battle of Prague (1620), won by his friend and chief supporter, Maximilian of Bavaria; the victories and assassination of Wallenstein (1634); the sack of Magdeburg by Tilly, and his defeat at Breitenfeld by Gustavus Adolphus (1631); the last victory of the Swedish king at Lützen (1632), and the victory of the imperialists at Nördlingen (1634). Simultaneously he waged war against Gabriel Bethlen of Transylvania, and the malcontents of Hungary. He was far from having reached the end of his bloody work when he died.—**FERDINAND III.**, emperor of Germany and king of Hungary and Bohemia, son of the preceding, born in 1608, reigned from 1637 to 1657. He was of a milder and more tolerant disposition than his father, and during his reign the 30 years' war was terminated by the peace of Westphalia (1648). His son, who was crowned under the name of Ferdinand IV., as king of Bohemia, Hungary, and Rome, died before ascending the throne in 1654. His younger brother Leopold I., succeeded his father.

FERDINAND I., emperor of Austria, son of the last German emperor, Francis, born April 19, 1793, succeeded his father on the imperial throne of Austria, March 2, 1835. His weakness, bordering on imbecility, made him a mere puppet in the hands of his chief minister, Prince Metternich. In 1848 his kindness of heart would not allow him to suppress the revolution by violent means, and after having sanctioned and betrayed it, by decrees, oaths, and plots, all extorted from him, and after having fled repeatedly from his capital, he was prevailed upon, or rather compelled, by his crafty sister-in-law, the archduchess Sophia, to resign in favor of her son, the youthful Francis Joseph. Since that time he has mostly resided at Prague, enjoying in his retirement a certain degree of popularity with the masses, but without any political influence.

II. NAPLES.

FERDINAND I., first king of Naples, illegitimate son of Alfonso the Magnanimous, born in 1425, died Jan. 25, 1494. His father, who had ruled both Naples and Sicily, as well as Aragon and Sardinia, bequeathed to him at his death in 1458 the throne of Naples. His reign was

troubled, and the nobles conspired to aid John of Anjou in a descent upon the country. Ferdinand lost the battle of Sarno in 1460, escaped to Naples with but 20 followers, and was reduced to the last extremity. He was, however, favored by Pope Pius II. and by Francesco Sforza, duke of Milan; and his partisans were greatly strengthened by the alliance of the Albanian chieftain Scanderbeg, who put himself at the head of the army of Ferdinand, defeated John of Anjou at Troja in 1462, and forced him to leave Italy. Ferdinand was cruel and revengeful. Count Piccinino was one of his illustrious victims. In this reign the Turks made a descent upon Italy and captured Otranto, and Ferdinand recovered this city from them in 1480. Five years later the nobles revolted again, and Ferdinand, after yielding to their demands, refused to fulfil his promises, and put the leader of the revolt to death. He was excommunicated by the pope, and died while the formidable expedition of Charles VIII. of France was preparing to set out toward Italy.

FERDINAND I., king of the Two Sicilies (or Ferdinand IV. of Naples), born in Naples, Jan. 12, 1751, died in the same city, Jan. 4, 1825. When in 1759 his father Charles III. became king of Spain, he succeeded him upon the throne of Naples, in accordance with a family statute which prohibited the reunion of the two crowns. In 1768 he married Caroline Maria, daughter of the empress Maria Theresa, and left the affairs of government to his imperious wife and her favorite minister Acton. The cabinet of Madrid lost all influence over the court of Naples, which closely allied itself with the cabinets of Vienna and London, and in 1794 joined the coalition against France. Though forced in 1796 to make peace with France, Ferdinand renewed the war after the departure of Napoleon to Egypt, and drew upon his kingdom the arms of the French, who in 1799 entered Naples. Ferdinand with his family escaped in an English fleet to Palermo, and the Parthenopian republic was instituted in Naples. But after a few months Ferdinand was restored to his capital by a Calabrian army under Cardinal Ruffo. A terrible inquisition now began against the republicans, the city was abandoned to the lazzaroni, and Ferdinand seemed to have returned only to shed the blood of his subjects. The successes of the French in Germany and Italy obliged Ferdinand in 1801 to sign a treaty under which he was forced to surrender a portion of his territory, and to support French troops in the remainder, thus putting Naples under the domination of France. When the war broke out in 1805 between France and Austria, the haughty Neapolitan queen thought it a favorable opportunity for throwing off the French yoke, and prompted Ferdinand to violate the treaty and to receive the support of an Anglo-Russian army. Hardly had he done this when Austria, conquered at Austerlitz, signed the treaty of Presburg. The *Moniteur* in a significant article declared that of 8 daughters of

Maria Theresa, one had destroyed the Bourbon monarchy, the second had ruined the house of Parma, and now the third had lost the throne of Naples. Napoleon sent an army against Naples, obliged Ferdinand and his queen again to take refuge in Sicily, refused offers of negotiation, and in 1806 declared that the house of Bourbon had ceased to reign over that kingdom, and gave the throne first to his brother Joseph, and in 1808 to his brother-in-law Murat. Ferdinand, protected by England, was able to save Sicily from French conquest; but the queen, as little willing to bear English as French supremacy, embroiled herself with the English ambassador, Lord William Bentinck, and was obliged to leave the island in 1811, while Ferdinand was forced to resign his government to his son Francis. After Murat was dethroned by Austria in 1815, Ferdinand was restored to his former throne, and in 1817 united Sicily and Naples into a single state, under the title of the Two Sicilies. He abolished the constitution which he had been forced to grant in 1812, but was obliged to promise to restore it by a rising of the carbonari in 1820. He was soon after re-established in absolute power by the Austrians.

FERDINAND II., king of the Two Sicilies, grandson of the preceding, born in Palermo, Jan. 12, 1810, died in Naples, May 22, 1859. He succeeded his father Francis I. in 1830, and at once excited the most lively hopes by pardoning several political offenders and introducing economical reforms and liberal measures. Having thus lulled the revolutionary party, he changed his policy, adopting the principles of absolutism; and the history of the kingdom from that time is a history of conspiracies and rebellions, followed by trials, imprisonments, and executions. There were revolts in 1833, '37, '41, '44, and '47, but in every case order was restored by the prison and the scaffold. During the general agitation of 1848 all Sicily rose in rebellion, and 10,000 men in arms marched upon Naples to demand a more liberal government. A constitution was granted them, modelled after the French charter of 1830, but within a year Ferdinand dissolved the chambers, annihilated the constitution, and restored the ancient order of things. In 1849 Pope Pius IX. took refuge at Gaëta under his protection. In the contest with the insurgents Ferdinand had ordered the troops to bombard his rebellious cities, and thus obtained the epithet of *bombardatore*, abbreviated into "Bomba," by which he has often been designated. The harshest treatment was exercised toward the political prisoners in Naples, who were estimated by Mr. Gladstone in 1857 to number at least 13,000, though his statements were called in question by writers friendly to Ferdinand. In 1857 the seizure and confiscation of the *Cagliari*, a Sardinian merchant steamer in which revolutionists had been conveyed to Naples, led to a diplomatic rupture between Naples and Sardinia, France, and England, which lasted till after the accession of his son, Ferdinand III.

III. SPAIN.

FERDINAND I. (THE GREAT), king of Castile, Leon, and Galicia, born toward the beginning of the 11th century, died in Leon, Dec. 27, 1065. He was the 2d son of Sancho el Mayor, king of Navarre. In 1038 he received the hand of Sancha, the sister of Bermudo III. of Leon, and the title of king of Castile, this province being henceforth recognized as an independent sovereignty. On the death of Sancho in 1035, Bermudo attempted to reannex the new state to his dominion; but he was defeated and killed by Ferdinand in 1037. The young king of Castile forthwith claimed and received the crown of Leon, in right of his queen; and by able management and forbearance he reconciled to his cause many lords who at first had opposed his accession to the throne. He soon gained popularity by his respect for the laws of the country, his maintenance of the ancient *fueros*, and his strict administration of justice. His elder brother, Garcia III., king of Navarre, having attacked him in 1054, lost his life in a battle fought near Burgos, in the plains of Atapuerca. By this victory Ferdinand gained several districts which formerly belonged to Navarre, and became the most powerful among the Christian princes in the peninsula. He then turned his arms against the Mohammedans; in 1055 he crossed the Douro, seized many fortresses, and obtained great plunder and numerous captives. Two years later he took the important cities of Viseu and Lamego, and in the beginning of 1058 invested Coimbra, which he gained by capitulation, after a siege of 6 months. He had thus added to his dominion the whole country between the Douro and the Mondego. Toward the centre of the peninsula, he extended the boundary of Castile to the gates of Alcala de Henares, and carried hostilities into Valencia and Andalusia, compelling the emir of Seville to swear allegiance and to restore to him the relics of St. Isidoro. His last days were spent in extraordinary devotional exercises. Attacked by a sickness which he knew would be fatal, he returned to Leon; on the eve of his death he had himself carried to St. John's church, in a penitential habit, and breathed his last prostrated before the image of the saint.

FERDINAND III., saint, king of Castile and Leon, born in 1200, died in Seville, May 30, 1252. The son of King Alfonso IX. of Leon by Berengaria, queen of Castile, he was indebted to his mother for the latter kingdom, of which he was placed in possession in 1217. His power being firmly established, and the rebellious spirit of the Laras quelled, in 1225 he commenced against the Mohammedans a career of conquest which effectually broke the Arabian power in Spain. In concert with several other princes he first carried his arms through Murcia and Andalusia. Alfonso, dying in 1230, declared his marriage with Berengaria void, and designated his two daughters by his first marriage as his successors. Ferdinand interrupted his progress for a while to secure

the inheritance, which he soon accomplished, and thus permanently united the kingdoms of Castile and Leon. Being now sovereign of Spain from the bay of Biscay to the banks of the Guadalquivir, and from the confines of Portugal to those of Aragon and Valencia, he was enabled to push his conquests with renewed energy. In 1288 he triumphed over Aben Hud, king of Murcia; he then successively obtained possession of Toledo, Cordova, Ubeda, Truxillo, Jaen, and finally Seville, which surrendered Nov. 23, 1248, after a siege of nearly 2 years. Ferdinand was an unsparing enemy of the Jews and Albigenses who had sought a refuge within his dominions. He was canonized by Pope Clement X. in 1671.

FERDINAND IV., king of Castile and Leon, born in Seville in 1285, died in 1312. He was only 10 years old when his father, Sancho IV., died, and he saw himself assailed at once by his uncle Enrique, who coveted the regency, by Don Juan Nuñez de Lara, who wanted to increase his estates, and by the infantes of La Cerda, who claimed the crown, and who, respectively aided by the kings of Portugal and Aragon, aimed at a partition of the kingdom. In these difficult circumstances the young king was preserved by the ability of his mother, Maria de Molina. She succeeded in dividing his enemies, conciliated the king of Portugal, whose daughter Constanza was married to Ferdinand, and also made an alliance with the king of Aragon. Ferdinand in 1306 made war upon the Mohammedans, gained advantages over them, and took Gibraltar. The order of Templars having been abolished by Clement V., he confiscated their property and shared their spoils with the other orders of chivalry. In an expedition against the Moors, having ordered the two brothers Carvajal to be put to death upon mere suspicion, they cited him to appear with them, in 30 days, before the judgment seat of God; and within the prescribed time he was found dead on his couch, on which he had been taking his siesta.

FERDINAND THE CATHOLIC, V. of Castile, II. of Aragon, III. of Naples, and II. of Sicily, born in Sos, in Aragon, March 10, 1452, died in Madrid, Jan 23, 1516. The son of John II., king of Navarre and Aragon, and of his second wife, Juana Henriquez, he was, as early as 1468, through the influence of his mother, declared by his father king of Sicily and associate in the crown of Aragon. Oct. 19, 1469, he married, at Valladolid, Isabella, princess of Asturias, the sister and lawful heiress of King Henry IV. of Castile. On the demise of the latter, Dec. 12, 1474, Ferdinand and Isabella were proclaimed joint sovereigns of Castile. Several powerful nobles, among whom were the marquis of Villena, the archbishop of Toledo, and the grand master of Calatrava, aided by the king of Portugal, rose in arms in the name of Juana (called Beltraneja, from her supposed father, Beltran de la Cueva), whom the late king had recognized as his daughter, but who had been set aside by the cortes on a charge of illegitimacy, which was

never legally proved. Finally in 1479 a treaty put an end to the civil war, and Juana, deserted by all her partisans, took the veil. John II. having died at the beginning of the same year, Ferdinand inherited Aragon, and thus became the undisputed master of the peninsula, with the exception of Portugal, Navarre, and Granada. He now pursued a threefold policy: the extirpation of highwaymen, the curtailment of the immunities of the barons, and the maintenance of the Christian faith. The first had become very numerous during the civil wars, and their boldness had increased through the inefficiency of the general and local governments. They not only robbed travellers and merchants on the roads, but getting possession of castles in which they fortified themselves, they spread terror all over the country, levying tribute even on towns and villages. In this they were frequently aided by the nobles. The ordinary weapons of justice were powerless against them; but Ferdinand appealed to the people, and encouraged the organization of a militia and the union between townsmen and villagers, who took arms to protect their lives and property, thus reviving one of the most respected and useful institutions of old Spain, the *hermandad*, or brotherhood, which soon destroyed the bands of highwaymen and reestablished order and security. This brotherhood, which had existed at intervals and exercised great influence in Castile since 1295, was reorganized in 1476, perfected during the following years, and, its primary object being accomplished, greatly modified in 1498. Ferdinand improved this element of power in his struggle against the nobles, in which it again did good service; cities, towns, and villages threw off the yoke of their lords, while the king himself, by subjecting the nobles to the ordinary tribunals of justice, inflicted a deadly blow on their already diminished influence. He meanwhile succeeded in vesting in the crown the mastership of the great military orders. On the death of the grand master of Calatrava, in 1487, he forbade the election of a successor, assumed the administration of the order, and procured the papal sanction for this profitable usurpation. The orders of Alcantara and Santiago were dealt with in nearly the same manner, the first in 1494 and the second in 1499, and the chief dignity of both likewise became merged for ever in the person of the reigning monarch. But it was against apostates, or converts who after baptism reverted to Judaism or Islamism, that Ferdinand evinced a zeal which in many cases amounted to implacable hatred. The king (Isabella giving a reluctant consent) in 1478 obtained from Pope Sixtus IV. permission to establish the inquisition in Castile, with unlimited power over the property and lives of all religious delinquents. The intolerance was perhaps still greater against the Jews than the relapsed heretics. On March 30, 1492, an edict for their expulsion was issued by the sovereigns at Granada. The number thus driven forth is estimated by some as high as 800,000, but by others, according to Prescott with

more probability, at 160,000. Overwhelmed with misery, they sought refuge in Portugal, France, Italy, Africa, and the Levant. Before this, however, Ferdinand and Isabella had succeeded in accomplishing their long cherished design of destroying the last vestige of Moorish power in Spain. The kingdom of Granada, all that remained of the once powerful empire of the Moors, succumbed to the assaults of the Christian warriors; the city itself, the siege of which was conducted by the king and queen in person, surrendered Jan. 2, 1492, after a heroic resistance; and the last of its sovereigns, Abdallah or Boabdil, retired to Africa. That great event was soon followed by a far greater one: Columbus, sailing under the Castilian flag, discovered the western hemisphere; but in this Ferdinand had little if any share; he evinced no disposition to assist the discoverer, and the glory of having helped Columbus belongs exclusively to Isabella. Charles VIII. of France having conquered the kingdom of Naples in 1494, Ferdinand sent thither his great general Gonzalvo de Cordova, and within a few months the French were expelled and the Spaniards got a foothold in Italy, which advantage they afterward improved. In 1500 he concluded a treaty of alliance with Louis XII. of France, by which the two monarchs divided between themselves beforehand the kingdom, which was to be conquered by their united forces. The plan succeeded through French valor and Castilian cunning; but scarcely was this accomplished when the allies quarrelled, and Gonzalvo de Cordova, for the 2d time, drove the French out of southern Italy, which thenceforth remained in the hands of Ferdinand. Family difficulties interfered for a while with his power and the progress of his conquests. Juana, the only daughter left to him (Isabella having been married to Emanuel of Portugal, and Catharine to Prince Arthur, afterward to Henry VIII., of England), had been married in 1496 to the archduke Philip, son of the emperor Maximilian; and on the death of Isabella, in 1504, this young prince claimed the regency of Castile, in the name of his wife. This brought on a contest between him and his father-in-law, which, however, terminated in favor of Ferdinand by the premature death of Philip in 1506. The king found himself still at liberty to give undivided attention to the affairs of Italy, and exercise there a paramount influence, not by his arms only, but by his superior political talents. He took part in the league of Cambrai against Venice in 1508; then in the holy league in 1511 against the French, whom the princes of Italy desired to expel from the peninsula; and in all these transactions he was generally the gainer. Beside the kingdom of Naples, he added to his dominions several towns and fortresses on the coast of Africa, which were conquered by Cardinal Ximenes and Count Navarro in 1509 and 1510, and the kingdom of Navarre, which he wrested from Catharine de Foix and her husband, Jean d'Albret, in 1512. By a singular whim, or perhaps through the troubles created

by the archduke Philip, Ferdinand had been estranged from his grandson, Charles of Luxemburg, afterward emperor under the title of Charles V.; and he thought of depriving him of part at least of his inheritance. He had consequently married in 1505 Germaine de Foix, a niece of King Louis XII. of France; but the child he had by her died, and he was disappointed in his hopes. In 1513 he took a philtre for the purpose of restoring his exhausted vigor; but the potion only destroyed his constitution and produced a lingering illness which ended in death. Ferdinand was the founder of the greatness of Spain; he consolidated the whole peninsula, with the exception of Portugal, into a single political body; gained for the crown a power which it had never possessed before; extended its influence beyond the peninsula, and gave it weight in the general affairs of Europe. To reach the aim of his ambition he was far from being over scrupulous in his means; a crafty politician, he did not hesitate to break his royal word, or even his oath, when interest or bigotry commanded. But notwithstanding his perfidy and treachery, his memory has been held in great reverence in Spain; and the severity shown toward him by some historians, especially the French, cannot prevent posterity from regarding him as the ablest prince of his age. A just appreciation of his life and times may be found in Prescott's "History of Ferdinand and Isabella." (See ISABELLA II.)

FERDINAND VII., king of Spain, born in San Ildefonso, Oct. 18, 1784, died in Madrid, Sept. 29, 1833. He was the eldest son of Charles IV. and Luisa Maria of Parma. In 1789 he was declared prince of Asturias and heir apparent to the crown. Under the influence of his preceptor, the canon Escoiquiz, he early felt a strong aversion to Godoy, the notorious Prince of the Peace, the favorite of both his parents. This was aggravated by Maria Antonietta of Naples, whom he married in 1802, and kindled into hatred in 1806 upon the sudden death of his wife, whom he asserted without sufficient proofs to have been poisoned. Henceforth two hostile factions openly divided the court: that of Godoy, supported by the king and queen, and that of the prince of Asturias, comprising the great majority of the nation, who shared in his hatred of the favorite. The dissensions between the son and the father, who was but a tool in the hands of his queen and Godoy, grew into scandalous quarrels. The crown prince, at the instigation of Escoiquiz and others, addressed a letter to Napoleon, complaining of Godoy's conduct, and proposing to place himself under his protection, and to marry a member of his family. He also copied a memorial to the king against Godoy, which he was to have read to him in person; but Charles being made aware of his proceedings, and yielding to the solicitations of Luisa Maria, had him arrested, and kept in close confinement. A royal proclamation issued Oct. 30, 1807, denounced Ferdinand as having laid a plot against the power and even

b of his father. This, however, failed to an impression against the prince. His liancy and Godoy's want of decision pre-l matters from being pushed to extremes. ague but humble letter, Ferdinand con-that he had sinned against his father and implored forgiveness, and was publicly ned. These transactions were soon fol-by more serious events. The royal fam-ho acted under the advice of Godoy, hav-tempted to leave Aranjuez with the ulti-view of embarking for America, a sedition-out, March 18, 1808; the departure was-nted, and the people, infuriated against Go-tormed his palace, seized, wounded, and-ave murdered him, had not the prince-urias, moved by the tears of his mother, his influence over the crowd to save his. The king was so much frightened that he-ated the next day in favor of his son. lays later he attempted a retraction, main-g that his abdication had been forced; e prince, who had been active in all these-ctions, assumed the title of king, and made-lemn entry into Madrid, March 24. The-ula was already invaded by French troops, -urat soon marched into the capital. Fer-l hoped to conciliate Napoleon by sub-n; he went as far as Bayonne to meet-her, notwithstanding the empty honors- were paid to him, he found himself a-er, and was made to understand that he-restore the crown to his father. The old- his queen, her favorite, and the infantes- so been brought to Bayonne; interviews- held between the members of the royal- in presence of Napoleon; degrading- took place between Ferdinand and his- s; and yielding to a pressure he was un- resist, Ferdinand assented, May 6, to the-der of his royal title. But this title, and- rights it conferred, had already been re- by Charles into the hands of Napoleon. -mperor declared that "the house of Bour- -d ceased to reign in Spain," and placed his- r Joseph on the vacant throne. Ferdinand- immediately transferred to the castle of Va-; the property of Talleyrand. Meanwhile- anish nation rose in arms, and Napoleon, -hope of diverting Spain from the coalition- t him, liberated his captive; by the treaty- 11, 1818, he restored to him the Spanish- , on condition that he would make the- h evacuate the peninsula, secure a large- e to his parents, and keep in their offices- munities all the Spaniards who had been- service of King Joseph. On March 8, -Ferdinand left his prison; and on his- l in Spain he was welcomed by popular- nations. His progress to Madrid was a- ph; but his return became the signal of- most dreadful reaction. That he did not- by the terms of his treaty with Napoleon, -e expelled at once all the *afrancesados*, -nothing surprising; but he went much- r; all the proceedings of the cortes, whose

energetic measures had powerfully aided in the national resistance, were annulled; the old despotism, with all its abuses, was reestablished; and persecution was directed against the very men who had most strenuously resisted the French invasion, their attachment to constitutional freedom being deemed to outweigh their former services. All the members of the cortes or the regencies, all those who had participated in the framing of the constitution of 1812 or had faithfully adhered to it, were arraigned before courts martial, tried, and sentenced. A number perished on the scaffold; hundreds of the most illustrious were sent to dungeons in Africa or imprisoned at home; the most fortunate were exiled. For 6 years Spain was given up to the unrelenting cruelty of a revengeful tyrant. At last discontent ripened into insurrection, the signal for which was given by the army. Troops assembled at the isle of Leon to sail for South America revolted under Col. Riego, Jan. 1, 1820, and proclaimed the constitution of 1812, and the whole army followed their example. Ferdinand convoked the cortes and swore (March 9) faithfully to observe the instrument he had formerly annulled. Under the influence of a provisional junta who assumed the direction of affairs, he abolished the inquisition, banished the Jesuits, and reestablished the freedom of the press. On the opening of the cortes, July 9, he renewed his oath to the constitution, and appeared to act in perfect accord with that assembly, while at the same time he was intriguing to defeat the plans of his own cabinet and to encourage the plots of the opposite party. This double dealing soon brought about bloody riots and finally civil war in the capital and nearly all the provinces. The liberals or constitutionalists, who formed a large majority of the nation, were strenuously opposed by the serviles or ultra royalists. The latter, pretending that the king was a prisoner in the hands of the cortes, organized an apostolic junta, and raised bands of insurgents in Navarre and Catalonia, under the name of "army of the faith." Monks and friars, among whom Merino was conspicuous, were at the head of these bands. At Madrid, the royal guards, secretly incited by their own master, attempted in July, 1822, to reestablish by force his absolute power; but after a violent struggle they were put down. Henceforth the constitutionalists held Ferdinand in a kind of imprisonment scarcely disguised under court ceremonial. A liberal ministry was appointed; energetic measures were resorted to; the "army of the faith" was totally defeated; its chiefs and soldiers, as well as the ultra-royalist committee known as the regency of Urgel, fled to France. The revolution was thus triumphant; but the "holy alliance" were preparing for its overthrow. France, which had assembled an army of observation near the Pyrénées, received orders from the congress of Verona to march into Spain for the purpose of restoring Ferdinand's authority. On the news of the threatened invasion, the king was removed to Seville, March

20, 1823; and on the rapid advance of the French through the peninsula, he was declared to be insane, suspended from his power, superseded by a regency, and taken to Cadiz, where the constitutionalists intended to make a stand. But this project was baffled by the French army, which stormed the Trocadero, Sept. 15. The cortes then decided on declaring King Ferdinand reëstablished; and the monarch at once published (Sept. 30) a proclamation granting a general amnesty, and securing the engagements entered into by the constitutional government. But having left Cadiz the next day, he revoked the proclamation and all his acts since March 7, 1820; he made his solemn entrance into Madrid, with the applause of the ultra royalists, Nov. 13, and the work of vengeance commenced, and was continued for years. The noblest victims fell under the sword of the executioner, and terror reigned throughout Spain. Ferdinand did not even evince the least forbearance toward those who had served him most faithfully, but used his power against his friends as well as his foes. He had already been married 3 times and had no children, and took as his 4th wife, Oct. 11, 1829, Maria Christina, daughter of King Francis of Naples. This queen, much younger than her husband, gave him a daughter, Isabel, and procured from him the publication of a decree abrogating the Salic law. This excited the anger of the partisans of Don Carlos, the king's brother; and insurrectionary movements broke out in the provinces, while intrigues were set on foot at the court for the recall of the decree. During a temporary illness the king was prevailed upon to abrogate it; but Christina, resuming her sway over her husband's mind, had it confirmed, and received herself the title of regent, while Carlos and many of his adherents were ordered out of the kingdom. This rekindled civil war, which broke out with great violence, soon after the death of Ferdinand. His daughter, scarcely 4 years old, inherited the crown; but it was not secured to her till after a protracted and bloody contest.

IV. TUSCANY.

FERDINAND III., grand duke of Tuscany and archduke of Austria, born in Florence, May 6, 1769, died in the same city, June 18, 1824. He came into possession of Tuscany in 1790, when his father Leopold II. was called to the imperial throne of Germany. In the difficult period following the French revolution, he maintained a strict neutrality in the war against the French republic, which he was the first sovereign to recognize. By the treaty of Luneville in 1801 he lost the sovereignty of Tuscany, but in 1803 obtained as indemnity the archbishopric of Salzburg, with the title of elector of the empire. This electorate he exchanged in 1805 for the grand duchy of Würzburg, and was admitted into the confederation of the Rhine. After Napoleon's abdication in 1814 Ferdinand was restored to the grand duchy of Tuscany, but was again obliged to abandon his capital for a short time in 1815, when Murat proclaimed the

independence of Italy. The battle of Waterloo restored him to his throne.

FERGUSON, ADAM, a Scotch philosopher and historian, born in Logierait, Perthshire, June 20, 1723, died in St. Andrew's, Feb. 22, 1816. He was educated in Perth, and in the university of St. Andrew's. He selected the clerical profession, and studied in Edinburgh, where he became associated with Robertson, Blair, and Home. In 1745, though he had studied but half the required term, he was ordained, in consequence of having been selected for his knowledge of the Erse language to act as chaplain of one of the highland regiments, which he accompanied to Flanders. He remained in this situation till 1757, when he became conspicuous by his defence of the morality of stage plays, written upon occasion of the success of his friend Home's tragedy of "Douglas." In 1759 he was elected professor of natural philosophy in the university of Edinburgh, a position which he exchanged 5 years later for the chair of moral philosophy. In 1778 he came to America as secretary of the commission appointed to negotiate with the revolted colonies, his place in the university being supplied during his year's absence by Dugald Stewart, who in 1785 became his successor. In his 70th year Dr. Ferguson paid a visit to the principal cities of the continent, and was elected a member of several learned societies. The last years of his life were passed in St. Andrew's, where he observed a strictly Pythagorean diet. His "History of the Progress and Termination of the Roman Republic," published in 1783, is valuable for its philosophical reflections, clearness of style, and masterly portraiture of character. His "Essay on the History of Civil Society," which appeared in 1766, discusses the origin, end, and form of government, affirms the natural sociability of men, in opposition to the hypothesis of Hobbes of their natural hostility, and defends civilization against the charges of Rousseau. His philosophical views are contained in his "Institutes of Moral Philosophy," published in 1769, and in his "Principles of Moral and Political Science," published in 1792. He belongs by his general method to the school of Bacon, recommending everywhere experience and the study of facts as the condition of successful research into moral and physical laws.

FERGUSON, JAMES, a Scotch experimental philosopher and astronomer, born near Keith in Banffshire in 1710, died in London in 1776. He was the son of a peasant, and when only 7 or 8 years old his attention was turned to the study of mechanics by seeing his father use a beam for a lever, and a prop for a fulcrum. He occupied himself with drawing diagrams and constructing models till he understood some of the more remarkable properties of the mechanical powers. While employed in tending sheep he acquired the rudiments of his astronomical knowledge. His taste for drawing was also very decided, and he cultivated it with such assiduity that at length he became able to

support himself by taking portraits during the prosecution of his studies at Edinburgh. In 1743 he removed to London. In 1747 he published his first work, "A Dissertation on the Phenomena of the Harvest Moon;" and in 1748 he delivered in the metropolis a course of lectures on experimental philosophy and astronomy, which were so well received that he subsequently repeated them in most of the principal towns in England. George III. settled on him a pension of £50 a year. In 1768 he was elected a fellow of the royal society, and in 1770 a member of the American philosophical society. His latter years were mostly devoted to the delivery of his lectures, which had become very popular. The most important of his works are "Astronomy Explained on Sir Isaac Newton's Principles" (4to., London, 1756); "Lectures on Mechanics, &c." (8vo., 1760); "An Easy Introduction to Astronomy" (8vo., 1769); and an "Introduction to Electricity" (8vo., 1770.) Sir David Brewster published corrected editions of his "Lectures" and "Astronomy" in 1805 and 1811.

FERGUSON, SAMUEL, an Irish poet and prose writer, born in Belfast in 1810. His first writings, among which was "Willy Galliland," were published in the "Ulster Magazine." In Feb. 1832, his ballad, the "Forging of the Anchor," appeared in "Blackwood," and was introduced into the "Noctes." It is perhaps his finest composition. He continued to write for "Blackwood," and in 1834 became connected with the "Dublin University Magazine," which he afterward for a time conducted. His aim to elevate the standard of Irish literature and to reprove the caricaturists of Irish life appears in his "Hibernian Nights' Entertainments" (re-published in New York, 1857), and in his papers on Hardiman's collection of Irish minstrelsy (1834). He was called to the bar in 1838, and continues to practise his profession and to contribute to the "Dublin University Magazine."

FERGUSON, JAMES, a British architect and writer on art, born in Ayr, Scotland, in 1808. He was educated at the high school of Edinburgh, and after several years' experience in a counting house in Holland and England, went in 1829 to India, where for 10 years he was engaged in mercantile pursuits. Returning to England, he devoted himself to the study of art and literature. During his residence in India he had taken great interest in the ancient architectural remains, and among the fruits of his observations was a description of the rock-cut temples of Hindostan, with illustrations by himself (1845), and "Picturesque Illustrations of Ancient Architecture in Hindostan" (1847-'8). In 1847 he published "Ancient Topography of Jerusalem," in which he undertook to show that the building known as the mosque of Omar is the church of the holy sepulchre. In 1849 appeared the 1st volume of his "Historical Inquiry into the True Principles of Beauty and Art, more especially with reference to Architecture," which was succeeded by the "Illus-

trated Handbook of Architecture" (1855), in the preparation of which he used the materials already collected for the succeeding volumes of the former work. In these works he gives a complete survey of the architectural monuments of the chief nations of ancient and modern times, and offers many suggestions of great practical value. His "Palaces of Nineveh and Persepolis Restored" (1851), published while Mr. Layard's excavations were proceeding, exhibits a profound knowledge of the architecture of the Assyrians and Persians; and upon the subsequent establishment of the crystal palace at Sydenham, of which he was the general manager for some time after its opening, he personally superintended the arrangement of the Assyrian court. His attention had been drawn in India to the use and application of earthworks in modern fortifications, and he proposed the substitution of circular forms for angles and bastions, and of earthworks for masonry. On this subject he has also published the "Peril of Portsmouth," and "Portsmouth Protected."

FERISHTAH, MOHAMMED CASIM, a Persian historian of India, born in Asterabad, near the Caspian sea, in 1570, died in 1611. His father left his native country to travel in India, where he settled in the Deccan as instructor to the son of the reigning prince. The young Ferishtah was advanced to honors at court, and after the civil commotions and changes of government in the province in which he had lived, repaired to the court of Ibrahim Adil Shah in Bejapore, where he passed the remainder of his life, and wrote his history. This work, one of the most authoritative of oriental histories, was published in 1606, contains all the facts which the author deemed worthy to extract from more than 30 older histories, and is still in India the most popular history of the country. The introduction gives a brief account of India prior to the Mohammedan conquest, and then follows in 12 books a history of the kings of the different provinces, and of the European settlers. At the conclusion there is a short account of the geography, climate, and other physical circumstances of the country. After having been several times partially translated into English, the whole work, with the exception of some passages which have been since discovered, was published in London in 1829 by Col. John Briggs, under the title of the "History of the Rise and Progress of the Mohammedan Power in India, from its commencement in 1000 to 1620." Col. Briggs also published an edition in Persian at Bombay in 1831.

FERMANAGH, an inland co. of Ireland, province of Ulster; greatest length from N. W. to S. E. 45 m., greatest breadth 26 m.; area, 714 sq. m.; pop. in 1851, 116,007. It lies almost wholly in the basin of Lough Erne, which divides it lengthwise into two nearly equal portions, and is itself composed of two lakes, connected by a short river. Its W. part, on the borders of the counties of Leitrim and Cavan, is mountainous, and the rest of the surface is di-

versified by steep hills. The soil is as varied as the surface, but except a wide belt in the S. is not remarkably fertile. The productions are oats, barley, wheat, flax, potatoes, turnips, and hay. Cattle are bred on the high grounds, and butter, eggs, &c., are exported. Limestone, marl, potter's clay, and small quantities of coal and iron, are the chief mineral products. Timber is more abundant than in most Irish counties, but is grown principally on the large estates, many parts of the county having a barren and desolate appearance. There are no important manufactures, and few large towns; those worthy of notice are Enniskillen, Lisnaskea, and Lowtherstown. The county returns two members to the house of commons.

FERMENTATION, a term applied to various spontaneous changes which take place in organic matters after life has ceased. In these changes, the occurrence of which is dependent on a certain degree of heat and moisture, the elements of the bodies enter into new combinations among themselves, heat and gaseous mixtures being eliminated. Several kinds of fermentation are distinguished by chemists, and the tendency of chemical science is to refer to this principle a great variety of chemical changes. Formerly only 4 kinds of fermentation were recognized, viz.: the vinous, panary, acetous, and putrefactive; and some chemists still admit but 3, omitting the second named. The process is induced in an aqueous solution of suitable temperature by the presence of a nitrogenous organic body, which it is believed must itself be in a state of change or decay. Yeast or leaven is a familiar example of this substance, called the ferment. The principle has been variously explained by different authorities. Mitscherlich refers it to a vegetable production, and in the case of putrefaction to the action of a certain species of infusoria. Berzelius and others suppose that fermentation is produced by catalysis, the mere presence or contact of the ferment being sufficient to produce the phenomena in the other bodies, without itself contributing its own elements to the new compound. Liebig supposes that the chemical change taking place in the ferment, which is itself in a state of decomposition through the oxidizing action of the air, communicates a chemical or molecular movement to the elements of the other bodies in contact, inducing their rearrangement in other forms. The subject is incidentally treated in numerous articles in this work, and reference may be made to **ACETIC ACID**, **ALCOHOL**, **BREWING**, **CATALYSIS**, **EREMACAUSSIS**, **PUTREFACTION**, and **YEAST**.

FERNANDO DE NORONHA, a group of small islands in the Atlantic ocean, belonging to Brazil, situated about 210 m. N. E. of Cape St. Roque; lat. of S. E. extremity of the principal island, $3^{\circ} 50' S.$, long. $32^{\circ} 28' W.$ The shores of these islands are rocky, and difficult of access on account of the violence of the surf. The largest island, which gives the name to the group, is about 20 m. in circumference. In it

is a conical mountain about 1,000 feet high, the upper part of which is very steep, and on one side overhangs its base. It is composed of phonolitic rock, which has been severed into irregular columns. The whole island is covered with wood, but such is the aridity of its climate, there being sometimes no rain for 2 years, that vegetable production is very limited. The island contains 2 harbors, and its coasts abound with fish. It is used as a place of banishment by Brazil, whose government maintains a garrison there to prevent the escape of criminals. No woman is permitted to land on it. Another of these islands is about 1 m. square, and the rest are mere rocky islets, separated from the main island by very narrow channels.

FERNANDO PO, an island in the bight of Biafra, W. coast of Africa, about 25 m. from the main land, lying between lat. $8^{\circ} 12'$ and $8^{\circ} 17' N.$, and long. $8^{\circ} 26'$ and $8^{\circ} 57' E.$; pop. estimated at from 10,000 to 12,000. It is about 44 m. long and 20 m. broad. Rising in bold precipitous cliffs from the sea, its surface gradually becomes more and more elevated, until in Clarence Peak, near the N. extremity of the island, it attains an altitude of 10,650 feet. The rocks are wholly of volcanic formation. The soil, which is mostly covered with wood, is everywhere well watered and fertile. The scenery is exceedingly picturesque and beautiful, the highest summits and the deepest vales being alike adorned with luxuriant vegetation. The principal vegetable products are palms, the magnificent bombax, or silk cotton tree, the goora or sterculia, a species of ebony, the sugar cane, here growing wild, and yams, which form the staple food of the inhabitants. The most numerous quadrupeds are antelopes, monkeys, squirrels, and rats. The rivers abound in fish, but are also infested with alligators. The climate was once esteemed salubrious, but the majority of the Europeans who ventured to settle on the island having been carried off by fever, the British garrison was withdrawn in 1834. The coast is indented with several creeks and bays, the most capacious of which is Maidstone bay, at the N. E. extremity, where is situated the capital, Clarencetown (pop. 800 to 900), which was founded by the British in 1827, and is now chiefly inhabited by emancipated negroes from Sierra Leone. The aborigines of Fernando Po, called Edeeyahs, are widely different in appearance and language from the natives of the continent. They are of lighter complexion and better features, well made and muscular, and in disposition brave, generous, and amiable. Their dwellings are of very rude construction, consisting merely of palm-leaf mats thrown loosely over upright poles. This island was discovered by the Portuguese in 1471, and named after the leader of the expedition. In 1778 it was ceded to the Spaniards, who attempted to colonize it, but were repelled by the natives. In 1827 Spain permitted it to be occupied by the British, who soon abandoned it on account of its insalubrity; since which po-

riod the Spaniards have again claimed it and changed its name to Puerto de Isabel.

FERNEY, or FERNEX, a French town in the department of Ain, on the frontier of Switzerland, at the foot of the Jura mountains, about 5 m. from Geneva. It was a place of refuge for the Huguenots during the era of religious persecution in France, and was for 20 years the residence of Voltaire. When he bought the land, about 1758, Ferney was a miserable hamlet, consisting only of a few hovels. By his exertions it became a prosperous town, with nearly 1,500 inhabitants. He drained and cultivated the adjacent grounds, and caused Geneva watchmakers and other industrious artisans to settle there, while the constant concourse of visitors and travellers contributed to enhance the general prosperity. The death of Voltaire proved disastrous to the industry of the place, the persons employed in the manufacture of watches being reduced from 800 to about 200; but the inhabitants still cherish the remembrance of their benefactor, and admirers of Voltaire still make pilgrimages to Ferney. The château in which he lived has undergone many alterations, so that but few relics of him remain. His long cane, his seal, his silver inkstand, one of his wigs, his cap of white satin embroidered with gold, his MS. correspondence with Frederic the Great, and the library of his last secretary Wagnière, are all the curiosities which are left for the inspection of visitors. Adjoining the château are two small edifices, one the theatre and the other the church built by the philosopher. Upon the porch of the latter is the following inscription: *Deo erexit Voltarius*. In front of the château is the mausoleum which he had built with the utmost attention to artistic execution.

FERNS (*filices*, Jussieu), commonly herbaceous plants, with permanent root-like stems, buried under the soil, and emitting fibres from their surfaces, creeping over the surrounding objects, such as the stems of other plants or their roots, or between the crevices of rocks, and producing from their extremities a succession of new leaves from year to year. Sometimes the stem assumes an upright position, elongating into a simple trunk, and rising to the height of 50 or 60 feet, becoming then the most gigantic of the acrogens or flowerless plants, approaching the palms through the *cycadaceæ*, and vieing with them in beauty. These tree ferns are chiefly to be met with in the torrid zone, and there only are they found in abundance. Indeed, it has been thought that they were confined to the equatorial regions, but Mertens found them of 50 feet in height near Japan, in lat. 28°. R. Brown speaks of arborescent ferns at the southern extremity of Van Diemen's Land, and even at Dusky bay in New Zealand, near lat. 46°. The interior of the trunk of the tree ferns consists of a cellular substance, which often disappears, and among which bundles of fibro-vascular tissues are sometimes mixed; beyond the cellular centre lies a zone of woody plates, much folded and plaited,

which communicate with the footstalks of the leaves, and which commonly present a horse-shoe appearance when cut across. Each of these woody plates is soft in the interior, where the texture principally consists of scalariform and pitted vessels and cells; the whole covered with a hard cellular integument, which serves instead of bark. The trunks seem always to produce roots in great abundance from their surface, even when elevated in the air, clothing them, especially near the ground, with a thick matting, and affording ample means of nutrition, and perhaps some kind of protection. The same general structure as that of the tree ferns may be seen in the herbaceous species, such as are common in temperate and boreal regions. The leaves of the ferns are called fronds, and are inserted upon the stem by an angular base; they are often of considerable size, and are cut into repeated divisions called *pinnae*. Each leaf and leaflet (*pinna*) is penetrated by veins, and so diverse are these that a kind of natural arrangement of genera has been based upon the characters. Upon the back of the frond are special organs for propagation, called *sporangia*, or inaccurately fruit dots. These are at first generated under the epidermis, which is separated and borne upward to protect the sporangia. This scale of epidermis becomes the *indusium*. When fully ripe, the indusium falls away and leaves the sporangium more or less exposed. The sporangia assume a great variety of forms, whereby genera are determined. A large number of ferns belong to the sub-order *polypodiaceæ*, of which the rock fern (*polypodium vulgare*, Linn.) may be taken as a familiar type. In this plant we notice rounded, brown or cinnamon-colored dots, situated in rows upon the back of the leaf. On removing the indusium, numerous elastic rings, filled with round, seed-like bodies, will be seen, which are a sort of buds or bulbs from which new plants are to issue. In the *scolopendrium*, instead of rounded dots, the indusium covers numerous obliquely transverse lines of sporangia. In the maiden's hair (*adiantum pedatum*, Linn.), the edge of each leaflet seems to be turned over, and covers the sporangia beneath; and the same arrangement occurs in the brake (*pteris*, Linn.). Such as these are called dorsiferous ferns, in distinction from the adder's tongue (*ophioglossum vulgatum*, Linn.), where the spore cases or sporangia, having two valves, are collected into a spike formed out of the sides of a contracted frond, without any trace of an elastic ring. The spores themselves resemble fine powder, instead of conspicuous seed-like dust. The elastic rings are also wanting in the *danæaceæ* (tropical forms), whose spore cases are sunk within, or rarely seated upon the back of the leaflets. As the increase and normal propagation of the ferns is through these spores, some brief account of the mode will be proper. In some species, it may be remarked, bulbs and even viviparous offsets are produced on the fronds; yet these are exceptional cases. The spore, falling upon

the surface of the moist earth, develops in a few weeks into a small, tender, cellular, leaf-like organ called the *prothallus* or *proembryo*. This rapidly develops itself, until two distinct, small bodies, which represent the flower, make their appearance in different parts of the surface. After a while one or more of these alter in appearance and size, and tender roots are found to issue from beneath. The proembryo now disappears, leaving only one or more of these points attached by roots to the soil. These are the young forms of the ferns, and are thus germinated and growing buds, having an axis or future stem and roots. From this diminutive bud the fronds spring; and growing rapidly, they help to develop the axis or stem, to multiply the roots, and maintain the life of the plant. In a few years the young plants make strong and efficient organs, and the fronds now having grown to proper size begin to show by the appearance of the indusium that the seed cases are being formed, when the process goes on as before.—The value of the ferns is chiefly medicinal. The leaves generally contain a thick, astringent mucilage with a little aroma, and are considered lenitive and pectoral. Some Peruvian species are said to have solvent, deobstruent, sudorific, and anti-rheumatic properties. Some of the stems or root stocks of ferns are eaten by swine. The aborigines eat the roots of a Tasmanian fern, after roasting it. The common brake (*pteris aquilina*, Linn.) and a species of *aspidium* have been used in making beer, and *A. filix mas* has been employed as a substitute for tea. Some tropical ferns contain a fragrant aroma, used in scenting coconut oil. The ferns are all beautiful, and many are of exquisite proportions; and as ornamental plants for the garden or greenhouse, they are unsurpassed; moisture, shade, and a uniform temperature being the chief requisites in their cultivation.

FEROZEPOOR, a district of Sirhind, British India, forming part of the Cis-Sutlej territories, and crossed by the parallel of $30^{\circ} 45'$ N. lat., and the meridian of 75° E. long. Its boundaries, area, and population are imperfectly known, but the last is said to be very scattered. Not more than $\frac{1}{3}$ part of the district is cultivated, and a large proportion of the remainder is totally unproductive; but several ruined towns and villages indicate a former state of prosperity, and it is again rising into importance. It passed into the hands of the East India company in 1835.—FEROZEPOOR, a town and fort of the above district, 3 m. from the left bank of the Sutlej, 79 m. W. from Loodiana, and 1,181 m. N. W. from Calcutta; pop. about 6,000. It is surrounded by a ditch and a weak mud wall, and is a mean, dirty place, but an important military station for the British, who have made many improvements in its appearance. The ruins surrounding it show that it was once a very large town. On May 13, 1857, some companies of the 45th regiment of native infantry revolted here, scaled a dilapidated part of the

fort, were joined by the native guard inside, and attempted to seize the magazine. They were driven out by a handful of Europeans, and after burning and plundering the bungalows, mess houses, hospitals, and church, decamped. A European regiment was at the station, posted so badly that it was able to render no service. Two other native regiments were disarmed, one of which (the 10th cavalry) rose on Aug. 19, killed several persons, and attempted to seize the guns, but was repulsed and dispersed.

FERRAND, ANTOINE FRANÇOIS CLAUDE, count, a French politician and historian, born in Paris, July 4, 1751, died there, Jan. 17, 1825. At the age of 18 years he was admitted a counsellor in the parliament of Paris by special dispensation. He left Paris in 1789, and attached himself to the prince of Condé; and after the death of Louis XVI., he was appointed a member of the council of regency. He returned to France in 1801, devoted himself to literature, and published a work, on which he had been long engaged, entitled *De l'esprit de l'histoire*, which was a bold defence of absolute monarchy. The czar of Russia sent the author a flattering letter and a valuable ring. Ferrand was engaged to complete the unfinished "History of the Anarchy in Poland" by Rulhières; but the police prevented the publication on the ground that the work belonged to the government. Ferrand was accused of having changed the manuscript to suit his own ideas. After the restoration of the Bourbons he was appointed minister of state and postmaster-general.

FERRARA, the northernmost province of the Papal States, bounded N. by the main branch of the Po, which divides it from Lombardy, E. by the Adriatic, S. by the provinces of Ravenna and Bologna, and W. by Modena, from which it is partly separated by the river Panaro; area, 823 sq. m.; pop. in 1853, 244,524. The surface is flat, and in many parts below the level of the Po, and protected from inundations by embankments along the river. A considerable portion of the E. part of the province is almost constantly under water. The soil is rich and fertile, but the vast swamps render the atmosphere more or less unwholesome, especially in summer. The chief products are grain, rice, flax, hemp, wine, olives, and silk. Extensive pastures favor the rearing of cattle, and the fisheries are of some importance. The province formerly constituted the greater part of the duchy of Ferrara, which was ruled by the house of Este from the early part of the 13th to the end of the 16th century, when it was annexed to the Papal States. At the end of the 18th century it was taken by the French and formed part first of the Cisalpine republic, and afterward of the kingdom of Italy, until 1814, when it was restored to the pope, with the exception of a small portion between the Po di Goro and the Po della Macestra, which was secured to Austria by the congress of Vienna, together with the right of garrisoning the citadel of Ferrara. The province was governed by a papal legate or

cardinal, and was called a legation, until Nov. 1850, when it came under the administration of an inferior prelate, and is now a delegation, forming part of the legation of the Romagna, and divided into the districts of Lugo and Ferrara. The principal towns, beside the capital, are Lugo, Cento, Bagnacavallo, and Comacchio, the latter a fortified town lately garrisoned by Austrians, situated on an island in the midst of extensive swamps, and noted for its fisheries, which are celebrated by Tasso and Ariosto.—The capital, FERRARA, is situated in a flat, unhealthy country, only about 7 feet above the level of the sea, on the left bank of the Velano, an arm of the Po, about 5 m. S. from the main channel of that river, 26 m. from Bologna, and 88 m. from Ravenna; pop. in 1856, 32,000, comprising about 2,000 Jews, who are not permitted to reside outside of the ghetto. Ferrara was for a long time only a small village, until about the end of the 6th century, when it was walled by the exarch of Ravenna. The bishopric of Ferrara dates from 661, the archbishopric from 1735. Under the rule of the princes of Este the city gained great importance, especially in the 16th century, when it was one of the cities of Europe most celebrated for learning, poetry, art, and for the refinement and splendor of its ducal court. In the 15th century it was famous for its school of painting. In the early part of the 16th century it gave an asylum to Calvin and other religious reformers. Guarini, Boiardo, Ariosto, and Tasso were among the most illustrious ornaments of the court of Ferrara. The city had in its most prosperous era over 80,000 inhabitants. It still retains many vestiges of its former splendor. The churches contain fine works of art, especially that of the Campo Santo, which occupies the site of the old Certosa convent. The cathedral of St. Paul was consecrated in 1135, and contains the tomb of Urban III. Santa Maria del Vado is the oldest church of Ferrara. That of San Francesco is famous for its echo, which has 16 reverberations. Ariosto was buried in the church of San Benedetto, but in 1801 his remains were removed to the public library. The finest of the palaces of Ferrara are the diamond palace, or Villa Ercole, and the palace *del Magistro*, where the *accademia Ariostea* holds its sittings. In the hospital of Santa Anna a small room on the ground floor is still shown in which Tasso was confined as a lunatic for many years by Alfonso II.; and near Ferrara is the villa *Bel Riguardo*, where the poet paid his court to Eleonora of Este. The university of Ferrara was founded in 1264, renovated in 1402, closed in 1794, and reopened in 1824. It was again closed during the revolutionary troubles of 1848-'9, and reopened Nov. 1, 1850, after the reestablishment of the papal authority. It is chiefly renowned as a school of jurisprudence and medicine, and is attended by 200 to 300 students. It contains a collection of antiquities, a library of 80,000 volumes and 900 MSS., comprising some of Guarini, Ariosto, and Tasso, and many

valuable editions of the 15th and 16th centuries. Ferrara possesses one of the finest and largest theatres of Italy, a botanical garden, and many charitable institutions and convents. In the centre of the city is a castle flanked with towers and surrounded by wet ditches, which was formerly the palace of the dukes of Ferrara, and is now that of the papal delegate. The population is chiefly collected in the vicinity of this castle, and but thinly scattered over the remainder of the town. The city is enclosed with walls and defended on the W. side by the citadel. The Austrians took possession of the whole city in Aug. 1847, but the troops were withdrawn in December following, and the Austrian occupation remained confined to the citadel until July 14, 1848, when the city was seized by the Austrian general, Prince Liechtenstein. On Feb. 18, 1849, it was occupied for a short time by Gen. Haynau, who imposed upon the inhabitants a contribution of 200,000 scudi. In 1859, after the battle of Magenta, the Austrian forces withdrew from the citadel, when they evacuated all the other places they had occupied in the Papal States.

FERRARA, FRANCESCO, an Italian political economist, born in Palermo in Dec. 1810, became in 1834 director of the statistical department of Sicily, and founded the *Giornale di statistica*. Having expressed liberal political opinions, he was imprisoned in 1847, but released in the following year. In 1849 he was appointed professor of political economy at the university of Turin. He still (1859) holds this position, and among other valuable writings he has published *Importanza dell' economia politica* (Turin, 1849-'50). His most important publication is the *Biblioteca dell' economista*, which gives annually biographies of eminent political economists, and selections from important disquisitions on the science. He commenced it in 1850, and 10 volumes of it had appeared in 1858. He is a zealous advocate of free trade principles.

FERRARI, GAUDENZIO, a painter of the Milanese school, born in Valduggia in 1484, died in Milan in 1550. His principal works are illustrative of the story of creation and of the early events of Christianity, and are found in the galleries and churches of Lombardy. He was also a sculptor, architect, mathematician, and poet.

FERRARI, GIUSEPPE, an Italian philosopher and author, born in Milan about 1811. Toward 1831 he was graduated as a doctor of law in the university of Pavia, but devoted himself to literature, and became intimate with the philosopher Romagnosi, of whose views he published in 1835 an interesting account in the *Biblioteca Italiana*. In the same year appeared his complete edition of the works of Vico, reprinted in 1858, in Milan, in the collection of Italian classics. In 1837 he repaired to France, and published in 1839 *Vico et l'Italie* (in French), which gives a succinct account of Vico's influence on the Italian mind, and of the relation between his theories and those of modern philosophers. He also wrote a series of articles on

popular Italian authors in the *Revue des deux mondes*, which involved him in a controversy with M. Libri. In 1840 he became professor of philosophy at the college of Rochefort, and afterward at Strasbourg, where he took the place of the abbé Bautain. He was vehemently opposed by the Catholic party, who accused him of having advocated communistic theories. But this charge was only founded upon the circumstance that he had translated a passage of Plato on those subjects, and explained it to his pupils. He wrote a pamphlet to vindicate himself (*Idées sur la politique de Platon et d'Aristote*, 1842), but could not regain his professorship. In 1847 he published his *Essai sur le principe et les limites de la philosophie de l'histoire*. After the revolution of Feb. 24, 1848, he was reinstated in his office at Strasbourg, but the dislike of the French clergy followed him there, and to Bourges, whither he removed at the end of 1848, and they eventually succeeded in procuring his dismissal (June 13, 1849). He has written many works in French and in Italian, the most important of which is his *Histoire des révolutions d'Italie, ou Guelfes et Gibelins* (4 vols., Paris, 1856-'58).

FERREIRA, ANTONIO, the reformer of the national poetry of Portugal, born in Lisbon in 1528, died there of the plague in 1569. He was a contemporary of Camoëns, and perfected the elegiac and epistolary style already introduced with success by Sa de Miranda. He enriched Portuguese poetry with the epithalamium, the epigram, ode, and tragedy, and the influence which he exerted in kindling a love for classical scholarship caused him to be called the Horace of Portugal. His *Poemas Lusitanos*, which are distinguished by remarkable purity of language, appeared in 1598, and his complete works in 1771. His best comedy is *Comedia do Cioso* (the "Jealous Man"), and his masterpiece is the tragedy of *Ines de Castro*. An English translation of this tragedy, by Mr. Musgrave, appeared in 1825.

FERRET, a carnivorous digitigrade animal, belonging to the weasel family, and the genus *putorius* (Cuv.). The dentition is: incisors, $\frac{3}{3}$; canines, $\frac{1}{1}$; molars, $\frac{4}{3}$, 2 above and 3 below being false molars. Since the time of Linnæus the ferret has been generally considered a southern or albino variety of the polecat (*P. fustidus*, Klein), principally from their producing offspring together; but they may more properly be considered distinct species for the following reasons: the ferret is a native of Africa and warm regions, and only exists in Europe in a domesticated state, being very sensitive to cold, and requiring the protection of man; its size is smaller, its shape more slender, and its snout sharper than in the polecat; and its habits, though quite as sanguinary, do not enable it to live wild in the woods. The length of the ferret (*P. furo*, Linn.) is from 12 to 14 inches from nose to base of tail, the latter being about 5 inches long. It is an error to suppose that the

ferret is always white, with pink eyes, as such individuals are only albino varieties, such as occur in many other animals; the general color is an irregular mixture of yellow and black, the fur being long and fine, with an undergrowth of cinereous woolly hair; the yellowest animals are most subject to albinism. Both sexes are alike in color, but the male is the larger, being about 8 inches high at the shoulder and 4 at the sacrum. Though ranked as a domesticated animal, and employed by man to hunt rabbits and rats, it is far from docile or gentle, and never seems to have any affection for those who feed and take care of it. According to Strabo it was introduced from northern Africa into Spain, whence it has spread over Europe. In its natural condition it has the habits of the polecat and weasels, sucking the blood of small quadrupeds and birds, and devouring eggs; it is nocturnal, sleeping nearly all day; in captivity it is fed on bread and milk and raw meat. It produces young twice a year, and from 5 to 8 at a time; gestation is about 6 weeks, and the young are said by F. Cuvier to be born hairless, and with closed eyes, and to be frequently devoured by the mother. Its natural enmity to the rabbit has been taken advantage of by man, who trains it to enter the burrows of these animals, and to drive them out into nets spread over the entrance; the ferret is muzzled to prevent its killing the rabbits, otherwise it is believed it would suck their blood, and go to sleep in the burrow. It will also soon rid a house of rats and mice. For these reasons the ferret is cared for by man, without whose aid it would not survive in Europe; it is therefore carefully bred in captivity, and sometimes crossed with the polecat, which is supposed to increase its ferocity. The ferret is easily irritated, and then emits a strong disagreeable odor. It is generally believed that the ferrets kill by sucking the blood of their victims, aiming at the jugular vein or the great vessels of the neck; but the rapidity of the death is entirely inconsistent with so long a process as this. Experiments have shown that the ferret often inflicts but a single wound, which is almost instantly fatal, and frequently immediately disengages itself from the body of its victim to attack and kill another in a similar manner; the simple wound is in the side of the neck, under or behind the ear, and may or may not pierce the large blood vessels; the canines enter the spinal cord between the skull and the first vertebra of the neck, destroying its victim by the same process as the bull-fighter with his keen sword, or the Cuban executioner with the steel point of the garrote, making neither a lacerated nor a contused wound, but penetrating into the medulla oblongata, the very centre of life, and instantly arresting the action of the heart and respiratory muscles, and at once destroying consciousness, sensation, and motion. This is one of many instances in which the instinct of animals has anticipated the slow deductions of science. The truth seems to be that when the animal is of small

size, it is killed by the ferret by wounding the upper part of the spinal cord; but that when it is of superior size and strength, the ferret seizes it wherever it can, producing death by loss of blood, pain, and exhaustion of strength. After the animal is dead, the ferret, like other weasels, no doubt sucks its blood, though the statement generally made in works on natural history, from Buffon to F. Cuvier and Geoffroy St. Hilaire, that the death is uniformly caused in this manner, is certainly untrue.

FERRIER, MARY, a Scottish novelist, born in Edinburgh about 1782, died there in Nov. 1854. Her works, all published anonymously, are: "Marriage" (1818); "The Inheritance" (1824); "Destiny, or the Chief's Daughter" (1831). She possessed a rare ability for delineating national characteristics, genial wit, and a quick sense of the ludicrous. Sir Walter Scott pays a tribute to her talent at the conclusion of his "Legend of Montrose." She was his frequent guest at Abbotsford, and contributed by her society to relieve the sadness which clouded the last days of his life.

FERRO, or HIERRO, the most westerly and smallest of the Canary islands, in lat. 27° 40' N., long. 18° W.; length, 18 m.; breadth, 9 m.; area, 100 sq. m.; pop. 4,337. The ancient geographers supposed this to be the westernmost point of the world, and drew through it their first meridian, as is still done by German geographers, and others of eastern Europe who follow them. Chief town, Valverde.

FERROL, a seaport city of Spain, on the N. arm of the bay of Betanzos, in the province and 12 m. N. E. of the city of Corunna; pop. 14,286. Its harbor is one of the best in Europe. The town is well built, and protected on the land side by formidable fortifications. It has an immense marine arsenal, covering nearly 24 acres, with a basin and docks, which are among the most magnificent in Europe, but are decaying. The marine barracks afford accommodation for 6,000 men. Ferrol has a few manufactures, but being a military port, foreign merchant vessels are excluded from it. It was but a small fishing town prior to 1752, when its fortifications were begun by Ferdinand VI. The English failed in an attack upon it in 1799, but it was taken by the French in 1809 and 1823.

FERRY may be defined as a place where persons, animals, or goods are carried across a river or other water; but the more technical common law definition is a liberty or franchise so to transport persons or things. It can exist in England only by grant from the king, or by a prescription which supposes a grant; and being granted and accepted, the grantee is indictable if he have not suitable means of transport. In the United States, ferries are created as well as regulated generally by statutes, although there may be ancient ferries resting on usage and prescription. The termini of the ferry are at the water's edge, and shift with that if it varies; but the owner has a right of way to and from the ferry. Ferry-men

are common carriers, and have the rights and come under the obligations of common carriers. Thus, they may determine (within reasonable limits) when and how often, and upon what terms, their boats shall cross the water, and what they will transport; but all these things they must do by general rules, without favoritism or arbitrary exception. They are liable for all loss of or injury to property in their possession, unless it be caused by the act of God or of the public enemy. But this liability does not attach when persons or things are coming toward or going from their boats, but begins as soon as they are on the boat, or on the slip or flat, and continues while they are there. One who owns a ferry, and employs persons to do all the labor and the actual transport, is in law the ferryman, and liable accordingly. But if he leases the ferry, reserving only his rent, the lessee in possession, and not the owner, is the responsible ferryman; and this is true even if the rent reserved be a certain proportion of the receipts.

FERSEN, AXEL, count, born in Stockholm in 1755, killed June 20, 1810. He was educated chiefly at the military academy of Turin, and entered the Swedish military service, but afterward repaired to Versailles, and was made colonel of the royal regiment of Sweden, a famous body-guard of Louis XVI. He served in the American revolutionary war with distinction, and was aide-de-camp of Rochambeau at Yorktown. We find his portrait in a group of officers in Trumbull's picture of the surrender of Cornwallis, in the rotunda of the capitol at Washington; and it appears that he received the badge of the Cincinnati from the hands of Washington. Upon his return to France he became a devoted adherent of the Bourbons. Marie Antoinette especially distinguished him, and scandal was not slow to attribute her favor to improper motives. In the memorable flight to Varennes, Fersen was the disguised coachman of the royal fugitives. After their capture he escaped to Prague, and was employed by Gustavus III. in furthering the project of reinstating the Bourbon dynasty in France. He became the favorite of Charles XIII., and his sister enjoyed in an equal degree the favor of the queen; but both were unpopular with the people. Fersen was made grand marshal of the kingdom; but the sudden death of the crown prince, Christian Augustus of Angustenburg, gave rise to suspicion that Fersen had poisoned him. A tumult occurred at the funeral, and while the troops looked on with indifference, the mob slowly tortured Fersen to death in the great square of the Riddarhus in Stockholm. The sister, disguised as a Dalecarlian girl, escaped after great peril across the Baltic. There appears to be no probability that Fersen was implicated in the death of the prince; but the event is enveloped in profound mystery.

FESCOENNINE VERSES, licentious poems sung at the private festivals of the ancient Ro-

mans, particularly at nuptial celebrations. They derived their name and origin from Fescennium, an Etruscan city, where they seem to have been a rude dramatic entertainment improvised in the intoxication of rustic festivals. They were composed with the most unbounded license, accompanied with uncouth posturing and dances, and gave delight to the yet savage and untaught Romans. The later satire and comedy took its origin from them, and Catullus introduced them into his epithalamia; but in attaining a better literary character these verses hardly improved their morals.

FESCH, JOSEPH, cardinal, and archbishop of Lyons, born in Ajaccio, Corsica, Jan. 8, 1763, died in Rome, May 13, 1839. He was the son of a Swiss officer in the Genoese service, and half-brother of Letizia Ramolino, the mother of Napoleon Bonaparte. After pursuing his studies at Aix, in Provence, he received holy orders, and was archdeacon of the chapter of Ajaccio when the chapters were suppressed by the revolution of 1789. In 1793 he was exiled from Corsica with the Bonaparte family, and being without resources renounced his ecclesiastical habit and was appointed commissary of war to the army of Italy, of which his nephew Napoleon held command. He resumed his ecclesiastical functions when the first consul determined to reestablish in France the Catholic worship, and was active in the negotiations between Napoleon and Pius VII. which prepared for the concordat of July 15, 1801. The influence of his nephew raised him to the archbishopric of Lyons in 1802, and obtained a cardinal's hat for him in 1803. As ambassador of France at Rome in 1804, after conducting the negotiations, he accompanied Pius VII. on his way to Paris to crown the emperor. Many civil dignities and emoluments were subsequently conferred upon him, but in 1809 he declined the archbishopric of Paris, to which Napoleon, wishing to make some one of his family the head of the French clergy, nominated him. He was president of the council which sat in Paris in 1810, and also of the national council of 1811, called to consider the disagreement between Napoleon and the holy see concerning the nomination of bishops. In this capacity he did not satisfy the emperor, and for a time he disappeared from court; and he afterward adhered to the pope, greatly to the displeasure of his nephew. Upon the fall of Napoleon he retired to Rome, but was recalled to Paris during the Hundred Days. After the battle of Waterloo he lived in retirement in Rome. His collection of paintings, one of the largest ever brought together by a single person, was dispersed after his death.

FESSENDEN, THOMAS GREEN, an American author and journalist, born in Walpole, N. H., April 22, 1771, died in Boston, Nov. 11, 1837. He was graduated at Dartmouth college in 1796, and studied law in Vermont, employing his leisure hours in writing humorous poems for the Walpole "Farmer's Weekly Museum," then

edited by Joseph Dennie, and other papers. One of his poems, "The Country Lovers," was very popular in New England. In 1801 he went to England as the agent for a newly invented machine, the failure of which to answer its purpose involved him in pecuniary difficulties. Obligated to resort to his pen for a subsistence, he produced in 1803 a poem in the Hudibrastic vein, entitled "Terrible Tractation," in which the metallic tractors of Perkins are advertised, and the medical profession in general is satirized. It was successful in London, where it was published anonymously, and was attributed to Wolcott, Gifford, and others. It was republished in New York in 1804, and again in 1806 in an enlarged form, under the title of the "Minute Philosopher." A third edition appeared toward the close of the author's life. Mr. Fessenden returned to America in 1804, settled in Boston, and in 1822 commenced the publication of the "New England Farmer," with which he remained connected during the remainder of his life. He also edited the "Horticultural Register" and the "Silk Manual," and contributed articles on agriculture and horticulture to a variety of journals. His remaining works are "Original Poems," published in England and America, "Democracy Unveiled" (1806), "American Clerk's Companion" (1815), and "Laws of Patents for new Inventions" (1822).

FESSENDEN, WILLIAM PITT, a U. S. senator from Maine, son of the Hon. Samuel Fessenden, born in Boscawen, Merrimack co., N. H., Oct. 16, 1806. He was graduated at Bowdoin college in 1823, studied law, was admitted to the bar in 1827, opened an office in Bridgton, Cumberland co., Me., and in 1829 removed to Portland. In 1831 he was elected to the state legislature, and though the youngest member, he rose at once to distinction in that body, both as a debater and a legislator. In a debate on the U. S. bank the youthful orator displayed remarkable spirit and ability. From 1832 to 1839 Mr. Fessenden devoted himself exclusively to his profession, in which he very soon rose to the first rank both as a counsellor and advocate. In 1838 he was solicited to become a candidate for congress, but declined. In 1839 he was again chosen to the legislature from Portland. The house was largely democratic. Mr. Fessenden was placed on the judiciary committee, and though a whig from the first, and always distinguished for uncompromising assertion of his principles, he was made chairman of the house committee to revise the statutes of the state. In 1840 he was nominated by acclamation as the whig candidate for congress, and was elected, outrunning the strength of his party. In congress he participated in the current debates, and made speeches on the loan bill, bankrupt act, army appropriation bill, against the repeal of the bankrupt law, and in reply to Caleb Cushing on Mr. C.'s personal position. He was nominated for reelection in 1843, but declined, preferring to return to the practice of his profession. Meantime he receiv-

the legislature of that year the votes of the party for a vacant seat in the U. S. senate. He was again induced, by considerations growing out of the position of parties on the temperance question, to become a candidate for the legislature, to which he was chosen, as in the succeeding year, when he declined to run further. While a member in 1845 he received the votes of the whigs of the legislature for a seat in the U. S. senate. From 1846 to 1852 he was in private life, devoting himself to his profession with a constantly increasing practice and reputation. During this time he was associated with Daniel Webster in an important case before the supreme court at Washington, involving a legal question never before discussed in that court, viz.: how far the illegal acts of an auctioneer in selling property should affect the owner of the property when he being no party to the fraud. Mr. Fessenden had to contend against the weight and force of Judge Story's opinion and decided against his client in the court below. He was successful, and Judge Story's decision was reversed. Mr. Fessenden's argument on that occasion was remarkable for its logical force and keenness, and won the highest admiration of the most fastidious judges. Once during the session (in 1850) Mr. Fessenden was elected to the senate, but his seat was given to his competitor through an error in the returns. Mr. Fessenden declined to contest the case before congress on account of an unwillingness to serve in that body, which he had decisively expressed in advance to the conventions of the whig and freesoil parties, which, against his wishes, had insisted upon electing him. He was elected a member of the national convention which nominated Gen. Taylor for the presidency in 1840; was a member of the convention of 1848 which nominated Gen. Taylor, in which he supported the nomination of Mr. Webster; and a member of the national convention of 1852, which nominated Gen. Fremont. He was opposed to Mr. Webster on the last occasion, and advocated Gen. Scott's nomination, as one of the 67 who opposed and voted against the platform at that time set up by the party. In 1853 he was again returned as a member of the state legislature from Portland, and was chosen by one branch (the senate) as senator. The democrats had a majority in the house, and that branch failed to concur in the nomination by 4 votes; a concurrent vote being required to a choice, no election of senator was made at that session. The same house, though divided, elected to Mr. Fessenden in politics, associated with the Hon. Reuel Williams in negotiating the purchase of the large body of wild lands of Massachusetts lying in Maine, which was successfully accomplished. In the succeeding year (1854) Fessenden was again a member of the legislature, which was democratic in both branches. On the Kansas-Nebraska question operating as a dividing element, Mr. Fessenden was now elected a senator by both branches on the first ballot by a union of the whigs and freesoil dem-

ocrats. Though he declined to be elected except as a whig, this event may be said to have been the preliminary step toward establishing the republican party in Maine, the necessity of which new organization, after the action of the main body of the southern whigs on the Nebraska bill, Mr. Fessenden was one of the first to proclaim and advocate. He took his seat in the senate, Feb. 23, 1854, and on the night of March 3 following, at which time the bill was passed, delivered one of the most electric and effective speeches made against it. This effort established his reputation at once as one of the ablest members of the senate. Of his subsequent speeches in the senate the most important are on a bill to protect U. S. officers (1855); on our relations with England; on Kansas affairs, on the president's message (1856); on the Iowa senatorial election (1857); and on the Lecompton constitution (1858). Mr. Fessenden has also taken a prominent part in the general debates and business of the senate, being a leading member of the finance committee. He was re-elected as U. S. senator for 6 years in 1859, by a unanimous vote of his party in the legislature, without the formality of a previous nomination, it being the first instance of the kind in the history of the state.

FETH ALI SHAH, called before his accession BABA KHAN, second king of Persia of the Turcoman dynasty of the Kadjars, born about 1762, succeeded in 1797 his uncle Aga Mohammed, died in 1834. In 1803 war broke out between Persia and Russia for the possession of Georgia, whose ruler had transferred his allegiance from the former to the latter power. In 1805 Napoleon offered Feth Ali his alliance and protection in the prosecution of the war, and in 1807 sent Gen. Gardanne as ambassador to Persia. The treaty of Tilsit having, however, put an end to hostilities between France and Russia, the Persian king abandoned the French alliance for that of the English; but he was obliged in 1813 by the successes of the Russians to yield Georgia to the czar by treaty. In 1821 a war broke out between Persia and the Ottoman empire on account of the extortions and oppressions practised by Turkish functionaries upon Persian pilgrims, and was terminated in 1823 by a treaty favorable to Persia. In 1825 Feth Ali, thinking to profit by the death of the czar Alexander, and to reconquer Georgia, declared war against the Russians; but his army was vanquished by Gen. Paskevitch, and he was forced in 1828 to abandon Persian Armenia to Russia, and to make the Aras the boundary of his dominions. He amused himself in his leisure with writing verses, and left a collection of odes and songs.

FETIALES, or FECIALES, in ancient Rome, a college of priests, consisting of 20 members belonging to the noblest families, who held office for life, with power to fill vacancies in their number, and whose duty it was to carry the complaints and grievances of the Roman people before the magistrates and rulers of offending cities and tribes, to ask redress, to declare in case

of refusal whether there was sufficient reason for hostilities, to perform the religious rites of warning the enemy, of declaration of war, and of ratification of peace, and to watch over the strict observance of treaties. This institution is believed to have existed among the people of Etruria. Its introduction at Rome is attributed by some to Numa, by others to Ancus Martius. When the policy of Rome became that of continual conquest, the institution lost its influence, preserving only its religious character. The term is variously derived from the Latin words *fidus*, *fœdus*, *ferio*, and *facio*, and the Greek *φημι*.

FETICHISM, or FETISHISM (Nigritian *feitico*, a magic thing, from which the Portuguese have derived *feitição*, magic), the religious worship of material things (fetiches) as the abodes of spirits. It is the lowest of the unsystematic forms of worship found among uncivilized tribes, and exists especially among the negroes in Africa. There are two kinds of fetiches, natural and artificial. Among the former are celebrated rocks, particularly high mountain peaks where the lightning is supposed to dwell; single trees, and more frequently whole forests; many animals, as serpents, one of which has its own temple, where the snakes are kept by priestesses; snails, crocodiles (with the Ashantees), goats, sheep, &c. Usefulness and hurtfulness seem to have often dictated their selection, but not always. Artificial fetiches are either public, preserved by priests, or private, purchasable from them usually at a very high price. Kings and princes have large collections of fetiches, and every family has at least one. They are hereditary, and either hung up in the dwellings or worn on the neck or elsewhere, and are even fastened on domestic animals. They are made to resemble the human form, and the public fetiches are sometimes of gold and very large. The worshippers provide their fetiches liberally with food, but if their prayers are not granted they frequently maltreat them, throw them away, or beat them to pieces. They have also festivals and sacrifices. For the latter the victims are oxen, swine, and other animals; but sometimes, when the royal and priestly power are united in the sacrificer, criminals, prisoners, or persons of the lowest classes of the tribe are immolated. The festivals—among which the Yam and Adai festival with the Ashantees, and the festival in honor of Khimavong, the god or divine messenger, are especially celebrated—are generally attended by excess in drinking, thefts, fights, and gross licentiousness. The priests form a separate society, with hereditary dignity, property, and privileges. They have in particular the right of retaining the slaves who come to them, or, as they call it, present their bodies to the fetich.—See De Brosse, *Du culte des dieux fétiches* (Dijon, 1760), through whom the terms fetich and fetichism were introduced into the history of religious worship. It must, however, be observed that the limits of the term fetichism have not yet been agreed upon, as some exclude from it the worship of forests, mountains, rivers, &c.

FÉTIS, FRANÇOIS JOSEPH, a Belgian composer and writer on music, born March 25, 1784, in Mons, where his father was organist. He was intended for his father's profession, and at the age of 10 years he was able to undertake an engagement as organist in his native town. After taking lessons from the most eminent teachers in Paris, among whom was Boieldieu, he travelled in Germany and Italy, and made himself familiar with the works of the great masters of those countries. He returned to Paris in 1806, married a rich woman, and devoted himself to a profound study of the history of music, especially of that of the middle ages. In 1811, a reverse of fortune obliging him to return to the practice of his profession, he took the position of organist and teacher of music at Douay, and in 1818 was appointed professor in the conservatory of Paris. In 1827 he founded the first journal of musical criticism that had appeared in France, entitled the *Revue musicale*, which was continued till 1835. At the same time he was pursuing his researches upon the theory of harmony, writing articles for various periodicals, and volumes upon the history and curiosities of music, and composing operas and pieces of sacred music. In 1832 he began his historical concerts, which have since found imitators in Germany and England. In 1833 the king of Belgium appointed him chapel master and director of the royal conservatory of Brussels, which offices he still holds. His most successful opera was *La vieille*, but his musical compositions have been less favorably received than his works on the history of the art. Among the most important of the latter was *Biographie universelle des musiciens, et bibliographie générale de la musique*, preceded by an epitome of the history of music (8 vols., Brussels, 1835-'44). Among his more recent writings are *Traité complet de la théorie et de la pratique de l'harmonie, contenant la doctrine de la science et de l'art* (Paris, 1853), and a sketch of Meyerbeer in the *Revue contemporaine* (Paris, 1859).

FEUCHÈRES, SOPHIE DE, baroness, mistress of the last prince of Condé (Louis Henri Joseph, duke of Bourbon), born in the isle of Wight about 1795, died in England, Jan. 2, 1841. She was the daughter of a fisherman named Clarke, represented herself as the widow of a Mr. Dawes, and is believed to have been for some time an actress; but the accounts of her life are conflicting until about 1817, when she became the mistress of the prince of Condé. At his instigation she married in 1818 the baron Adolphe de Feuchères, who became a member of his household, on which occasion the prince settled upon her 72,000 francs per annum. In 1822 she was divorced from the baron. She exercised over the weak mind of Condé an almost unbounded influence. In 1824 he presented her with the domains of Boissy and St. Leu, and in 1825 with 1,000,000 francs, beside leaving her 2,000,000 by his will, dated Aug. 30, 1829. A year afterward (Aug. 27, 1830) the prince was found dead in his room, under circumstances which

the suspicions of his relatives upon the countess, and also upon Louis Philippe; for in order to ingratiate herself with the Orleans family she is said to have prevailed upon the prince to bequeath the bulk of his large fortune to his nephew, the duke of Aumale, a disposition which before his death he seemed inclined to retain in favor of the count of Chambord. His wife was accused her of having murdered the countess, and insisted upon a judicial investigation; nothing could be proved against her, and the prince's death was ascribed to suicide. The efforts of the prince's relatives to break the will were equally fruitless; but public opinion was against the baroness, and the trial created a great sensation. (See *Histoire complète des rois relatifs à la mort et au testament du duc de Bourbon*, Paris, 1832.) She left her immense fortune to her niece, Mlle. Sophie Tancrède. The baron de Feuchères gave to the hospital of Paris the whole amount of his share of the property of his former wife.

FEUDAL SYSTEM, the name given to the condition of society that prevailed throughout the greater part of Europe during the middle ages.

Of its origin little is known, and learned men have differed largely on the subject, but they have inquired into its history under the idea that it was from the first a system, and that it was long in coming to maturity.

Some of its conditions existed for several centuries in Europe anterior to its establishment.

Its germs were probably Asiatic, and in fact it has outlasted the system established in Europe, though in that quarter of the world it was so fully developed as it came to be in Western nations. The countries in which it had the firmest existence were France, Germany, Aragon, a large part of Italy, England, and Scotland. Other European countries were more or less influenced by it, in them it never had the hold which it had in those we have named. The cause of the system was so little developed in Castile, explained by Prescott. "The nobles," he says, "embarked with their sovereign in the common enterprise of rescuing their ancestral patrimony from its invaders, felt entitled to share with him the spoils of victory. Issuing forth at the head of their own retainers, their strongholds or castles, they were actually enlarging the circuit of their territory with no other assistance than that of their own good swords. This independent mode of effecting their conquests would appear unfavorable to the introduction of the feudal system, which, although its existence in Castile is not ascertained, by positive law, as well as never prevailed to anything like the same extent as it did in the sister kingdom of Aragon and other parts of Europe." The system spread in Europe from the 5th to the 9th century, and was the consequence of that struggle between barbarism and for civilization in which men were constantly engaged. It had, like all systems that have lived for any great length of

time, a progressive formation. "No great fact," says M. Guizot, writing on this subject, "no social state, makes its appearance complete and at once; it is formed slowly, successively; it is the result of a multitude of different facts, of different dates and origins, which modify and combine themselves in a thousand ways before constituting a whole, presenting itself in a clear and systematic form, receiving a special name, and standing through a long life." So it was with the feudal system, which emerged into life after several centuries of barbarism. The struggle out of which it grew began with the fall of the imperial authority in so many parts of the Roman empire; and when feudalism had established itself, the way had been prepared for a far greater advance toward the establishment of civilization. In France, feudalism was brought into a rude but intelligible form in the 10th century, and "the feudal period" is held to synchronize with the 10 generations during which the throne of that country was held by the elder branch of the Capet family, that is to say, from the accession of Hugh Capet to the death of Charles the Fair, 987-1328. For some generations previous to the extinction of the Carolingian dynasty it had had a rude existence, and many of its incidents are traceable in legislation to the reign of Charlemagne, throughout the limits of whose vast dominion feudalism had at a later period its fullest continental development. "The regular machinery and systematic establishment of feuds, in fact," says Hallam, "may be considered as almost confined to the dominions of Charlemagne, and to those countries which afterward derived from them." It is not, however, until a much later period that we find "the feudal period" clearly established. As the object of the great monarchs of the Carolingian line was the establishment of a consolidated empire, it can scarcely be held that they deliberately sought to develop a system the very essence of which was the disintegration of every country in which it existed. As has been justly said: "The peculiar general character of feudalism is the dismemberment of the people and of power into a multitude of petty nations and petty sovereigns; the absence of any useful nation, of any central government." The imbecility of the later kings of the second race favored the advance of feudalism in France; and in that country it was known earlier than anywhere else, and there it received its essential peculiarities. At the time of the conquest of Gaul, and the rise of the Merovingians, there were many freeholds, that is, independent properties, but in the course of the 5 following centuries most of these had disappeared. The beneficiary condition became the common condition of territorial property. Benefice and fief are words that express the same facts at different dates. In the middle of the 12th century *feodum* and *beneficium* were used indifferently, as they had been used for some time previously to that date. The exact na-

ture of benefices has been the source of considerable dispute, but the better opinion is, that their ordinary duration was the life of the possessor, after which they reverted to the fisc; yet there were instances of hereditary benefices as early as the Merovingian times. The tendency to retain property in their families would lead men to make use of a variety of means to render what they held hereditary, while the weakness of the kings would not enable them to resist claims powerfully urged in behalf of the sons of beneficiaries. "A natural consequence of hereditary benefices," says Hallam, "was that those who possessed them carved out portions to be held of themselves by a similar tenure. Abundant proofs of this custom, best known by the name of subinfeudation, occur even in the capitularies of Pepin and Charlemagne. At a later period it became universal; and what had begun perhaps through ambition or pride was at last dictated by necessity. In that dissolution of all law which ensued after the death of Charlemagne, the powerful leaders, constantly engaged in domestic warfare, placed their chief dependency upon men whom they attached by gratitude, and bound by strong conditions. The oath of fidelity which they had taken, the homage which they had paid to the sovereign, they exacted from their own vassals. To render military service became the essential obligation which the tenant of a benefice undertook; and out of those ancient grants, now become for the most part hereditary, there grew up in the 10th century, both in name and reality, the system of feudal tenures." A marked distinction between the hereditary right to the benefice and the right of fiefs was this: "Whenever the beneficiary or the giver died, the possessor of the benefice thought it necessary that he should be confirmed in his possession; so strongly was the primitive idea of the personality of this relation and the right which resulted from it engraved upon their minds. At the end of the 10th century, when we enter truly into the feudal period, we no longer find any thing of the kind; the right of fiefs, inheritance, is no longer called into doubt by any one, it has no longer any need of confirmation." Under the feudal system the territorial element was known as the fief, and it has been argued that this did not mean originally the land itself, but only the tenure thereof, its relation of dependence toward the suzerain; but the weight of authority is adverse to this view, though it is admitted that at a later period there may have been some such distinction made. Whether *feodum* is of Latin or German origin is not distinctly settled, but the German claim is best supported. The titles, or most of them, which became so identified with feudalism, were not originally hereditary, but were made so gradually, like the property possessions which rendered the great vassals so powerful. Dukes, counts, and marquises, or margraves, were at first provincial governors, officers intrusted with certain specific duties, the margraves being charged with the custody of the frontiers.

The weakness of the Merovingian kings caused those officers to become very important persons in the state. The Carolingians sought to lessen their power, and with some success so long as that race produced able kings; but under Charlemagne's successors the counts rapidly acquired influence and wealth, and political station. The same man was allowed to enjoy several counties, in all of which he endeavored to acquire landed property, and to assume a right to his dignities. In the last quarter of the 9th century the succession of a son to a father's county was a recognized usage; and "in the next century there followed an entire prostration of the royal authority, and the counts usurped their governments as little sovereignties, with the domains and all regalian rights, subject only to the feudal superiority of the king. They now added the name of the county to their own, and their wives took the appellation of countess. In Italy, the independence of the dukes was still more complete; and although Otho the Great and his descendants kept a stricter rein over those of Germany, yet we find the great fiefs of their empire, throughout the 10th century, granted almost invariably to the male and even female heirs of the last possessor." Thus the hereditary principle was recognized in a double respect—as related to the possession of land, and as related to the possession of political power. The counts became the enemies of the allodial proprietors, whose importance was derived from a system entirely unlike that upon which their consequence rested. The allodialists, or independent proprietors, had no protection. The king and the law could not prevent them from being spoiled by their enemies. Many of them surrendered their lands, and received them back upon feudal conditions; or they acknowledged themselves vassals of a suzerain. Yet the allodial lands were not entirely extinguished. They were common in the south of France, the strength of the feudal tenures being between the Somme and the Loire. According to the old French law, allodial lands were always noble, like fiefs, down to 1580. In the German empire many estates continued to be held by allodial tenures. This part of the subject, however, is involved in considerable obscurity, for in the royal charters of the 10th and 11th centuries the word *allodium* is continually used for a fief, or hereditary benefice.—Hallam notices the custom of "commendation," concerning which other writers are silent. "Several passages in ancient laws and instruments," he says, "concur to prove, that beside the relation established between lord and vassal by beneficiary grants, there was another species more personal, and more closely resembling that of patron and client in the Roman republic. This was usually called commendation, and appears to have been founded on two very general principles, both of which the distracted state of society inculcated. The weak needed the protection of the powerful; and the government needed some security for public order. Even before the invasion of the

Salvian, a writer of the 5th century, as the custom of obtaining the protection great by money, and blames their rapaciousness because he allows the natural reasonableness of the practice. The disadvantageous condition of the less powerful freemen, which ended in servitude of one part, and in the feudal age of another, led such as fortunately reserved their allodial property to insure it by a stipulated payment of money. Payments may be traced in extant charters, chiefly indeed of monasteries. In the case of free persons, it may be presumed that the voluntary contract was frequently changed in favour of the stronger party into a perfect feudal dependence. From this, however, as I imagine, it probably differed, in being capable of dissolution at the inferior's pleasure, without incurring forfeiture, as well as having no relation to Homage, however, seems to have been distinct from commendation, as well as to vassalage. Military service was sometimes the condition of this engagement. It was the law of the land, so late at least as the commencement of the third race of kings, that no man could take part in private wars except in defence of his own lord. This we learn from a historian of the end of the 10th century, who relates that Erminfrid, having been released from bondage to Count Burchard, on ceding the land he had held of him to a monastery, renewed the ceremony on a war breaking out between the count and another nobleman, wherein he was anxious to give assistance; since, the chronicler observes, it is not, nor has been the custom in France, for any man to be concerned in a war except in the presence or by the command of his lord. Indeed, there is reason to infer from the capitularies of Charles the Great that every man was bound to attach himself to some lord, though it was the privilege of a free man to choose his own superior. And this is strongly supported by the analogy of our Saxon laws, where it is frequently repeated that no man should continue without a lord. There are, too, as it seems to me, a number of passages in Domesday book which confirm this distinction between personal bondage and the beneficiary tenure of land. Perhaps I may be thought to dwell too long on this obscure custom; but as it tends to illustrate those mutual relations of lord and vassal which supplied the place of regular government in the polity of Europe, and has seldom or never been explicitly noticed, its introduction seemed not improper."—By the edict of Conrad II., emperor of Germany (1024), 4 regulations are established: "that no man should be deprived of his fief, whether by the emperor or a mesne lord, but by the judgment of the empire, and the judgment of his lord; that from such judgment an immediate appeal might be made to his sovereign; that fiefs should be inherited by sons and their children, and, in their failure, by brothers, provided they were of the *suda paterna*, such as had descended from

the father; and that the lord should not alienate the fief of his vassal without his consent." This edict, though relating immediately only to Lombardy, is thought to mark the full maturity of the feudal system, and the last stage of its progress. Its object was to put an end to disagreements between inferior vassals and their immediate lords, which had been caused by the want of settled usage. Guizot is of opinion that the essential facts, the constituent elements of the feudal system, may be reduced to three, viz: 1, the particular nature of territorial property, real, full, hereditary, and yet derived from a superior, imposing certain personal obligations on its possessor, under pain of forfeiture; in a word, wanting in that complete independence which is now its characteristic; 2, the amalgamation of sovereignty with property, the attribution to the proprietor of the soil, over all the inhabitants of that soil, of the whole or nearly the whole of those rights which constitute what we now call sovereignty, and which are now possessed only by government, the public power; 3, the hierarchical system of legislative, judicial, and military institutions, which united the possessors of fiefs among themselves, and formed them into a general society. These, he thinks, are the truly essential and constitutive facts of feudalism, containing all the others, though it would be easy to resolve it into a larger number of elements, and to assign to it a greater number of characteristics. Of territorial property we have already spoken. Of feudal relations, support and fidelity were the principal. The vassal owed service to his lord, and the lord protection to his vassal. If the vassal failed in his obligation, his land was forfeited; if the lord failed, he lost his seigniorship. It is disputed whether the vassal was bound to follow his lord's standard against his own kindred. As respected the king, the relations were loose and shifting. There are instances of vassals aiding their immediate superiors against the king; and the royal power was always in antagonism to the feudal system.—The ceremonies followed when a fief was conferred were principally homage, fealty, and investiture. The first expressed the submission and devotedness of the vassal toward his lord. The oath of fealty differed little in language from the act of homage, but was indispensable, was taken by ecclesiastics, but not by minors, and could be received by proxy. Investiture was the actual conveyance of feudal lands, and was proper or improper. By the first, the vassal was put in possession upon the ground, by the lord or his deputy, which the English law calls livery of seisin; by the second, possession was given symbolically, by the delivery of a branch, turf, or stone, or some other natural object, according to custom. Nearly a hundred varieties of investiture are mentioned. The vassal's duties commenced with his investiture. These were very numerous, and it is impossible to define them at large. They embraced nearly every obligation that can exist in such a state of soci-

ety as then prevailed over most of Christendom. They varied, too, with place and time. Military service depended upon circumstances, though 40 days was the usual term that the tenant of a knight's fee was bound to be in the field at his own expense. Among the feudal incidents advantageous to the lord were reliefs, fines upon alienation, escheats, aid, wardship, and marriage, the two latter placing the wards and orphan minors among his vassals almost entirely at his mercy. The control of female vassals was carried to its utmost extent in the Latin kingdom of Jerusalem, founded by the first crusaders at the time when the feudal system was at its height. Improper fiefs, as they were called to distinguish them from the military fiefs, were in time granted, in order to gratify pride, or to raise money. "They were granted for a price, and without reference to military service. The language of the feudal law was applied by a kind of metaphor to almost every transfer of property. Hence, pensions of money, and allowances of provisions, however remote from right notions of a fief, were sometimes granted under that name; and even where land was the subject of the donation, its conditions were often lucrative, often honorary, and sometimes ludicrous." Fiefs of office, too, were granted, by which persons received grants of land on condition of performing some domestic service to the lord. The mechanic arts were carried on in the houses of the great by persons receiving lands upon those conditions.—The feudal system was exclusive in its spirit. In strictness, a person not noble by birth could not possess a fief, though, as with all general principles, there were occasional exceptions to this rule, which increased as the aristocratical spirit declined. Three descents were necessary to remove fully the stain of ignoble blood. Children born of an ignoble mother, in lawful wedlock, were looked upon as of illegitimate origin. The higher clergy, as prelates and abbots, were feudal nobles. Ecclesiastical tenants came within the scope of feudal duty. Below the gentle classes were the freemen and the serfs. The former were dwellers in chartered towns, and were destined to have an important part in destroying the feudal system; and in England, the yeomanry, to whose existence that country owed its leading place in the military system of Europe, were also among the freemen. The serfs, or villeins, were among the most abject of mankind, and were hated and maltreated because they had been injured. In some countries there was a distinction made between villeins and serfs, the latter being compelled to the performance of the vilest labors, and thoroughly enslaved, while the condition of the former was not so harsh, their payments and duties being defined. "The third estate of man," says Beaumanoir, "is that of such as are not free; and these are not all of one condition, for some are so subject to their lord that he may take all they have, alive or dead, and imprison him, whenever he pleases, being accountable to none but God; while others are

treated more gently, from whom the lord can take nothing but customary payments, though at their death all they have escheats to him." Probably at no time in the world's history were the mass of the people so badly treated as during the existence of the feudal system; and many of those customs and opinions that still impede the growth of the people in knowledge and happiness in several countries, are but relics of that system, and yet continue to do its work.—There were several causes for the decline and fall of feudalism. The two extremes of society were alike interested in its destruction, and continually sought it: the king, feebly grasping a sceptre that was not an emblem of power, but scarcely more than a fool's bauble; and the squalid people, who were treated by the ruling classes with less consideration than they bestowed upon beasts of chase. The growth of the institution of chivalry, which was one of the children of feudalism, was injurious to the system whence it sprung. The feudal system had much to do with the crusades, and it was probably the only state of society in which those expeditions could either have been undertaken, or have been renewed from time to time during nearly 200 years; yet they worked most injuriously to it, and helped to prepare the way for its fall. The growth of the towns, the increase of commerce, the development of the commercial spirit, the acquisition of military knowledge by the people in several countries, scientific inventions and discoveries, and the application of gunpowder to the uses of war, were among the causes of the downfall of the system. Its chief seat was France, and in that country it failed utterly as a bulwark against the English invasions of the 14th century, which rapidly accelerated its fate. It might have remained powerful during the first century of the Valois kings had it not proved totally unequal to the business it claimed to be peculiarly its own, that, namely, of defending the soil its members owned, and the country they governed. Crécy and Poitiers were blessings to France, and the *Jacquerie* as well, for they led to changes that were incompatible with the existence of political feudalism.

FEUERBACH, PAUL JOSEPH ANSELM, chevalier, a German jurist, born in Frankfort-on-the-Main, Nov. 4, 1775, died May 29, 1833. He studied law at Jena, where he became a professor of the university in 1801, and afterward lectured at Kiel and Landshut. From 1808 to 1813 he was assistant secretary of justice and privy councillor in Bavaria. He lost this place in consequence of his liberal opinions, and was appointed chief justice of the supreme court at Anspach. While there he interested himself in the mysterious circumstances surrounding the fate of the unhappy Caspar Hauser, and attempted to probe

the mystery without much regard to the sovereign families which were thought to be compromised in the matter. Feuerbach was the author of a code of criminal law for the kingdom of Bavaria, and of many standard law books. Of these, the *Lehrbuch des gemeinen in Deutschland gültigen peinlichen Rechts* (1801) is to the present day one of the highest authorities on the subject of criminal law in Germany.—LUDWIG, son of the preceding, a German philosopher of the so-called younger Hegelian school, born in Ansbach in 1804, studied theology and philosophy at Heidelberg and Berlin from 1822 to 1825, and became a tutor at the university of Erlangen in 1828, but retired into private life soon after, occupying himself solely with literary labors. In 1844 he delivered a brief course of lectures at the university of Heidelberg. He subsequently retired to a small village in Franconia, where he directs an industrial establishment, and devotes his leisure hours to literary pursuits. Among his works (a collection of which has been published in 9 vols., 1846-'57) the following are the most important: *Abälard und Heloise* (1833); *Geschichte der neueren Philosophie* (2 vols., 1833-'37); *Pierre Bayle* (1838), *Das Wesen des Christenthums* (Leipsic, 1841); *Das Wesen der Religion* (2d ed., 1849), *Theogonie* (Leipsic, 1857).—The leading principle of Feuerbach's philosophy is the identification of God with the idealized essence of man, or the deified essence of nature. His own statement is: "My theory may be condensed in two words: nature and man. That being which, in my opinion, is the presupposition, the cause of existence of man, is not God—a mysterious, vague, indefinite term—but nature. On the other hand, that being in which nature becomes conscious of itself, is man." "True, it follows from my theory that there is no God, that is to say, no abstract being, distinct from nature and man, which disposes of the destinies of the universe and mankind at its discretion; but this negation is only a consequence of the cognition of God's identity with the essence of nature and man."

FEUILLANTS, a branch of the order of Cistercians, founded in France in 1577 by Jean de la Barrière for the stricter observance of the rules of St Benedict, and declared independent by Sixtus V. in 1586. It received originally a very severe discipline, its members being obliged to go with naked head and feet, to sleep upon planks, and to eat on their knees. The rules were subsequently greatly relaxed, and the order spread over France and Italy. It was distinguished by the part which its members, especially the preacher Bernard de Montgaillard, called *Le petit Feuillant*, took in the civil wars of France in the time of the league. After having been the centre of numerous agitations, the Feuillants of France were in 1630 separated from those of Italy. Their costume was a white robe without a scapular, and a white cowl.—De la Barrière founded at the same time a female order of Feuillantes, whose convent was first near Toulouse, and afterward, by invitation of Anne

of Austria, in Paris. The severe discipline to which the members of this order at first subjected themselves caused the death of many of them, and was reprimanded by the pope. The order lasted till 1790.—In the French revolution a club opposed to the Jacobins was known as the Feuillants, from their meeting in a convent of the abolished order.

FEUILLET, OCTAVE, a French author, born in St. Lo, Manche, in 1822. He was educated at the college of *Louis le Grand* in Paris, and since 1845 has gained a high reputation as a graceful writer of novels and plays, in some of which other literary men have been his collaborators. A collection of his writings was published in 1853-'56, in 3 vols., in the *Bibliothèque contemporaine*. His most popular novel, *Roman d'un jeune homme pauvre* (Paris, 1858), has been dramatized in France and in Germany (Vienna, 1859), and translated into English (New York, 1859).

FEVER, the name commonly applied to the assemblage of symptoms formed by acceleration of the pulse, chills followed by heat, thirst, and a general feeling of lassitude and uneasiness; various names have been added to the fever, according to the organ affected, or the supposed nature of the morbid cause. There is no subject which has been a greater source of contention among physicians, or has been more discussed in the schools of medicine from Hippocrates to Louis and Chomel, than that of the nature and seat of fever; and even at the present time different and opposite opinions prevail concerning it. According to Laënnec, Hippocrates considered fever as a simple disease, always of the same nature, regarding as complications the symptoms which modern pathological anatomy has made characteristic of the numerous varieties of fever. Celsus regarded fever as a general disease. Galen seems to have been the first to give a precise definition of the word, and to have divided fevers into the idiopathic or essential, and the symptomatic, an idea which has been the cause of endless and bitter disputes in the medical world. He made, however, a great progress when he discovered that many so called fevers are the consequence of local inflammations; it has been said that in his writings may be traced the division of fevers into inflammatory, bilious, mucous, putrid, and malignant, the famous "pyretological pentateuch," sanctioned afterward by the authority of Pinel. The principles of Galen influenced the medical world until the time of Stahl, Hoffmann, and Boerhaave. Stahl considered fever a salutary effort of the vital principle to throw out morbid matter by the increased excretions and secretions; Hoffmann made it consist in the febrile heat (fever of the Greeks), and in its preceding chill; Boerhaave laid still more stress on mechanical principles, and regarded it as an acceleration, agitation, and combination of the various fluids, by which the cause of disease underwent a coction and elimination, with the characteristic symptoms of fever. Cullen disbelieved

the humoral causes of fever, and traced its origin to the nervous system, the depression of whose energy produces at first feebleness of all its functions, followed by reaction, spasm, and increased circulation, on the degrees of which the varieties and duration of fevers depend; he divided remittent fevers into inflammatory and nervous, calling the former *synocha* and the latter *typhus*; he admits also a third, the common fever of his country, a combination of the other two, but most resembling typhus, which he calls *synochus*. Sauvages, by combining together different febrile symptoms, established more than 150 kinds of fever, ridiculing the idea of essentiality, and considering all fevers as symptomatic. The results of the observations of the 18th century had in all countries diminished the number of essential fevers, and increased that of local inflammations. Sydenham regarded the violence of inflammation as the principal cause of what was then called the malignancy of fevers, and said that the consequences arising from the previous understanding of that word had been more destructive to the human race than gunpowder. Notwithstanding the occurrence of several epidemics in the last third of the 18th century which seemed to prove that intestinal inflammation is the cause of some fevers, the essentiality of these diseases still held firm possession of the minds of physicians; the mucous fever at Göttingen in 1760 and 1761, that at Naples in 1764, and the petechial fever at Genoa in 1799 and 1800, in most cases were what is now called typhoid fever, whose principal lesion is in the Peyer's patches of the ileum. At this time Pinel divided essential fevers into 5 varieties, which are only badly characterized portions of the course and modifications of typhoid fever; and, though he denied their connection with local inflammations, his very names of angiotenic, meningo-gastric, and adeno-meningeal, recognize the influence of such inflammations, especially those of the gastro-intestinal mucous membrane. The researches of Prost in 1804 gave the first decided blow to the theory of the essentiality of fevers. These were followed by the discovery of Petit, who traced in a clear and positive manner the connection between the ulceration of Peyer's glands and entero-mesenteric fever, afterward so fully illustrated by Louis in his work on typhoid fever. Upon this fever was made to turn the whole theory of non-essentiality, its intestinal manifestation forming the connecting link between the febrile exanthemata with evident cutaneous inflammation, and other fevers where anatomical lesions were not so apparent. It was reserved for Broussais, the author of the so called physiological doctrine, in 1816, to completely overturn the doctrine of essentiality, and to maintain that all fevers enter into the category of local inflammations. Almost all the medical writers of France flocked to the standard of Broussais, who in his own country at least bore down all opposition. Still, many enlightened physicians in other countries, and Chomel and Gendrin in France, did not accept

the sweeping conclusions of the new nosology, which, from the very fact of its exclusiveness, opposition to received opinions, and bold advocacy, as in many subsequent and present medical delusions, led away in a body the great mass of routine practitioners and the ever credulous public. While with Bouilland there is no such thing as essential fevers, all such being symptomatic of inflammation, vascular irritation, or action of complicating putrid matters in the blood, Chomel, at the same time that he admits fever as symptomatic of local inflammations, from clinical and post-mortem researches, maintains the existence of idiopathic fevers, with acute and general symptoms, independent of local affections, and leaving after death no lesions to which the phenomena could be fairly attributed. Louis has established satisfactorily a connection between typhoid fever and the anatomical lesion of the glands of the ileum; but he does not explain the nature of this lesion, whether it is the cause or consequence, why death occurs in this disease before the appearance of the intestinal affection, and why the grave symptoms continue and even prove fatal after the cicatrization of the ulcers; in fact, this fever, which many make the turning point in the discussion, stands much in need of further investigation. It is evidently impossible to decide for one or the other of the exclusive opinions of essentiality or non-essentiality of fevers; the most able physicians of the world would probably occupy at present the middle ground of Chomel, accepting the febrile affections symptomatic of inflammation, but also certain essential or continued fevers characterized by the want of relation between the severity of the symptoms and the slight extent of anatomical lesion, by the special nature of their causes (as in contagious, endemic, and epidemic fevers), and by such a series of general phenomena that no one local lesion could in any way explain them. Leaving, then, the nature of fever to be settled by future researches, a few of the principal forms mentioned in the books may be alluded to here. Among the fevers symptomatic of external or internal inflammations are: the traumatic fever, accompanying wounds and surgical operations; lung fever, which is pneumonia, or inflammation of the lungs; brain fever, or inflammation of the substance or membranes of this organ; rheumatic fever, or acute rheumatism; catarrhal fever, accompanying epidemic influenza; milk fever, the functional disturbance attending the physiological secretion of this fluid, coming on the 3d or 4th day after delivery, and rarely lasting more than 24 hours; and puerperal fever, by which is understood inflammation of the peritoneum, or of the uterus and its appendages, attacking women recently delivered, and sometimes raging epidemically, becoming contagious, and seeming to arise from and to produce phlegmonous erysipelas. In all these forms the heat of the surface is increased, the pulse accelerated, the thirst great, the urine less, with lassitude, weakness, sweating, and

lar symptoms according to the organ attacked; this condition may unquestionably be caused by fatigue, by the influence of physical agents, and by moral causes. Intermittent fevers (like fever and ague) are characterized by paroxysms of chills, heat, and sweating, regularly succeeding each other, with intervals of complete apyrexia; they are irregular, quotidian, or quartan, according as the intermissions last one, two, or three days, or of varying and uncertain duration; in miasmatic districts many fevers take on an intermittent type, which under ordinary circumstances have no such character. According to Chomel, the double quotidian fever is always, and the common quotidian in half the cases, symptomatic of inflammation in the pulmonary, digestive, or urino-mucous membranes, of the 2d stage of dysentery, or of deep-seated and superficial suppurations; so that the duration of intermissions becomes an important diagnostic sign. Even in the course of typhoid fever, chills will often recur at the same hour for a few days in succession. Remittent fevers are characterized by a continuous febrile condition, complicated with intermittent symptoms of chills and heat at the beginning of their course, and of heat toward the close; they seem in many cases to be of miasmatic origin, and to be modified intermittently.

Continued fevers have no intermissions during their course, but generally one or two paroxysms of increased febrile condition, with chills during the 24 hours; they affect the whole system, independent to a certain extent of organic lesions, yet characterized by symptoms indicating cutaneous or gastro-intestinal affection. The simplest is the ephemeral continued fever, having the usual symptoms of fever, such as heat and uneasiness, with heat of skin, headache, and rapid pulse, rarely lasting more than a day or two, and frequently relieved by fatigue of body or mind, or vivid delirious hallucinations. The most common continued fever in the United States is the typhoid, which may be described under its own title; slow nervous fevers are mere forms of it. Recurrent fever is that form well known in persons suffering from lingering and exhausting diseases, such as consumption and chronic suppurations.

Black fever, or black vomit, is endemic in the tropical and subtropical America, requiring for its development a high temperature and a locality near the sea coast; it seems to spend its chief force upon the gastro-intestinal mucous membrane, as does the epidemic cholera. In the class of continued fevers belong the exanthematic fevers, such as small pox, measles, and scarlatina.

The division of fevers into idiopathic and symptomatic seems to be sanctioned by the quantity of fibrine in the blood, Andral having shown its amount invariably diminished in the former and increased in the latter; in ordinary continued fever, when uncomplicated with local inflammation, the amount was more or less diminished, with an increase in the quantity of corpuscles; local inflammation tends to increase it,

but the febrile condition itself limits this increase; in typhoid fever the decrease of fibrine in proportion to the corpuscles is still more marked, though here also any local inflammation will increase it; the eruptive fevers were not found to present such a striking disproportion between the fibrine and the corpuscles, and their specific inflammations did not tend to increase the former like ordinary inflammation; in the so called putrid fevers not only the fibrine but all the solid constituents of the blood are diminished. The prognosis of fevers depends on the type, the constitution of the individuals attacked, and the surrounding circumstances as to pure air, cleanliness, and proper attention; continued fevers are most common and most fatal among the poor and crowded populations of cities and of unhealthy localities; wherever such diseases are known to prevail, hygienic and sanitary measures will generally remove the predisposing and render harmless the exciting causes. The treatment of fever must depend also on the type, and be antiphlogistic, tonic, stimulant, specific, or expectant, according to the ascertained nature of its cause.

FEVER BUSH (*benzoin odoriferum*, Nees), a shrub from 4 to 10 feet high, with long, slender, and brittle branches, common in the northern United States, and remarkable for its graceful form and large handsome leaves, especially when it grows upon the margin of some cold, swampy place in the deep shade of woods. Here it produces an abundance of flowers and fruit. The flowers appear in April or May in clusters from 3 to 6 in number, are of a greenish yellow color, and come out where the last year's leaves were. The fruit is a small, oval, dark red or purple drupe, in bunches of 2 to 5. The twigs or young branches are smooth and of a bright green, which assumes an olive tint the next year, and afterward a pearly gray. A decoction of the twigs is used to alleviate the itching from poisoning by sumach. According to Dr. Darlington, it is also used as a medicine for horned cattle in the spring. The berries have a pleasant, spicy taste, and are much admired, and have sometimes been used as allspice.

FEW, WILLIAM, colonel, an American revolutionary officer, born in Maryland, June 8, 1748, died in Fishkill, N.Y., July 16, 1828. His father removed to North Carolina when his family was young. Here William received a good education, and on the breaking out of the revolution became distinguished for zeal and ability in the patriot cause. In 1776 he removed to Georgia, where he was elected a member of the convention for framing a constitution. For the next 25 years he was employed in various public offices; he was surveyor-general of the state, presiding judge of Richmond co. court, and in 1780 a member of congress, remaining in that body till the peace, and again appointed in 1786. The next year he assisted in forming the federal constitution. He distinguished himself in various actions with the English and Indians.

About 1785 he engaged in the practice of the law, and in 1798 was a member of the third constitutional convention of Georgia. From 1789 to 1793 he held a seat in the U. S. senate. About 1800 he removed to the city of New York, where he filled several offices, and was at one time mayor.

FEZ (Ar. *Fas*), a province of Morocco, occupying the N. portion of that empire, bounded N. by the Mediterranean, E. by Algeria, S. by the mountains of Atlas, W. by the Atlantic. The face of the province is a rich champaign country, productive in grain, chiefly wheat and barley, honey, tobacco of the kind called *mequinasi*, olives, and wine. The principal mountains are the Zaragh and Zarkon, or Zaraharum. The chief river is the Sebou, which, rising in the E. part of the province near the Atlas mountain, passes within 6 m. of the city of Fez, and enters the Atlantic at Mamora, where it is navigable. The chief cities are Fez and Tangiers, the principal commercial seats of the empire, Mequinez, Tetuan, Larach, Salee, Rabat, and Al-Kasar. The Spanish presidios of Ceuta, Alhucemas, Señor-de-Velez, and Melilla are in this province, on the Mediterranean. Fez was an independent kingdom till conquered and annexed to Morocco in 1548.—The city of Fez is situated in lat. $34^{\circ} 6' 3''$ N., long. $5^{\circ} 1' 11''$ W., 85 m. S. from the Mediterranean, 100 m. E. from the Atlantic, and 80 m. S. E. from Tangier, on the slope of a valley watered by the river Fez, also called Wad-el-Jubor (river of pearls), which divides within the city into 2 branches, supplying the baths and fountains; pop. estimated at 80,000, including 10,000 Berbers, 5,000 negroes, and a large number of Jews. The city, surrounded by dilapidated walls, is 4 m. in circuit, and is divided into the old and new towns, both, however, ancient, and both composed of narrow, dirty streets. The houses are of brick, with galleries and flat roofs. It is one of the 3 residences of the emperor, but the palace, although large, is not remarkable. In the 16th century this place was a famous seat of Arabic learning. It has yet a university called the house of science, colleges, and elementary schools. Formerly the city contained some hundreds of mosques, and is said still to have 100, of which the principal are El Carrobeen, and the mosque of Sultan Muley Edris, founder of the city. The former has a covered court for women to pray in, and the latter, which contains the remains of the founder, is a sanctuary for criminals. From its abundance of mosques and relics Fez is the holy city of the western Arabs. It possesses 200 caravansaries, some hospitals, and manufactories of woollens, sashes, silk stuffs and girdles, the red woollen caps called fez (dyed of a bright red color by means of a berry found in the vicinity), slippers, coarse linens, fine carpets, saddlery, &c. Of the fine leather known by the name of morocco, the red comes from Fez. Its artisans are also very skilful in goldsmith's work and jewelry. It is the depot of the inland trade, and collects

for export gums, spices, ostrich feathers, ivory, &c. Caravans set out from the city semi-annually, in March and October, across the desert for Timbuctoo. They complete the round journey in 139 days, of which only 54 are employed in actual travel. The pirates who inhabit Riff, one of the provinces of Fez, committed depredations in 1855 and 1856 on Prussian and French vessels as well as on a Spanish establishment on the coast, and the sultan made a compensation to the French government in 1856.

FEZZAN (anc. *Phazania* and the land of the Garamantes), a country of Central Africa, generally supposed to reach from lat. 24° to 31° N., and from long. 12° to 17° E., but the boundaries are ill defined; pop. estimated at from 75,000 to 150,000. It lies south of the pashalic of Tripoli, to which it is tributary, and is bounded on all other sides by the Sahara. In consequence of the want of moisture, and the great heat, it is almost barren of vegetation. The soil consists of black shining sandstone, or the fine sand of the desert. The valleys intersecting the low ranges of hills contain the cultivable land of the region. The Black Haratch, the White Haratch, and other mountain ranges, cut Fezzan generally in the direction of N. W. to S. E. The land lies in a hollow lower than the surrounding desert. The heat in summer is intense, rising sometimes to 133° F. In winter the cold is greater than might be anticipated from its latitude; in 1850 snow fell at Sockna, and ice as thick as a man's finger was found at Moorzook. There are no rivers nor brooks, and rain seldom falls, thunder storms are rare, and the climate is very unhealthy for Europeans. Dates are the staple product; small quantities of maize and barley are grown. Among the other productions are figs, pomegranates, watermelons, legumes, durra, and a little wheat. Of domestic animals, goats are the most numerous; camels, horses, and asses are reared. Of wild animals, there are the lion, leopard, hyena, jackal, buffalo, fox, and porcupine; among birds, vultures, falcons, and other birds of prey, with ostriches and bustards. Fezzan is exempt from flies, but ants, scorpions, and bugs abound. Planted on the high road of commerce between the coast of Africa and the interior, the Fezzaneers place their main reliance upon the caravan trade. From Cairo to Moorzook the caravan takes about 40 days, from Tripoli to the same place about 25 days. Of manufactures the country is almost destitute. Fezzan is inhabited by two branches of the Berber race: the Tuariks, who occupy the N. W., and the Tibboos, who dwell in the S. E. Their complexion is dark brown, their cheek bones are prominent, hair woolly, faces flat, eyes small, lips thick and protuberant. Their persons are well formed. They speak a corrupt dialect of Arabic and Berber; their media of exchange are Spanish coin and grain. The country is ruled by a sultan, who resides at Moorzook, and can bring about 15,000 men into the field. The chief sources of his revenue are taxes upon slaves and merchandise.

The only places exhibiting to the eye some degree of life and prosperity, according to Dr. Barth, are Moorzook and Sockna. The population of each is estimated at about 8,000. Cornelius Balbes Gaditanus, Roman proconsul of Africa, penetrated into Phazania about 20 B. C. The remains of Roman civilization, in the shape of columns or mausoleums, are still found as far S. as 26° 25' N. In the 7th century Fezzan fell under the dominion of the Arabs, who introduced Mohammedanism, to which religion the Fezzaneers are still fanatically attached. Since then Fezzan has generally been tributary to some Arab potentate. In 1811 the bey Mukni usurped the throne, and acknowledged allegiance to the pasha of Tripoli. Fezzan has been much visited by modern travellers, and is regarded as the starting point for the interior of Negroland. Denham and Clapperton, Oudney, Hornemann, Lyon, Ritchie, Barth, Richardson, and lastly Dr. Vogel, have all visited and described it.

FIARD, JEAN BAPTISTE, abbé, a French demonologist, born in Dijon, Nov. 28, 1736, died there, Sept. 30, 1818. He accounted for the perversities of human conduct by supposing demonic agency, and it was his opinion that Voltaire and other philosophers of his time were merely demons, and denounced them as such before an assembly of the clergy of France in 1776. The French revolution seemed to him a great diabolic triumph, and his opinion was confirmed by his own imprisonment for 2 years for persistence in the exercise of the priesthood.

FIBRINE, a nitrogenous compound which forms the solid portion of the flesh or muscular fibre of animals, and also the fibrous portion of the blood. A substance identical with it in composition is found in the newly expressed juices of plants, particularly in the grape, when these are allowed to stand for some time, and the gelatinous substance that is deposited is washed free from the coloring matter associated with it. This is called vegetable fibrine. It exists also in wheat flour, being separated in the substance commonly called gluten. Animal fibrine is separated from the muscle or flesh by washing the soluble saline coloring and albuminous matters with cold water, and then dissolving the gelatinous and fatty matters with hot water. The residue is principally fibrine. It is obtained from freshly drawn blood by taking up theropy portions that adhere to a twig with which it is stirred, and thoroughly cleansing these of coloring and soluble matters by washing. It is a soft white substance, which becomes on drying yellowish, brittle, and semi-transparent. Numerous analyses have been made of the fibrine, albumen, and caseine derived from vegetables used for food—the albumen from the clarified juice of turnips, asparagus, &c., and the caseine from beans and peas—and the results prove an identity of composition not only among themselves, but with the chief constituents of the blood, animal fibre, and albumen. One of the

analyses of animal fibrine by Sherer might almost equally well be given for either of the other substances, or indeed for the caseine of milk, which is in no respect different. The following is one of many quoted by Liebig: carbon, 54.454; hydrogen, 7.069; nitrogen, 15.762; oxygen, sulphur, phosphorus, 22.715. When meat is cooked, the quick application of a strong heat or of boiling water causes the albuminous liquid which surrounds the fibrine to coagulate and enclose the savory juices in a coating they cannot penetrate. The fibrine is also thus protected and remains tender. Cold water does not coagulate the albumen, and so the juices escape when the meat is placed in it, and the fibrine afterward contracts in cooking and becomes poor and tough. In young animals the fibrine is accompanied with more of this albuminous liquid than in those that are older.

FICHTE, JOHANN GOTTLIEB, a German philosopher, born in Rammenau in Lusatia, May 19, 1762, died in Berlin, Jan. 27, 1814. He was the son of a poor weaver, and owed his education to the munificence of a wealthy nobleman, the baron of Miltitz. He studied theology at Jena, Leipsic, and Wittenberg, 1780-'88, and for 10 years obtained a precarious living as a private tutor. Not unfrequently during this time he was brought to the verge of abject poverty. While at Königsberg in 1792, he became acquainted with the philosopher Kant, of whom he had been one of the earliest and most enthusiastic admirers, and as an application of his philosophy wrote a pamphlet entitled *Kritik aller Offenbarungen* ("Review of All Revelations"), which, having been published anonymously, was generally believed to have been written by Kant himself. In 1793, while residing in Switzerland, he published a work in 2 volumes "to rectify public opinion in regard to the French revolution." In 1794 he obtained a professorship at the university of Jena through the influence of Goethe, then secretary of state of Saxe-Weimar. In the same year he published a treatise containing the fundamental doctrines of his philosophical system: *Ueber den Begriff der Wissenschaftslehre* ("On the Idea of a general Theory of Knowledge"), and during the next 5 years his system was matured and completed. By it he immediately took rank among the most original living philosophers, and as it appeared to furnish a metaphysical basis for progressive political and religious views, he was considered one of the leaders of the liberal party in Germany. The Saxon government, becoming alarmed at the boldness of his theories, insisted on his removal, and Goethe, though secretly sympathizing with him, felt himself bound to express to him his official disapprobation. Exasperated by these proceedings, Fichte resigned his professorship and appealed to the public in a pamphlet entitled *Appellation gegen die Anklage des Atheismus*. But this appeal, although proving the deep earnestness of Fichte, could scarcely be considered as a conclusive refutation of the objections raised

against his doctrines. He maintained in it that science could conceive the idea of existence only in regard to such beings or things as belonged to the province of sensual perception, and that therefore it could not be applied to God. God was not an individual being, but merely a manifestation of supreme laws, the logical order of events, the *ordo ordinans* of the universe. For the rest, Fichte held that the question whether a philosophical system was atheistic or not was utterly preposterous. It was, he said, no less ridiculous to ask a philosopher if his doctrines were atheistic than to ask a mathematician whether a triangle was green or red. From Jena Fichte went to Berlin, where by his writings and lectures he exerted a great influence on public opinion, and after the reverses which befell the Prussian monarchy became one of the most conspicuous and powerful anti-Napoleonic agitators. For a few months only (1805), he accepted a professorship at the university of Erlangen. After the battle of Jena (1806) he went to Königsberg, and thence to Copenhagen, but returned to Berlin in 1807. While the French conquerors were still there he delivered in the academy his "Addresses to the German Nation" (*Reden an die deutsche Nation*), which even to this day are admired as a monument of the most intense patriotism and depth of thought. Immediately after the establishment of the Berlin university in 1810, he accepted a professorship there. In 1813 he resumed his political activity with great success. When at last the deliverance of Germany from French oppression had given him sufficient tranquillity of mind to resume the completion of his philosophical system, he fell a victim to the noble exertions of his wife in the cause of charity. By nursing the sick and wounded in the military hospitals for 5 months she had become infected with typhus. She recovered, but her husband, who had also taken the disease, succumbed to it.—Beside the above mentioned publications of Fichte, the following are his principal works: *Grundlage der gesammten Wissenschaftslehre* (1794); *Grundlage des Natur-Rechts* (1796-'97); *System der Sittenlehre* (1798); *Ueber die Bestimmung des Menschen* (1801); *Anweisung zum seligen Leben* (1806). His complete works were published at Berlin in 1845. To give a succinct and intelligible analysis of Fichte's philosophical system is next to impossible. His language is extremely pedantic, abstruse, and liable to misconstruction, to which, indeed, Fichte's philosophy has been subject in a higher degree perhaps than that of any other modern philosopher. Thus, for instance, to designate the self-conscious intellect as contrasted with the non-conscious objects of its conception, he uses the personal pronoun "I" as contrasted to the "not I" (*Ich* and *Nicht-Ich*, in English versions generally rendered by the Latin *ego* and *non-ego*); and this was misconstrued by many of his contemporaries as a deification of his own individual self, while in point of fact he meant only that which by other moderns has been

called the absolute, and by the ancient philosophers the substance. Fichte's philosophy was intended to amplify that of Kant. Kant, in investigating the theory of human cognition, had arrived at the conclusion that all properties of external objects, by which they are discerned and known, are not realities, transferred from without into the human mind, but mere forms of conception innate in the human mind. Hence he argued that objects *per se*, or such as they really are, independent of human cognition, are utterly unknown to man. So far as man is concerned, they are only phenomena, that is to say, for man they exist only as they appear to the human mind according to its forms of conception (categories), while as *noumena*, or such as they are *per se*, they are unknown and inconceivable. Now that which Fichte attempts to prove is simply this, that between objects as they appear to human conception, and such as they are, there is no real difference, since the forms of human cognition are identical with the action of the absolute intellect; that objects are only the limit set by the absolute within itself in order to arrive at perfect self-consciousness; that the absolute (the *Ich*) is at the same time subject and object, the ideal and the real. Reduced to plainer language, all this would mean that God (the absolute subject, the great active and creative "I") and nature (the "not I," the aggregate of objects) are united in a similar manner as soul and body; that the absolute intellect pervades all and every thing, and that the human mind is an integral part of the absolute intellect. But, clothed in the most singular and obscure formulas, the theory of Fichte was understood by many to mean that all reality existed only in the imagination of man, and was in fact merely an outward reflection or manifestation of the workings of the human mind. Such was not his idea, and the term "idealist," when applied to Fichte, has a different meaning from that in which it is applied to Berkeley. That the ultimate consequences of Fichte's system would have led him into a sort of pantheistical mysticism is apparent from his later writings, in which the "I" is, much more clearly than in his earlier works, set forth as God, and all individual minds only as reflections of the absolute. Applying his metaphysical theories to ethics, Fichte concludes that morality consists in the harmony of man's thoughts (conscience) and actions. Entire freedom of action and self-determination is, according to Fichte, not merely the preliminary condition of morality, but morality itself. Hence law should be nothing more than a determination of the boundaries within which the free action of the individual must be confined, so as to concede the same freedom to others. Law has no meaning or existence without society. The object of society is the realization of the supreme law as conceived by human reason. The most perfect state of human society would be the true kingdom of heaven, since the absolute or God is revealed in the rational development of mankind. It is easily seen how these

cal nature-philosophy would then correspond to the period of the French restoration, and that period of French literature represented by the romantic school; and to Hegel, whose elaborate philosophical system of checks and balances might be made to correspond to the constitutional period of French history under Louis Philippe. These comparisons are no mere fancies. Certain it is that all those seemingly abstract systems of philosophy, which to outsiders appeared merely as abstract metaphysical lucubrations, had for Germany herself a practical meaning, and served as an ultimate basis for the aspirations of political parties. Thus, it might be shown that the system of Kant lay at the bottom of the sympathies with the levelling tendencies of the French revolution, which during the last 19 years of the 18th century became manifest in some portions of Germany; that Fichte's idealism was the source from which sprung the aspirations of the *Burschenschaft* toward a regeneration of the German empire in all its medieval splendor; that Schelling's mysticism had much to do with the retrograde political romanticism of the feudal party; and lastly, that the Hegelian system was the guiding light of those political parties in Germany whose aim was a constitutional monarchy. The close affinity between those philosophical systems and political tendencies was as apparent to their immediate contemporaries as was in 1848 the affinity

reason of its position in the centre of Germany this chain is regarded as the nucleus of all the Germanic mountains, though it does not surpass the neighboring chains in elevation. It separates the affluents of the North and Black seas, the river Naab descending from it on the S., the Saale on the N., the Eger on the E., and the Main on the W. It extends in length 86 m. N. E. from Baireuth to the Bohemian frontier, and its 2 loftiest summits are Ochsenkopf (Ox head) and Schneoberg (Snow mountain), respectively 3,397 and 3,450 feet high. The Fichtelberg possesses a robust and laborious population of 153,000. The upper part of the mountain yields oats and wood in abundance, and the lower parts produce rye, barley, flax, pulse, and a little wheat; but the chief industry of the inhabitants is in working the numerous mines of iron, vitriol, sulphur, lead, copper, and marble. The mountains are densely populated and traversed by good roads, and in the N. W. by the Saxon-Bavarian railway.

FICINO, MARCELLO, a Platonic philosopher of the 15th century, born in Florence, Oct. 19, 1483, died in Careggi, Oct. 1, 1499. He was the son of the first physician of Cosmo de' Medici, and was intended for his father's profession. A learned Greek, Gemistus Platho, an enthusiastic student of the long forgotten philosophy of Plato, inspired Cosmo with so much of his own enthusiasm, that the latter deter-

mined to naturalize this philosophy at home. He selected young Ficino as a youth of great promise, to be instructed in the mysteries of Platonism, and to become the chief and preceptor of a new Platonic academy. He educated him in his palace, surrounded him with Greek masters, encouraged him to read in their native language the philosophers of antiquity, placed him when 30 years old at the head of the academy of Florence, and charged him to be the interpreter and propagator of the Platonic philosophy in the West. Ficino made numerous translations from Plato, Iamblichus, Hermes Trismegistus, whom he especially admired, and from most of the Alexandrian philosophers. Too weak to hold the balance between Plato and Aristotle, and between Plato and the Alexandrians, he became the disciple of all schools, and borrowed from all systems. He treated of the nature and immortality of the soul, the functions and distinguishing characters of angels, and the being and attributes of God. His chief merit, however, is as the translator and first western admirer of Plato, and in his partiality for this philosopher he is said to have endeavored to introduce fragments from his writings into the offices and prayers of the church.

FICQUELMONT, KARL LUDWIG, count, an Austrian statesman and general, born at Dieuze, Lorraine, March 23, 1777, died in Venice, April 7, 1857. He was a son of Count Joseph, who, after emigrating from Lorraine to Austria, died in 1799 from a wound received at the battle of Magnano. Like his father, he fought against the French, and became in 1813 major-general, and afterward general of cavalry. He was employed as Austrian ambassador, and on special important diplomatic missions in various countries, became minister of foreign affairs during Metternich's temporary absence from Vienna in 1839, and joined the cabinet in 1840 as minister of conference and as director of the war department. During the revolution of 1848 he was for a short time minister of foreign affairs, and then provisional prime minister, till May 4, when he retired on account of a hostile demonstration of the people, who looked upon him as a disciple of Metternich. He afterward wrote several political pamphlets, some of which, as *Lord Palmerston, England, und der Continent* (Vienna, 1852), and *Zum künftigen Frieden* (1856), attracted considerable attention. *Les pensées et réflexions morales et politiques du Comte de Ficquelmont* appeared in Paris in 1859, with a biographical notice by M. de Barante.

FICTION, in law, a supposition which is known not to be true, but which is taken to be true, in order that certain conclusions and inferences may be supported. Fictions were formerly used more frequently than at present; and most of those which are still retained are simply absurdities which might better be abandoned. Thus, in the action of trover, in which the plaintiff demands damages for the defendant's refusal to deliver to the plaintiff his property in the defendant's possession, the plaintiff declares

that he lost the thing in question, and the defendant came into possession of it by finding, and has converted it to his own use; and the defendant is not permitted to deny the losing or finding, the only question being whether he has refused to give to the plaintiff property which the plaintiff has a right to demand from him. Other familiar instances are the *nunc pro tunc* suppositions that a thing done now was done at a former time, and all the John Doe and Richard Roe proceedings. The fictions of the common law were derived, it is said, from the Roman civil law, in which the prætor, for the sake of doing justice without violating the law, was permitted to suppose a state of facts to exist other than the real one. In the old law, fictions were said to be "of five sorts, abeyance, remitter, relation, presumption, and representation." To avoid the mischiefs which might result from them, there were certain rules, such as the following: 1, the law never makes fictions but from necessity and to avoid a wrong; 2, they must not be of a thing impossible; 3, they are never admitted where truth will work as well; 4, they are confined to civil cases, and are not permitted in criminal trials. But these rules, excepting the last, were not of much practical value; and the true explanation of legal fictions is, that they belong to the old system of technicality and formula, and have for the most part disappeared. What are called presumptions of law (which will be treated under their own head) are sometimes classed with fictions, but not accurately.

FIELD, DAVID DUDLEY, an American jurist, born in Haddam, Conn., Feb. 18, 1805, the eldest son of the Congregational minister of that town. When he was 14, his father removed to Stockbridge, Mass., and in 1821 he entered Williams college. In 1825 he commenced the study of law, was admitted to the bar in 1828, and immediately entered upon practice in the city of New York, where he has been conspicuous at the bar for more than 30 years. He is especially known by his labors in the cause of law reform. As early as 1839 he published his first essay on the subject, pointing out the defects of the old system, and the necessity of a reconstruction of the modes of legal procedure. This he followed up by other articles on the same subject in 1842, 1844, 1846, and 1847. In the latter year he was appointed by the legislature of New York a commissioner on practice and pleadings, and as such took the leading part in the preparation of the code of procedure. Of this work only a part has been as yet enacted into law, half of the code of civil procedure, and the whole of the code of criminal procedure, remaining still to be acted upon by the legislature. The radical design of the new code of civil procedure is to obliterate the distinction between the forms of action and between legal and equitable suits, so that all the rights of the parties in relation to the subjects of litigation can be determined in one action, instead of dividing them as heretofore between

different suits, often inconsistent and always perplexing. Upon this idea as the foundation the whole system is built, and the effect has been to produce a legal revolution, not only in New York, but in the states of Missouri, Ohio, Kentucky, Indiana, Alabama, Minnesota, California, and Oregon. From America the reform soon attracted the attention of the law reformers of England, with Lord Brougham at their head, and through their influence it has modified the legislation of Great Britain and her colonies. In 1857 Mr. Field was appointed by the legislature of New York at the head of a new commission to prepare a political code, a penal code, and a civil code, works which are designed to contain, with the codes of procedure, the whole body of the law.—CYRUS WEST, an American merchant, brother of the preceding, chiefly known from his connection with the Atlantic telegraph, born in Stockbridge, Mass., Nov. 30, 1819. He was educated in his native county, and at the age of 15 went to New York, and in a few years fought his way from a clerk's desk to the head of a large and prosperous mercantile house. Such was his success that in 1853 he partially retired from business, and spent 6 months in travelling in South America. On his return he became deeply interested in the project of a telegraph across the ocean. He was first applied to for aid to complete the telegraphic line commenced between St. John's and Cape Ray in Newfoundland. While investigating the subject he considered the practicability of establishing telegraphic communication between Europe and America by a submarine cable stretching from Newfoundland to Ireland. In the early part of 1854 he was instrumental in procuring a charter from the legislature of Newfoundland, granting an exclusive right for 50 years to establish a telegraph from the continent of America to Newfoundland, and thence to Europe; associating himself with Peter Cooper, Moses Taylor, and other citizens of New York, under the title of the "New York, Newfoundland, and London Telegraph Company," for the purpose of carrying this design into effect, and thereby uniting Europe and America by a submarine cable. Mr. Field thenceforth devoted himself almost exclusively to the execution of this project. He participated largely in the construction of the land line of telegraph in Newfoundland and Cape Breton island, and in the two attempts to lay the submarine cable between Cape Ray and Cape Breton, visiting England in 1854 and 1856 on the latter business. In 1856 he organized the "Atlantic Telegraph Company" to continue the existing line to Ireland, subsequently procured from the British and American governments aid in money and ships, and accompanied the expeditions which sailed from England in 1857 and 1858 for the purpose of laying the cable across the Atlantic ocean. Upon his return to America in 1858, after the successful laying of the cable, he was the recipient of enthusiastic ovations in some of the chief cities of

the Union. Mr. Field is now (1859) in England, engaged in forwarding a third attempt to lay a submarine Atlantic cable, the electric communication over that of 1858 having been interrupted.—HENRY MARTYN, an American clergyman and journalist, brother of the preceding, born in Stockbridge, Mass., April 3, 1822. He was graduated at Williams college at the age of 16, and after 4 years' study of theology became pastor of a church in St. Louis in 1842. After 5 years he resigned his charge to go abroad. The summer of 1847 he spent in travelling over Great Britain, and the winter following in Paris. Returning to America in the autumn of 1848, he published a historical sketch of the Italian revolutions, and a letter from Rome, on the "Good and the Bad in the Roman Catholic Church," which provoked a good deal of criticism. Soon after, an acquaintance with the families of the Irish exiles residing in New York led him to study the history of the rebellion of 1798, and finally to write a book upon it, which was entitled "The Irish Confederates" (12mo., New York, 1851). In Jan. 1851, he was settled at West Springfield, Mass., whence he removed in 1854 to New York, to become one of the editors of the "Evangelist," a religious journal of that city. In 1858 he again visited Europe, a tour which he described in a volume entitled "Summer Pictures from Copenhagen to Venice" (New York, 1859).

FIELD MARSHAL (Ger. *Feldmarschall*), the highest military dignity in some of the principal countries of Europe. The title originated in France at a remote period, but never conferred exclusive military command, the *maréchaux de camp* of the old French service being inferior officers whose duty it was to select proper places for encampment, provide subsistence for the troops, and in battle to command the wings or the reserve. The corresponding title in France at present is *maréchal de France*. The term in its present signification was introduced into England in 1736, when George II. created the duke of Argyle and the earl of Orkney field marshals, although it had long previously been used in the German military service. The following are (in 1859) the field marshals of the principal European nations: England, the king of the Belgians, Prince Albert, Viscount Combermere, and the earl of Strafford; Austria, Prince Windischgrätz, Counts Nugent and Wratislaw; Prussia, Count von Wrangel. The present marshals of France are: Count Reille (1847), Prince Jerome Bonaparte (1850), Count Vaillant (1851), Magnan (1852), Count de Castellane (1852), Count Baraguay d'Hilliers (1854), Pélissier, duke of Malakoff (1855), Count Randon (1856), Certain-Canrobert (1856), Bosquet (1856), McMahon and Regnaud de Saint-Jean d'Angely, created marshals after the battle of Magenta, and Niel after the battle of Solferino (1859). The title does not occur in the military service of Russia.

FIELDFARE, a European bird of the thrush family, the *turdus pilaris* (Linn.), in form, size,

proportions of parts, and characters of the plumage, resembling the migratory thrush or American robin (*T. migratorius*, Linn.). The length is between 10 and 11 inches, the extent of wings $17\frac{1}{2}$, the tarsus $1\frac{1}{2}$, and the weight about 4 ounces; it is a stout bird, and from its long tail and wings rather elegant in form. The bill, which is that of the thrushes, is orange at the base, and brownish black at the end; the inside of the mouth is orange, the edges of the lids yellow, the iris brown, the feet and claws dusky; the head, hind neck, and rump are gray, most of the feathers on the first with a central dusky streak; a space before the eye brownish black, and a whitish line over the eye; the anterior half of the back and the wing coverts are chestnut, shading behind into ash-gray; fore neck and breast yellowish red, with elongated triangular brownish black spots, the sides paler with broadly rounded spots; the lower breast and abdomen grayish white tinged with red; the wings are grayish black, with the edges of the feathers paler; tail deeper black, the lateral feathers grayish toward the end; the lower wing coverts and axillary feathers are pure white, conspicuous during flight. The specific name is derived from a few hairy filaments on the occiput, which are also found in other species, and even in other genera. The female very closely resembles the male. The above is the plumage when it enters Great Britain from the continent; varieties in size and coloring are met with, and albinos are occasionally seen. They arrive in October and November, and some remain until the following spring if the season is mild; they roost in trees if they can, leaving for the fields at early dawn, in parties of from 8 or 4 to many hundreds; their flight is easy but not rapid, and their movements in the trees and on the ground are graceful; they frequent open fields, associating often with other species, and are generally very shy. The food consists of hawthorn and other berries, worms, larvæ, insects, seeds, and grains. They generally disappear in April or May, retiring probably in summer to the north to breed; the nests are built in society, usually in fir and spruce trees, and with the eggs, which are 5 or 6 in number, resemble those of the blackbird. The flesh is considered an excellent article of food, being tender, fat, and of good flavor; this is the species that is supposed to have been so highly esteemed by the ancient Romans.

FIELDING, COPLEY VANDYKE, an English painter in water colors, born about 1787, died in Worthing, Sussex, March 3, 1855. He belonged to a family of artists, and his first picture was exhibited in 1810. He early became a teacher, in which capacity he acquired many pupils and friends. On the death of Joshua Cristall, he was elected president of the old society of painters in water colors, which office he held till his death. Fielding's favorite subjects were either rich wooded landscapes, or ships at sea off a stormy and rock-bound coast. From these two types he seldom varied. His manip-

ulation was peculiar, but it represents atmospheric effects with great freshness. The demand for his works was so great that they were produced too rapidly, and fell into mannerism.

FIELDING, HENRY, an English novelist and dramatist, born at Sharpham Park, near Glastonbury, Somersetshire, April 22, 1707, died in Lisbon, Oct. 8, 1754. His father was a grandson of the earl of Desmond, and great-grandson of the first earl of Denbigh, and served under the duke of Marlborough, attaining to the rank of lieutenant-general at the close of the reign of George I. The family of the Fieldings is stated in the English peerages (where the name is spelled Feilding) to be descended from the same ancestry as the imperial house of Hapsburg. Gibbon says: "Far different have been the fortunes of the English and German divisions of the family of Hapsburg. The former, the knights and sheriffs of Leicestershire, have slowly risen to the dignity of the peerage; the latter, the emperors of Germany and kings of Spain, have threatened the liberty of the old and invaded the treasures of the new world. The successors of Charles V. may disdain their brethren of England; but the romance of 'Tom Jones,' that exquisite picture of human manners, will outlive the palace of the Escorial and the imperial eagle of Austria." This eloquent eulogy is as just as it is unique, and the value of the eulogy is enhanced by remembering the prepossessions of its author in favor of rank and position. The early education of Fielding was intrusted to the care of the Rev. Mr. Oliver, a private teacher in Gen. Fielding's family, and who, with what justice we are unable to determine, appears in "Joseph Andrews" under the unenviable character of Parson Trulliber. He received but little benefit from his private tutor, and was sent at an early age to Eton, where he distinguished himself by his brilliant parts, and before his 16th year had made great progress in classical learning, the influence of which is plainly evinced in his writings, and especially in his dramatic works, which are now never acted, and but rarely read. From Eton he was sent to the university of Leyden, where he placed himself under the tuition of the celebrated Vitriarius, professor of civil law. He applied himself with great assiduity to his studies, but did not forget that he was the son of a gentleman; and he led so gay a life that his father, who had taken a second wife, and had a numerous family, found himself unable to defray the cost of his son's extravagance. In his 20th year Fielding was compelled to return to England, and was at once thrown upon his own resources, with a fondness for costly pleasures and but slender means of paying for them. His father had promised him an allowance of £200 per annum; but this, as Fielding said, "any one might pay who would." His vivacity, good humor, and genial wit gained him the companionship, if not the friendship, of the most eminent wits of his time; and after he arrived in London, while yet a minor, he commenced writing for the stage. His first

comedy, "Love in Several Masques," was produced in 1727, when he was but 20 years of age. He wrote his dramatic pieces with great rapidity, and threw into them a marvellous amount of wit and satire; but it was only his necessities that induced him to expend his resources in a line which was not in accordance with his genius. As the pay he received was small, the necessity for constant productions left him little time to make elaborate plots, or to pay much attention to the characters of his plays. The "Wedding Day," one of his most successful comedies, gained him but £50, and his vocation of a dramatist brought him in contact with a class of acquaintances who were not calculated to improve either his finances or his morals. In the midst of his gay career, while living from hand to mouth by his pen, and writing the scenes of his plays on the backs of his tavern bills, he formed an acquaintance with a young lady of rare personal endowments, Miss Craddock of Salisbury, whom he married in his 27th year. As his wife had a fortune of but £1,500, the financial condition of the gay dramatist was not much improved by his marriage. Soon after this event he retired to a small estate in the country which he had inherited from his mother, worth about £200 per annum. He was devotedly attached to his young bride, and made serious resolutions of reform. He gave up writing for the stage, having during the brief time that he followed it as a business produced about 20 comedies, farces, and burlesques, only one of which, the burlesque of "Tom Thumb," has kept its place in the theatre. He applied himself with great vigor to literary studies in his country retreat; but he also gave himself up with all the energy of his generous nature to such pleasures as the country afforded, and what with horses and hounds, and entertainments, and open doors for his neighbors, he was soon insolvent, and compelled to return to London to retrieve his fortunes. At the age of 30 he entered himself a student at the Inner Temple, studied diligently, and in due course was admitted to the bar. But repeated attacks of the gout compelling him to abandon legal practice, he again had recourse to his pen. He renewed his connection with the theatre by furnishing dramatic pieces for the stage, and wrote essays, poems, satires, and whatever else the taste of the day demanded, for the literary periodicals that would pay for them. Though he could no longer travel his circuit, he turned his legal acquirements to account by preparing a work on crown law, which evinced his remarkable capacity for patient drudgery. Failing to obtain from these sources the income requisite for his daily wants, he wrote nearly the whole of the literary contents of the "Champion," a periodical which is now only known from his contributions to its columns. But now his genius was first attracted to that sphere for which it was most happily adapted, and in which he was destined to secure an enduring fame. A recent anonymous English

writer says: "We had really no novelist in England until Fielding wrote and set the world ever since writing." But this is hardly true, for though one of the greatest of English novelists, he cannot be called the earliest, since his first novel, "Joseph Andrews" (1742), professedly in the manner of Cervantes, was begun as a burlesque on Richardson's "Pamela," which was then the most popular novel of the time. "Joseph Andrews," an inimitable story of English life in the last century, is infinitely better than the author intended to make it, and, if his fame rested upon that work alone, he would be remembered while the language in which it is written endures. In 1743 he published 3 volumes of "Miscellanies," including the "Journey from this World to the Next," a work which, though incomplete, and seemingly without any special plan, exhibits the same strength of imagination and satirical power so splendidly developed in his novels. The "History of Jonathan Wild," which appeared at the same time, is a great storehouse of wit, of profound thought, serious satire, and of benevolence so genuine that even under the guise of the greatest villains that ever disgraced humanity, we are made to love our brother man, vile as he is. The Newgate ordinary in this great prose satire is the representative of the whole class of worldly-minded ecclesiastics, as much so as Macbeth is the type of unscrupulous ambition, or Othello of noble jealousy. Shortly after the publication of "Joseph Andrews," amid an accumulation of illness, broken fortunes, and constant disappointments, he had the misfortune to lose his wife, whom he tenderly loved and most sincerely mourned; though in a few months after her death he married her maid, an act curiously apologized for by his relative, Lady Mary Wortley Montagu. Though he had faithfully served the whig party with his pen, the only reward he received was his appointment, in his 42d year, when his constitution was completely broken, as an acting magistrate for Westminster. He was not content to confine himself to his official duties, but published several tracts on the causes of crime and pauperism in the metropolis, the most remarkable of which may be regarded as the first temperance tract ever published. It was an "Inquiry into the Increase of Thieves and Robbers." Robbery was then frightfully prevalent, and he attributed it to the great consumption of a kind of drink, then in great vogue with the lower classes, called "gin." It was amid all these avocations that he found time to write that greatest of all compositions of its class, the Iliad of prose fictions, "Tom Jones, or the History of a Foundling" (1749). His third novel, the "History of Amelia," wherein he portrays the virtues of his first wife, and the reckless conduct of his own earlier years, and on which he probably bestowed more careful labor than on any of his other productions, was published in 1752. So inconsiderable was his income from his official position,

and from the sale of his writings, that in this year he was compelled to the necessity of projecting another literary undertaking, which was his last, "The Covent Garden Journal, by Sir Alexander Drawcansir, Knight, Censor-General of Great Britain." He now undertook as magistrate, at the request of the duke of Newcastle, the prime minister, to extirpate several gangs of ruffians which infested London; and in this, amid great bodily suffering, and with very meagre pecuniary aid, he completely succeeded. But it was at length announced that his bodily strength would no longer sustain the burden imposed upon it; the dropsy with which he had long been troubled had alarmingly increased, and by the consent of his physicians and his friends he was induced to try the influence of a change of climate, Lisbon being selected as the most desirable spot for the purpose. But it was too late. He left England on his journey in pursuit of health on June 26, 1754. The journal which he kept of his voyage gives a most touching proof of his affectionate and noble nature in detailing the events of his parting with his saddened family at Fordhook. But, when once away, though suffering great pain, being hardly capable of moving himself, and forced to be continually tapped, his intellect retained all its activity; he made a record of all the incidents of his voyage, and he furnishes us in his journal the best account we have of the condition of shipping in the last century, and of the inconveniences, troubles, and delays those were subjected to who made passages by sea. Unhappily the climate of Lisbon did not agree with him, and he died 2 months after his arrival, leaving behind him his second wife and 4 children; all of whom were most generously provided for by his brother Sir John Fielding, aided by his friend Allen, the original of Squire Allworthy, to whom he dedicated his immortal work of "Tom Jones," and in allusion to whom he had said, if a letter were inscribed simply *Detur Optimo*, there would be few persons who would think it needed any other direction. In personal appearance, Fielding had a commanding presence; he was more than 6 feet high, strongly built, and of most engaging manners. Great as his literary labors were, and the benefits which his writings have conferred upon the world, they were hardly superior in importance to the services he rendered during the brief time he acted as a police magistrate, in reforming the laws, and in introducing measures for the extirpation of thieves and desperadoes.—The works of Fielding have passed through very many editions, the principal of which are those of 1762 (4 vols. 4to. and 8 vols. 8vo., London), with a life of the author; 1784 (10 vols. 8vo.), with an essay on his life and genius, by Arthur Murphy; 1821 (10 vols. 8vo.), edited by Alexander Chalmers; 1840 (imp. 8vo.), with a life, and notice of his works, by Thomas Roscoe; and his "Select Works," with a memoir by Sir Walter Scott (royal 8vo., Edinburgh, 1821).

FIELDING, SARAH, 8d sister of the preceding, and an authoress of some contemporaneous popularity, born in 1714, died, unmarried, in Bath, in 1768. Her principal works are the "Adventures of David Simple in search of a Faithful Friend" (2 vols. 12mo., London, 1744; a 3d vol. added in 1752); "History of the Countess of Delwyn;" "History of Ophelia" (2 vols. 12mo., 1785); and "Lives of Cleopatra and Octavia." In 1762 she published a translation of Xenophon's "Memorabilia of Socrates, with the Defence of Socrates before his Judges," in which she was assisted with notes by Mr. Harris, a gentleman of Salisbury.

FIELDS, JAMES T., an American poet and publisher, born in Portsmouth, N. H., in 1820. He has resided for many years in Boston, before the mercantile library association of which city he delivered an anniversary poem in his 18th year, the orator of the occasion being Edward Everett. In 1848 he read a poem entitled the "Post of Honor" before the same society, Daniel Webster officiating as orator. He is a member of the Boston publishing house of Ticknor and Fields, among the publications of which is an edition of De Quincey's writings, in 21 volumes, prepared under the personal supervision of Mr. Fields. He visited Europe in 1847-'8, and soon after his return, in 1849, published a volume of poems. A similar volume, for private distribution, appeared in 1854, and another in 1858, entitled "A Few Verses for a Few Friends."

FIERI FACIAS, the name of a writ at common law, so ancient that its origin is unknown. By it a sheriff, or other competent officer to whom it was directed, was ordered *quod fieri facias, de terris et catallis* (or *de bonis et catallis*), "that you cause to be made out of the lands and chattels," or "the goods and chattels of," &c., a certain sum of money, being that to which the party for whom the writ was issued was entitled by the judgment of court; and it may be remarked, that the only regular foundation for the writ of *feri facias* is a judgment of court. It is in fact the great writ of execution in general, though not exclusive, use throughout the United States, and is often spoken, or at least written of, by way of abbreviation, as a *fi. fa.* By virtue of it the officer to whom it is directed will obtain from the property of him against whom it is directed enough to satisfy the amount of debt or damages and costs, which are always specifically stated in the writ. The rights which this writ confers upon the officer, and the manner in which he is to exercise them, are to some extent matters of statutory regulation. In general it may be said that he must not obtain an entrance by breaking an outer door or window; and it was mainly from this rule that there grew up, with the aid of a little rhetoric, the famous apothegm that "every Englishman's home was his castle." But he may break the outer door of a building disconnected with a dwelling house, as a barn or store; and being peaceably, by voluntary ad-

painter monk. At the age of 20, for the sake of a tranquil life, and particularly for his spiritual benefit, he entered the Dominican monastery of St. Mark at Florence (previous to which time he had borne the name of Guido Petri di Magallo), where he passed the remainder of his days in the devout discharge of his religious duties and the pursuit of his art. A more humble or holy spirit never animated an artist, and from the seraphic beauty of his angels and glorified saints he was called by his countrymen *il beato* (the blessed), and the angelic. He painted only sacred subjects, would never accept money for his pictures, and never commenced them without prayer. The practice of his art was thus with him an act of religion, and to the species of devotional ecstasy with which it was pursued must be ascribed the elevated purity which his works display, and in which they are not surpassed by the most inspired creations of Raphael. Whenever the subject is not in harmony with his gentle spirit he is less successful, and his delineations of human passion or vigorous action are comparatively feeble. He visited Rome at the command of Nicholas V. to decorate the papal chapel. The pope offered to make him archbishop of Florence, a dignity which his great humility would not permit him to accept, but

FIFE, a small instrument of the flute species, consisting of a narrow tube, from a foot to 16 inches in length, perforated on one side with holes for the regulation of the tones, and blown through an opening at the side. It has but one key, and emits a shrill, piercing sound, very effective in military bands, in which it is chiefly employed.

FIFE, or FIFESHIRE, a peninsular county of Scotland, bounded N., E., and S. by the frith of Tay, the German ocean, and the frith of Forth, and W. by the counties of Clackmannan, Perth, and Kinross; greatest length, 43 m.; greatest breadth, 17 m.; area, 459 sq. m.; pop. in 1851, 153,546. The surface of the county is much diversified. The chief mountains are the Lomond hills, Largo Law, and Norman Law. The soil is of various quality, but so productive in general that fully two-thirds of the whole is under cultivation. During the last half century agriculture has made extraordinary advances in Fifeshire, especially in the department of drainage. In the mountainous districts and on inferior soils oats are the principal crop, but elsewhere wheat, barley, beans, potatoes, and turnips are extensively grown. The Fife breed of cattle have long been celebrated, and are in high repute both at home and in the English markets. Coal, iron, limestone, and freestone are abun-

nt. The principal manufacture is linen, which is carried on very extensively at Dunfermline and Kirkcaldy. There are salmon fisheries in several of the rivers, and herring, cod, turbot, and haddock fisheries on the coasts.

FIFTEENTH, in music, an interval equivalent to 2 octaves. The term is also applied to that stop of an organ whose tones are 2 octaves higher than those of the diapasons.

FIFTH, in music, an interval embracing 5 degrees of the scale, as C-G, D-A, &c.

FIG TREE (*figus carica*, Linn.), a native of Asia and Barbary, much cultivated in the warmer portions of the globe. The leaves of the fig tree are rough, lobed, and deciduous. The flowers are so curiously concealed from observation, that many persons think it has none, though they are very numerous, being borne inside of a succulent, hollow receptacle, which first appears on the sides of the young shoots like a small round bud. This receptacle is called a *syconus*, and on being cut open, the minute, chaffy, apetalous florets, each furnished with 3 stamens and 2 styles, will be seen lining its walls. If these florets have become duly impregnated, the *syconus*, after having remained entirely at rest for some time at its half growth, begins to swell again, augments considerably in size, becomes very pulpy and sweet when it ripens, assumes some kind of color, and is the fig. The pulpy, sweet mass will be found to be penetrated with small round seeds, each of which is the result of a minute chaffy floret. The fig tree attains the height of 20 feet, with a branching, spreading head, like an apple tree, in those countries where it is indigenous; but in northern countries it is seldom seen except as a shrub, unless when trained under glass. In the middle states, where cultivated in the open air, it is purposely kept low and shrub-like, so that it may be bent to the ground and covered with earth in winter, to protect it from frosts. In England the tree is usually planted against a low wall, in order that it may receive some of the heat reflected from the surface of the soil. Such walls are sometimes furnished with flues to conduct artificial heat to the ripening crop of figs in autumn. In some parts of France it is grown as a dwarf standard tree, the chief end being to keep the branches short, low, and spreading, in order that they may benefit by the sun's rays reflecting heat from the earth. The soil is manured occasionally and stirred once a year, and some slight protection is given to the lower branches and base of the trunk in the winter. In the south of England it has been treated in the same way with success. Two or more crops of fruit are produced from the fig tree by judicious pruning and training, each crop being produced on distinct sets of shoots. The second crop, for instance, grows from the eyes or buds of the shoots made in early summer, and if the season be sufficiently long and warm, the fruit will ripen; but this seldom happens in the open air. In hot climates it is the second crop that is the most prolific and valuable, being what

are called summer figs, and used for exportation. By continued high temperature Mr. Knight has produced in England 8 crops in 12 months, showing at least the remarkable power of the tree.—The fig tree is easily propagated from cuttings, or by ringing some branch and surrounding the cut place by a small pot of earth, into which the roots will penetrate and increase to such extent that the branch may be separated before the fruit upon it has ripened. Branches also girdled by removing a narrow ring of the bark below the fruit-bearing parts, will produce earlier ripening figs, the process being found as safe and efficacious as with the pear tree or the grape vine. It is cultivated to a considerable extent around Boston, Mass., in conservatories and forcing houses such as are used in the cultivation of foreign grapes. Trained upon the back wall of such structures, by using espaliers or by nailing in the branches, a single tree may be made to produce large crops. The branches are spread out horizontally, and so arranged that they can be loosened from the walls, pruned, washed, and cleaned when necessary. Judicious management is important to prevent too great growth of young or useless shoots. By this mode two crops are secured. There are many choice varieties of the fig, each having some peculiar merit. The London horticultural society's catalogue for 1842 gives 42 varieties, and in this number are comprised fruits of white, green, yellow, and brown colors. As an abundant bearer, and hardier than any other, the brown Turkey fig seems to be preferred. Downing considers it the best for the open air, and says that it has a delicious flavor. The brown Ischia, white Marseilles, Brunswick and white Ischia are highly commended. M. J. F. Allen, a successful cultivator, esteems very highly the black fig of St. Michael's. The fresh ripened fig is delicious and luscious. Few, however, fancy it on first acquaintance, but experience soon decides in its favor over dried and pressed fruit of commerce.—Nearly all the figs consumed in the United States and Great Britain are grown in Turkey. The exports into Great Britain in 1856 were 4½ cwt., of the computed real value of £83, and the imports into the United States during the year ending June 30, 1858, were 4,98 lbs., valued at \$308,472, of which 159,49 lbs. were valued at \$16,867, were reexported to parts of the western hemisphere.

FILANGIERI, GAETANO, an Italian jurist, born in Naples, Aug. 18, 1752, died July 2, 1828. From 1777 he held various offices at court, and in 1787 he was called to the supreme court of finance. His principal work is the *Scienza della legislazione*, the first 4 books of which were published between 1780 and 1784, and was left unfinished at his death, caused entirely by his excessive labors.—**CARLO**, the preceding, born in Naples in 1781, was indebted for his military education at the kindness of Napoleon I., fought in the ranks of the French at the battle of

litz, served in the Neapolitan army under Murat, and bravely exposed himself to the rifles of the Tyrolese in 1815 by making a reconnoissance at the bridge of the Tannaro with only 80 men, on which occasion he was severely wounded, and appointed general. The late king Ferdinand placed him at the head of the artillery and of the engineers, employed him in 1848 in bombarding Messina and in quelling the rebellion in other parts of Sicily, and as governor-general of that island, he invested him with unlimited power. Shortly after the death of Ferdinand, he became Neapolitan premier and minister of foreign affairs (June, 1859).

FILBERT (*corylus Avellana*, Willd.), a term applied to those sorts of hazelnuts which have very large husks. The original species is a native of Europe, and derives its specific name from Avellino, a city of Naples, near which it grows in great abundance. The common hazelnut also grows wild in many coppices and woods in Britain. The name of *corylus* comes from the Greek *κορυς*, a bonnet, to which the enwrapping calyx may very well be compared; and hazel is from *hæsel* (Anglo-Saxon), which signifies a kind of head dress. The fruit of the filbert (hill-beard) is 3 or 4 times as large as that of the common hazelnut, and surpasses it in flavor. The shrub is raised from layers made in the spring; but scions will grow if engrafted upon the hazel. It is recommended to extirpate all the suckers from the roots, and to keep the bush down by giving it a low, spreading, rather thin head, branching out about 2 feet from the ground, and shortening back the extremities of the young shoots one half every spring. The most esteemed varieties among cultivators are only 4 or 5 in number, viz.: the frizzled filbert, easily known by its handsome, deeply cut husk; the Northamptonshire prolific, with a thick shell, hairy husks, and ripening early; the cob-nut, a very prolific kind; the Cosford, with a large, oblong nut, hairy husks, remarkably thin shell, and of excellent flavor. The filbert grows best in a good soil, tolerably dry, and occasionally manured. In Great Britain, the filbert is chiefly cultivated for the London market in that part of Kent where the soil is a loam upon a dry sandy rock. The filbert is monœcious; that is, it bears barren flowers in the form of aments or catkins, beneath which, on the same branches, the fertile flowers may be perceived. Failure in the crops is sometimes attributable to the loss of the aments by injudicious pruning or by frosts, to guard against which it is recommended to allow unpruned, wild specimens to grow among the better kinds; these prove of value in impregnation, and, being hardier, do not suffer from unusual cold. In the United States, so far as we are informed, the filbert is only found in collections of curious shrubs and trees, and is not cultivated to any extent. The value of the filbert in the neighborhood of London may be estimated by the fact that as many as 30 cwt. per acre have been grown on particular lands. The filbert is represented in Turkey and Asia

Minor by *C. colurna* (Linn.), the Constantinople hazel, which rises to a tree of 50 or 60 feet in height, growing rapidly and with great vigor in the climate of London, having been introduced into England in 1665. A smaller tree of 20 feet in height is found in Asia, a native of the top of the mountain Sheopur in Nepaul, with a small nut, having an exceedingly hard shell, and of a sweet flavor, described by Wallich as the *C. ferox*, the edge of the calyx being remarkably laciniate and shaggy.—In the American flora the filbert is represented by two species, both shrubs, and producing small, sweet kernels. The most common is *C. Americana* (Walter), a branching bush from 3 to 6 feet high, with coarse leaves, broad-ovate or elliptical, acuminate, heart-shaped at base, irregularly serrate on their edges. It is one of the earliest blooming plants, flowering about the same time with the black alder. It may be found along fences, stone walls, and among bushes and weeds in neglected places, having pale gray aments, which elongate and shed the abundant yellow pollen, to fall upon the little starry, crimson, fertile flowers, which project in small clusters from the sides of the branches and just below. The nut is about $\frac{1}{2}$ of an inch in breadth and rather less in length, covered with 2 broad leaves much larger than the nut, deeply and irregularly cut and fringed on the border, and turning brown when mature. Some accidental varieties are said to equal the European filbert in size; and the flavor of the American hazelnut is preferred by some tastes. There is another wild species, not so common, called the beaked hazel (*C. rostrata*, Aiton), a smaller shrub, with pear-shaped leaves, irregularly serrate, smooth above, hairy or downy beneath. The nut is small and roundish, having a bristly husk closely set about it, which lengthens into a jagged beak, whence its common name. According to Dr. Richardson, this species extends as far north as the Saskatchewan, in Canada. It occurs also upon the highest Alleghanies, and even in the S. W. part of the United States.

• **FILE**, a bar of steel, roughened by lines upon its surface, and used for wearing down the face of metals, or fashioning these into various shapes. If the instrument is cut with only one set of lines, which form a succession of parallel ridges across it, it is said to be single cut, and is called a float; if roughened by triangular teeth or burrs, which are pushed up from the face of the metal by a pyramidal sharp-pointed chisel, it is called a rasp. The latter is used for working down wood; floats are preferred for copper and other metals of inferior hardness; while the double-cut files, made by two sets of lines crossing each other, are best adapted for taking hold of the hardest metals. Files are applied to such a variety of purposes, from the heavy work of machinists to the delicate operations of the watchmaker, that they are found in a great number of forms and sizes. Some are 2 or even 8 feet in length, while others do not exceed $\frac{1}{2}$ of an inch. Their patterns, though numerous, are

mostly limited to certain established classes of forms, of which 3 are recognized, distinguished by the cross sections of the bar, viz.: those derived from the square, from the circle, and from the equilateral triangle. The common names of square, round, half-round, three-square, &c., are given from the form of the section of the bar. In its length also various modifications are given to the shape of the bar, by which many forms of files are distinguished. Taper files are drawn down and terminate in a sharp point; parallel files are made of a uniform size throughout their length; and blunt files are intermediate between these. Files of the different classes of cross section are subject to these modifications. Then they are variously designated according to the number of lines cut to the inch, an established number being adopted by the English file makers for each length of file; the coarsest are called rough, the next bastard, the third smooth, and the last dead smooth or superfine. Other varieties are produced by leaving an edge or side or other portion smooth, or safe, as it is technically called, thus adapting the files for working in angles and recesses without cutting away portions it is desirable to preserve. The smooth part serves sometimes as a guide by which the file is directed. For the sake of economy an inferior blistered steel is commonly used for the heavier files, but for the finer ones the best cast steel is selected, rolled in rods approaching the dimensions of the files. The large flat files are drawn down from the bars upon the face of the anvil, one man striking with a heavy hammer and the other with a small hand hammer. The three-square, half-round, and many other forms are shaped from square rods, the end of one, heated to blood-red, being laid along in a die which is set in the anvil, and then hammered in until it fills it and receives its form, the hammers shaping the top side. The die of the half-round files presents a section of the segment of a circle; that of a triangular file is formed by two sides of a triangle meeting at the bottom. The square rod is placed with one edge down in this channel, and is then hammered into place and shape. Before the process is completed the tang also is shaped out of the blank. The next operation is to anneal the blanks, so as to soften the steel for receiving the impressions of the chisel used to cut the lines. This is commonly done in a brick annealing oven; sometimes by heating the blanks buried in sand in an iron box, the heat not being allowed to exceed a blood red. They are then smoothed upon the face, the small blanks by filing, the large ones by grinding, and sometimes those with parallel faces by planing. The blanks are then ready for the file cutter, who, seated astride of a low bench, has in front of him an anvil of size proportionate to the files he cuts. Taking one of these, he lays it, if flat, directly on the smooth face of the anvil, the end pointing toward him. The file is kept in place by two leather straps, one passing over each end, which are held down by the feet. Files other

than flat, and all that have been cut on one side, are held upon a block of soft alloy of lead and tin, adapted by grooves or otherwise to hold the blanks with the upper side properly presented for receiving the cuts. The chisels used for this purpose are very short for the sake of stiffness and for being conveniently held in the fingers of the left hand, and they have an edge longer than the width of the face to be cut, sharpened to an angle of about 20° . One being placed upon the blank at the further end of the file, it is held inclined toward the person at an angle of 12° or 14° from the perpendicular, and is then smartly struck with the hammer held in the right hand. A groove is thus cut across the blank with any desired obliquity, and a ridge of steel turned up; the chisel is then brought forward and slid from the operator until it reaches the ridge just made, which determines the position of the next cut, which is instantly given by another blow. Thus the blows and the cuts are made at the rate of 60 to 80 in a minute, their parallelism and uniformity being secured by the guiding ridges and by uniformity in the force of the blows. The heavier the blows, the deeper the cuts and the higher the ridges are thrown up, thus involving coarser work. The hammers vary greatly in weight. The coarse files require them to be of 7 or 8 pounds, and the finest ones are made with hammers of one to two ounces only. Great practice is required always to give the blows of equal force for insuring uniform work. When the face of the blank is gone over once the process is repeated for double-cut files, the chisel being held so as to cause the two sets of lines to cross each other obliquely. The blows are lighter, so that the second set is finer than the first. As the small ends of taper files will not bear the blows struck upon the middle of them, the work is commonly finer at their extremities. Files with curved surfaces are cut with the same sort of chisels as those with plane surfaces, a row of short cuts being first made the length of the file, then another row whose ends connect with those of the first row, then a third, and so on till the cuts meet around the cylindrical file or cover the curved surface of the section of the cylinder cone. The fine round files sometimes require as many as 20 rows of cuts to encircle them, and an inch of the file may contain 100 cuts. The burrs upon rasps are punched up by a similar hand process. The workmen acquire great skill in raising them in true lines, and in bringing each one opposite a vacant space in the adjacent lines. The directions of the lines are required.—After the files are cut they are to be hardened—a process which requires experience and dexterity. The teeth must be protected from the direct action of the fire, or they will become oxidized and roughened. They must be heated uniformly throughout, and not beyond a cherry red. They must be cooled in cold water, with particular care in immersing them to prevent their cooling so unequally.

be warped from a straight line. Long thin files are particularly liable to this, as also the half-round, and the defect is afterward corrected with difficulty. To protect the teeth in fine files they are first covered with a strong brine, thickened with beer grounds, yeast, or some cheap kind of flour, as that of beans. As this dries, the salt melts uniformly over the surface. The carbonaceous matter is thought to increase the hardness of the steel, but animal charcoal, as that of burnt leather, horn, &c., which is used by some makers, is better adapted for this object, and probably the prussiate of potash may prove still better. The temper of the tang is brought down by immersing it in melted lead. After hardening, the files are thoroughly cleansed by scouring with sand and water, and the salt is got rid of by leaving them some hours in lime water. They are then well dried, rubbed over with olive oil containing a little turpentine, tested with a piece of steel, sorted, and packed in papers for the market.—A variety of machines have been invented to take the place of hand labor in cutting files. Some of these, as that patented by Capt. Ericsson in 1836, were made with great ingenuity, and when introduced into large establishments, as this was in the works of Messrs. Turton and sons of Sheffield, each machine was found to do the work of nearly 10 men; but so many difficulties have been met with in their use, that they are for the most part entirely given up. A machine has recently been patented in England by M. Lacroix, which is recommended as embracing every motion requisite for cutting files, producing the varying degrees of fineness, the blows of different force, the various inclinations of the chisels, and all the other devices required in cutting the different kinds of files. In the London exhibition of 1851, a Prussian machine of this class was exhibited, and the display of hand-cut files from France, Austria, and other portions of Europe showed that the art was carried to a high degree of perfection in other countries beside England. The following is recorded of the Danish articles of this class: "In the Danish department was a series of files manufactured of cast steel by J. W. Naylor of Copenhagen. The largest file, which was square, was covered with a series of file cutter's cuts, representing on one face the city of Copenhagen, on another face the operations of the forge and of file cutting, &c. These effects were entirely produced by the file cutter's chisel; the effect of color and shading being given by the various angles of the teeth reflecting the light at different degrees of obliquity. The teeth of a large circular file were cut so as to represent, in a spiral going several times round the file, the maker's name, the date, wreaths of flowers, &c. This file was hollow, and contained within it a second hollow file, which in its turn contained 10 others, all ornamented with wreaths, &c. The smallest file was not larger than a small needle." In the United States the manufacture of files is successfully conducted in several localities; among

which may particularly be named the works of Mr. John Russell at Sing Sing, on the Hudson.

FILIOAJA, VINCENZO DA, an Italian lyrical poet, born in Florence in 1643, died there, Sept. 24, 1707. He studied theology, philosophy, and jurisprudence, was appointed to several civil offices, and was made senator and governor of Pisa. His poems are distinguished for their patriotic and religious sentiments, and their purity of style. An ode which he composed after the raising of the siege of Vienna by the Turks in 1688 gained for him the felicitations of several European sovereigns. The abdication of Christina, queen of Sweden, induced him to write a poem in praise of that princess, and he afterward received many favors from her. One of his sonnets, entitled *L'Italia*, is esteemed among the most admirable in the Italian language.

FILIGREE (It. *filigrana*, from Lat. *filum*, wire, and *granum*, a grain), ornamental work in fine gold or silver wire, often made with little metallic beads or grains interspersed among the wires. The work may be complete in itself, or it may be used, as is the common method, by applying the wire in flattened and twisted shapes upon the surfaces of the trinkets or whatever else it is designed to adorn, and soldering it there in the patterns of stems and leaves of plants. It is much practised by the Italians, who derived the art from the eastern nations. Fine specimens of it were seen at the great exhibition of 1851, in London, from Sardinia, Turkey, the Ionian islands, and Malta. The inhabitants of Sumatra are very expert in it, working with the rudest sort of tools. The leaves to be attached to the roughened wires, which represent the stems, are hammered out of these same wires and clipped off their ends, when they are arranged in their proper places and soldered down.

FILLIBUSTER. The river Vly in Holland is said to have furnished the name flyboat in English, in Spanish *flibote*, or by a softening of the first syllable *flibote*, to a sort of small fast-sailing vessel of about 100 tons burden, which in the 17th century held in point of sailing qualities the place now occupied by the Baltimore clippers. The buccaneers of the West Indies, who began their depredations against Spanish commerce in mere row boats, as they acquired the means for a more formidable outfit, selected these vessels as the sort of craft best suited to their purpose. Hence they became known in French as *flibustiers*, and in Spanish as *flibusters*, an appellation gradually extended in those languages to any kind of pirates. The term fillibuster has recently been introduced into the English language—its use commencing in New Orleans, but thence rapidly spreading wherever English is spoken—as a designation for certain adventurers who since the termination of the late war between Mexico and the United States have busied themselves with setting on foot within the United States military expeditions designed to operate in the Spanish American countries to the south of us.

The pretence of these expeditions has been the emancipation of those countries from tyranny foreign or domestic, and the introduction of democratic institutions after the model of the United States. The real object is generally understood to be the enrichment of the persons engaged therein by a reenacting of the part of the original Spanish conquerors. The setting on foot of such expeditions is prohibited by our neutrality laws, but in Mobile and New Orleans they have been a great deal encouraged by a prevailing sentiment in their favor. Thus the laws have been frequently evaded, and where violations of them have been prosecuted the parties have often escaped conviction. The most noted expedition of this sort hitherto was that led by William Walker against Nicaragua in 1855, to the pecuniary expenses of which, at least toward the close of it, several large capitalists are understood to have contributed. By means of a military force recruited from the United States, Walker was for some months master of the country; from which, however, after maintaining himself in it for nearly two years, he was finally expelled by the union against him of the other Central American states. Similar designs are understood to be still entertained against Cuba and Mexico. Though expeditions of this sort are regarded in some portions of the United States with favor, and are countenanced to a certain extent by men of position and character, the parties actually participating in them have consisted largely of foreigners.—Fillibustering is a cant term much used of late years in the legislative assemblies of the United States to designate the employment of parliamentary tactics to defeat a measure by raising frivolous questions of order, calls of the house, motions to adjourn, &c., in order to weary out the opposite party, or to gain time.

FILLMORE, a S. E. co. of Minnesota, bounded S. by Iowa; area about 900 sq. m.; pop. according to incomplete returns in 1857, 6,595. It is intersected by Root river and its branches, and has a rolling surface and an excellent soil, well adapted to grain, potatoes, and pasturage. Capital, Preston.

FILLMORE, MILLARD, 13th president of the United States, born in the township of Locke (now Summerhill), Cayuga co., N. Y., Jan. 7, 1800. He was the 2d of the 9 children of Nathaniel and Phœbe Fillmore. Cayuga co. was at that time a wilderness, broken by a few pioneer settlements. The nearest house to that of the Fillmores was 4 m. distant. Young Fillmore's education was limited to instruction in reading, writing, spelling, and the simplest branches of arithmetic. He never saw either a grammar or a geography until he was 19 years of age. At 14 he was apprenticed to learn the fuller's trade, and the next 5 years were devoted to dressing cloth, carding wool, and to labor upon his father's farm. A portion of each winter was also spent in attending the rude common schools of the country. In 1819 his father removed to Aurora, in Erie co. Being left in Cayuga co.,

he conceived the design of studying law. The laws of New York then required 7 years' preparation for admission as attorney from those who had not received a classical education. Fillmore had yet two years of his apprenticeship to serve. He agreed with his employer to relinquish his wages for his last year's services, and to pay him \$30 for his time. His master took his promise to pay and released him. At the same time he made with Walter Wood, Esq., a retired lawyer, who possessed a law library, an arrangement by which he was to receive his board during such time as he should devote himself to Mr. Wood's private business. Blackstone and Tidd's "Practice" were placed in his hands, and he gave his leisure time to an uninstructed and bewildered study of their contents, wondering why, in America, he should be put to reading the laws of England. Three months of the next winter were devoted to teaching school. The entire product was \$36, of which \$30 fulfilled his promise to his master; the remainder had to suffice for the year's expenses, except board. At the age of 20 he was invited by his fellow citizens to deliver the 4th of July oration for that year, and succeeded so well that he was requested to publish it; a request which, after consulting Judge Wood, he modestly and with characteristic caution declined. At 21, concluding that he never should learn his profession by attending to Judge Wood's affairs in summer and teaching school in winter, and being desirous to be near his family, he removed to Buffalo. The journey was performed mostly on foot. He arrived there an entire stranger, with \$4 in his pocket. His only resource was keeping school. During his first winter's residence at Buffalo, he rose while it was yet dark, swept the law office in which he was permitted to study, built his own fire, and studied law till breakfast time. He knew no Latin; his English education was hardly begun; each line was read faithfully over and over again, and firmly impressed upon the memory. Nothing was passed until it was thoroughly understood. The day was devoted to school-keeping, the evening to discussing the subjects of the morning's study with a fellow student. The succeeding winter was still more laborious. His school was 2 miles from the village. The postmaster being absent, Fillmore was employed temporarily to perform a large share of the duties of the office. He rose in winter in time for the 4 o'clock morning stage which passed by his school house; made his fire, swept his school room, and studied law alone and by candle light till breakfast. The day was spent in school; the evening till late at night with mails and post office accounts. By the spring of 1823 he had so far gained the confidence of the bar, that by the intercession of several of its leading members he was admitted as an attorney by the court of common pleas of Erie co., although he had not completed the period of study usually required. He purchased a few

he was elected representative to the state legislature by the anti-masonic party. He served 3 successive terms, retiring in the spring of 1831, and sustaining while in the legislature a high reputation for integrity, candor in argument, thorough investigation, and the faithful performance of the minutest details of every duty. He particularly distinguished himself by his advocacy of the act to abolish imprisonment for debt, which was passed in 1831, and which was drafted by him, excepting the portions relative to proceedings in courts of record, which were drawn by the Hon. John C. Spencer. — In the autumn of 1832 he was elected on the anti-Jackson or anti-administration ticket to congress. After serving one term he retired till 1836, when he was re-elected to the same position as a whig. He was chosen again in 1838, and again in 1840. In 1842, although he had previously written a letter declining to serve another term, he was unanimously re-nominated by the whig convention of his district, and it was with difficulty that he obtained leave from his constituents to retire from the public service. In congress he rose gradually to the first rank for integrity, industry, and practical ability. During the early part of his congressional career a national bank was the prominent subject of discussion. Mr. Fillmore was never a warm friend of the bank,

of the state. It so happened that these 5 members were all whigs. Parties were so evenly balanced in the house, that if these 5 members were admitted at once it would give the whigs control of its organization, including the election of speaker, while if they could be deprived of their seats until the house should be organized, its organization would be controlled by the democrats. The whigs contended that the certificate of the governor, authenticated by the seal of the state, should be received as presumptive evidence of the right of the 5 members to their seats, that they should be permitted to participate in the organization of the house, and that afterward the claims of contestants to their seats should be investigated in the ordinary course of business. The democrats insisted that the house should decide the question before electing a speaker. A violent debate arose. The house remained in a disorganized and confused condition until Dec. 5, when Mr. Adams was chosen temporary chairman. Two weeks were consumed in discussing the question whether the 5 New Jersey members should be permitted to participate in organizing the house. A resolution to admit them was lost by a tie vote. A speaker was chosen on Dec. 16, and the discussion then resumed. Mr. Fillmore was assigned a place on the committee on elections.

He canvassed the entire vote of the state of New Jersey, devoting 3 months' time to this repulsive drudgery. A majority of the committee, being democrats, reported that the 5 contestants, also democrats, were entitled to the seats, to the exclusion of the 5 whigs, who held the certificate of the governor. The minority of the committee, among whom was Mr. Fillmore, were satisfied that 3 at least of the whig members were unjustly excluded by the majority report. On March 6, by a strict party vote, overruling the decision of the speaker, Mr. Fillmore was declared to be out of order while supporting his views on this question, and all further debate was substantially prohibited. On March 10 the democratic contestants were admitted to their seats, and their title to them confirmed by a party vote on July 16. This brief history of the celebrated New Jersey case is given in this place, as Mr. Fillmore was one of the most prominent actors in it, and by his labor in the committee and zeal in debate upon the questions involved, added greatly to his reputation throughout the country. Hitherto Mr. Fillmore had always been in a minority in the national councils; but the whig party was largely in the majority in the 27th congress, which assembled in 1841. A new financial system, and an entirely new tariff, were to be devised and put in operation. Under the circumstances the position of chairman of the committee of ways and means was the most arduous, the most responsible, and at the same time the most honorable place in the house. It was assigned to Mr. Fillmore, and he devoted himself to the performance of its duties with even more than his accustomed industry. The session continued 9 months, during which time he was not absent a single hour from the house, though he did his full share of the labors of the committee. The preparation of the new tariff bill involved an examination, digestion, and arrangement of figures and statistics appalling to any but a mind strengthened by years of toilsome investigations. Although Mr. Fillmore did not profess to be the discoverer of any original system of revenue, still the tariff of 1842 was a new creation, and he is justly entitled to the distinction of being its author. At the same time, with great labor, he prepared a digest of the laws authorizing all appropriations reported by him to the house as chairman of the committee of ways and means, so that on the instant he could produce the legal authority for every expenditure which he recommended. Sensible that this was a great safeguard against improper expenditures, and one that was likely to be neglected, he procured the passage of a resolution requiring the departments, when they submitted estimates of expenses, to accompany them with a reference to the laws authorizing them in each instance. This has ever since been the practice of the government. Mr. Fillmore retired from congress in March, 1843. He was the candidate for the vice-presidency, supported by his own state and by some of the western

states, in the whig national convention which met at Baltimore, May 1, 1844. In the convention of the whigs of the state of New York, which met Sept. 11, he was nominated for governor by acclamation, but was defeated by Silas Wright, Mr. Clay being defeated at the same time in the presidential election by Mr. Polk.—In 1847 Mr. Fillmore was elected comptroller of the state of New York, an office which at that time included in its sphere many duties now distributed among various departments. In his report of Jan. 1, 1849, he suggested that a national bank, somewhat upon the plan of the free banking system of New York, with the stocks of the United States as the sole basis upon which to issue its currency, might be established and carried on so as to prove a great convenience to the government, with entire safety to the people. His suggestions have since been approved by many of our most eminent financiers of different political parties.—In June, 1848, he was nominated by the whig national convention for the vice-presidency, with Gen. Zachary Taylor for president; and was elected in the ensuing November. In February he resigned the office of comptroller, and on March 5, 1849, was inaugurated as vice-president. When congress met in December, California presented itself for admission into the Union, under a constitution excluding slavery, framed without legal authority, by a convention of its people. There being at this time an equal number of free and slave states in the confederacy, the proposition to admit California and thus destroy the balance of power in the senate in favor of the free states excited throughout the South the most violent opposition, founded in part on the irregular manner in which its constitution had been framed. At the same time, Deseret, now Utah, and New Mexico, were without a government; while the boundary between the latter and Texas was in controversy, and Texas was threatening to take possession of the disputed territory by force. President Taylor, in his message, recommended the admission of California, and that congress should await the action of the people of the other newly acquired territories and admit them in the form of states, with or without slavery, as their constitutions should prescribe. He made no suggestions, however, for the government of the territories in the mean time, nor for the settlement of the boundary line between Texas and New Mexico. To reconcile the South to the admission of California, Mr. Clay introduced his famous "omnibus bill." (See CLAY, HENRY.) The whig party was divided, a portion supporting the policy of President Taylor, and a portion that of Mr. Clay. The debates in the senate were extremely acrimonious. A violent agitation ensued throughout the Union. Threats of secession in case of the admission of California were made by southern statesmen even of the moderate and conservative school; and many persons, not hitherto deemed timid men, were exceedingly anxious and alarmed as

in conflict with the provisions of the constitution relating to the writ of *habeas corpus*. That officer prepared a written opinion in favor of its constitutionality. The president concurred in this opinion and signed the act, together with the rest of the compromise measures. The fugitive slave law was exceedingly offensive to great numbers, if not to a majority, of the whig party of the North, as well as to those known strictly as anti-slavery men. Its execution was resisted, and slaves were rescued from the custody of the marshals by mobs at Boston, Syracuse, and Christiana in Pennsylvania, in the last of which places one or two persons were killed. The president announced his intention to enforce the law, and issued a proclamation calling upon all officers to perform their duty in its execution. Prosecutions were instituted in various instances against the rescuers, but without practical results, owing to the unpopularity of the law. Although it was known that the president was in favor of the compromise measures as a whole, and selected a cabinet entertaining the same views, yet, in pursuance of a general rule which he had laid down for his official action, he did not seek to exercise any influence in their favor, nor did he assume any responsibility in respect to them, excepting such as strictly belonged to his duties as president.

tween the Mississippi and the Pacific; a provision for settling disputed land titles in California, and an extension of the system of land laws over the newly acquired territories; a law to provide for the retiring of superannuated officers from active service in the army and navy; a board of commissioners for the adjustment of private claims against the government; and, in conclusion, "an adherence to the adjustment established by the compromise measures, until time and experience should demonstrate the necessity for future legislation to guard against evasion or abuse." But his administration being in a political minority in both houses of congress, none of these recommendations calling for action were adopted, excepting those for the settlement of land claims in California, and the survey of its public lands, and for an asylum for disabled and destitute seamen. During this session congress made an appropriation for the extension of the capitol according to such plan as might be approved by the president. Having adopted a plan, on July 4, 1851, he laid the corner stone of the extension, amid an immense concourse of people, who were addressed by Daniel Webster. Learning that an attempt was to be made to invade Cuba by lawless citizens of the United States, the president on April 25,

1851, issued a proclamation warning them of the consequences. On Aug. 4, however, an expedition under Lopez, in the steamer *Pampero*, sailed from New Orleans by the connivance of the collector of that port and landed in Cuba. They were there captured; some were executed, a few pardoned, and the remainder sent prisoners to Spain. Those sent to Spain were finally pardoned, and congress paid their expenses home. The collector of New Orleans was removed from office, and the steamer *Pampero* seized by the government, and condemned and sold for a violation of the neutrality laws. During the same summer information was privately communicated to the president which led him to suspect that a Dr. Gardner had presented a fraudulent claim to the Mexican commissioners, which had been maintained by forgery and perjury, and allowed, and on which he had drawn from the treasury nearly \$500,000. A prosecution was immediately instituted, Gardner was convicted and committed suicide, and a large portion of the money obtained by him was recovered. In his message of 1851, beside reiterating the views expressed in that of 1850, the president urged a revision of the fee bill of the U. S. courts, a thorough revision and codification of the laws of congress then in force, and a law prescribing the relative rank of officers in the army and navy. Mr. Fillmore's administration is distinguished by the expedition of Commodore Perry to Japan, in a squadron which sailed in the autumn of 1852, and which resulted in a favorable treaty with that country. During the years 1851 and 1852 treaties were also formed with Peru, Costa Rica, Brazil, and other South American states. A steamer was sent to explore the La Plata and its confluents. Believing, from the gold purchased on the coast of Africa, that there must be large deposits of that metal in its interior, and in the hope that the discovery of large quantities of gold there would result in the prosperous emigration of many of the free colored people of the United States, Mr. Fillmore despatched an expedition under Lieut. Lynch, with instructions to explore the interior of Africa, and, if possible, to ascertain the location of its gold deposits. This expedition, it is understood, failed on account of the sickness of the commander. Another exploring expedition under Capt. Ringgold was despatched by order of congress into the Chinese seas. An expedition was also ordered by the president to explore the valley of the Amazon. This accomplished its object, and instructive reports were made by Lieuts. Haddon and Gibbon. Mr. Fillmore carried out strictly the doctrine of non-intervention in the affairs of foreign countries, and frankly stated his views upon this subject in an interview with Kossuth. At the same time, however, it appeared clearly enough by the celebrated letter of Mr. Webster, secretary of state, to M. Hülse-mann, how little the administration sympathized with Austria in its struggle with Hungary. The British man-of-war *Express* having fired into the

American steamer *Prometheus* at San Juan, an ample apology was required and given in a letter by Lord Granville, Jan. 16, 1852. In the autumn of 1852, Mr. George Law of New York city claimed the right to send to Cuba in the steamer *Crescent*, owned by him, an individual obnoxious to the Cuban authorities. They would not permit the vessel to land. Mr. Law proposed to seek redress by force. In a letter to the collector of New York, dated Nov. 12, 1852, Mr. Fillmore stated that the controversy was one to be settled by the government, and not by a private citizen, and that should Mr. Law attempt to obtain redress as a private citizen by force, the whole power of the government would be interposed to prevent it. This letter, at Mr. Fillmore's request, was communicated to Mr. Law, who desisted from any further warlike demonstrations. Mr. Webster died Oct. 24, 1852, and Mr. Edward Everett was appointed his successor as secretary of state. His brief term of office was distinguished by his letter declining the proposition for a tripartite treaty with England and France, by which each country was to disclaim then and for the future all intention to obtain possession of the island of Cuba. But in his message to congress in Dec. 1852, the president expressed his opinion that the incorporation of Cuba into the Union would be a hazardous and impolitic measure. Mr. Fillmore retired from the presidency March 4, 1852. He left the country at peace within and without, and in the enjoyment of a high degree of prosperity in all departments of its industry. In his cabinet there had never been a dissenting voice as to any measure of his administration; and upon his retiring from office, a letter was addressed to him by all its members, expressing their united appreciation of his abilities, his integrity, and his devotion to the public service. At the whig convention of 1852, although his policy, the fugitive slave law included, was approved by a vote of 227 against 60, and although one of his cabinet, who was known to have approved of all his measures, was nominated for vice-president, he could not command 20 votes from the free states. This was owing, no doubt, partly to his lack of friends among active politicians whom he had never sought to conciliate by hopes of patronage, and partly to the exertions of the friends of other candidates, but chiefly to his unpopularity with that large section of his party whom he had alienated by his signature of the fugitive slave law. His departure from the seat of government was also embittered by a heavy domestic grief. Mrs. Fillmore, whose early advantages had been superior to his own, and who through his rising fortunes had been his nearest friend and counsellor, died at Washington, March 30, and he returned to Buffalo deprived at once of public employment and of the solaces of private life.—Since the close of his administration, Mr. Fillmore has devoted himself to the study of general literature with systematic industry. During the spring and summer of 1854, he made an extensive tour

through the southern and many of the western states; but the year was rendered one of the saddest of his life, by the death of his only daughter. By this bereavement he was left with an only son, now a practising lawyer in Buffalo. In the spring of 1855, after an excursion through New England, he sailed for Europe, where he remained until June, 1856. He was received with marked distinction by the leading statesmen and at the principal courts of Europe. The degree of D.C.L. was tendered to him by the university of Oxford, but he declined the honor. While at Rome he received the news of his nomination as candidate for the presidency by the American party. He accepted the nomination, but before the close of the campaign it became evident even to his friends that the real struggle was between the democrats and the republicans. Very many of those with whom he was the first choice for president cast their votes either for Mr. Buchanan or Mr. Fremont, believing that there was no hope of Mr. Fillmore's election; and though he received the support of large numbers in all the states, Maryland alone gave him its electoral vote. On Feb. 10, 1858, he was married to Mrs. Caroline McIntosh, the youngest daughter of the late Charles Carmichael of Morristown, N. J. He has since resided in Buffalo, devoting himself to study and to the society of his friends, and enjoying that general respect to which he is justly entitled by his many years of public service, and by his punctilious and faithful performance of all the duties of private life.

FILLMORE CITY, the capital of Utah territory, is the principal settlement in Millard co., and lies about 150 m. almost due S. from the Great Salt lake. Both it and the county were named in honor of Millard Fillmore, who is held in great esteem among the Mormons on account of the favor he displayed toward them at the time of the organization of the territory in 1850. The city charter was granted by the territorial legislature in Feb. 1852. The white population now (1859) is about 700. In the vicinity is one of the government Indian farms, which is the head-quarters of a band of Pahvant or Para-vant Indians, an offshoot of the great Utah nation. The chief, Canosh, is noted as one of the most inveterate thieves that infest the roads across the continent. The main wagon road to California *via* Parowan, Mountain Meadows, Santa Clara, and San Bernardino, passes through Fillmore, and for many years the principal subsistence of Canosh and his band has been derived from depredations upon American travellers. The only building in Fillmore of any pretension is the capitol. The plan of this edifice, of which one wing only has been completed, is in the shape of a Greek cross, with a rotunda in the centre 60 feet in diameter. The material is red sandstone, rough hammered. All the other buildings in the town are of adobe or else of fire-burned brick, which last is made nowhere else within the territory, and rarely here, owing to the scarcity of fuel. The

situation of Fillmore is very beautiful, being directly at the foot of the main Wahsatch range, and commanding a view of at least 150 m. westward into the Great Basin. The altitude of the site is more than 5,000 feet above the sea, considerably exceeding that of Salt Lake City. In one respect Fillmore differs noticeably from the chain of towns running northward from it toward the Salt lake; it is open on all sides, whereas most of the others are walled. The difficulty of transit from the northern and most populous portion of the territory in the winter, led the Mormon legislature in 1856 to pass resolves removing the seat of government to Salt Lake City; but it has been conceded that these resolves were unauthorized, and the capital is now definitely established at Fillmore.

FILTER, an instrument for separating from fluids the foreign substances mechanically intermixed with them. Beds of sand and gravel constitute natural filters, through which the waters of springs flow upward clear from all sediment and visible impurity. Artificial filters are constructed upon the same principle; a diaphragm of some substance is presented, through the pores of which the fluid can penetrate, but which are so fine that they arrest the particles held in suspension. They are variously constructed according to the nature of the fluid to be purified. The chemist takes a disk of unsized white paper, and doubling it twice, introduces it into a funnel of proper size, which, for facilitating the passage of the fluid, is commonly ribbed, and opening one of the folds, pours in the liquid. This soon drops through the paper and the funnel, leaving the sediment behind; if any of this passes through in the commencement of the operation, it is commonly retained when returned after the pores of the paper are wet and partially obstructed. The sediment is often the object of this process; in this case it may be washed clean of the liquid which contained it by the use of water, or sometimes of some other fluid which has no chemical action upon the residuum. Paper is an excellent material for filters; but those kinds should be selected which contain the least amount of earthy matters, lime particularly, the presence of which may affect the composition of the substances employed. These may, however, be in part dissolved out by acids before using the filter. Each filter is used only once; and thus there is no accumulation of impurities to impair its quality. The weight of the ashes yielded by a disk of the size used being known, the quantity of the insoluble precipitate collected in the filter may be determined by burning both together, thus avoiding risk of loss in removing the fine particles, and of uncertainty as to the proportion due to the filter when the burnt product is weighed. Apothecaries also use paper filters, but generally of coarser material and folded from a square piece in a number of folds like those of a paper fan, all of which terminate in one point which was the centre of the square. Paper filters are

strengthened and made more impervious when necessary by using one within another. In filtering for the purpose of obtaining extracts, a very efficient apparatus is made use of by the apothecaries, called Boullay's filter, which has been already noticed under EXTRACTS. The old pharmacutists used a cone-shaped bag of cotton or woollen called Hypocrates's sleeve, and the same contrivance is still one of the best for the clarification of sirups and other viscid liquids. Cotton flannel, which has a thick nap, is an excellent material. The conical hat body made of felt is well adapted, before its shape is altered, to the filtration of fixed oils. Corrosive liquids, as strong acids, may be cleared by passing them through pure silicious sand supported upon coarse fragments of glass placed in the neck of a funnel and gradually diminishing in size upward. Sponges have been used for filters from time immemorial for purifying the water of the Niger; unless often replaced, they have the defect common to all filters made of organic materials, as straw, hemp, cotton, sawdust, shavings, branches, leaves, &c., of undergoing a chemical change from constant exposure to dampness, which at last causes them to affect injuriously the quality of the liquid. The fibres of asbestos might be substituted with advantage, and would moreover find a proper application in the filtration of corrosive fluids. Charcoal is a favorite material, particularly for the purification of water used at sea; it has the property not only of separating the impurities passed through layers of it alternating with others of sand, but also of removing disagreeable odors. The Japanese use porous sandstones hollowed into the form of an egg, and set in a frame over a vessel, into which the water drops as it percolates through the stone. The Egyptians adopt the same method for clarifying the water of the Nile. A stone which answers this purpose well has long been known at Teneriffe, and was formerly largely imported into England. In Spain porous earthenware vessels are manufactured, called *alcarrazas*, which are used for this purpose, and also for wine-coolers. (See EVAPORATION.) New devices designed for exhibiting or rendering more efficient the process of filtering are constantly appearing, some of them not differing from methods long ago introduced, yet protected by patent rights. Filtering upward, by introducing the liquid at the bottom of a cask and causing it to rise by the pressure of the column behind through sand and gravel or charcoal, was patented in England in 1791, together with the method of getting rid of the sediment by washing it out with currents of water passed under pressure in the contrary direction. In 1800 a process not essentially different was patented in France, the water being made to pass in a downward direction through layers of such materials, to which sponges were also added. It was employed on a large scale in 1806 to clarify the water of the Seine. After the water passes through the layers contained in leaden boxes, it is made to drop from a height

like rain, in order to take up the air found in rain water, and which it has lost in its filtering. When the river water is very turbid, the upper strata require renewal twice a day on account of the impurities deposited. The quantity of water passed through them is proportional to the area of the filtering surface. Each square metre of surface produces in 24 hours about 3,000 litres of pure water, or each square foot about 78½ standard gallons. The result, however, varies with the state of cleanliness in which the filtering materials are kept; and as the degree of retardation cannot be ascertained beforehand, it will be impossible to calculate with accuracy the capacity of any filter of this nature. An ingenious filter was noticed at the London exhibition, sent by the Wenham lake ice company of Massachusetts, the invention of Mr. Alfred Bird. It consists of a siphon, the short limb of which terminates in a cylindrical box, which is placed in a cask of water under the surface. This box contains the filter, and on drawing the air out of the long arm, which projects from the cask, the water is forced up through the filter and passes through the siphon, its flow being regulated by a stop-cock at the lower end of the long arm. It has the advantage, if the cask is kept properly supplied, of drawing the water neither from the top where the lighter sediment collects, nor from the bottom to which the heavier impurities sink. Filters upon a large scale are connected with the reservoirs from which cities receive supplies of water. These reservoirs are divided into several basins, the first of which are intended for receiving the sediment that will subside as the water is left standing; from these it passes through porous beds which separate them from an adjoining basin, and which collect the impurities still remaining suspended. By using several such basins the beds may be kept alternately in use, affording an opportunity for their cleansing whenever this is required.—In connection with the purification of water by filtration, ingenious methods have been devised of separating the soluble salts of lime, &c., which give the property of hardness to water, and which being in the state of solution pass through the filter. Pure water can thus hold only about two grains to the gallon of carbonate of lime, or $\frac{1}{33.333}$; but as the water absorbs carbonic acid gas, its power of dissolving carbonate of lime increases, till its capacity may be 10 times that of pure water. Its hardness increases with the quantity of lime taken up. Thus the water of springs, especially in districts where calcareous rocks abound, differs in composition from the soft rain water which has not flowed through the ground. When such water is boiled, the excess of carbonic acid gas is expelled, and with it the capacity of holding a portion of the carbonate of lime. This falls as a precipitate, and forms the crust which collects on the inside of kettles in which such water is boiled. By continuing the boiling, all the lime may be thus separated, ex-

cept about two grains to the gallon; and it is then in the best condition to be purified by filtering. Other salts, the solubility of which does not depend upon the carbonic acid gas present, as the sulphate of lime, or the chlorides of soda, magnesia, &c., which give the saltiness and hardness to sea water, can only be separated by distillation.—There are also some substances often present in the state of suspension in water which may not be separated by subsidence or filtration. Such are some organic matters, and the fine clayey or aluminous particles. Waters which wash cliffs of clay become saturated with the impalpable material, which they almost wholly refuse to shed by any mechanical action. This property may be witnessed upon a large scale in passing in a steamboat along the north shore of Lake Erie, where the water, particularly after a storm, carries the sediment from the clayey banks miles out into the lake, and receives from it a milky appearance. Such water, it is found, may be purified by adding to it a few grains of alum to the gallon. The alum is decomposed, and its ingredients fall in insoluble precipitates, carrying with them the alumina or other impurities which discolor the water; and all may be separated by filtration or decantation except the excess of alum that may have been added. Its use is objectionable from the liability of adding it in excess, and also from the formation of a sulphate of lime, a portion of which remains in solution, rendering the water hard. Caustic or quick lime is also used for a similar purpose. It acts by seizing upon the free carbonic acid present, and thus all the carbonate of lime in solution, except two grains to the gallon, is rendered insoluble, and falls together with the lime introduced to the bottom. This process has been put in practice upon a large scale at the Mayfield print works in Lancashire, England, in which 300,000 gallons of water are daily purified. Filtration is not necessary unless the water was turbid before the liming, the precipitate formed subsiding in the course of 24 hours, so that the clear water may be drawn off. In the spring of 1851 experiments were made upon the water of the Thames river at the Chelsea water works, from 3,000,000 to 4,000,000 gallons, or nearly a day's supply, being subjected to this process. The quantity of lime admitted was regulated by testing the water in the reservoir by a drop of nitrate of silver, the formation of a brownish precipitate indicating that an excess has been introduced. All the fixed constituents contained in one gallon of water were found to be reduced from 24.07 to 8.81 grains, and the organic matter from 2.50 to 1.60 grains. The water was rendered comparatively soft and transparent, acquiring neither odor nor taste by the process. The cost was estimated at about £1 for 1,000,000 gallons.

FINCH, a name given to many birds of the order *passeres*, tribe *conirostres*, and family *fringillida*, including a numerous series of small and generally brilliant birds, with short, thick,

more or less conical bill, without emargination at the tip. This family, according to Gray, comprises the sub-families *ploceina*, or weavers, African for the most part, except the typical genus *ploceus* (Cuv.), which is Asiatic; *coccothraustina*, or hawfinches, well scattered over the globe, of which the rose-breasted grosbeak is a familiar representative in the United States; *tanagrina*, or tanagers, peculiar to this continent, especially to South America; *fringillina*, or finches, found all over the world; *emberizina*, or buntings, of which the common snow bunting is a good example; *alaudina*, or larks, of which the shore lark of the north and a second species on the Pacific coast are the only American specimens: this sub-family is by some, and with good reason, removed from the *fringillida*; *pyrrhulina*, or bullfinches; *loxina*, or crossbills; and *phytotomina*, or plant-cutters. The characters of the bullfinch, bunting, and crossbill have been given under those titles respectively; those of the grosbeaks, hawfinches, larks, plant-cutters, tanagers, and weavers, will be noticed in their alphabetical order; leaving nothing for this article but the proper finches. The characters of the *fringillina* are, in addition to those already alluded to as belonging to the whole family, wings more or less lengthened and pointed; tail varying in length, sometimes with the feathers acuminate; tarsi rather shorter than the middle toe, in a few cases as long, slender and transversely scaled; toes long and slender, the hind toe moderate, with the claws curved and acute. The genus *estrelida* (Swains.) is found in Africa, Asia, and Australia, occurring in small flocks in meadows and bushy grounds, and occasionally visiting gardens. The wax-billed finch, or bengaly (*E. astrild*, Linn.), is of the size of a wren, about 4½ inches long; the bill is deep red, and a streak through the eye and the middle of the breast are of the same color; the general color above is brown, and below reddish gray, everywhere crossed with fine blackish undulations. This handsome bird inhabits Africa from Senegal to the cape of Good Hope; it often commits considerable havoc in gardens, where it devours both buds and seeds; it is frequently kept in cages, more for its beauty than its song. The wings in this genus are short, and the flight is consequently for small distances at a time; the tail is lengthened. There are more than 40 other species. As a specimen of the genus *amadina* (Swains.), differing from the last chiefly in a more uniformly conical bill and in a short and rounded tail, may be mentioned the Java finch, commonly called here Java sparrow (*A. oryzivora*, Linn.); other names are the padda and rice bird. This is of the size of a sparrow, in length about 5 inches; the bill is stout and red; the eyelids are of the same color; the head and throat black; the sides of the head, under the eyes, white; the upper parts pale ash; belly and thighs pale rose, white toward the vent; the tail black. It inhabits Java, China, and India, where it occasionally does

much mischief in the rice grounds; it eats seeds and insects; it is often seen here as a cage bird, and is a favorite for its beauty. There are more than 50 other species of the genus.—The typical finches are found in the genus *fringilla* (Linn.), which is distributed over all the world, living in flocks in which are often associated several species; their food consists of seeds of various kinds of plants and trees in winter, and of larvæ, grubs, and grain in summer; some, like the red poll and the snow bird, are found in very cold regions. There are more than 80 species, which by Gray were brought under the Linnæan genus *fringilla*; some of the old subdivisions have been re-adopted in Prince Bonaparte's *Conspectus Avium*, and in Baird's catalogue of North American birds, but the simpler method of Gray will be adhered to in this article. In the genus *fringilla* the wings are long and pointed, and the tail is generally slightly forked. The chaffinch (*F. cœlebs*, Linn.) has been described under that title, and the siskin (*F. spinus*, Linn.) under ABERDEVINE; the goldfinch (*F. carduelis*, Linn.), the redpoll linnet (*F. linaria*, Linn.), the snow bird (*F. hyemalis*, Linn.), and the yellow bird or American goldfinch (*F. tristis*, Linn.), will be noticed under their respective titles.—The brambling or mountain finch (*F. montifringilla*, Linn.) is a little smaller than the chaffinch, being about $6\frac{1}{2}$ inches long, with an extent of wings of $10\frac{1}{2}$ inches; it resembles this bird in its form, mode of flight, gait, and manners; the bill is larger in proportion. The greater part of the upper mandible and the end of the lower are dusky, the base of the former pale gray, and the rest of the latter yellow; the head and back in the male are deep black, the feathers with a tinge of rusty gray; the throat, breast, and upper wing coverts are light reddish brown; the rump white tinged with yellow; the quills and larger coverts black, the former margined with yellow externally, the inner with a reddish margin and a white spot at the base; the sides spotted with black; the tail black, the exterior feather white on the outer web, and the middle ones edged and tipped with ash color; abdomen and lower tail coverts yellowish white. The female is much less bright; the sides of the head and the back of the neck are gray, the top of the head and back being dusky margined with gray; the rufous markings of the breast and wings are very faint; the size is smaller. It is seen in Great Britain in large flocks in winter, with the chaffinch and allied species, disappearing toward the end of spring, going north to breed; it is hardy and bold, feeding on seeds and what it can pick up in the open fields; its flight is rapid and undulating; the note is like the "tweet" of the chaffinch repeated several times; according to Montagu, it builds a nest in fir trees, and lays 4 or 5 yellowish spotted eggs. Albinos are occasionally seen. It is said to be very fond of beech mast.—The green finch (*F. chloris*, Linn.), also a European species, is about 6 inches long and 9 in extent of wings; the bill is very stout,

the tail short, and the body bulky, which characters have led Mr. Gould to consider it rather a grosbeak (*coccothraustes*) than a finch, and it no doubt is one of the intermediate forms between this and *fringilla*. The male is bright olive green above, passing into yellow; the quills blackish gray, with outer webs bright gamboge yellow; the tail, except the 2 middle feathers, which are gray with light yellow margins, are yellow like the wings, with the external edges grayish brown; below greenish, passing into sulphur yellow; the bill is white, with a pink tinge; the legs brown; the young are marked with oblong dashes of brown on the lower surface and the upper part of the back. This is an indigenous, non-migratory, hardy bird, living in flocks, familiar and docile; it is often kept in confinement for its facility in imitating the notes of other birds; its own song consists of 3 or 4 short mellow notes, which are very pleasing during the breeding season; it is not particular in its choice of food, eating the usual grains and seeds given to caged birds. The eggs are 4 or 5 in number, pale bluish white, speckled at the larger end with reddish brown.—The pine finch (*F. pinus*, Wils.; *chrysomitria*, Boie), distributed over North America from the Atlantic to the Pacific, is $4\frac{1}{2}$ inches long, with an extent of wings of $8\frac{1}{2}$ inches. The plumage is soft, but with little gloss; the short, conical, acute bill is light yellowish brown, with a dusky tip; the iris brown; general color above yellowish gray, with dark brown streaks; the wings and tail dusky, with grayish white edges; the base of the secondaries, the tips of their coverts, and the margins of the rump feathers are cream-colored; grayish white below, with streaks of dull brown, and a brown tinge on the fore neck; the female very closely resembles the male. This species, though seen in the southern states, prefers the northern regions of the country and the Canadas, wherever pine trees abound; it is most common in the north during winter, where it is seen in small flocks with the redpoll and the crossbill; the favorite food is found amid the branches of the highest fir trees, where they hang head downward like the titmouse; the seeds of the thistle and the sweet gum are also much eaten by them. Though he could find no nests, Audubon met with great numbers of these birds accompanied by their young on the coast of Labrador toward the end of July; and they doubtless breed there. The mode of flight and notes resemble those of the goldfinch; like the latter, it sweeps through the air in long graceful curves, uttering its sweet and clear song as it takes a fresh start.—The genus *passer* (Briss.) includes the sparrows of the old world, which are rarely called finches. The American sparrows are contained in the genus *zonotrichia* (Swains.); many of these are popularly called finches; the bill is perfectly conical, the wings moderate, the tail long, broad, and nearly even at the end. The grass finch (*Z. graminea*, Gmel.; genus *poœcetes*, Baird) is $5\frac{1}{2}$ inches long, with an extent of wing

of 10 inches; the general color above is light brown, streaked and mottled with darker; a narrow circle of white around the eye; throat and breast yellowish white, the latter streaked with dark brown; the larger coverts and the quills deep brown, the former edged with paler, and the first of the latter with white external margin; lesser coverts bay; tail deep brown, marked and margined with white; sides and abdomen pale yellowish brown, the former streaked with darker; under tail coverts white. It is distributed far to the north and over the United States from the Atlantic to the Pacific, and there is a variety, or perhaps a species, to the west of the Alleghanies; it seems to prefer sandy and barren soils in cultivated districts, its song is sweet and protracted; it is shy and solitary, and runs nimbly through the grass, in which the nest is built; the eggs, 4 to 6 in number, are laid about the middle of April at the south, where 2 broods are generally raised each year; they are $\frac{7}{8}$ of an inch long, bluish white, with reddish brown blotches; the food consists of various kinds of seeds and insects, and the flesh is tender and of good flavor. This bird employs a great variety of artifices to deceive any one who approaches her nest, imitating lameness, and attempting to draw attention to another locality. Lincoln's finch (*Z. Lincolnii*, Aud.; *melospiza*, Baird) is yellowish brown above, with streaks of brownish black; head chestnut, streaked with brownish black, with a grayish blue band in the centre and two at the sides; quills and larger coverts deep brown, with lighter margins, and the latter tipped with whitish; tail yellowish brown; throat white, with dusky streaks and spots; below grayish white. It is found as far north as Labrador, from the Atlantic to the Pacific, and south through Mexico to Guatemala. The song is very sweet and loud; the flight is rapid and low; the food is insects and berries; the males, as in most finches, are pugnacious.—The genus *ammodromus* (Swains.) has the wings short, the tail lengthened, the lateral feathers graduated, with the end of each acuminate; the species generally remain within the limits of tide water, and run along the shores among the weeds, like sandpipers, climb along the rushes, or swiftly dart among the tufts of grass; they eat shrimps, small mollusks and crustaceans, and other minute marine animals. The sharp-tailed finch (*A. caudacutus*, Gmel.) is found along the whole Atlantic coast of the United States, being most abundant among the salt marshes of South Carolina. The crown of the head is bluish gray in the middle and deep brown at the sides, with a band of yellowish red from the bill over the eye; hind neck dull gray, tinged with brown; fore neck pale yellowish red with dusky streaks, the throat paler and unspotted; back brown, tinged with gray; primaries and tail wood brown; secondaries and smaller coverts reddish brown; sides yellowish red, with dusky streaks; breast and abdomen grayish white. They come down to the marshes when the tide is out, re-

turning to the shores and rice fields at high tide; the note is a single "tweet;" the nest is placed on the ground, near the water, in a slight hollow; the eggs, 4 to 6, are laid sometimes twice in a season; the color is dull white, with light brown dots, most numerous at the larger end; from the quickness with which they move on the ground, they are most easily shot on the wing. The seaside finch (*A. maritimus*, Wils.), with similar habits to the preceding, and found in the same localities as far north as Long island, has the crown of the head deep brown, surrounded by a line of grayish blue; upper part of the back, wings, and tail, olive brown mixed with pale blue; lesser wing coverts reddish brown; a yellow streak from the bill over the eye; throat and fore neck grayish white; breast and sides grayish blue, the abdomen paler. The eggs are grayish white, with brown freckles all over; many nests are found in company. The food consists of marine insects, snails, crabs, sand beetles, and seeds.—Bachman's finch, placed in the genus *ammodromus* by Gray, belongs to the genus *peucaea* (Aud.); this (*P. aestivalis*, Licht.) is reddish brown above, with the centre of the feathers black and their margins bluish gray; the quills dark brown, with lighter edges; tail feathers brown, lighter on the outer edges; ochre-yellow streak over the eye; throat pale yellowish gray; fore part of the breast and sides tinged with brown, lower parts yellowish gray. The length of the bird is 6 inches, and the extent of the short wings only 8. The habits of this species render it difficult to observe; it runs in the grass more like a mouse than a bird, and is much oftener heard than seen; the notes are soft and sweet, justifying the remark that it is perhaps the finest songster of the sparrow family. The food consists of grass seeds, beetles, and berries. It is confined to the southern states.—In the genus *spiza* (Bonap.), or *cyanospiza* (Baird), the wings and tail are moderate, and the latter even. The painted finch (*S. ciris*, Linn.) is $5\frac{1}{4}$ inches long and $7\frac{1}{4}$ in extent of wings; in the adult male, the head and neck are azure blue; the back and lesser wing coverts yellowish green; circle round the eye, lower back, and under parts carmine; quills and tail purplish brown; secondary coverts green. The female has a brown bill, the upper parts light olive-green, and the under parts dull orange, paler behind; the male of the first year resembles the female, except in having the blue lower mandible of his sex; the adult male plumage is not obtained until the 4th year. It is an inhabitant of the south Atlantic and gulf states, extending into Texas and Mexico; its flight is short and quick, and its movements on the ground like those of the sparrows; its song is very sonorous and pleasing, and is continued through the hottest part of the day; the nest is usually built in an orange tree, and the eggs, 4 or 5, are of a fine bluish pearl color, speckled with blackish. It appears in the vicinity of New Orleans about the middle of April, when great numbers are taken in traps, set with a stuffed

specimen of a male bird; all males which perceive this are led by their pugnacious dispositions to attack it, and the trap springs upon them during the operation; they are easily kept in confinement, and will sing and breed in captivity if properly cared for. Great numbers of this beautiful finch were formerly carried to Europe, where they brought almost fabulous prices, a bird which cost 8 cents in New Orleans selling in London or Paris for more than twice as many dollars. Their flocks sometimes occasion considerable damage to ripe figs and grapes, of which they are exceedingly fond. The lazuli finch (*S. amœna*, Say) is another handsome and allied species, belonging rather to the Pacific fauna. The bill is brownish black; the head and neck, hind part of back and rump, are beautiful greenish blue; fore part of the back, scapulars, wings, and tail, brownish black, the feathers with blue margins; a conspicuous white band on the wings; on the fore part of the breast a broad band of brownish red; the sides, lower wing coverts, and tibial feathers, bluish gray; lower parts white. The female is far less brilliant, a grayish tint prevailing in most parts of the plumage. It is rather a shy bird, with a lively and pleasing song. Another beautiful species is the *S. cyanea* (Linn.), which will be noticed under INDIGO BIRD.—The last finch which will be mentioned belongs to the sub-family of *pyrrhulinae*, and to the genus *carpadacus* (Kaup.). The purple finch (*C. purpureus*, Gmel.) is 6 inches long, with an extent of wings of 9 inches; The bill is very robust, conical, bulging, and acute, deep brown above, bluish below; the head, neck, breast, back, and upper tail coverts are of a rich lake color, nearly crimson on the head and neck, and fading into rose color on the abdomen; the fore part of the back is streaked with brown; the quills, larger coverts, and tail are deep brown margined with red; a narrow cream-colored band across the forehead close to the bill. The female and young are brownish olive above, with dark brown streaks; the under parts grayish white, the sides streaked with brown; quills and tail feathers dark brown with olive margins; a broad white line over the eye, and another from the gape backward. In the southern states their flocks are seen from November to April, feeding on the interior of buds which they husk with great skill; they are usually seen in the morning and at night, darting after insects. Their song is sweet and continued. They are found from Labrador to Louisiana, being replaced on the Pacific coast by the *C. Californicus* (Baird) and the *C. Cassinii* (Baird); they breed in the north, where they are seen in midwinter in company with crossbills and other hardy birds, feeding on the berries of the evergreens. Their nests have been found in Massachusetts; the eggs are of an emerald green color, with a few black dots and streaks near the point, and some purplish blotches. The farmers believe them to be injurious to fruit trees by destroying the blossoms, great numbers of which they pull off. Audubon considers their

flesh equal to that of any small bird, except the rice hunting. They are sometimes kept in cages and in aviaries, but they do not sing in confinement.—Many other sparrows and buntings are called finches in different parts of the country, but they all belong to the family of *fringillida*, and may be found described in any work on ornithology.

FINCH, HENRAGE, 1st earl of Nottingham, a British statesman and jurist, born in Kent in Dec. 1621, died in Dec. 1682. He was educated at Westminster school and at Christchurch college, Oxford, subsequently studied law in the Inner Temple, and rose to great eminence as a lawyer. During the revolution he enjoyed general respect and confidence. At the restoration he was made solicitor-general, took part in the prosecution of the regicides, of which he wrote a full account, and in 1661 entered parliament as member for the university of Oxford. In 1667 he defended Lord Clarendon, when impeached for high crimes and misdemeanors, and after being successively attorney general and lord keeper, was appointed in 1675 lord high chancellor of England. In 1681 he was created earl of Nottingham, having for some years previous borne the title of Baron Finch of Daventry. He was equally celebrated for his eloquence in the senate and at the bar. His literary remains include a number of published parliamentary speeches and legal arguments, and some volumes of manuscript chancery reports.

FINDEN, WILLIAM, an English line engraver, born in London in 1787, died there, Sept. 20, 1852. He was apprenticed to an engraver, and afterward found employment as an engraver of book plates. Being remarkable for a certain neatness of line and smoothness of finish, he became one of the most popular engravers of his time, and was selected to engrave Lawrence's celebrated portrait of George IV., for which he received 2,000 guineas. He also engraved the "Village Festival" and the "Highlander's Return," both from well known pictures by Wilkie. He published some very extensive series of engravings, the best of which is the "Gallery of British Art;" he lost heavily by this enterprise.

FINDING. It is a little strange that when the act of finding is so common, and always must have been so, the law of finding is, in some particulars, not quite settled. It is certain that nothing can be found that was not lost; hence, unless the owner of property has it no longer in his possession or within his reach, and is deprived of all power over it, either by accident or voluntarily, as when he casts it away, another man who happens upon it acquires none of the rights of a finder. Lost goods were defined by the old law as *bona vacantia*; and Savigny, in his "Treatise of Possession" (of which there is an excellent translation into English, by Sir Edward Perry), says, § 18: *Vacua est, quam nemo detinet*. The ancient law of treasure trove was said to apply to gold and silver only; and indeed only to that which had been purposely

hidden in the earth, and of which the owner was unknown. Originally it belonged to the finder; but many centuries ago it was adjudged to belong, to a greater or less extent, to the sovereign, and Grotius says this rule had become in his time *jus commune, quasi gentium*. Blackstone ("Commentaries," vol. i. p. 296) makes a distinction between goods hidden by the owner, which the owner never reclaimed, being prevented by death, forgetting, or neglect, and goods voluntarily or accidentally cast abroad. In the first case, there was no intention to abandon them, and when they were not the owner's they became the king's, to whom the finder must give them. In the latter case they became the property of the finder. The law of treasure trove never had much force in this country; and although there were formerly some colonial regulations and are now some statutory provisions in respect to finding, they do not appear to have much force, unless it be in relation to what may be termed wrecks. The law on this subject, so far as it can be gathered from the authorities, seems to be this: 1. The finder of lost property is owner of it against all the world excepting the original owner; but the owner may reclaim it from the finder at any time, although leaving it unclaimed in the finder's hands for a sufficient length of time after the owner knew where it was and could claim it (perhaps 20 years, the ordinary period of prescription, might be necessary), would be equivalent to a waiver or abandonment of his ownership. The finder has therefore all the rights of action of an owner, either to recover possession of it, or damages for loss of it or injury to it. 2. The finder is always at liberty to leave what he finds untouched, and cannot be made accountable for any injury thereafter happening to it. But if he takes it into his possession, he acquires some rights and comes under some obligations which do not seem to be perfectly well defined. On the one hand, it is said by the old authorities, that if the thing found perish by his mere neglect, or without his active aid, he is not responsible. But the tendency of modern law is, that while he may abstain if he pleases from any interference whatever, if he chooses to take what he finds into his custody, he makes himself responsible not only for any wilful injury to it (which is quite certain), but for the consequences of his gross negligence. 3. As the correlative rule, or as the right which corresponds to this obligation, he may demand from the owner all his expenses necessarily incurred in keeping and preserving the property, and probably his reasonable expense in the way of advertising, or for similar charges for the benefit of the owner. We should say that where a finder takes into his possession the thing found, it becomes a kind of bailment; and the owner, by reclaiming and receiving it from the finder, assents as it were to this bailment; and out of this constructive bailment grow the obligation and responsibility of the finder on the one hand, and his rights on the other. 4. It has been in-

timated by one high authority, at least, Judge Story ("Bailment," sections 85 *et seq.*), that the finder may also make a further charge against the owner for compensation for care and labor, and perhaps for reward. There are moral reasons for this, but no legal authority; and except when property is found at sea, and comes under the admiralty law of salvage, we know no law which authorizes the finder to claim more than his expenses. 5. For whatever the finder may lawfully demand of the owner in respect to the property found, he has, we think, as one of the consequences of the constructive bailment above spoken of, a lien on the property itself; that is, a right to hold it even against the owner, until his demand is satisfied. 6. It seems now to be settled that the place where property is found has no effect upon the rights of the finder. Thus if A finds money on the floor of B's store, and hands it to B for the owner, and B advertises, and does what else he should to discover the owner, and fails in this, the finder may demand it of B, tendering B's expenses in discharge of his lien. There was at one time some disposition to say that if A found goods buried in B's lands, they were the property of B; but this seems to have passed away, or rather never to have been settled law, and the rule above stated, that the place where found has no effect whatever on the right of the finder, is without qualification. 7. If a reward be offered, which is specific and certain, or can be made so by reference to a certain standard, the finder by bringing the thing found to the owner, or otherwise complying with the terms of the advertisement, becomes a party to a contract offered to all by the advertiser, and may sue for the compensation or reward promised. But if the advertisement is general only, as that the finder shall be liberally rewarded, the finder has no specific claim, and can have no action. 8. The rule that the finder is owner against all the world except the original owner has one important exception. A finder of what the law calls a *chose in action*, or mere evidence of debt or claim, cannot demand payment of it; and if one should pay a note, a check, or a lottery ticket, to a holder known by the payer to have come into possession of it by finding, the payer would be bound to pay the amount to the owner who could prove his property. 9. A finder may incur punishment as for crime, by misconduct about the property he finds. Thus, if he knows the owner, or there are circumstances which, if he chose to profit by them, would lead him to the owner, a conversion of the property to his own use is larceny or theft. But it is not larceny unless the *animus furandi* existed at the time of the appropriation; for if the finder only discovered the owner after he had made the appropriation, and then concealed his finding, it would seem to be the law that he is answerable only in damages.

FINISTÈRE, or FINISTERRE, the extreme W. department of France, from which position (Lat. *finis terræ*, land's end) it derives its name, sur-

rounded on 3 sides by the ocean and the English channel, and bounded E. by the departments of Côtes-du-Nord and Morbihan; length N. and S. 65 m.; breadth about 55 m.; area, 8,575 sq. m.; pop. in 1856, 617,710. It was included in the former French province of Brittany. The coasts, generally steep and deeply indented, are about 410 m. in length, and present many excellent bays and harbors. The most important ports are Brest, Morlaix, Landerneau, Quimper, and Douarnenez. Of numerous rivers, 3 only, the Aulne, the Elorn, and the Odet, are navigable. Two hill chains, that of Arés in the N., and that of the Black mountains in the S., run through this department E. and W. The climate is mild, but humid; fogs are common; W. winds are most prevalent, and violent storms often occur. The soil of some parts is good, and the pasturage is excellent; but heath or waste land covers no less than a third of the department, and agriculture is in a backward state. The wealth of the department consists especially in its argentiferous mines of lead; those of Poullaouen and Huelgoat are perhaps the largest in France. Iron, zinc, coal, and bitumen are also mined. The fisheries employ about 880 boats and 4,400 hands, and realize a gross produce of about \$500,000 a year. There are manufactures of linen and woollen fabrics, paper mills, rope yards, sailcloth, and earthenware factories.

FINLAND (Fin. *Suomema*, region of lakes), a grand duchy in the N. W. of the Russian empire, lying between lat. 60° 50' and 70° N., and long. 32° and 21° E., bounded N. by the Norwegian province of Finmark, E. by the Russian provinces of Archangel and Olonetz, S. by the gulf of Finland, and W. by the gulf of Bothnia and Sweden; area, about 136,000 sq. m. The name of Finland was given to it by the Swedes. The population in 1856 was as follows:

Nyland	154,918
Abo	298,273
Tavastehus	155,685
Viborg	263,343
St. Michael	153,621
Kuopio	212,331
Vasa	273,845
Uleaborg	171,522
Total	1,639,588

The population comprises 125,000 Swedish Finns, 8,000 Russians, 1,000 Lapps, 1,000 gypsies, 400 Germans, and the rest are Finns proper. The most populous districts are along the coast; there are some districts in the interior wholly uninhabited. The population of the whole country is about 12 to the square mile.—The S. coast of Finland is bordered with rocky islets, between which and the mainland are narrow and intricate channels difficult of navigation. The W. coast is generally low, but becomes very rocky near the Quarken, and in some parts is not less dangerous than the southern. Some of the islands, as those of Sweaborg, which command the entrance to the harbor of Helsingfors, are strongly fortified. The rivers are few and unimportant; the principal is the Kymmene, which flows into the gulf of Finland, and is

broad and deep, but owing to cataracts is not navigable. The lakes, however, constitute a prominent feature in the geography of the country, being very numerous and occupying a large proportion of the territory. Independently of Lake Ladoga, which lies partly in Finland, the largest of these sheets of water are Lakes Saima and Enara. The communication between the various watersheds and the Finnish gulf has been established since 1854 by the lake of Saima. The surface is tableland from 400 to 600 feet above the level of the sea, with occasional higher elevations. The Maanselke mountains in the N. have an average altitude of 3,000 or 4,000 feet. The principal geological formation is red granite with hard limestone and slate. The granite is of a kind which readily disintegrates. The soil is poor and stony, but during a long period it furnished considerably more grain than was required for home consumption. The climate is more severe than that of Sweden, although resembling it in many other respects. Dense fogs are frequent, and the rains in autumn are very heavy. In the S. provinces the winter lasts 7 months. In the N. the sun disappears in December, and is not seen again until the middle of January, but during the short summer it is almost continually above the horizon. The mineral products comprise bog iron, lead, sulphur, arsenic, and a little copper ore. Salt is very scarce, and is one of the principal articles of importation. Among the fauna are the bear, wolf, elk, deer, beaver, polecat, and various kinds of game. Large herds of reindeer are domesticated in the N., and cattle-breeding is a prominent branch of industry. The seal and herring are caught off the coasts, and the lakes and streams abound in salmon and a small species of herring which form an important part of the food of the inhabitants. When connected with Sweden, Finland was called the granary of Sweden; but since the Russian conquest agricultural production is said to have declined. The chief crops are barley, rye, hops, hemp, flax, oats, leguminous plants, and potatoes. A little tobacco, carrots, colewort, parsnips, and onions, are also grown. Wild berries are almost the only fruit. The forests are extensive, reaching N. to lat. 69°, consisting principally of pine and fir, but containing also beech, elm, oak, poplar, ash, and birch. These forests are one of the chief sources of national wealth, but have been much wasted by a system of manuring land with their ashes. The soil requires frequent stimulus, and when the cleared land ceases to produce sufficiently it is abandoned for other portions of soil, the timber of which is purposely burned. Much tar, pitch, and potash, however, as well as firewood, are still exported. The pasture lands are good, but ill managed. About 50,000,000 lbs. of butter are made annually.—Manufactures are chiefly domestic. The peasant prepares his own tar, potash, and charcoal, builds his own boat, makes his own chairs and tables, and in his cottage are woven the coarse woollen and other fabrics of which his dress is

of Maanselka, its Abo variety being the dialect used in books; the upper, or that of the inland region, divided into the sub-dialects of Uleå and Viborg, and the varieties of Savolax, Karelia, Annalaet (Olonets), Cajaneburg, Ingria, &c. The Suomic language is written with 28 Latin or German letters, of which two are repeated at the end of the alphabet with a diacritic sign, viz., *ä, ö*. It contains, however, but 19 genuine sounds, viz., 8 vowels and 11 consonants. The letters *b, c, d, f, g* occur only in a few foreign words and in some dialects, and *q* is now obsolete. *K, p, k* are the most frequent initials, *ä, p, t* the most frequent letters on the whole, and sound a little softer than in other languages. The concurrence of consonants is avoided, so that the foreign words *Francis, Stephen, school, stable*, become *Kantai, Tekran, koulu, tallus*. There are many diphthongs. Long vowels are written double. The hiatus is not avoided. A few themes end in consonants, but none in *m*. The rhythm of the language is trochaic, and the root bears the tone. Rask considers the Suomic to be the most harmonious of tongues. The radical, which precedes all other syllables, never undergoes any change in its beginning and middle. The theme is originally dissyllabic, and often corresponds to monosyllabic Magyar roots; thus: *käsi*, Magyar *kéz*, hand; *sata*, *sata*, 100; *vesi*, *vesi*, water; *veri*, *veri*, blood; *sana*, *sano*, word; *tyri*, *tü*, stem, &c. The various relations of nouns to one another, which in other languages are expressed both by cases and prepositions, are indicated by postpositions or suffixes, forming from the nominative, which is sometimes the theme with a changed final, 13 cases, of which 7 are simple, the others more full. The object is indicated by the genitive, nominative, or partitive, according to the shade of meaning. Plurality is denoted for the nominative by suffixing *t*, and for the other cases by inserting *i* before their endings. In some instances a euphonic *e* is inserted before the endings. Vocal harmony is strictly observed between the vowels of the theme (in

The commercial fleet in 1855 consisted of about 500 vessels, of which the greater part were employed in the trade with Sweden, Russia, and Germany. Many are employed in the Mediterranean, about 12 in Brazil, and a few in the East Indies. Travelling is effected mostly by posting in carriages without springs. The principal road follows the coast from Abo to Viborg, and thence runs to St. Petersburg, but there are public conveyances only on a part of it. Steamers ply between St. Petersburg and Stockholm and the principal coast towns.—Of the whole population 1,681,353 are Lutherans, divided into 3 dioceses, which control 84 provostships, 487 Lutheran churches, and 223 schools. The archbishop resides at Abo. The rest are mostly of the Greek church, and acknowledge the archimandrite of St. Petersburg. Education receives considerable care, and the study of the Finnish tongue, which was much neglected while the country was subject to Sweden, has been encouraged under the Russian government. Other branches of education have received equal attention from

nouns as well as verbs), and for this purpose the vowels are distinguished into 3 groups, viz.: *a, o, u*; *e, i*; and *ä, ö, y*; the first and last never occurring in one word together, but both being compatible with the middle one. Hence the first and last group are then converted reciprocally in the suffixes, in order to suit the vowels of the theme; for instance, *maa-ta*, land-part, but *pää-tä*, head-part. No language of this family has grammatic genders, but all indicate sexes either by distinct words or by epithets. The Magyar alone uses an article. The adjectives in Suomic are immutable, and are rendered comparative by suffixing *mpa*, *mma*, and superlative by inserting *i* before that termination. Nouns and adverbs receive an intenser meaning by inserting *mpa* and *impa*. The numerals are: 1, *yksi*; 2, *kaksi*; 3, *kolme*; 4, *neljä*; 5, *viisi*; 6, *kuusi*; 7, *seitsemän*; 8, *kahdeksan*; 9, *yhdeksän*; 10, *kymmenen*; 11, *yksi-toista-kymmentä*; 20, *kaksi-kymmentä*; 30, *kolmi-kymmentä*; 100, *sata*; 1,000, *tuhanen*, *tuhot*. The personal pronouns are: *minä*, I; *sinä*, thou; *hän*, he, she; *me*, we; *te*, you; *he*, *hevat*, they. The verbs have but two simple tenses, viz., the present and past, the others being periphrastic. Their conjugation is more complicated than in any other family of languages, expressing by certain syllables inserted between the theme and the personal suffixes all voices, modes, species, and other nice shades of meaning. The infinitive shares more than in any other language in the nature of a noun; it comprehends the Latin gerunds, supines, and other shades of sense, and is declinable. The Finnish language has no separable particles, and even affirmation is expressed by means of the auxiliary *olen*, I am, and negation by means of the verb *e*. By connecting several such significant syllables into one word, the most complicated ideas may be very precisely expressed, which often require many separate words in other languages. Derived words may be formed almost indefinitely. The construction is extremely free, as in Magyar, without endangering the clearness of the sense, as for instance:

<i>Katso</i>	<i>kylräjä</i>	<i>meni</i>	<i>kylänään</i> ,	<i>ja</i>	<i>kylväessänsä</i>
Lol	sower	went	sow-to,	and	sowing-while
<i>lankesivat</i>	<i>muutamia</i>	<i>tien</i>	<i>ohien</i> ,	<i>ja</i>	<i>linnut</i>
fell	some (seeds)	road's	edge-on,	and	birds
<i>tulivat</i> ,	<i>ja</i>	<i>öivät</i>	<i>ne</i> .		
came	and	picked-up	them.		

The best grammar of the language is that of Jac. Juden in Swedish (Viborg), 1818. Finnish dictionaries have been published in Latin and Swedish by D. Justenius in 1745, Renvall in Latin, Swedish, and German (Abo, 1826), O. Helenius in Swedish (Abo, 1838), and E. Lönnrot (Helsingfors, 1853).—The national songs or runes of the Finns may be divided into mythological and lyrical songs. They are sung by *Runolainen* (song men), to the sound of the favorite national instrument, the *kantele*, a species of harp with 5 wire strings. The songs, scattered among the people for generations past, and some of which had been published since the be-

ginning of this century, were at length collected by Elias Lönnrot and published at Helsingfors in 1835 under the title of *Kalevala*, which work is now regarded as the great national epic of Finland. Alexander von Humboldt, in his "Cosmos," says: "Among the Finnish tribes who have settled far to the west in the lowlands of Europe, Elias Lönnrot has collected from the lips of the Karelians and the country people of Olo-netz a large number of Finnish songs, in which there breathes, according to the expression of Jacob Grimm (*Ueber ein finnisches Epos*, 1845), 'an animated love of nature rarely to be met with in any poetry but that of India. An ancient epos containing nearly 3,000 verses treats of a fight between the Finns and the Lappa, and the fate of a demi-god named Vaino. It gives an interesting account of Finnish country life, especially in that portion of the work where Ilmarine, the wife of the smith, sends her flocks into the woods and offers up prayers for their safety.'" So great was its success that the Finnish literary society took immediate measures for a more comprehensive collection, and the 2d edition, which appeared in 1849, contains 50 songs, with about 23,000 verses, while the first edition contained only about half as many. A Swedish translation of the poem by Castren (Helsingfors, 1844) was speedily followed by a French translation by Léouzon le Duc (Paris, 2 vols. 8vo., 1845), and by a German translation by A. Schiefner (Helsingfors, 1852). Lönnrot has further collected about 600 ancient lyrical songs and 60 ballads (*Kanteletar*, Helsingfors, 1840); about 7,000 proverbs (*Suomen kansan sanalskuja*, 1842); and about 2,200 charades (*Suomen kansan arwoituksia*, 2d ed., 1851); while Rudbäk has edited a collection of legends and tales (*Suomen kansan satuja*, Helsingfors, 1854). There are many poets in Finland of Swedish descent, and Swedish works are often translated into Finnish. The most popular contemporary Finnish poet is a peasant named Paul Korhonen. An edition of his songs was published at Helsingfors in 1848, under the auspices of Lönnrot. The prose literature of Finland is devoted almost exclusively to religious and moral subjects. A Finnish translation of the New Testament by Michael Agricola appeared in 1548, a portion of the Old Testament in 1552; but the whole Bible was not translated into Finnish until 1642. A *Bibliographia hodierna Fennica* appeared at Abo in 1846, and a continuation in 1849. A catalogue of the Finnish works printed in Finland was published at Helsingfors in 1854. The total number of all sorts of publications issued in Finland between 1843 and 1855 was 4,000. The Finnish literary society has published since 1841 an annual record (*Suomi*). The number of newspapers and periodicals in 1858 was 18, of which 8 were in Finnish and 10 in Swedish. The latter appear at Helsingfors, Viborg, Abo, Borgo, and Vasa.—Finland has been united since 1809 to the empire of Russia. Its constitution was confirmed by the emperor Alexander I., March 27,

1809; again by the emperor Nicholas, Dec. 24, 1825; and by Alexander II., March 4, 1855. The government is administered by a governor-general and a senate consisting of 14 members, half of whom are noble, and who are presided over by the governor-general assisted by two vice-presidents not included in the number of the members. The senators are named for 8 years by the emperor. The vice-presidents are chiefs of the departments of justice and finance. The deliberations of the senate are held at Helsingfors, the modern capital. High courts of justice sit at Abo, Vasa, and Viborg. There is also a regular military court. Provincial governors reside at Helsingfors, Abo, Tavastehus, Viborg, St. Michael, Kuopio, Vasa, and Uleaborg. These dignitaries are all, by the terms of the constitution, Finns, and a secretary of state for Finnish affairs, a Finn, resides at St. Petersburg, and is a member of the imperial council. A diet, composed like that of Sweden of the 4 orders, nobility, clergy, burghers, and peasants, is a constitutional privilege of Finland, according to the imperial recognition; but it is now rarely convoked, and is unlikely to be except when its concurrence is necessary to the imposition of new taxes. The army, under the immediate command of the governor-general, comprises an effective force of 6,100 men of all arms. It is the privilege of the Finnish regiments that they shall not be incorporated or intermingled with the forces of the empire. The naval force also forms a distinct squadron under their own national flag. The revenue and expenditures in 1857 were as follows:

REVENUE

	Silver rubles.
Real estate tax.....	969,080
Poll tax.....	299,400
Tax on manufactures.....	48,000
Customs revenue, stamps, &c.....	1,284,540
Casual dues, escheats and other.....	87,195
Total	2,708,215

EXPENDITURES

Government	187,723
Department of justice.....	87,699
Military affairs (army and navy).....	741,484
Civil affairs.....	500,781
Church and public instruction.....	278,445
Extraordinary expenditures.....	244,674
Endowments (charitable) and hospitals....	185,184
Agriculture and commerce.....	187,658
Pensions	191,204
Total	2,549,802

The clergy, part of the troops, and various civil functionaries receive their emoluments and pay from resources not included in the foregoing list of revenue; namely, from country parishes, or from government lands reserved for this purpose. These expenditures therefore do not appear on the general budget. The debt of the state in 1854 amounted to 2,898,200 silver rubles, of which sum 1,850,000 grew out of the war of 1854-'5. A loan of 5,000,000 silver rubles was raised by Finland in 1859 with the sanction of the Russian government.—Less is known of early Finnish history than of that of any other European country. The inhabitants, pagans, were governed by their own indepen-

dent kings until about the middle of the 12th century. Their piracies at this period so much harassed the Swedes, that St. Eric, king of the latter people, undertook a crusade against them, and introduced Christianity, and also probably planted Swedish colonists upon their coasts. The Swedes thus acquired a hold upon the country which they retained for several centuries. From this period down to 1809 the history of Finland is included in that of the kings of Sweden, during which the country was the frequent scene of Russian and Swedish wars. By the peace of Nystad (1721), 8 years after the death of Charles XII., the territory of Viborg, the eastern division of Finland, became definitively Russian. In 1742 the Swedes, hoping to repair their losses, declared war, and in a few months the whole of Finland was overrun by the Russians. In the following year, at Abo, Sweden ratified anew all her former cessions, yielding additional territory also, but recovered the principal duchy. In 1787 Gustavus III. began his great attempt to recover these losses and to humble his antagonist; but the results of the war added little glory to the Swedish arms. In 1808 a fresh invasion from Russia took place, and Sweden purchased peace by the cession of all Finland and the islands of Aland, Sept. 17, 1809. The Swedish language and customs during 750 years had taken such firm root that Russian dominion has been unable to modify them. Abo remains in some degree a Swedish city, and the removal of the seat of government to its rival Helsingfors (1812), and of the university (1826), has not contributed to Russianize the ancient capital. Indeed, at the present day Stockholm is for Abo much what St. Petersburg is for Helsingfors. Finland suffered greatly during the war of 1854-'5 from the blockade of the allied fleets, but the people manifested a patient fidelity to the cause of her present government. The emperor's exertions to relieve the privations which his Finnish subjects were called upon to undergo are believed to have attached them strongly to him. The bombardment of the Finnish fortresses and the unrelenting coast blockade during two seasons conducted in like manner to detach the Finnish sentiment from the western powers, while the maintenance of Swedish neutrality during the war tended also in some degree to alienate the Finns from their ancient masters.

FINLAND, GULF OF, the eastern arm of the Baltic sea, extending from the Aland and Dago islands eastwardly to the bay of Cronstadt and St. Petersburg, between long. 22° and 30° E., and intersected partly by the 59th parallel of north latitude. Its coasts are entirely Russian possessions; namely, Finland and Viborg on the north, and Esthonia on the south. The head of the gulf terminates in the bay of Cronstadt, on the shores of which is the province or government of St. Petersburg. The waters of the great lakes Onega and Ladoga, N. E. of St. Petersburg, flow into the gulf of Finland, the first by the river Svir into Lake Ladoga, and the

latter by the Neva into the bay of Cronstadt. The bed of the gulf is of calcareous rock, in some parts compact and naked, in others covered and filled with shells. Occasional points of granite are intermingled with this general character. The depth of water is nowhere great, and is least along the southern coast, of which the submerged descent is gradual. The northern shore is much hemmed in with islands. The water is very slightly salt, and is readily drunk by cattle. The harbors of the gulf of Finland are closed by ice every year from early in December to the middle or end of April. It has several times happened that the waters of the gulf, driven by westerly gales, have recoiled so violently as to submerge whole streets in St. Petersburg, even up to the first floor of houses; an event against which no provision for the future has appeared possible. The Russian survey of the gulf of Finland is described in Struve's great work on the subject, of which 2 vols. had been published up to 1859, the 3d and last vol. being soon expected to appear.

FINLAY, GEORGE, a British Philhellenist and historian, born in Scotland about 1800, enlisted at an early age in the cause of Greek independence, lived much with Lord Byron before his last illness, was an associate of Dr. Howe of Boston, and since the war has resided in Athens. The appropriation of his garden by the Greek government, for which Mr. Finlay claimed a large indemnity, as the garden affords a most beautiful view of the Acropolis, gave rise to one of the many controversies between the English and Greek governments. Mr. Finlay remarked on the subject of his claim to the earl of Carlisle, who visited Athens in Nov. 1853, that "the modern Greeks wholly ignore the whole period from Alexander the Great to Lord Palmerston;" "which," as Lord Carlisle wittily adds, "is an appropriate complaint from a historian of mediæval Greece." Mr. Finlay is noted for his thorough knowledge of Greek topography, art, and antiquity, and is the author of a series of works on Greek history, comprising "History of Greece under the Romans" (1st ed., London, 1843; 2d ed., 1857), "History of Mediæval Greece and Trebizond" (1851), "History of the Byzantine and Greek Empires" (2 vols. 8vo., 1853-'4), and "History of Greece under Othoman and Venetian Dominion" (1854). He is now engaged in a work which will bring the history of Greece down from the Turkish conquest to the constitution of 1843.

FINLAY, JOHN, a Scottish poet and biographer, born in Glasgow in 1782, died in Moffat in 1810. His principal poem, "Wallace, or the Vale of Ellerslie," was published when he was only 19 years old. The more important of his other works are: "Scottish Historical and Romantic Ballads, chiefly Ancient, with Explanatory Notes," &c. (2 vols. 8vo., Edinburgh, 1808), and a "Life of Cervantes." He also edited Blair's "Grave," and Smith's "Wealth of Nations."

FINLAYSON, GEORGE, a Scottish surgeon

and traveller, born in Thurso about 1790, died on the passage from Bengal to Scotland in Aug. 1823. As surgeon of the British army he was present at the battle of Waterloo. He served also as surgeon in Ceylon and India, and in 1821 accompanied Crawford in his mission to the sovereigns of Siam and Hue (Cochin China), of which he wrote an interesting journal, edited and published after his death by Sir T. S. Raffles (London, 1825).

FINLEY, JAMES BRADLEY, an American clergyman and author, born in North Carolina, July 1, 1781, died in Eaton, Ohio, Sept. 6, 1857. His father was a minister in the Presbyterian church, and removed to Kentucky, where he opened an academy. The son entered the Ohio M. E. conference in 1809. In 1821 he was sent as a missionary to the Wyandot Indians, among whom he remained 6 years. In 1845 he was appointed chaplain of the Ohio penitentiary. His last labors were principally in connection with a church in Cincinnati, Ohio, which bore his name, though he served temporarily as conference missionary. He was one of the most successful of western authors. His "Wyandot Mission," "Prison Life," "Autobiography," "Sketches of Western Methodism," and "Life among the Indians," have been extensively read, especially in the western states.

FINLEY, ROBERT, D.D., an American scholar and philanthropist, born in Princeton, N. J., in 1772, died in Athens, Ga., Oct. 8, 1817. He was graduated at Princeton college in 1787, and from 1793 to 1817 was connected with that institution, either as tutor or trustee, and during the greater part of that period was also pastor of Baskingridge. He may be regarded as the founder of the African colonization society, the plan for sending emancipated blacks to Africa having originated with him, and the constitution and organization of the society having been chiefly formed through his instrumentality. In 1817 he was chosen president of Franklin college at Athens, Ga., but did not long survive his installation in that office.

FINLEY, SAMUEL, D.D., president of the college of New Jersey, born in Armagh, Ireland, in 1715, died in Philadelphia, July 17, 1766. A sermon that he heard at the age of 6 years determined him to be a minister. Arriving in America in 1734, he spent several years in completing his studies, and was licensed to preach in 1740. The first part of his ministry was much occupied with itinerant labors in promoting the revival of religion, at that time so remarkable throughout the country. His zeal at one time brought him into unpleasant circumstances; for preaching in New Haven, Conn., contrary to a law of the colony forbidding itinerants to enter parishes of settled ministers without their consent, he was seized by the civil authority and carried as a vagrant beyond its limits. In 1744 he was settled at Nottingham, Md., where he remained for 7 years, and where, in addition to his ministerial duties, he carried on an academy which acquired a high reputation. On the

death of President Davies of the college of New Jersey, he was chosen his successor, and removed to Princeton in 1761. The college flourished while under his care, which was, however, but 5 years. He published a number of sermons and discussions.

FINMARK, a province of Norway, and the northernmost region of the continent of Europe, bounded N. and N. E. by the arctic ocean, E. by Lapland, and S. by Lapland, Sweden, and the province of Nordland, with the last of which and with Drontheim it forms a division of the Norwegian government; area, about 27,000 sq. m.; pop. in 1855, 54,665. It lies wholly within the arctic circle. Its northernmost point is the North cape, a bold promontory 900 feet above the sea. Its coasts are thickly indented by long winding inlets, and are bordered by a vast number of irregular islands. It has important cod fisheries, which give employment to 8,000 vessels and between 15,000 and 16,000 men, and produce yearly about 16,000,000 fish, 21,500 barrels of cod liver oil, and 6,000 barrels of roe. The principal rivers are the Alten and Tana, the valleys of which are fertile and well cultivated. The climate of the coasts is so mild that some of the fiords never freeze. Hammerfest, an active trading place, is one of the principal towns.

FINN, HENRY J., an American actor and author, born at Sydney, Cape Breton, about 1785, perished in the conflagration of the steamboat *Lexington* in Long Island sound on the night of Jan. 13, 1840. He went to England in his youth, on the invitation of a rich uncle residing there, and on the voyage was for many days exposed in an open boat on the sea in consequence of the shipwreck of the vessel in which he sailed. He was finally picked up by a ship and landed in Falmouth. His uncle dying without making any provision for him, he was obliged to resort to the stage for a support. After a few years he returned to New York, subsequently revisited England, and in 1822 made his first appearance at the Federal street theatre in Boston. Until his death he was one of the most popular actors on the stage, his forte being broad comedy. He accumulated a competency by his professional labors, and was travelling to his residence in Newport, R. I., at the time of his death. He enjoyed a considerable reputation as a humorous writer, and published a "Comic Annual" and a number of articles in the periodicals. He published a drama entitled "Montgomery, or the Falls of Montmorenci," which was acted with success, and he left beside a manuscript tragedy.

FINNEY, CHARLES G., an American preacher and author, born in Warren, Litchfield co., Conn., Aug. 29, 1792. He studied law in Jefferson co., N. Y., and in early manhood gave evidence of unusual independence of character and clearness of intellect. During this period of his life he manifested an indifference to religious matters which caused him to be regarded as a dangerous companion for young men; but under the influence of the revival of 1821 he

was induced to alter his course of life, and in 1824 he commenced the career of a preacher. Having decided not to enter the pastoral office, he labored as an evangelist with great success until 1835, when he accepted a professorship in Oberlin college, Ohio. He however continued to preach in New York and elsewhere at intervals, and in 1848 went to England, where he remained 3 years. In 1852 he became president of Oberlin college, which position he still holds. His principal works are: "Lectures on Revivals" (12mo., Boston, 1835), "Lectures to Professing Christians" (8vo., Oberlin, 1836), "Sermons on Important Subjects" (8vo., New York, 1836), and "Lectures on Systematic Theology" (2 vols. 8vo., Oberlin, 1847), all of which have gone through several editions in the United States and in England. In both countries the author holds a high position among evangelical Congregationalists as an eloquent, energetic, and effective revival preacher.

FINNS, a race of men, of whom the vernacular name is *Suomilainen*, or inhabitants of the marshes, and whose number at the present day is estimated at nearly 8,000,000, inhabiting several districts of northern Europe. The *Fenni* of Tacitus, whose favorite abode was the woods and morasses of the north, were probably not the people of the region inhabited by the modern Finns. Strabo and Ptolemy placed the *Finnes* vaguely in the regions that afterward formed the provinces of Poland. Some centuries later Jornandes knew various tribes of Finns; but modern ethnologists have found it difficult to place them. Probably the Esthes of Jornandes and the Norwegians of Other were the Finnish race, although dwelling even south of modern Esthonia. Other found a people in the Archangel district who spoke nearly the same language as the Finns of more southern regions. Alexander von Humboldt in his "Cosmos" says: "On passing northward from the Iranian plateaux through Turan to the Uralian mountains, which separate Europe and Asia, we arrive at the primitive seat of the Finnish race; for the Ural is as much a land of the ancient Finns as the Altai is of the ancient Turks." At the period of the first Gothic invasion from Asia, it is alleged, with strong historical probability, that the shores of the Baltic were possessed by these tribes, from whom are descended the modern Finmarkers and Laplanders, who, according to Grotius and others, occupied a much more extensive territory than that within which they are now circumscribed. They had spread themselves over southern Norway and Sweden, whence in course of time they were driven away by more powerful intruders, and forced within the shelter of their rocks and morasses. It is impossible to ascertain when the first Finns entered modern Finland. In the 10th, 11th, and 12th centuries, 3 tribes were known there, the Quaines in the north, the Kyriales in the southeast, and the Ymes in the south. A popular tradition makes the Kyriales (Karelians) the first discoverers of the Swedish mines.

The religion or mythology of the Finns of Finland was very similar to that of the Lapps and Finns about the White sea; but there are no traditions of it earlier than the missionary accounts of St. Eric. Their supreme being was Rawa, sprung from the bosom of nature. He had two sons, Wainamoinen and Ilmarainen, inventors of various arts useful to man. There was a goddess of love, Viden Ema, and a god of war, Turris, a Finnish word for battle or combat. There were many gods of the chase among this migratory people; but there were gods also for vegetable nature, with a superior divinity, Kekri, the grand protector of agriculture. Many interesting traditions remain, but are much disfigured by modern superstition. The old Finnish songs are charming, and the people are still naturally and universally musical. The Finns are a grave, laborious, industrious race, inured to hardship; brave, but self-willed and obstinate; not wanting in intelligence, kind, and hospitable. Humboldt says: "Few races exhibit greater or more remarkable differences in mental cultivation, and in the direction of their feelings, according as they have been determined by the degeneration of servitude, warlike ferocity, or a continual striving for political freedom, than the Finns, who have been so variously subdivided, although retaining kindred languages. In evidence of this we need only refer to the now peaceful population among whom the epos *Kalevala* was found, to the Huns, once celebrated for conquests that disturbed the then existing order of things, and who have long been confounded with the Mongols, and lastly, to a great and noble people, the Magyars."

FIR (*abies*, Don.), the common name of a large number of coniferous trees of a pyramidal form and elegant proportions, separated from the genus *pinus* by modern botanists. The leaves of the fir arise singly from around the stem, unlike those of the pines, whose leaves are bundled up in twos or threes and enclosed at the base in thin, membranous, withered sheaths. The species of firs are numerous, but their variations are so distinct and marked that they form 4 natural tribes: I. Those whose leaves grow singly round the branches, all turned toward one side, and glaucous or white beneath, of which the most prominent is the silver fir (*A. picea*, Linn.), which inhabits exposed, dry, stony places on mountains of the middle and south of Europe, and reaches to the height of from 130 to 150 feet. At first its growth is slow, but after a few years it rapidly develops and attains a great diameter. This species is supposed to be the *abies pulcherrima* of Virgil and of Roman authors. A fine species of the American continent is the *A. grandis* (Lambert), or great Californian fir, of the height of 200 feet, having very long, narrow leaves, oblong, erect, slightly curving cones, which are from 3 to 4 inches long, the bracts or scales of the cones being very short, jagged, 2-lobed, with a short intermediate spine or point. The wood is soft, white, and inferior. A still more noble species,

forming vast forests in the mountains of California, is the *A. nobilis* (Lambert), discovered by Douglas. Its timber is excellent. A highly prized ornamental species is known as the balsam fir (*A. balsamea*, Marsh.), with violet-colored, thin, narrow leaves, erect, cylindrical cones, occurring in cold springy spots, and forming small trees, rarely of 40 feet in height. From little crypts sunken beneath the smooth green bark, a clear exudation known as balsam exudes. This is gathered by puncturing the vesicles formed by the swollen fluid in the crypts, and collecting it in some hollow vessel; a slow process, as only a few drops can be collected at a time. The fluid thus obtained is also called Canada balsam, and is an admirable substance for mounting specimens for the microscope; beside which, it has much repute in treatment for pulmonary complaints, and is used as a valuable varnish for water colors. Another similar species is *A. Fraserii*, or double balsam fir, discovered by Mr. Fraser on the high mountains of Carolina, and, according to Pursh, found on the Broad mountains of Pennsylvania. Mr. G. B. Emerson met with it on Saddleback mountain, Mass. It occurs also at the White mountains in New Hampshire, and the Green mountains in Vermont; and probably it is more common than is supposed, being overlooked from its similarity to the balsam fir. The hemlock spruce (*A. Canadensis*, Mx.) is a well known and elegant tree, commonly called hemlock, no other tree vieing with it in richness of a dark green foliage, which contrasts finely in the early summer with its delicately green young shoots and leaves. Its branches are slender toward the extremities, much forked, flat and spreading, sloping downward to the ground and sweeping it, its trunk rising to the perpendicular height of 70 or 80 feet. Its wood is not at all adapted for timber, and as a fuel is only fit to burn in close stoves, but its bark is very valuable for tanning purposes. When small and young it bears clipping, and answers for hedges, resembling somewhat the yew in the shape and color of the leaves. II. The 2d group of firs are known under the name of spruce, whose leaves grow singly round the branches, and all spread equally. Of these we may notice the American white spruce (*A. alba*, Mx.), with rather glaucous leaves, 4-cornered and pointed; a small tree of inferior timber, but of value for its small, thread-like, tough roots, employed by the Canadians and Indians to sew their birchen canoes, and for its resin, which they use for pitch. The young saplings, straight, light, and durable, are used for poles in horticulture. The black spruce (*A. nigra*, Mx.) is a native of North America, to be seen probably in its most perfect condition in Maine, but extending to Newfoundland, Nova Scotia, and all the Canadas. Its trunk is perfectly straight, and it tapers regularly from the ground to the top. Its leaves are dark green, obtusely 4-sided, having numerous resinous dots. The roots penetrate just below the surface, and run horizontally 8 or 10

feet in extent. This species seldom grows to a large size. Its wood is light, strong, elastic, and durable. The young shoots are employed in making beer. The Douglas fir (*A. Douglasii*, Lambert) is a gigantic species found in immense forests in N. W. America, from lat. 43° to 52° N. The trunks of the trees are from 100 to 180 feet high, and attain a diameter of 10 feet. The timber is heavy, firm, with few knots, and not at all liable to warp. The cones are remarkable for their long tridentate bracts, which are exerted far beyond the scales themselves. The Menzies fir (*A. Menziesii*, Lambert) is a native of northern California, and was discovered by Douglas, who describes the wood as being of excellent quality; but little is known of the habits of the tree. Its smaller naked branches are covered with hard, thin tubercles, its leaves are turned in every direction, resupinate from being twisted at the base, linear, mucronulate, incurved, silvery beneath; cones pendulous, cylindrical, 8 inches long; scales elliptic, obtuse, loose, somewhat wavy, cartilaginous and scarious, bright brown, ragged when mature on the upper margin, persistent after the seeds have dropped. III. The 3d group of firs are known as larches, whose leaves grow in clusters, and fall off in the autumn, of which the hacmatac (*A. microcarpa*, Lambert) is the most common form. It is only in deep forests that this tree attains any considerable size, usually rising to about 30 feet high. Its leaves are in little tufts, which are deciduous, leaving the branches entirely bare, excepting the small cones, which are for a long time persistent. The range of the species is from the mountains of Virginia to Hudson's bay. At lat. 65° N. it becomes very dwarf and stunted, rising only 6 or 8 feet. Its wood is compact and close-grained, of great strength and durability, superior to all the other coniferæ, and only surpassed by the oak. In beauty, however, it is inferior to the European larch (*A. larix*, Lambert), whose branches, when suffered to grow freely, sweep the ground, and whose outline is more symmetrical, and hence preferred for ornamental purposes. The European larch grows much faster also, is better adapted to drier soils, and is much used for artificial plantings. IV. The 4th group of firs embraces those whose leaves, growing in clusters, are persistent and evergreen, commonly called cedars, magnificently represented in the cedar of Lebanon (*A. cedrus*, Lambert). This species does not rise to any extraordinary height, but spreads laterally into immense branches, affording a picturesque object. There are several American species called cedars, as the arborvitæ (*thuya*) and the northern cypress or white cedar (*cupressus thuyoides*, Linn.), but they do not belong to the fir family. So the gigantic cedars of California, known as the "big tree" (*sequoia gigantea*, Torrey), on the Sierra Nevada, are not firs, but nearly related to the cypresses, and resemble the *thuya*, but have the wood of the *juniperus*.—All these species of *abies* embracing

many forest trees of value, can be easily raised from seeds, and are not difficult to cultivate. Some, which produce abundance of cones every year, can be sown in rows in open ground, but there are others which need some early protection in frames or in pots. It is best to sow the seeds as soon as practicable after being gathered, as they spoil by keeping.

FIRDUSI, FERDUSI, or FERDOUSI, ABUL KASIM MANSOOR, a Persian poet, born near Thus, in Khorassan, about A. D. 940, died in the same city in 1020. He was often called Thousi from the place of his birth, and his ordinary name (*firdus* meaning both garden and paradise) was given him either because his father was a gardener or from the excellence of his poems. Early occupying himself with the traditions concerning the ancient kings of Persia, he was invited to the court of Mahmoud of Ghaznee, where he was presented to the most distinguished scholars and poets of the time, and encouraged by the sultan to compose his great historical poem, *Shah Nameh*. He spent 35 years upon this work, which contains 60,000 verses, and relates the mythical and romantic exploits of the Persian kings from the foundation of the world, that is, from the hero Cayomera, who disputed the earth with genii, to the invasion of the Mussulmans in A. D. 636. Its most interesting portion is the account of the prowess of the hero Rustem. Receiving 60,000 silver, instead of the same number of gold dirhems promised to him by the sultan, he is said to have distributed the whole sum, in 3 equal parts, to the slave who brought it and 2 attendants of the bath where he received it, and then in revenge to have composed against the sultan the best satire in the Persian language. Forced to fly from court, he took refuge first at Mazanderan and then at Bagdad, and being finally permitted to return to his native city, he spent there the remainder of his life. The *Shah Nameh* is one of the oldest poetic monuments of Persian literature, and is regarded by the orientals as the highest authority for the primitive history of western Asia. The disciples of Zoroaster adopted it, since it contained no other mythology than their own demonology. An abridged English translation of it in prose and verse by Atkinson was published in London in 1831. The best German (abridged) edition is by Görres (Berlin, 1820), and translations of extracts appeared in Berlin in 1851 and 1853. An edition in Persian and French, by Jules Mohl, appeared in Paris (4 vols., 1838-'54).

FIRE. See FLAME, HEAT, LIGHT.

FIRE ANNIHILATOR, a machine designed for extinguishing fires by discharging large quantities of gases which do not support combustion. That of Mr. Phillips is the most noted, and at several fires prepared to exhibit its merits has proved very successful. It is made of several sheet iron cylindrical vessels, set one within another. Water is contained between the two outer ones, and the steam generated from this when heated is discharged into an inner cylin-

drical receptacle. Still within this is contained the gas-generating mixture, which is a compound of charcoal, nitre, and gypsum. An apparatus is furnished for igniting it, consisting of a bottle of chlorate of potash and sugar placed beneath another containing sulphuric acid, so arranged that the latter may be broken by a blow from without, and the contents of the two thus be made to mix and inflame. The main charge then being ignited, the gases pass in an outward direction through numerous holes perforated for their passage, and so soon as the water is sufficiently heated, its steam mixes with them, and a dense cloud of vapor is projected through the opening in the top of the machine made for this purpose. In situations favorable for retaining the vapor around bodies in combustion, the fire is extinguished; but when currents of air are strongly blowing, as is generally the case about burning buildings, there would seem to be little opportunity for its action. On board ships fires often occur below deck, which no doubt could be controlled by such an apparatus. Whether it has ever proved of service in case of burning buildings not expressly prepared for its application, we are not informed. It has been proposed to construct them both in a portable form and as stationary engines on a large scale for the protection of important buildings.

FIRE ENGINE, a machine for throwing a stream of water for the purpose of extinguishing fires. The earliest notices of machines designed for this purpose are in some allusions of ancient Roman writers to an apparatus, nowhere described, which they called a *sipho*, and which some now regard rather as the name of the aqueduct pipes for supplying water to houses than as an especial fire-extinguishing machine. That they were very inefficient may be inferred from the remark of Seneca, that owing to the height of the houses at Rome it was impossible to save them when they took fire. Apollodorus the architect, perhaps, was the first to suggest the use of a kind of hose, in recommending for the conveyance of water to high places exposed to fiery darts the use of the gut of an ox having a bag filled with water affixed to it. By compressing the bag the water was made to rise in the tube. In early periods of English and French history the chief protection against destructive fires appears to have consisted in the care with which those used for domestic purposes were managed. The curfew bell, or *couvre feu*, was sounded at 8 o'clock as a signal for the fires to be extinguished. (See BELL.) In Germany fires were of frequent occurrence in the 16th century and latter part of the 15th; and ordinances were established regulating the manner of building houses and the methods to be adopted in preventing fires. At Augsburg fire engines, called "instruments for fires" and "water syringes useful at fires," were in use in 1518. The Jesuit Caspar Schott describes one he saw at Nuremberg in 1657, which much resembled those in use at the present time and he men-

tions that 40 years before he had seen a similar engine of smaller size in his native city, Königs-hofen. The one at Nuremberg was placed upon a sledge 10 feet long and 4 feet broad, which was drawn by 2 horses. It had a water cistern 8 feet long, 4 feet high, and 2 wide. It was moved by 28 men, and forced a stream of water an inch in diameter to the height of 80 feet. The cylinders are described as lying in a horizontal position in a box. No mention is made of an air chamber, nor of anything more than a short flexible discharge pipe, which could be directed to one or the other side. The oldest record of fire engines in Paris is in the work of Perrault, published in 1684. From this it appears that there was one in the king's library, which, though having but one cylinder, threw out the water in a continuous jet to a great height—a result attained by the use of an air chamber, of which, as introduced into the fire engine, this is the earliest notice. Destructive fires were of frequent occurrence in Paris and in the provinces in the latter part of the 17th century, the work of incendiaries, who were known as *boutefeux*. In 1699 a special officer was charged with the duty of constructing, keeping in repair, and using at fires the 17 *pompes portatives* belonging to the royal service, and in 1722 the number of these had increased to 80. There were beside many others not included in this particular service. It is believed that none were provided with air chambers; for in 1725 a paper was published in the *Mémoires* of the academy of sciences at Paris describing this improvement as adopted in the engines at Strasbourg, and in it no intimation is expressed of the same contrivance ever having been introduced in Paris. Leathern hose was invented about the year 1670 in Amsterdam by two Dutchmen named Van der Heide, and the apparatus was speedily introduced into all the engines of the city. They also invented the suction pipe. In 1690 the inventors published a folio volume containing engravings, the first 7 representing dangerous conflagrations at which the old engines had been used to little purpose; the 12 following represent fires which had been extinguished by the new engines, and the method of working the machines. By the estimate they present it appears that by 10 fires property had been destroyed of the value of 1,024,180 florins; but in 5 years succeeding the introduction of the new machines the losses by 40 fires amounted only to 18,355 florins. The details of construction are not given. The title of the work, which is regarded as exceedingly valuable on account of its excellent engravings, is *Bechrijving der nieuwlijks uitgevonden Slang-Brand-Spuiten*.—It was long before the inventions of the Dutch were introduced into England. At the close of the 16th century the only engines there known were "hand squirts," or syringes, made of brass, and holding two or three quarts of water. Some of them are still preserved in the vestry room of St. Dionis Backchurch in Fenchurch street, London. Each one required the

labor of 8 men, one on each side to hold the instrument steady with one hand, and with the other to direct the nozzle, while the third man worked the plunger. When discharged, the piston was taken out and the nozzle was dipped into water, which flowed in and filled the body. They were afterward fitted into a portable cistern, and furnished with levers for working the pistons. About the close of the 17th century Newsham's improved engine was patented in England. This was a strong cistern of oak, placed upon wheels, furnished with pumps, air chambers, and a suction pipe of strong leather, to prevent its collapsing when the air began to be exhausted from it by the action of the pumps, through which was run a spiral piece of metal. The end for receiving the water was provided with a strainer. In case the suction pipe could not be conveniently used, the water was supplied to the cistern by buckets passed by hand—a method still practised in many places in the United States. This engine was very little improved until the early part of the present century, when some changes were introduced in it. Various other forms have been contrived, which for the most part are only modified methods of applying the principle of the force pump. Engines working on the rotary principle have proved very laborious in their operation and troublesome to keep in order. In one engine, invented by a Mr. White of Salford, England, 12 force pumps were arranged around a central air chamber, into which they all discharged. Any number of these could be worked independently; and one man only being required for each pump, the working of the engine might be commenced without the necessity of waiting the arrival of the full complement of hands. In capacity of throwing water it is stated to have surpassed other English engines worked with a greater number of men.—Modern engines consist essentially of two vertical double-acting force pumps, one under each end of a lever beam (or sometimes 4 single-acting pumps), to which are attached long brakes for many men to take hold of and work by hand. The pumps discharge into one reservoir, the upper part of which contains air, that acts as a spring to cause the water alternately introduced by each pump to flow in a uniform current through the discharge pipe. This pipe opens in the reservoir below the surface of the water, and leads without to any required distance according to the number of lengths of leather hose that may be attached together by the brass couplings with which they are furnished. The water is discharged through a tapering metallic pipe upon the end of which is screwed a tip of any required bore, which is held in the hand to direct the stream upon the fire. A suction pipe from the lower end of the force pump is always ready to be used when necessary; but where a stream of water with sufficient head, as from the aqueduct hydrants, can be introduced, the suction pipe is not required. The machine is attached to a carriage con-

structed expressly for the purpose, and furnished with various implements such as are likely to be wanted in conflagrations. It usually has a reel with a quantity of hose wound upon it, but the great supplies of this are carried upon separate carriages. The brakes are long wooden arms extending over the wheels each way beyond the extremities of the engine, or sometimes transversely to the carriage, and attached at right angles to the lever beams, which are arranged along the horizontal axis placed over the centre of the carriage. They are moved up and down by men standing on the ground each side of the engine, working with others who take their position on the top. Sometimes a rope is made fast to each brake, and being passed through a block at the bottom of the carriage is hauled upon by a number of men with each down stroke. In some engines the pumps are placed horizontally, and seats are arranged upon the top for the men to sit and work as in rowing a boat. In most of the American cities each engine is managed by an organized company of volunteer firemen, whose chief emolument is in being exempted from military duty. In Boston each fireman is paid \$100 annually, and a similar system has been introduced in Providence and some other cities. All act under the control of the fire commissioners or chief officers of the fire department of the city. Some companies, instead of a fire engine, have charge of the heavy utensils, as the long ladders, the great iron hooks and ropes used for pulling down the walls of buildings, which are carried upon separate carriages. These are called hook and ladder companies. A spirit of emulation among the different companies, and the interest excited in the machines by men of various trades and professions who are engaged in attending them, have led to the introduction of every possible improvement, and they may properly be regarded as the most perfect specimens of the class of mechanism to which they belong. The following is a description of a first class side stroke machine, costing \$3,000, sent from New York in 1859 to Nashville, Tenn. The cylinder is of 10 inch diameter, and stroke 12 inches; brakes over 25 feet in length. All the iron and steel work is elaborately polished, and the discharge and receiving pipes, gates, suction caps, joints, rests, screw-heads, and lockers are silver-plated. The box is of rosewood, inlaid with oblong squares of pearl; at either side is an ornamental scroll-work of gold, from which appear an eagle, lion, serpent, and snake's head branching out. Upon the air chamber, which is of burnished silver, is engraved the word "Deluge," and upon the receiving pipe, also of silver, plated, appears the motto of the company: "Our aim the public good." The tips of the brakes are also of plated work. Underneath the hind axle a gong bell is set, and in front of the wheels are patent brakes to check the machine in descending hills. The wheels are painted in white and gold. It is considered good performance for a first class

engine to throw a stream through 100 feet of hose to the vertical height of 130 feet. One built in 1857 at Pawtucket, R. I., is stated to have thrown a stream 184 feet vertically through 400 feet of hose, drawing also its supplies of water.—Steam fire engines have recently been successfully introduced in several American cities, and must eventually take the place of all the hand machines. They will be noticed after presenting the statistics and distinguishing features of the fire departments of a few of the principal cities; these data, however, are continually changing. New York numbers 47 engine companies, 58 hose companies, 14 hook and ladder and 4 hydrant companies. It has also 3 steam fire engines in use. The length of hose in the service is about 70,000 feet. Each first class engine company is allowed 60 men; the others, and the hook and ladder companies also, 40 men each; the hose 25 men, and the hydrant companies 10 men. Each company is restricted to its own district (of which there are 8), except in case of a large fire. Brooklyn has 22 engine companies of 60 men each, 3 hose companies of 40 men, and 2 hook and ladder companies of 30 men. Two steam fire engines have lately been introduced. In Boston there are 13 engine companies, entitled to 40 men each, 6 hose companies of 20 men each, 3 hook and ladder companies of 25 men each, and 1 steam fire engine manned by 16 men. Philadelphia has 43 engine companies, 37 hose companies, 5 hook and ladder companies, and 1 steam fire engine. The companies are not restricted in the number of men, some having 300 to 400 members. The total number of men engaged in the service is 6,576, viz.: 2,100 active members, 2,265 honorary members, and 2,211 contributing members. In Baltimore the fire department has recently been reorganized, and the paid system adopted in place of the former chartered "Baltimore United Fire Department." There were in this 4 engine companies, 6 hose and 2 hook and ladder companies, the number of men in each unlimited. The fire department of Cincinnati is a very efficient organization. There were recently 7 steam fire engines, 7 hand engines, and 1 hook and ladder company, all manned by 400 members, who are paid \$60 a year each. The fire department of St. Louis, which lately numbered 8 forcing engines, 9 suction engines, and 14 hose carriages, has introduced a large number of steam engines, employing more than any other city, unless it be Cincinnati.—The great modern improvement in fire engines is the application of steam power to work them. This was first attempted by Mr. Brathwaite, in London, in 1830. His first engine was of barely 6 horse power, weighing a little over 5,000 lbs., was furnished with an upright boiler, in which steam was generated to a moderate working pressure in 20 minutes, and was capable of forcing about 150 gallons of water per minute from 80 to 90 feet in height. It had a steam pump of the same form as those now in common use, the steam and water

pistons being on opposite ends of the same piston rod, the former being 7 inches in diameter and the latter 6½ inches, and the stroke of each 16 inches. A larger engine of the same general construction was built by Brathwaite in 1832 for the king of Prussia; but though its performances were highly spoken of, this attempt to apply the power of steam for fire-engine purposes cannot be said to have been successful. The time required for raising steam, and the great weight of the apparatus when adequate boiler power was obtained, were undoubtedly the principal difficulties. In New York, after the great fire of 1835, premiums were offered for plans of steam fire engines, and in the year 1841 an engine was built, from plans by Mr. Hodges, under a contract with the associated insurance companies, and was on several occasions brought into service at fires with good effect; but though very powerful, its great weight proved to be a fatal objection to its use, and it was at last sold and converted to other uses. To the city of Cincinnati belongs the credit of giving the first practical demonstration of the feasibility of this application of steam, and of making steam fire engines the basis of a fire department of unequalled efficiency, steam having wholly superseded hand engines, except in a few of the outermost districts of the city. The first of these engines, built by Mr. A. B. Latta, was brought out early in 1853. This was a very large, powerful engine, weighing upward of 12 tons, and requiring 4 strong horses to haul it, even with the aid of the steam which was applied to the wheels to assist in its propulsion. Two others of the same class were built in 1854, but since that time the application of the steam to the wheels, for the purpose even of partial propulsion, has been abandoned, and the weight of the first class engines brought down to 8 or 10 tons. The controlling feature of the Cincinnati engine is the boiler, which is of very peculiar construction and properties. It has a square fire box like a locomotive boiler, except that the furnace is open at the top where the chimney is set on. The upper portion of the furnace is occupied by a continuous coil of water tubes, opening above into the steam chamber, the lower end being carried through the fire box and connected with a force pump outside, by means of which the water is driven through the whole length of the coil, maintaining a forced circulation. When the fire is started the fire box is full of water, but the tubes are empty, and kept so till they get hot enough, when the forcing pump is worked by hand, and water injected, which is almost instantly converted into steam. The process is continued till steam enough is generated to work the circulating pump, which from that time is kept constantly in motion to supply the tubes. By this method, attesting not more the ingenuity than the nerve of its inventors, the Cincinnati builders solved the problem of raising steam to a working pressure within the shortest time necessary to get an engine to a fire and its attachments made;

the time ordinarily taken for this purpose being from 5 to 10 minutes. These engines, though very heavy and somewhat complicated, are complete in all their arrangements, of great strength of construction and power of action, and in their practical operation have been triumphantly successful. One of them is said to have thrown a $1\frac{1}{4}$ inch stream 300 feet horizontally, and a distance of 250 to 260 feet for a stream of that size is a very common achievement. The lightest engine of this construction is one intended to be drawn by two horses, which weighs about 10,000 lbs., and when exhibited in New York in Nov. 1858, reached a distance of 237 feet in playing through a $1\frac{1}{4}$ inch nozzle, taking its supply from a hydrant, and discharging about 375 gallons per minute. In Cincinnati, the same engine is reported to have played 210 feet through 1,000 feet of hose, taking its water from a cistern. St. Louis, Louisville, and some other cities have supplied themselves with engines built in Cincinnati; in the two first named they have nearly superseded hand engines. In the mean time other builders have essayed their skill in the same direction, with various success, and a considerable number of engines have been put in operation in New York, Philadelphia, Boston, Chicago, Baltimore, and other cities. In Boston, in Aug. 1858, there was a trial between steam fire engines for a premium offered by the city authorities. Four engines were entered for competition: the Philadelphia, built by Rainey, Neafie, and co., of Philadelphia; the Lawrence, by the Lawrence machine shop, of Lawrence, Mass.; the Elisha Smith, by Bird and co., East Boston; and the New Era, by Hinckley and Drury, of Boston. The weight of these engines, exclusive of water, taken in the order just named, was 7,455, 7,800, 9,380, and 9,415 lbs.; the weight including water, 8,055, 7,870, 9,866, and 9,915 lbs.; the time of raising steam from cold water to 60 lbs. pressure, 11 minutes 8 seconds, 10 m. 29 $\frac{1}{2}$ s., 13 m. 51 s., and 18 m. 21 s.; the quantity of water per minute thrown by each, in the same order as above, in a test experiment, 306, 302 $\frac{1}{2}$, 309, and 345 galls.; the horizontal distance thrown, in playing through a $1\frac{1}{4}$ inch pipe, 168, 154 $\frac{1}{2}$, 140, and 185 feet; the vertical throw, 110, 110, 125, and 90 feet. During these experiments, the greatest pressure of steam permitted, under the regulations adopted, was 120 lbs.; an arbitrary restriction which operated unfavorably to the Lawrence, the boiler of which was so constructed as to be safe, and to be capable of supplying an abundance of steam, when working under a much higher pressure. Under the conditions prescribed the Philadelphia was properly declared the victor, her actual performance being slightly in advance of that of the Lawrence, but the latter was really the successful engine, and was subsequently purchased by the city and placed on duty. Each of these engines was provided with an upright tubular boiler and with reciprocating steam pumps of the usual form, the peculiarities of each being in the details rather than

in the general principles of construction and arrangement. Of the same character are several other engines by different builders in Philadelphia, Baltimore, and other places, none, however, showing any material advance on the results obtained with the Lawrence and Philadelphia. Of an entirely different character are the engines built at Seneca Falls, N. Y., by Silsbee, Mynderse, and co., 4 of which are in successful use in Chicago and one in Boston. In this the boiler is horizontal and rectangular, or box-shaped, and forms the bed for the machinery, which is placed on top of it, and consists of a rotary engine and a rotary pump, both on the same shaft. Both pump and engine are of the form known as the elliptical rotary, consisting in effect of a pair of cog wheels, with longer and shorter teeth alternating, working into one another inside of an elliptical case. This engine illustrates well the peculiar adaptation of the rotary movement in the pump to steam fire engine purposes, being capable of a very high speed, and consequently of dealing with much larger volumes of water than reciprocating pumps of the same capacity of chamber. As no valves are used, either in the engine or pump, all valve gear is dispensed with, and a remarkably simple and compact arrangement of machinery secured; with the serious drawback, however, of a large unbalanced pressure on the journals, and of the sacrifice of all the benefit of cut-off and expansion. An engine of this construction, of about the same weight as the Lawrence and the Philadelphia, throws a $1\frac{1}{4}$ inch stream nearly 200 feet, and raises steam to a working pressure, by the aid of a fan-blower, in from 6 to 8 minutes.—The boldest, and not the least successful movement in perfecting the application of steam to fire engine purposes, has been made by Messrs. Lee and Larned of the city of New York, who seem to have reached the furthest point at present attainable in the concentration of power within given limits of weight. An engine built by them for the Manhattan engine company of the city of New York, and put on active duty with great success in June, 1859, though intended as a hand engine, to be run by the company without aid from horses, and weighing but little over 5,000 lbs., has succeeded in throwing a $1\frac{1}{4}$ inch stream 185 feet in perpendicular height, equivalent to a horizontal throw of 247 feet, and discharging at that rate nearly 500 gallons per minute; a performance, it will be seen, quite equal to that of the largest of the two horse engines already described. The extraordinary power developed by this engine relatively to its weight depends partly on its perfection as a carriage, the suspension being so perfect that the strain on the bed and machinery, and consequently the weight of framing, are reduced to a minimum; partly on the pump, which is Cary's patent rotary, by Cary and Brainard of Brockport, N. Y. (see PUMP, ROTARY), one of the few examples of a rotary arrangement which has stood successfully the test of years; but most of all on the remarka-

ble properties of the boiler, which is Lee and Larned's patent annular boiler, a peculiar form of the upright tubular, combining in the highest degree hitherto attained the lightness, strength, safety from explosion, and great evaporative power indispensable in steam fire engine boilers. It is composed almost wholly of tubes, boiler plate being used only in the steam dome, which is but 18 inches in depth, and in the tube sheets. The furnace is enclosed by water tubes, standing side by side like palisades, and opening into the steam drum above and a ring-shaped water bottom below, on which the grate bars rest. This arrangement gives a very high and roomy flame chamber, most favorable to perfect and effective combustion, in the middle of which is suspended a shallow water chamber perforated by numerous thimbles or short air tubes, and connected with the steam drum by a large number of water tubes, each one of which is penetrated by a smaller air tube running from the lower sheet of the water chamber to the upper sheet of the steam drum. The water of course occupies only the annular space between these concentric tubes, and this thin stratum of water is attacked by a fierce flame both around and within it, the whole arrangement giving the greatest amount of fire surface, of the most effective kind, and acting upon the smallest body of water that can possibly be combined within given limits of space and weight. With this boiler, steam is generated to working pressure in from 6 to 8 minutes, and can be maintained at the highest speed of the engine at a pressure of from 150 to 200 lbs. per inch, a pressure far within its limits of strength. The results obtained with this engine indicate that sufficient power for all ordinary purposes can be secured on the plan pursued by Lee and Larned, with engines but little if any exceeding in weight the ordinary hand engine worked by man power. The same boiler and pump have however been applied by the same builders in a form of engine which promises still more important results, designed especially for use when extraordinary power is required. In Dec. 1858, they finished for the city of New York two large first class engines, weighing each about $5\frac{1}{2}$ tons, in which for the first time the power of the steam was successfully applied to the wheels to propel the engines themselves, without any aid from horses. The quantity of water thrown by these engines, and the force with which it is projected, are beyond all precedent in the history of hydraulic apparatus of a portable form. A $1\frac{1}{4}$ inch stream thrown 210 feet in perpendicular height, a 2 inch stream 180 feet, and a $2\frac{1}{2}$ inch stream from an open butt the astonishing distance of 210 feet horizontally, the discharge of water in the latter case being not less than 1,200 gallons per minute, and this not in a momentary spurt, but in steady and sustained work, with steam to spare, are among the well attested feats of these powerful machines. Requiring not only no aid from horses, but carrying with it the men needed for

working it, a liberal supply of fuel, and all needful hose, one of these engines is a fire department complete in itself, and in case of a conflagration among the lofty, deep, and richly stored warehouses which abound in the city of New York, must be of incalculable service. They are intended to be kept with steam up, ready to start at a moment's warning; can run at any speed which the state of the streets will permit; and on arriving at the fire, by disconnecting two rods, which is the work but of an instant, the locomotive part is thrown out of gear, and the power of the engines left to act on the pump alone. The description of this engine, considered as a locomotive, will be given more appropriately elsewhere. (See STEAM CARRIAGE.)—The number of steam fire engines in actual use is now (July, 1859) about 50, and is constantly increasing.

FIRE-FLY, the popular name of many serricorn beetles, belonging to the tribes of *elaterides* and *lampyrides*, and to the old genera *elater* and *lampyrus* of Linnæus; the luminous species of the former belong to the new world, those of the latter to both hemispheres; these insects are also called fire beetles. The elaters have a firm and solid body, of an oval form; the middle portion of the sternum between the first pair of legs is prolonged into a short spine usually concealed in a cavity behind it; the antennæ in the males are simply serrated. They are called spring beetles from the faculty possessed by them of throwing themselves upward with a spring by means of the spine; as they live on plants, when they drop to the ground they often fall upon the back, whose great convexity and the shortness of the legs prevent them from turning over; the spine having been unsheathed by bending the head and thorax backward, it is made to strike with such force against the sheath by the sudden straightening of the body, that it projects the insect into the air, and gives it the chance of coming down on the feet; if unsuccessful, other attempts are made until the object is attained. Fire-flies of this tribe are numerous in tropical America and the West Indies. One of the largest and most brilliant is the night-shining elater, or lightning spring beetle, the *cucujo* of the West Indies (*pyrophorus noctilucus*, Linn.); this is more than an inch long, of a dark color, and gives a strong light from 2 oval tubercles on the dorsal surface of the thorax, and from the under surface of the segments of the body. Specimens are frequently brought alive to the United States, where they may be kept for some time if fed on sugar cane; the grub is said to be very injurious to the sugar cane by devouring the roots; one of these was once transported to Paris, and escaping into the streets, after assuming its perfect state, very much astonished the inhabitants of that city. This insect is common in summer, both in the lowlands and at moderate elevations; according to Mr. Gosse, the thoracic light is visible even in broad daylight; when undisturbed, these spots are dull white, but

they gradually become bright when touched, the brilliancy beginning at the centre and extending until the whole tubercle shines with a rich yellowish green. The light is so intense that it will cast a shadow of any object on the opposite wall in a dark room; the under side of the thorax seems as if it were red-hot, particularly beneath the tubercles; when left to itself, the insect becomes quiet, and the light fades to a mere speck. The insect when held in the hand shows only a green light, but when flying free it diffuses a rich ruddy glow from the ventral surface; it may show the green light at any time, but the red light only when flying; the former is seldom shown during flight, but in rare instances both tints are seen, producing an exceedingly beautiful effect. The thoracic light is subject to the will of the insect, but the abdominal is by some considered involuntary; the former is intermittent, but the latter seems to be a constant red glare, which will illuminate the ground for the space of a yard square. There are more than a dozen other luminous elaters, mentioned by Illiger, found in South America, where they fly during dusk and at night, generally remaining quiet during the day. These insects are used by the natives, confined under gauze, as ornaments for their head dresses and garments; they have been usefully employed by the Indians for the purposes of illumination in their dwellings and in their journeys; several, confined in a glass vessel, give light enough to read small print by. Many is the traveller whose path has been shown to him by these insects in the forests and mountains of the West Indies, on nights when even the lightning was insufficient to disclose the surrounding dangers; in the words of Southey:

Innumerable tribes
From the wood-cover swarmed, and darkness made
Their beauties visible; awhile they streamed
A bright blue radiance upon flowers that closed
Their gorgeous colors from the eye of day;
Then, motionless and dark, eluded search,
Self-shrouded; and anon, starring the sky,
Rose like a shower of fire.

This is one of many instances in which an acquaintance with natural history has dissipated the fears of the superstitious; the deceitful light of supposed malignant spirits has become the beautiful radiation of an insect sporting amid its inoffensive companions. These insects may be kept for weeks, if fed on sugar cane, and placed in damp moss; their light is more powerful than that of the glow-worm. The larvæ of many elaters are also more or less luminous; in the adults both sexes are luminous.—The genus *Lampyris* (Fab.) includes the fire-flies of the United States and the glow-worm of Europe; they are characterized by soft and flexible bodies, straight and depressed; there is no snout, and the head in the males is occupied almost entirely by the eyes, and is much concealed by the thorax; the antennæ are short, with cylindrical and compressed articulations; the abdomen is serrated on the sides; the elytra are coriaceous, and the legs simple; the females have only rudiments of elytra at the base of the

abdomen. The glow-worms of Europe, *L. noctiluca*, *L. Italica*, *L. splendidula*, and *L. hemiptera*, will be described under GLOW-WORM. In the United States there are many species, of which the *L. scintillans* (Say) and *L. corusca* (Linn.) are familiar examples. The latter is 4½ lines long; the body is oblong pubescent, brownish black; a rose-colored arched streak, dilated and yellower anteriorly, joins the elevated thoracic disk; the elytra are obsoletely carinated, with numerous minute dots; it is found as far north as 54°. Both sexes are luminous, but the light is strongest in the female; the light streams from the ventral surface of the abdomen; even the larvæ of many species, and also the eggs, are luminous. Like the elaters, they conceal themselves by day, and fly about in warm damp evenings; the males fly from plant to plant, while the female remains still, betraying herself to the other sex by her brighter light, of a bluish or greenish white tint. The luminous *lampyridæ* of tropical America are very numerous and brilliant, in the words of Humboldt, repeating on the earth the spectacle of the starry heavens; according to Gosse, their sparks, of various degrees of intensity, in proportion to the size of the species, are to be seen gleaming by scores about the margins of woods and in open places in the island of Jamaica. This writer describes many species, of which the most remarkable are *pygolampis xanthophotis* and *photuris versicolor*. *P. xanthophotis* is ¾ of an inch long and ¼ of an inch wide; the elytra are smoke-black; the thorax drab, dark brown in the centre; the abdomen pale, with the last 8 or 4 segments cream-white; the light is very intense, of a rich orange color when seen abroad, but yellow when examined by the light of a candle, and intermittent, lighting up a few segments or the whole hinder part of the abdomen. *P. versicolor* is a large species, with drab-colored elytra, less brilliant in its light and less rapid in its flight than the former species; the light is of a bright green hue; it frequently rests on a twig, gradually increasing the intensity of its light to the brightest, and then by degrees extinguishing it, remaining dark a minute or two, shining and fading again like a revolving light. Sometimes one species is attracted by the other, when the intermingling of the green and orange rays presents a very beautiful appearance. Other smaller species, which fly in at the windows in summer in considerable numbers, have either a yellow or a green light. Mr. Gosse speaks of these insects in a lonely dark dell, where "the strange sounds, snorings, screeches, and ringings of nocturnal reptiles and insects, sounds unheard by day, were coming up from every part of the deep forest around, giving an almost unearthly character to the scene."—Two species of hemipterous insects, of the genus *fulgora*, are said by some authors to be luminous, though the greatest weight of negative evidence is against this statement; the muzzle in this genus is long, straight or curved upward, and the light is said

to emanate from its extremity, whence their common name of lantern flies. The South American species (*F. laternaria*, Linn.) is a large and handsome insect, with wings varied with black and yellow; Madame Mérian asserts positively that the light from the head is so brilliant that it is easy to read by it; Count Hoffmannsegg, M. Richard, and the prince of Neumied have denied the truth of this statement; but, from the positive assertion of the above lady, the general application of the name fire-fly to this species, and the possibility that the emanation of light may be perceptible only at certain seasons of the year, it may well be that the insect possesses luminous powers. It flies high, and hovers about the summits of trees. Another species (*F. candelaria*, Fab.), from China, of a greenish color varied with orange and black, with its long snout curved upward, is said to flit among the branches of the banyan and tamarind trees, illuminating their dark recesses.—The causes which produce this light have been the subject of much discussion among naturalists; some lay the principal stress on the influence of the nervous system, others upon the respiration, others upon the circulation; chemists have asserted the presence of phosphorus in the fatty tissue whence the light seems to issue, but there is no proof of this from analysis. The most recent writers agree that the luminous tissue is made up of fat globules permeated by numerous tracheæ conveying air, with no traces of nerves or blood vessels, according to Dr. Burnett. It does not appear satisfactorily determined whether there may not be in this tissue phosphorized fats which give forth light on contact with oxygen, hydrogen, or nitrogen. Matteucci concludes from his experiments that the light is produced by the union of carbon of the fat with the oxygen in the tracheæ, by a slow combustion, and without any increase of temperature. The intermittence of the light is believed to depend on the movements of respiration, and to be entirely independent of those of the circulation, though Carus says that the light of the glow-worm grows brighter with each fresh wave of blood sent to the neighborhood of the tissue. It is probable also that the nervous system has some influence on the light, though it may not be essential to its production; as in the electric fishes we find the physical and chemical elements necessary for the production of electricity, to a great extent independent of, yet brought into harmonious action and directed by, the nervous system, so in the luminous insects we may have the chemical elements necessary for slow combustion and the production of light independent of this system, yet influenced and directed by it; the light may also be directly influenced by the action of the nerves on the respiratory function. The luminous substance grows brighter in oxygen, duller in carbonic acid, and shines even in the dead insect and under water. It is said that there is no heat accompanying this light, though it be a true

combustion and a combination of carbon with oxygen; this may be owing to the rudeness or imperfection of our instruments, or to the slowness or peculiarity of the combustion. The phenomena of animal heat, electricity, and light show that organisms are to a certain extent chemical laboratories, in which the Creator performs his wonderful and ever successful experiments of life, and that the great forces of nature are the same in the external world and in the recesses of the animal system—the same throughout the universe.

FIRE-PROOFING, a term applied to processes by which fabrics or buildings are rendered proof against taking fire. Various solutions of mineral salts applied to cloths serve to cover the fibres with an unflammable coating, protecting them from access of oxygen when heated, and thus preventing their combustion. A solution of alum is both cheap and effectual for this purpose. A process has been patented in England of preparing starch by incorporating it with phosphate of ammonia, to which for coarse fabrics a little muriate of ammonia is added, so that when applied to clothes they should be rendered to a degree incombustible. According to the description given of the process, sometimes more of the phosphate is used than of starch in making the mixture, and this is effected either by mixing the solution of each, or by grinding them together dry. On applying the mixture when treated with water in the usual way of using starch, the fabric only partially dried should be rolled in a dry cloth and left for a time before ironing; and if there should be liability of the iron's sticking, a little tallow or white wax may advantageously be added to the starch.—Several methods have been devised for rendering wood fire-proof. In the United States wooden roofs are partially secured from fire by covering them with a coating of gravel, secured by mixture with coal tar or asphaltum; and particular paints recommended as especially adapted to the purpose have been much used. A thick coating of any ochreous or other mineral paint must be serviceable according to the quantity laid on. The following is a method of Mr. Payne of England. He partially exhausts the air from a tight vessel containing the wood, lets in a solution of sulphuret of barium or of calcium, and by a force pump drives in more up to a pressure of 130 lbs. or more on the square inch; after remaining an hour, the solution is drawn off. An acid, or a solution of a salt like sulphate of iron, is next introduced, and a chemical change takes place, producing a salt of barytes or of lime, which becomes fixed in the pores of the wood. The English war department has lately caused experiments to be made to test the utility of an application of one of the cheap soluble alkaline silicates, as the silicate of soda. Specimens of wood were soaked a few hours in a weak solution of the salt, which was found to penetrate about $\frac{1}{2}$ inch, and to render the wood difficult to burn. Painting the wood with the salt was equally effectual. But the best results were ob-

tained by going over the coating of the silicate of soda with another of lime whitewash, and after this had stood a few hours coating it with another stronger solution of the soda. The first solution, it is directed, should be prepared by mixing with one measure of the thick sirup of silicate of soda 8 measures of water; the wood should be brushed over with this, as much being laid on as the wood can be made to absorb. When nearly dry, the lime wash of creamy consistence is applied, and after this has become moderately dry, the solution prepared with 2 parts of sirup to 3 of water is laid on with the brush. The covering thus prepared adhered very well, even when exposed to a stream of water and to rains; the former when striking the wood in the shape of a jet only slightly abraded it, and it was not easily removed by applying heavy blows to the wood. It was found that when the silicate was prepared so as to mix readily with water, one pound was sufficient to cover 10 square feet, and at the rate of £20 per ton of the sirup, the cost of the silicate for this amount of surface is only about twopence. By this application to the timbers and other woodwork of houses, they may be rendered comparatively safe from fire; but for important structures, the most thorough protection is in the use of wrought iron beams, built into the walls of brick or stone, and of iron or other incombustible material for the partition walls, floors, roof, and stairs. The most efficient methods in use in the United States are described in the article BEAM. Even buildings thus constructed in the most perfect manner may be completely ruined if filled with combustible goods that become once thoroughly ignited; for the beams when heated must expand, and with a force against the walls that cannot be resisted. The iron rods also used to tie the low arches of the roof fail entirely to perform their office as their length increases with the elevated temperature, and an additional strain is brought upon the walls to throw them out. Cast iron beams and columns have been shown to be more objectionable even than wood; for in case of becoming heated they rapidly lose their strength, and are liable to give way suddenly, and much sooner than timbers even when consuming. Mr. Fairbairn, experimenting in England upon the effect of increase of temperature in weakening cast iron, found that in cold blast iron $\frac{1}{10}$ the strength was lost in heating from 26° to 190° F., and in hot blast iron the loss was 15 per cent. in raising the temperature from 21° to 160° F. Should this effect continue in similar ratio with higher temperatures, the cast iron supports must lose all their useful effect much below the point at which they would begin to melt. The effect of cold water thrown upon them when moderately heated must be to materially weaken, and possibly to cause them to break. Other methods of rendering build. partially fire-proof have been practised in 1 de, but are either now given up or are lit. Such is the method

of Mr. Hartley, introduced in 1775, of sheathing the timbers with thin plates of iron, the earl of Stanhope's method of filling in and coating with plaster, &c.

FIRE SHIP, a vessel occasionally used in naval warfare for carrying fire among the enemy's fleet. It is filled with very inflammable materials so arranged as to be rapidly ignited, and being navigated as near as may be to the vessels toward which it is directed, these materials are set on fire, and the ship is deserted by the crew. Vessels of this character were effectively used by the Rhodians in their war with the Syrians, 190 B. C., as stated by Livy (lib. xxxvii. cap. 80). The English also employed them in their engagements with the Spanish armada in 1588, and English works give the most detailed descriptions of the manner in which they should be prepared; but this necessarily varies greatly in actual practice, according to the means at hand and the ingenuity of the actors. The chief object to be attained is that the ship shall be in complete conflagration with the flames pouring through the port holes as she drifts near the vessels to be attacked; and in some large quantities of powder are arranged in the hold to be ignited and cause a terrible and most destructive explosion to every object near by.—In this century fire ships were effectually employed by the Greeks in their war of independence against the Turks.

FIRE WORKS. See PYROTECHNY.

FIRKIN (Dan. *fire*, four), the fourth part of a barrel, an old English measure of capacity, variously given as containing from $7\frac{1}{2}$ imperial gallons to 10.987 standard gallons. For ale its capacity was one gallon less than for beer; as usually reckoned, it was 8 gallons for the former and 9 for the latter. In the United States, firkin designates a tub, usually of butter, the weight of which should be 56 lbs. In some parts of Pennsylvania it is 110 lbs.

FIRMAMENT (Lat. *firmamentum*, support), in ancient astronomy, the 8th sphere or heaven, surrounding the 7 spheres of the planets. Two motions were attributed to it: the diurnal motion from east to west, given by the *primum mobile*; and another motion from west to east, completed, according to Ptolemy, in 86,000 years, when the fixed stars were again in precisely the same position as at the beginning. This period was called the Platonic or great year.

FIRMAN, FERMAN, or FIRMAUN, a Persian word signifying an order, employed especially in Turkey to designate any decree issued by the Porte, and authenticated by the sultan's own cipher or signet. Each of the ministers and members of the divan has the right of signing firmans relative to the business of his own department, but only the grand vizier is authorized to place at their head the cipher containing the interlaced letters of the sultan's name, which alone gives them force. A decree signed by the sultan's own hand is called *hatti-sherif*. The name firman is also applied to a Turkish passport, whether issued by the Porte or by a pasha, enjoining

the subordinate authorities to grant the traveller bearing it protection and assistance. In India, a written permission to trade is called a firman.

FIRTH. See FIRTH.

FISCO (Lat. *fiscus*), originally, the treasure of a prince or sovereign lord. Under the Roman empire *fiscus* designated the domain or treasure of the sovereign as distinguished from that of the state, or *ararium publicum*. Under the later emperors it lost its distinctive character, and denoted the property of the state, a signification which it still retains in the civil law of Europe. The *fiscus*, being furnished partly from fines and the property of condemned persons, has given rise to the word confiscation, by which is meant the forfeiture of any species of property to the state or a body corporate. The fisc had a legal personal existence, similar to that of a corporation, and various officers, as *procuratores*, *advocati*, *patroni*, and *præfecti*, were employed in its administration.

FISH HAWK, a bird of prey, of the family *falconidæ*, sub-family *aquilinæ*, and genus *pan-dion* (Savigny). This genus, which belongs to the same sub-family with the eagles, is characterized by a short bill, curved from the base to the acute hooked tip, compressed laterally with slightly festooned margins; wings extending to tip of tail, the 2d and 3d quills equal and longest; tail moderate and rather even; general form heavier and less adapted for rapid and vigorous flight than that of the eagles; tarsi short and strong, covered with small circular scales; toes very rough beneath, long, and united at the base; claws long, curved, and sharp. Gray describes only 3 species: *P. Carolinensis* (Gmel.) in America, *P. haliaëtus* (Linn.) in the old world, and *P. leucocephalus* (Gould) in Australia. These species are nearly allied to each other, and inhabit the temperate regions, in the vicinity of lakes, rivers, and shallow arms of the sea; they have been seen several hundred miles from land, probably driven off the coast by severe storms. The female American fish hawk, or osprey, is 25 inches long, with an extent of wings of about 5 feet; the male is somewhat smaller. In the adult the head and under parts are white; a stripe through the eye, the top of the head and upper parts, wings, and tail, deep umber brown, the latter having about 8 bands of blackish brown; numerous spots of pale yellowish brown on the breast; bill and claws bluish black; tarsi and toes greenish yellow; the tibial feathers short, and the tarsus feathered one third the way down in front; the young have the upper parts edged with white. This well-known species inhabits the continent from the Atlantic to the Pacific; its powerful and protracted flight, and the dexterity which it displays in catching fish, render it conspicuous among our birds of prey. It is one of the most sociable of the hawks, migrating in considerable numbers along the coast in spring and autumn; it is mild, even timorous in its disposition, rarely quarrelling with its mates, and even nesting on the same tree with

birds which other members of its family would chase or destroy; the readiness with which it yields its prey to the eagle has been alluded to under that head. It never pursues its prey in the air; flying at a moderate height above the water, when it sees a fish within its reach it closes its wings, and plunges headlong, sometimes entirely disappearing below the surface; if successful, it retires to its nest or to a tree to eat it at leisure; it is said sometimes to strike a fish too heavy for its strength to raise, and, unable to free itself, to be drawn under water and drowned. Though a heavy flier compared to the eagle, its flight is high and its motions graceful; in the rare instances in which it alights on the ground, it walks in a very awkward manner. The fish hawk appears in the middle states from the south about the beginning of April, and is welcomed by the fishermen as the forerunner of various kinds of fish; it goes southward again as winter approaches. The males arrive 8 or 10 days before the females; during the love season both sexes assist in making new nests and in repairing old ones, and in incubation; the nest is placed in the fork of a high tree near the water, and is composed of sticks, grass, and sea weeds, firmly united, 3 or 4 feet wide and as many deep. As evidence of its gentle disposition, Audubon says that he has seen the fish crow and purple grackle raising their families in nests built among the outer sticks of the fish hawk's nest. The eggs are 3 or 4 in number, broadly oval, yellowish white, with numerous large irregular spots of reddish brown; the young are carefully fed and protected, and often remain in the nest until they are as large as the parents; only one brood is raised in a season. When wounded, they defend themselves with bill and claws; they are capable of flying off with a fish weighing 5 lbs. The fish hawk of Europe resembles very much the American bird.

FISH HOOKS. The manufacture of these little implements, used for capturing fish, is largely carried on, together with the kindred production of needles, at the village of Redditch in Worcestershire, England. Steel wire prepared from the softest and best qualities of iron is first cut into suitable lengths, and, the metal being softened by heat, 8 wires together are next cut by a knife firmly pushed in the direction to make the slit from which the barb is raised. The end is then filed by hand to a point, the wire being held with pliers against a piece of box wood. The barb is next caught into a notch at one end of a slip of brass standing edgewise in a block of wood and shaped with the same curve as the hook, and the wire is quickly bent around this slip. It thus receives the hooked form, and the obliquity is given to the curve by the workman raising the end held in the hand as the turn is given. Nearly a hook in a second can thus be bent by a single workman. The end for receiving the fastening is next flattened by a smart blow with a small hammer; and the hooks are then completed by

the finishing processes of tempering at a sand bath heat, scouring in a rotating barrel with emery and soap, and finally blueing at the proper heat in a sand bath.—Walton, in his "Complete Angler," presents much curious information concerning fish hooks, tracing their use to the times of the prophecies of Amos, and to the still more remote writing of the book of Job, in both of which they are mentioned; and he cites their use by the apostles, which was expressly approved by our Saviour, in recommendation of his gentle art. In Bohn's late edition of his work are described the nice differences of form and qualities of the Kirby, Limerick, Kendal, and Sneck-bend hooks, and long shanks are recommended for hooks that are to be dressed with long-bodied flies, as the dragon fly, the stone fly, and the spider fly, any superfluity in length being easily nipped off. The plates of this edition present a great variety of forms for various fish, some double hooks being contrived by binding two together back to back. The Kirby hook derived its name from an ancient family, who had become famous in their manufacture. Charles Kirby, who lived in the time of Charles II., Walton states acquired from Prince Rupert the method of tempering which remained in use in the family till the time when Walton wrote (in 1760). A lineal descendant of that Charles was then making near Aldersgate street in London the hooks in best repute for shape and temper. Among recent improvements in the construction of fish hooks are—the addition of a swivel close to the shank, which admits of the hook spinning around, and thus preventing the twisting of the line; and also electro-plating the hooks, which serves to protect them from rusting, and moreover by their gilded or silvered appearance causes them to be more attractive to the fish. For the same reason the mackerel fisherman scrapes and brightens the leaden plummet in which the shank of the hook is buried for the purpose of causing it to sink quickly. In the United States there is but one manufactory for fish hooks, which is at Brooklyn, N. Y.

FISH SKIN, in the mechanical arts, is the skin of the dog fish and some other species which possess a similar hard and rasp-like integument, with scales pointed and projecting in one direction. It is used, after being dried, in the same way as glass or sand paper, and in pattern making is especially convenient for cleaning off rounded and irregular surfaces, being bent round the finger and working almost like a file. On account of not leaving behind it any sharp particles, it is sometimes to be preferred to sand paper.—For clarifying liquors, and especially coffee, the skin of the dried cod-fish is an excellent material, a small piece thrown into the boiling fluid collecting and carrying down in a few minutes all the sediment.

FISHER, a carnivorous digitigrade mammal, belonging to the family *mustelidæ*, and the genus *mustela* (Linn.); this animal (called also Pennant's marten, black cat, and pekan) and the pine

marten are the only two species of the genus found in North America. The fisher (*M. Pennantii*, Erxl.) is the largest known species, the length of the body being over 2 feet, and the tail $1\frac{1}{2}$ feet. The dental formula is: incisors $\frac{3}{3}$, canines $\frac{1}{1}$, premolars $\frac{1}{1}$, molars $\frac{1}{2} = \frac{1}{2}$, 88 in all; the lower carnivorous tooth has a rounded lobe on the inner side, indicating a less sanguinary disposition than that of the weasels. The general appearance is fox-like; the head is long and muzzle rather pointed; the ears short, rounded, and wide; the eyes large; body slender; tail long and bushy at the base; feet short, stout, and armed with strong sharp claws, 5 on each foot; no anal pouch, but a small gland which secretes a musky fluid. The fur is of 2 kinds, the outer long and coarse, the inner fine and soft. The general color is blackish, with a grayish tinge on the head and shoulders; some specimens are brownish, and a few with light tints; there is sometimes a white spot on the throat. Specimens vary so much in size and coloration that it has been supposed that 2 species are confounded under the name. A specimen measuring 23 inches in length of body, with the tail 14 inches, would weigh about $8\frac{1}{2}$ lbs. Occasionally seen in Pennsylvania and New York, and even as far south as North Carolina, it is common in Canada and in the Lake Superior mineral region; it is found as far north as lat. 63° , and across the continent to the Pacific. It is eminently an arboreal species, very agile, though less so than the squirrel, which it is fond of pursuing; it is generally nocturnal in its habits; it preys upon hares, raccoons, squirrels, grouse, mice, and any small bird or quadruped which it can seize. Though called fisher, there is no certain evidence that it catches fish, but it is fond of the fish with which the hunter baits his traps for the pine marten; in this respect the fisher is a great nuisance, as it breaks into the traps from behind, sometimes robbing every one in a line of miles, escaping itself and preventing the capture of the more valuable pine marten. They have been often kept in confinement, where they become docile if taken when young; but the temper is very changeable, and they quickly become angry without apparent cause. From their agility, strength, and ferocity, they are difficult to obtain unless severely wounded. Like the other fur-bearing animals, the fisher's pelage is finest in winter and in high latitudes; a skin is worth about \$1 50, while that of the smaller pine marten is worth \$2 50; their fur is not much used in the United States, but is generally sent to Europe, where it is used for linings of more costly furs, for trimmings, and for robes. It brings forth its young once a year toward the end of spring, from 2 to 4 at a birth, depositing them in hollows in trees at a considerable height above the ground. This animal is called by Schreber *M. Canadensis*.

FISHER, ALVAN, an American artist, born in Needham, Mass., Aug. 9, 1792. He was intended by his parents for a mercantile life, but at

the age of 18 manifested so strong a taste for painting that he was allowed to study the art with an ornamental painter of merit named Pennyman. In 1814 he commenced his professional career as a portrait painter, and soon after undertook barn-yard scenes, winter pieces, portraits of animals, and in general, scenes belonging to rural life in which cattle are prominently introduced. He subsequently returned to portrait painting, which he practised for many years in Boston.

FISHER, JOHN, an English divine, bishop of Rochester, and a zealous opponent of the reformation, born in Beverley, Yorkshire, in 1459, beheaded June 22, 1535. Having become the confessor of Margaret, countess of Richmond, he induced that lady to found St. John's and Christ's colleges at Cambridge. In 1501 he became chancellor of that university, and in 1504 bishop of Rochester. He has been supposed to have written the treatise *Assertio septem Sacramentorum*, for which Henry VIII. obtained the title of "Defender of the Faith." Though long favored by the king, Fisher fell under his displeasure by his opposition to the divorce of Catharine of Aragon. On the question of the king's spiritual supremacy being broached in 1531, the bishop firmly refused to acknowledge it. He further fell into disfavor, and was arraigned for misprision of treason, for concealing certain prophecies of Elizabeth Barton, called the holy maid of Kent, respecting the king's death. For this offence he was condemned to imprisonment during the king's pleasure, but was released on paying a fine of £300. Refusing to take the oath of allegiance in 1534, he was committed to the tower, attainted, and his bishopric declared vacant. Pope Paul III. took the opportunity to create him a cardinal; but Henry having sent Cromwell to interrogate him with regard to the appointment, and being informed that he would accept the cardinal's hat, exclaimed: "Mother of God! he shall wear it on his shoulders then, for I will leave him never a head to set it on!" The aged bishop was at once condemned on the charge of denying the king's supremacy, and was beheaded. He wrote a commentary on the 7 penitential psalms, sermons, and controversial and devotional treatises. Erasmus, his literary opponent, describes him as a man of extensive powers of mind, and for integrity, sweetness of temper, and greatness of soul, superior to most persons of his age. His life has been written by the Rev. J. Lewis (2 vols. 8vo., London, 1854).

FISHERIES, the business of catching fish upon a large scale, and the localities frequented by the kinds of fish that are the chief objects of pursuit and capture, such as the cod, herring, mackerel, and salmon. The whale fishery and the seal fishery are terms employed to designate the pursuit of the whale and the seal, though those animals are not fishes. (See **WHALE FISHERY**, and **SEAL FISHERY**.)—Among the ancients, fisheries were carried on extensively from a very early period, and formed a valuable

branch of industry. Byzantium (the modern Constantinople), and Sinope on the Black sea, were famous for their lucrative fisheries. From Suetonius we learn that the *muræna* or lamprey, the favorite fish of the Romans, was caught in the greatest abundance in the sea around Sicily, and in the Carpathian sea between Crete and Rhodes. In the 8d century of our era the fishermen of the Mediterranean pursued their prey not only on the coasts, but in the open sea, making long voyages, and even passing the pillars of Hercules. The fisheries of Egypt were especially celebrated for their productiveness, but they were all inland, in lakes, canals, and the river Nile. The Egyptians regarded the sea with abhorrence, and do not seem to have fished in its waters; but of fresh-water fish they made great use, its consumption being encouraged by law. On the 9th day of the first month every person was obliged to eat a fried fish before the door of his house, except the priests, who burned instead of eating the fish. Though of a muddy flavor, and insipid compared with sea fish, the fish of Egypt seems to have been highly prized. The Israelites remembered with regret "the fish which (they) did eat in Egypt freely." The revenues arising from the fisheries of Lake Mœris were given to the queen of Egypt for pin money, and are said to have amounted to \$470,000 annually.—The earliest mention of the herring fishery that has reached us dates from A. D. 709. The cod fishery began to be regulated by legislation in western Europe toward the end of the 9th century. From an ordinance of Charles VI. in 1415 it appears that the mackerel fishery of France at that period was very extensive, and that the fish were sold at an extremely low rate in the markets of Paris. The development of the fisheries during the middle ages was greatly promoted by the demand for fish that was created by the fasts of the church. But the discovery, at the end of the 15th century, of Newfoundland and its fisheries, which to this day surpass all others in magnitude and value, gave the greatest impulse to the business. The cod, mackerel, and herring are the chief objects of pursuit, and their range is not limited to the neighborhood of Newfoundland, but they are caught in vast numbers on the coast of New England, in all the bays and inlets of the British maritime possessions, and on the coast of Labrador. The French were the first Europeans who engaged in the American cod fishery. They visited Newfoundland as early as 1504. In 1508 one Thomas Aubert made a fishing voyage from Dieppe to the gulf of St. Lawrence, and after that the Newfoundland fisheries increased so rapidly that in 1517 they gave employment to 50 vessels from different nations, chiefly, however, from France. In 1577 there were 150 French vessels engaged in the business, which they pursued with great success. A few years later the government of Henry IV. took active measures to protect and encourage the cod

fishery. Early in the 17th century, however, the business began to decline, so that in 1645 the number of French vessels employed in it was 50 less than in 1577. At this period began those angry contests between the French and English about the sovereignty of the fishing grounds, which continued, with more or less violence, for upward of a century. After the treaty of Ryswick in 1697, the French claimed the exclusive ownership of the American fisheries, and their cruisers seized and confiscated all British fishing vessels found anywhere east of the Kennebec river, in Maine, except on the western coast of Newfoundland, where, by a specific stipulation of the treaty of Ryswick, the English were permitted to fish. These pretensions of France to the monopoly of the fishing grounds were among the causes of the war declared by England in 1702. By the treaty of peace in 1713 the French fishermen were prohibited from coming within 80 leagues of the coast of Nova Scotia, and the right of England to the whole of Newfoundland was acknowledged, though it was conceded that the French should have the privilege of fishing on the eastern coast of that island, from Cape Bonavista to the northern point, thence along the western shores as far as Point Riche. The concession to France of even this limited right to the American fisheries was vehemently condemned in England. The earl of Oxford, one of Queen Anne's ministers, was impeached for high treason in 1717, and among the charges against him it was alleged "that in defiance of an express act of parliament, as well as in contempt of the frequent and earnest representations of the merchants of Great Britain and of the commissioners of trade and plantations," he had advised his sovereign that "the subjects of France should have the liberty of fishing and drying fish in Newfoundland." The French, however, notwithstanding their exclusion from Nova Scotia, and from most of the coast of Newfoundland, continued to pursue the fisheries with energy and success. They settled on the island of Cape Breton, where they built the famous town and fortress of Louisburg, at an expense of 80,000,000 livres, to protect and facilitate the fisheries. In 1721 their fleet of fishing vessels is said to have increased to 400 sail, a greater number than at any former period. A quarter of a century later the number of their vessels was computed at 600, manned by 27,000 men, and producing fish to the annual value of \$4,500,000. Louisburg was the great rendezvous of the French fishermen, and soon acquired an immense importance in American affairs. "More than 200 pieces of cannon were mounted to defend it," says Sabine. "So great was its strength that it was called the Dunkirk of America. It had nunneries and palaces, terraces and gardens. That such a city rose upon a lone, desolate isle, in the infancy of American colonization, appears incredible. Explanation is found alone in the fishing enthusiasm of the period." In 1745 this stronghold was besieged

and captured by a volunteer force from New England, largely composed of fishermen, and led by Sir William Pepperell, the son of a fisherman of the Isles of Shoals. He was made a baronet for this exploit, which excited the greatest enthusiasm in England, where it was considered "an equivalent for all the successes of the French upon the continent." The first lord of the admiralty declared that "if France was master of Portsmouth, he would hang the man who should give Cape Breton in exchange." The French fisheries declined rapidly after the fall of Louisburg, so that of 500 vessels that constituted the fishing fleet of France in 1745 only 100 remained in 1746. By the treaty of Paris in 1763 it was agreed that the French should have the liberty of fishing and drying fish on a part of the coasts of Newfoundland, and of fishing in the gulf of St. Lawrence at the distance of 3 leagues and upward from the shore, and on the coasts of Cape Breton at the distance of 15 leagues from the shore. The little islands of St. Pierre and Miquelon near the S. coast of Newfoundland were ceded to France to serve as shelter for the French fishermen. A few years later, in 1768, the number of French vessels at Newfoundland had increased to 259. By the treaty of peace in 1783 the right of the French to Miquelon and St. Pierre was confirmed, but, as was alleged, to prevent quarrels, France renounced her right to fish on that part of the coast of Newfoundland which stretches from Cape Bonavista to Cape St. John or Point Riche. The French revolution was disastrous to the fisheries, so that in 1792 the number of Frenchmen engaged in them in the North American seas was less than 3,400. During the reign of Napoleon they continued to languish, and the fishermen met with severe losses from the British cruisers. After the peace of 1815 the business rapidly increased, till in 1852 the cod fishery alone employed 450 ships and 14,000 seamen. In 1856 the products of the French fisheries were officially estimated to be worth 16,100,000 francs. The protection and encouragement of this great branch of national industry has from its commencement been sedulously attended to by the French government. Bounties to a large amount are granted to the fishermen. At present, under a law passed in 1851, the bounties to the cod fisheries are as follows: for each man of the crew of a vessel employed on the coast of Newfoundland or Iceland, 50 francs; for each metric quintal (220½ lbs.) of dry codfish, 20, 16, or 12 francs, according to the country to which it is shipped, the highest bounty being given on codfish shipped to the French colonies in America, India, and the west coast of Africa.—Sebastian Cabot on his return from his voyage of discovery in 1497 first called the attention of the English to the American fisheries, by pointing out the abundance of fish in the seas around Newfoundland and Labrador. The first English voyages in quest of fish, however, of which we have any account, were in 1517. In 1522, 40 or 50 houses for the accommodation of

fishermen were built in Newfoundland, which may thus claim to be much the oldest English colony in America, though no permanent settlement was effected till about a century later. In 1548 parliament, to encourage the fisheries, passed an act laying heavy penalties on persons convicted of eating flesh on fish days. At the same time restrictions previously existing were removed, and the Newfoundland fishery made free to every English subject. In 1563 another act was passed providing that "for the maintenance of shipping, the increase of fishermen and marines, and for the sparing of the fresh victual of the realm, it shall not be lawful for any one to eat flesh on Wednesdays and Saturdays, unless under the forfeiture of £3 for each offence." The sick and those who had bought special licenses were excepted from the action of this statute. But as under these laws the mass of the people were compelled for 153 days of the year to abstain from meat, the demand for fish was of course very great. In 1583 Sir Humphrey Gilbert took possession of Newfoundland under the first charter granted in England for colonization in America, and from this act of Sir Humphrey and from the discovery by Cabot in 1497, England derives her right to Newfoundland and its fishing grounds. At the beginning of the 17th century it is estimated that 200 English ships went annually to Newfoundland, and that they employed in catching and curing the fish not less than 10,000 men and boys. In 1602 Bartholomew Gosnold explored the coast of New England, and, catching cod near the southern cape of Massachusetts, gave it the name it bears. Capt. John Smith followed in 1614, and on the coast of Maine took and dried or pickled 47,000 fish, the profits from which, and from the furs he bought of the Indians, amounted to \$7,000. From this time the fisheries on the coast of New England began to be prosecuted with vigor. In 1616 full fares were taken by 8 English ships, and sold at high prices in Spain and the Canary islands. In 1620 the island of Monhegan off the coast of Maine had become a noted fishing station, and in 1622 profitable fishing voyages to New England were made by 35 English ships. In 1621 an angry controversy arose in England in consequence of a claim set up by the "council of Plymouth," a company chartered by James I., to the monopoly of fishing in the American seas between the 40th and 48th degrees of N. latitude. This company demanded from each vessel fishing in these waters a tax of about 83 cents a ton. This claim was stoutly resisted. The house of commons took part with the fishermen, and the contest was continued into the reign of Charles I., and was one of the causes of the quarrel between him and parliament, which brought on the civil war. In 1639 the province of Massachusetts passed an act for the encouragement of the fisheries, exempting fishing vessels from all duties or taxes for 7 years. The English fleet at Newfoundland about this time had dwindled from 400 to 150 sail, partly from the diminished consumption of fish in

Europe owing to the growth of Protestantism, and partly from the increase of the coast fishery by the settlers on Newfoundland. Charles II., in 1660, issued a proclamation for the strict observance of Lent, assigning as one reason "the good it produces in the employment of fishermen." In the same year parliament passed an act remitting the duty on salt used in curing fish, and exempting all fishing materials from customs and excise. Still the number of fishing vessels continued to decline, till in 1670 only 80 were sent out. To revive the trade the barbarous expedient was resorted to of breaking up the settlements in Newfoundland from which boat fishing was carried on, and the fishermen were accordingly driven off and their dwellings burned by Sir John Berry, who was sent over for that purpose. This harsh measure increased the number of fishing vessels, which in 1674 had risen to 270, employing 10,800 men. Toward the end of the century settlers were again allowed to dwell in Newfoundland, and in 1729 the number of resident inhabitants was estimated at 6,000. The boat fishery of the colonists again supplanted the fishery in vessels of large size, and to encourage the home merchants parliament in 1775 allowed a bounty of £40 to each of the first 25 ships, £20 to the next 100, and £10 to the second 100 that should make fares of fish before the middle of July and return to the fishing grounds for a second lading. At this time the whole number of British subjects employed in the Newfoundland fisheries was 23,652, all of whom, it is said, became sailors. The English fisheries were exceedingly prosperous between 1795 and 1815. In 1814, 1,200,000 quintals of fish were produced, worth \$12,000,000. There have been great fluctuations since then both in the number of fish taken and in their price in the market, but the average annual catch of codfish by the English fishermen is computed at a million of quintals of 112 lbs. each. They are sold chiefly in the British islands, in British America, and in Portugal, Italy, Spain, Brazil, and the West Indies. The home fisheries of the British islands are of great extent and importance, the surrounding seas swarming with herring, mackerel, cod, and other species. The formation of railroads has greatly increased the consumption of fish by rendering it possible for the inhabitants of the most interior parts of the kingdom to obtain sea fish in a few hours after they are caught. In Birmingham, for example, the annual demand has risen since the opening of railways from 400 to 4,000 tons. A very productive salmon fishery is carried on in the Scottish and Irish rivers. The east coast of Scotland is the chief seat of the herring fishery, the annual product of which is computed at 650,000 barrels, worth, at 16s. a barrel, £520,000. The total value of the British fisheries is estimated at £4,500,000. The coast and river fisheries of the British islands, after deducting all expenses, yield a profit of £1,500,000. Among other European nations, the Dutch for several centuries

from which he oversees at the same time 12 or 13 of the birds.—The great sea fisheries of the United States are mostly carried on from New England. They date from the earliest settlement of the country, it being probable that among the motives that led to the colonization of Massachusetts was the hope of profit from the fisheries on the coast, which Smith, Archer, Brereton, and other writers of the day represented as surpassing even those of Newfoundland. Edward Winslow, in his "Narrative of the true Grounds and Causes of the First Planting of New England," relates an interview between James I. and the agent of the Puritans who went over to England from Leyden in 1618 to solicit his consent to their going to America. The king asked them: "What profit might arise?" They answered: "Fishing." Upon which James replied: "So God have my soul, 'tis an honest trade; 'twas the apostles' own calling." Very soon after their arrival at Plymouth the pilgrims engaged in the fisheries. In 1624 they sent to England a ship laden with fish, and in the next year two others with fish and furs. In 1628 they were selling fish to the Dutch at New Amsterdam. About 1670 the profits of the mackerel, bass, and herring fisheries at Cape Cod were granted to found a free school, which was opened in 1671. From Bos-

the fishing region from the English was a favorite project with the revolutionary leaders, and much negotiation upon the subject was held with the French government, which was offered, in case of success, possession of one half of Newfoundland and equal rights with the Americans in the waters of the fishing grounds. These projects, however, resulted in nothing. In the negotiation of the treaty of peace at the end of the war, the right of the Americans to a share in the fisheries was secured by the firmness of John Adams, who made the concession of that right an ultimatum in the discussions with the British commissioners. By the treaty it was agreed "that the people of the United States shall continue to enjoy unmolested the right to take fish of every kind on the Grand bank, and on all the other banks of Newfoundland; also in the gulf of St. Lawrence, and at all other places in the sea where the inhabitants of both countries used at any time heretofore to fish; and also, that the inhabitants of the United States shall have liberty to take fish of every kind on such part of the coast of Newfoundland as British fishermen shall use, and also on the coasts, bays, and creeks of all other of his Britannic majesty's dominions in America." To check the growth of the United States fisheries and to promote those of their own colo-

nies, the British government issued an order in council, July, 1783, prohibiting American fish from being carried to the British West Indies, which had been before the war one of the best markets for the New England trade in fish. The federal government early recognized the importance of the fisheries and the necessity of encouraging them by legislative action. In 1789 congress passed an act granting a bounty of 5 cents per quintal on dried and pickled fish exported from the United States, and imposing a duty of 50 cents per quintal on foreign fish. In 1792 the bounty on dried and pickled fish was abolished, and a specific allowance was made to vessels employed in the cod fishery: to boats between 5 and 20 tons, \$1 per ton annually; to those between 20 and 30 tons, 50 cents per ton additional; and to those more than 30 tons, \$2 50 per ton; but the annual allowance to any one vessel was limited to \$170. In 1797 these rates were increased. Vessels of the smallest class were allowed \$1 60 per ton annually; vessels upward of 20 tons, \$2 40 per ton; and the maximum was fixed at \$272. During the war with England in 1812-'15 the enemy's cruisers kept the fishermen from the distant fishing grounds. Many of them entered the navy, and the frigate *Constitution* was chiefly manned by them. They fitted out privateers in great numbers, and though remarkably successful in their new pursuit, so great was the number who were exposed to the chances of war that among the prisoners discharged from Dartmoor on the conclusion of peace there were 500 men from the little town of Marblehead alone. In the negotiations for peace the English commissioners strove earnestly to procure the consent of the American commissioners to a relinquishment of the right of the United States to the use of the fishing grounds, but the latter were instructed to break off the negotiation and come home, rather than allow the question of surrendering the fisheries to be discussed. The British, however, maintained, even after peace was concluded, that the state of hostilities had abrogated the concession of rights made in 1783. Discussions ensued between the two governments, which resulted, in 1818, in a convention, by which it was agreed that the Americans should have the liberty of taking fish on the southern coast of Newfoundland between Cape Ray and the Rameau islands; from Cape Ray to the Quirpon islands; on the shores of the Magdalene islands; and also on the southern coast of Labrador from Mount Joly to and through the straits of Belleisle, and thence northwardly indefinitely along the coast. The United States on their part renounced formally the right of fishing on or within 3 marine miles of the British dominions in America not included in the above specified limits. The act of congress now in force respecting fishing bounties was passed in 1819. It requires that vessels claiming bounty shall have been exclusively employed in the cod fishery at sea a specified period between the last day

of February and the last day of November; the master and $\frac{1}{4}$ of the crew must be citizens of the United States, and very stringent proof must be laid before the collector of the district to which the vessel belongs, that all the requisitions have been complied with. The bounties allowed are: to vessels between 5 and 80 tons, \$3 50 per ton; more than 80 tons, \$4 per ton; no vessel to receive more than \$360. The average annual amount of these bounties, of late years, is about \$350,000. In the summer of 1852 serious troubles broke out on the fishing grounds of British America between the American fishermen and the British authorities, who claimed the right to exclude the former from the bays and inlets of the British possessions. This claim, which was supported by an armed naval force, was regarded by the United States as illegal, and the war steamers *Princeton* and *Fulton* were sent to the coast of Nova Scotia to protect the rights of the fishermen. The dispute was temporarily settled by mutual concessions, and in 1854 a reciprocity treaty was agreed upon by the two countries, containing the following stipulations concerning the fisheries: "The inhabitants of the United States shall have, in common with the subjects of her Britannic majesty, the liberty to take fish of every kind except shell fish on the sea coasts and shores, and in the bays, harbors, and creeks of Canada, New Brunswick, Nova Scotia, Prince Edward's island, and of the several islands thereunto adjacent, without being restricted to any distance from the shore, with permission to land upon the coasts and shores of those colonies, and the islands thereof, and also upon the Magdalene islands, for the purpose of drying their nets and curing their fish." It was specified that the liberty thus granted should apply solely to sea fisheries, and not to salmon, shad, or other river fisheries; and that the fishermen should not interfere with the rights of private property, or trespass on parts of the shore occupied by British fishermen. Similar rights, with similar reservations, were granted to British fishermen on the coast of the United States north of lat. 36°. The total value of the products of the sea fisheries of the United States exported during the year ending June 30, 1858, was \$3,550,295. Of this sum \$2,865,847 was the product of the whale fishery, and \$684,448 of the cod, mackerel, and herring fisheries. The island of Hayti took of the exports of the latter fisheries the amount of \$233,058, or more than one third of the whole. The next best customer was Cuba, which took to the value of \$129,623. —Beside the sea fisheries, the river and lake fisheries of the United States are of great importance. There are valuable shad fisheries in the Connecticut, Hudson, Delaware, Potomac, and other rivers falling into the Atlantic. The great lake fisheries are those of Erie, Huron, Michigan, and Superior. The white fish is the principal object of pursuit, though trout and pickerel are caught in large quantities. The amount taken annually is estimated at 45,000

barrels, which are worth nearly \$500,000. From the rivers flowing into the lakes, about 10,000 barrels of pickerel, worth \$85,000, are annually taken. The fisheries of the Pacific coast of the United States are yet in their infancy, but the rivers of that region abound in salmon of the finest quality, of which a great amount is already annually caught.—See “Report on the principal Fisheries of the American Seas,” by Lorenzo Sabine (Washington, 1852); “Report on the Sea and River Fisheries of New Brunswick,” by M. H. Perley (Fredericton, 1852).

FISHES, the lowest class of vertebrated animals, red-blooded, breathing through the medium of water by means of *branchiæ* or gills. Like other vertebrates, they have an internal skeleton, the brain and spinal cord protected by a bony cavity and canal, muscles external to the bones, never more than 4 extremities, and the organs of special sense in the cavities of the head; living in a medium heavier than air, and very nearly of the same density as their bodies, locomotion is comparatively easy, and their form, fins, and smooth surface are admirably calculated for rapid progression; breathing by means of air contained in the water, their blood is cold, and consequently their vital energy is less than that of mammals and birds. The brain is very small, and the organs of sense calculated to receive only the simplest impressions of sight, smell, hearing, taste, and touch; generally unable to make any sounds, with an inflexible body, simply articulated limbs, fixed and staring eyes, living in comparative darkness and silence, there is no change in their countenance, no expression of feeling or emotion, no apparent motives in their monotonous existence beyond the necessity of supplying themselves with food, escaping from their enemies, and providing for the continuance of their species. Their chief pleasure is that of eating, and their only danger is from the superior strength and quickness of other inhabitants of the waters or from the artifices of man; to eat, and to avoid being eaten, are the great occupations of their lives, and the varieties of their forms, their instincts, and their favorite haunts, are intimately connected with these objects; the movable filaments of the *lophius* or goose fish, the prolonged snout of the pipe fish and *chætodon*, the wing-like expansions of the flying fish, and the electric armature of the torpedo and *gymnotus*, are all instruments either for offence, defence, or escape. Cold-blooded, they are little sensitive to changes of temperature, and their migrations and seasons of propagation are less influenced by thermometric conditions than are those of the higher vertebrates; many fishes spawn in winter, and it is in the cold northern waters that the innumerable individuals of the cod and herring species are pursued by man. Even the loves of fishes are marked by the same *sang froid*; very few species have sexual union; in most, the males pursue the eggs rather than the females, and coldly fecundate the spawn of unknown adults, from which arise young which

they will never recognize and probably never see. A few females, as the stickleback, deposit eggs in nests made by the males; some carry their eggs and even their young with them for a short period, and feed and protect their little ones like true mothers; but, as a general rule, the joys of maternity are unknown among fishes, and the sexes care nothing for each other even in the breeding season. With all this apparent lack of enjoyment, and low position in the vertebrated series, the class of fishes displays as much and perhaps more variety and elegance of form and beauty of coloration than the more psychically favored birds and mammals; there is not a color of the rainbow, nor a metallic reflection, nor the hue of a precious stone, which may not be seen in the bands, spots, and scales of fishes. Their beauty, therefore, as well as their utility as food, early drew attention to these inhabitants of the waters; many tribes of men, both savage and civilized, obtain their principal nourishment from the sea; the countless numbers of cod, mackerel, herring, and other migrating fishes, give employment to thousands of men, and prove important items of national wealth; on the one hand, the poorest person may satisfy his hunger in the cheapest manner with fish, and on the other, the wealthy epicure may tempt his palate by the most expensive luxuries from the same sea; the aristocratic salmon and turbot swim side by side with the plebeian tribes. The habits of fishes, even of the most common species, are comparatively little known from the difficulty of observing them in their native haunts; we know that some are solitary, and others gregarious; some great wanderers, others restricted within narrow limits; some surface swimmers, others remaining near the bottom or at great depths; some living on sandy bottoms, others in rocky, others in muddy localities; some found only in salt water, others only in fresh, others in both or in brackish waters; some seen only near the shore, others in very deep water far from land; some sluggish like the skates, others active like the sharks and scomberoids; some perish quickly out of the water, as those with widely open gills like the herring, others live a long time after being caught like the eel, or can travel over land or climb trees like the *anabas scandens*. It is to be hoped that the study of fishes in aquaria will furnish valuable additions to our knowledge of the most common species. When we consider that more than two thirds of the surface of the globe is covered by the sea, and that a large part of the continents is occupied by lakes, rivers, and marshes, we may understand the importance of this class of animals in the economy of nature.—The external form of fishes is very various, but the head is not separated from the body by a distinct neck, and the trunk generally is continued gradually into the tail; in the skates the tail is long and distinct from the body. The body may be rounded as in the *diodon*, cylindrical as in the eel, compressed horizontally as in the rays, or

flattened vertically as in most fishes; the head may be larger than the body as in the goose fish, compressed, angular, and obtuse, as in the bullhead, prolonged into a beak as in the pipe fish, or the upper jaw may project over the mouth as in the sword fish and sharks; the mouth may open on the under or upper surface, or, as is usual, at the end of the snout, with a greater or less extent of gape. The nostrils may be single as in the sharks and rays, or double as in most fishes. The eyes vary greatly in size and in direction; generally on the sides of the head, in the *uranoscopus* they look upward, and in the flounder family both are on one side. In the cartilaginous fishes the external borders of the gills are attached to the skin, and the gill openings correspond in number to the intervals between the branchiæ; but in the osseous fishes there is a single large gill opening on each side, just behind the head, serving for the exit of the water after it has been swallowed and made to pass over the gills, the flapping of the gill covers assisting the respiratory process. Some of the apodal or muraenoid fishes have hardly the rudiments of fins; in others, the fins are either vertical and on the median line, or lateral and in pairs. The lateral fins are the pectorals and the ventrals, corresponding to the anterior and posterior limbs of higher animals; the pectorals are attached behind the opening of the gills; the ventrals are generally on the lower surface of the body, and may be variously placed from under the throat, even in advance of the pectorals, to the origin of the tail. The vertical fins serve the purposes of keel and rudder, and are the dorsal on the back, the anal under the tail, and the caudal at the end of the body. All these fins vary in size and in the number of rays which sustain them, being sometimes spiny, sometimes soft, branched, and composed of many small joints. In the old system of nomenclature, the malacopterygians are bony fishes with soft articulated fin rays, the acanthopterygians, bony fishes in which some of the rays are spiny, and the chondropterygians, the so-called cartilaginous fishes; these classes have been variously subdivided, and the reader is referred to the article ICHTHYOLOGY for the numerous classifications from Artedi to Agassiz. The anus may open far behind the ventrals, move forward with them, and in their absence be situated even under the throat, as in *sternarchus*; the jaws may be armed with different kinds of teeth, which often exist also on the tongue and various parts of the mouth and throat; the lips may be provided with sensitive barbels as in the horn pout, or with fleshy appendages as in the sea raven (*hemitripterus*). The skin may be nearly naked, or covered with very small scales; the scales may be rough grains as in the sharks, thick plates as in the sturgeon, a smooth enamelled coat of mail as in the *lepidosteus*, smooth as in the herring, or serrated as in the perch. Along the side of the body is the lateral line, formed by a series of pores, the out-

lets of the muciparous glands; this line extends from the head to the caudal fin, generally at the mid height of the body, nearer the back in some fishes than in others, sometimes ceasing long before the region of the tail, and occasionally multiple; the scales along this line are arched, notched, or perforated for the protection of the ducts; they are sometimes larger or smaller than the rest, and may be the only ones present; they often have strange forms and armatures. In various parts of the body, but especially about the head, are numerous pores, or water tubes, by which water is introduced into the system, even into the circulation; some are situated along the lateral line. The tissue of the fish skeleton is either cartilage, fibro-cartilage, or bone; the first is found in the sharks and rays, the second in the sun-fish (*orthogoriscus*) and goose fish (*lophius*), and the last in common fishes; the chemical composition is that of other vertebrates, principally the phosphate and carbonate of lime. The osteology of the head, branchial apparatus, trunk, and limbs, has been already given, as fully as the limits of this work will allow, in the article COMPARATIVE ANATOMY (vol. v. p. 558); for further details see Cuvier and Valenciennes, vol. i., and Owen on "Fishes."—Most fishes are quick in their movements; the salmon, for instance, can swim at the rate of 25 feet in a second, and can with ease pass over 20 to 25 miles in an hour; progression is effected by lateral strokes of the water by the alternate flexions of the tail and trunk; the manner in which the vertebræ are connected allows easy motion of the spine from side to side, and the muscles destined to move it are so largely developed as to form the principal bulk of the body; while the vertical fins increase the amount of oar-like surface for purposes of locomotion, the pectorals and ventrals keep the fish in an upright position, and assist in directing its course; the movements of the gill covers, by forcing backward the water which is passing between them, contribute to propel the fish forward. In the pipe fish (*syngnathus*) the dorsal fin in its vibration resembles that of the screw of a steam propeller, and, with a similar action of the tail, causes a forward or backward motion without any apparent movement of the body; the nice adjustment of the movements of the fins of the pickerel, so that while every ray seems in action the fish is perfectly stationary, must have been noticed by every angler. The movements of fish in a vertical direction are greatly assisted by the swimming or air bladder, which, though anatomically a rudimentary lung, by the air which it secretes enables the fishes that have it to rise or fall in the water by compression or extension exercised by the ribs; it is placed in the abdomen, under the spine, and communicates often with the œsophagus or stomach; the air is a product of secretion, and its containing reservoir is sometimes a shut sac; it is often wanting in some species of a genus when others possess it, and is generally very small or absent in ground fish, such as skates and turbot; in

some cases it is considerably vascular, resembling very much a pulmonary sac. The muscles of fish are generally pale and comparatively soft, divided into parallel layers by aponeurotic laminae; the flavor and odor are very different from those of flesh, and the gases of decomposition are much more fetid. Some fish have a singular apparatus by which they adhere to other bodies, animate or inanimate; in the remora, of the genus *echeneis*, there is a flattened disk on the top of the head, composed of movable cartilaginous plates, by which it fixes itself to stones or the bodies of other fishes; in the lump fish and other *discoboli*, the ventrals are arranged to act as suckers for attaching them to various substances; the lamprey eel (*petromyzon*) also attaches itself by the mouth to stones and fishes. Referring the reader to COMPARATIVE ANATOMY for details on the nervous system, the organs of sense, the scales, and the digestive apparatus, only general points of interest need be mentioned here. The cavity of the skull is very small compared to the size of the body, and the brain is far from filling it, a considerable space being occupied by a spongy fatty substance; the lobes are placed one behind the other in the following order from before backward: olfactory or lobes of smell, the cerebral hemispheres, the optic or lobes of vision, and the cerebellum. From the scaly covering of their skin, the sense of touch must be obtuse, and the lips are their only prehensile and principal tactile organs, with the exception of the barbels and other appendages above alluded to. The corneous, slightly movable, and often tooth-armed tongue receives but few nerves, and cannot be the seat of any sense worthy of the name of taste; and moreover, the food does not remain long enough in the mouth for any exercise of this sense. The olfactory apparatus is more complicated, but it is traversed neither by air nor the water used in respiration; the nasal cavities do not communicate with the mouth. The ear, almost always entirely within the cranium, on the sides of the brain, consists essentially of a vestibule and 3 semicircular canals, which receive the vibrations of the integuments and cranial walls; there is rarely any thing that can be called external ear, drum, or tympanic cavity; loud, sudden, and strange sounds frighten fish, as the experience of every fisherman tells him; in ancient, and even in modern times, they have been taught to come and receive food at the tinkle of a bell, or the pronunciation of pet names. The eyes have neither true lids nor lachrymal apparatus; the pupil is large and permanently open, the lens is spherical, and the flat cornea is covered by the skin. Fish are very voracious, most of them living on animal food, and swallowing indiscriminately any thing of this kind which comes in their way; some genera, like the lamprey eels, live upon the juices of other fish, and the mouth is provided with circular cartilages, fleshy disks, teeth, and a piston-like tongue, which enable them to adhere to any surface. The intestinal canal is short and simple, and digestion is rap-

idly performed, and their increase in size is remarkably affected by the nature and abundance of their food; their limit as to size and the natural duration of life are very little known in the great majority of species.—The blood of fishes is red, and the globules are elliptical and of considerable size. The heart is placed under the throat in a cavity separated from the abdomen by a kind of diaphragm, protected by the pharyngeal bones above, the branchial arches on the sides, and generally by the scapular arch behind; it consists of a venous sinus, auricle, ventricle, and bulb; all these cavities circulate venous blood, and therefore physiologically correspond to the right side of the mammalian heart, though Owen says that the heart of fishes with the muscular branchial artery is the true homologue of the left auricle, ventricle, and aorta of higher vertebrates, tracing the complication of the organ synthetically; the auricle and ventricle, however, are alone proper to the heart itself, the sinus being the termination of the venous system, and the bulb an addition to the pulmonary artery; these 4 compartments, therefore, are not like the 4 divisions of the human heart, but succeed each other in a linear series. The circulation is double, that of the system at large and that of the branchiae being complete and distinct, and there is also an abdominal circulation terminating at the liver; the peculiar character is that the branchial circulation alone is provided with a propelling cavity or heart, the branchial veins changing into arteries without any intermediate left auricle and ventricle. The venous sinus receives the blood from the general system, after the manner of *venæ cavæ*; it is not usually situated within the pericardium. The auricle, when distended, is larger in proportion to the ventricle than in the higher vertebrates; its walls are membranous, with thin muscular fasciculi, and its simple cavity communicates with the ventricle by a single opening guarded by free semilunar valves, 2 to 4 in number. The ventricle, usually a 4-sided pyramid, is very muscular, and its fibres are redder than those of any other part of the system; its cavity is simple, the auricular valve generally free and without chordæ tendinæ, and its opening into the bulb provided with 2 or 4 semilunar valves. The contractile *bulbus arteriosus* is provided in the ganoids and plagiostomes with several rows of valves, and its muscular walls are distinct from those of the ventricle. The immediate force of the heart's action is applied through the continuation of the bulb into the branchial artery, which is generally short, and is divided into lateral branches going to the gills; the blood, which has become arterialized by its subjection to the air contained in the respired water, is carried along the returning vessels into the branchial veins, the analogues of the pulmonary veins of man; the 4 on each side form the aortic circle from which the pure blood is sent over the system through the carotids and the aorta and its branches; the blood of the chylopoietic viscera passes through

the liver before entering the great sinus. Though all the blood passes through the branchial apparatus, it traverses the heart but once. —Respiration is effected by means of the innumerable vascular lamellæ and tufts attached to the external edge of the branchial arches; these are generally 4 on each side, each composed of 2 rows of fringes; in most cartilaginous fishes there are 5, and in the lamprey 7; in the last fish there is a canal from the mouth to the respiratory cavity, resembling a trachea. Fish consume but a small amount of oxygen, but some, not content with that contained in the water, come to the surface occasionally to swallow air; they perish soon out of water in proportion to the quickness with which the gills become dry, asphyxia being produced not by the want of oxygen directly, but because the blood cannot circulate in them properly unless sustained and kept soft by water. Though fish produce little heat, some possess the singular faculty of generating and discharging electricity, as has been described in the articles *EEL*, and *ELECTRIC FISHES*.—Fish reproduce by means of eggs, the number of which in some species amounts to hundreds of thousands; these have generally only a mucilaginous envelope, and are fecundated after being laid; a few enjoy sexual congress, and are ovoviviparous and viviparous, but the young are almost always left to themselves as soon as born. It is owing to the simultaneous development of great numbers of eggs deposited in the same locality, and to the instinct possessed by some species to keep in company, that fish occur in what are called banks and schools; these schools, composed of individuals kept together only by similarity of food and habits, and in which each one looks out for himself without regard to the wants of the rest, make long migrations from the sea to the rivers and back again, and from one favorite locality to another. At the time of laying the eggs, the migrating species generally approach the shores, and ascend rivers, often coming thousands of miles; year after year, at the same season, the fish appear in immense numbers. The migrations of the herrings, salmon, shad, smelt, mackerel, &c., afford well-known instances of these phenomena. All fishes are of distinct sex. The testes vary much in form in the osseous fishes, and are remarkable for their enormous development in the breeding season, when they are called milt or soft roe. The ovaries in most osseous fishes are 2 elongated sacs, closed anteriorly, and produced posteriorly into short, straight, and wide oviducts, which coalesce before reaching the cloaca; the greatly developed ova are called the roe. There are several interesting points in connection with the development of fishes, which will be better introduced here than in special articles. In most fishes it has been already stated that the exclusion of the ova or roe precedes fecundation, and that in a few (the sharks and rays especially) the ova are fecundated before exclusion; when the embryonic membranes contract no adhesion to

the uterine walls, the fish is called ovoviviparous, and in such the embryo escapes from the egg before it quits the parent, while in the ovipara the ovum is expelled while the embryo is contained in it; when adhesion takes place by vascular interlacements, the species is said to be viviparous; the great difference between viviparous fishes and mammals is, that in the former the rupture of the membranes takes place long before birth, while in the latter this occurs at the moment of exclusion. The sudden and great increase of the milt and roe is not compatible with a firm bony cavity such as would be formed by ribs and sternum; this explains the physiological reason for their free or floating ribs. At the approach of the breeding season the colors become brilliant, as is familiarly seen in the bright red throat of the male stickleback; the female seeks to deposit her eggs in shoal water, where the heat and light of the sun may bring them to maturity, and the male follows close to diffuse the fecundating milt over them. It is well known that some fishes deposit their eggs in species of nests, as the stickleback, bream (*permotis*), and lamprey; Aristotle mentions a fish of the Mediterranean, a species of *gobius*, as making a nest of sea weeds and depositing the spawn in it, the male keeping guard over the female and her young; the hassara, siluroid fishes of Demerara (*callichthys*), make nests of grass and leaves, and both sexes guard the eggs and young; the toad fish (*batrachus*) has been observed on the south shore of Long island lying concealed in deep holes protecting its young, which attach themselves to stones by means of the yolk sac. Another kind of incubation is found in the pipe fish (*syngnathus*), in which the ova are transferred from the female to a kind of marsupial pouch under the tail of the male, being fecundated during this process, and the cavity closing over them; when the young are hatched they follow the male, and return into the pouch at the approach of danger; the male *hippocampus* has a similar sub-abdominal marsupial pouch. In some species of bagré, a siluroid fish from the rivers of Surinam, the females carry their eggs in the mouth, showing the young in various stages of development even to the fish recently hatched; eggs of 2 distinct species have been found in the mouth of a single individual. In the *aspredos*, or *trompettis*, the eggs are attached by pedicles surmounted by cups to the under side of the abdomen as far forward as the mouth, on the sides to the pectoral and ventral fins, and as far as the middle of the tail; after the eggs are hatched the pedicles are absorbed. Viviparous fishes may be divided into 2 groups: the first includes those in which the gestation is almost wholly ovarian, as in *embiotoca*, *anableps*, *blennius*, &c.; the second those in which the egg enters the oviduct before the development of the embryo begins, as in the *plagiostomes*. Prof. J. Wyman ("Proceedings of the Boston Society of Natural History," vols. v. and vi.) has described the development of *anableps Gronovii*,

one, having, however, a disk of considerable size uncovered at the upper part, where the spermatozoa may come in contact with the yolk membrane; this condition has been also found in skates and tortoises, and probably exists in all vertebrates. Internal impregnation is very general in the plagiostomes, and, as this is more certain than the indiscriminate spawning of common fishes, the eggs are much fewer in number and of larger size, as in birds; the egg in its passage through the oviduct receives a dense corneous covering, so that the cases resemble oblong flattened pillows, often with long tendrils at the corners, in which the embryo is snugly coiled up, they become attached to objects floating near the surface, and are there developed by the influence of solar light and heat; from the researches of Prof. J. Wyman it appears that in the skates the eggs are fecundated in the ovary, and that the egg case is formed in advance to receive it as it descends. From these and other structural peculiarities Prof. Agassiz has separated the chimaera, sharks, and rays from fishes proper, and elevated them into a class, the selachians. Many facts go to show that fishes undergo a kind of metamorphosis as well as insects. August Müller has proved that the 2 genera hitherto considered characteristic of the cyclostome fishes are really different stages of the same

collecting the excluded particles in a common vessel; the contents are occasionally put in motion in order to prevent the growth of parasites upon the eggs, which are very sure to destroy them; a low temperature and even desiccation is not necessarily fatal, so that many kinds in a nearly mature state may be transported for considerable distances; it has been estimated that a million of trout may be raised in this way at a cost of less than \$200. The disappearance of salmon from many localities, and the scarcity of trout, both of which are in demand at high prices, should lead pisciculturists to propagate artificially these and other valuable fish; it has been practised extensively in France and Scotland, and the shad and alewife have been experimentally raised in the United States on a small scale. Fish readily adapt themselves to new localities, both marine and fresh-water species; pickerel were easily introduced into the ponds of Berkshire co., Mass., and the great pike of the northern lakes has been transplanted to the Connecticut; the salt-water smelt lives in Jamaica and other ponds in Massachusetts; and the tautog has found a new home in Massachusetts bay, north of Cape Cod. The expense is trifling, the knowledge required small, and the labor slight, of raising and introducing new species of fish; but the advantages in a pecuniary and sanitary point of view are very great. It is to be hoped that, with the prevailing high prices of meat, legislatures and individuals will soon see the importance of giving special attention to this new industrial pursuit, and place pisciculture by the side of agriculture and horticulture as an element of national prosperity. To say nothing of foreign fish, such as the turbot and the sole, which might be advantageously introduced, there are many native species of great value which are not appreciated here; fish highly prized in Europe are not thought edible in New England; even our despised skates would be considered worth attention in the old world. Massachusetts is annually a loser by many thousands of dollars through unfounded prejudices against such fish as the pollock and whiting; it is only within a few years that the blue fish, long considered a delicacy in New York, has been offered for sale in the Boston market; in like manner, the pollock, which along the shore of Connecticut sells for 5 or 6 cents a pound, in Massachusetts

is considered fit only for manuring land or for grinding up into mackerel bait. In various parts of the Union similar prejudices deprive the people of abundant and wholesome articles of food.—In most fishes the young when hatched are left to shift for themselves, and of course the greater number are devoured by larger fish, aquatic birds, and reptiles; many species devour each other; small mackerel are often found in the stomachs of larger individuals, when they are abundant; so that with all their fecundity the class of fishes does not multiply beyond the limits set by nature. Though fish are cold-blooded, and the watery element is less affected by sudden changes of temperature than the air, there are external circumstances which limit their distribution both in depth and extent of surface. The difference in density and chemical constitution of salt and fresh water draws the line between the marine and the fluviatile faunæ; below a certain depth, probably not far from 120 fathoms, the absence of light and the increase of pressure would prove an insurmountable barrier to most of the class. Though fish are able to resist extreme cold, and to regain vitality after having been apparently frozen, the average of cold has an important influence on their geographical distribution; the average temperature of the water for the year has been usually taken as the regulator of this distribution, but Dana has shown that the line of temperature established by the average of the 30 coldest days in the year gives the clue to the limits of the marine faunæ. A few arctic species are the same in America and Europe, migrating southward from the same northern centre; but below this region the marine fauna of America is essentially tropical, and that of Europe essentially temperate. In the Atlantic the zones of temperature are remarkably modified by the arctic, Gulf stream, and African currents; on the American side the temperate zone extends only from Cape Cod to Cape Hatteras, about 10 degrees of latitude, while on the eastern it extends from the Swedish coast to the Cape Verd islands, nearly 5 times as many degrees; while the tropical zone, which in America extends from Cape Hatteras to 25° S., or 60 degrees, on the other side embraces only about 20 degrees on the African Guinea coast. As a few instances of local distribution, in contradistinction to the cosmopolitan scomberoids and cyprinoids, may be mentioned the American cottoids and goniodonts, the Mediterranean sparoids, the tropical scienoids, *squamipenna*, and mullets; the *pleuronectidæ* of the temperate regions; the tropical fresh-water *characini* of America and Africa; the true salmons of arctic and cold regions; and the marine labroids, and fresh-water chromids. Estimating the number of vertebrates at 20,000, the number of living species of fish may be set down at 10,000, of which more than 6,000 are described.—Of all the vertebrata, fishes are by far the most numerous and widely distributed in the earth's strata: their remains

are found from the silurian to the tertiary formations, and are of great aid in determining the changes of the surface of our planet during successive and long geological periods. The first great geological division, the primary age, comprises the lower and upper silurian and the devonian; during this there were no air-breathing animals, and fishes were the lords of creation; it has, therefore, been very properly called the "reign of fishes." Prof. Agassiz, in his *Recherches sur les poissons fossiles* (1833-'43), laid the foundation of fossil ichthyology; 1,000 species are described in the most complete and scientific manner, with superb illustrations. He divides fossil fishes, as he afterward did the recent ones, into 4 orders, according to the form and structure of their scales; these orders, ganoids, placoids, ctenoids, and cycloids, have been sufficiently described in the article COMPARATIVE ANATOMY (vol. v. p. 568). Three fourths of all known fossil fishes belong to the ctenoids and cycloids, which occur in all formations from the chalk upward; the remaining fourth belong chiefly to the ganoids (with enamelled scales like the garpike and sturgeon) and the placoids (like sharks and rays), and extend through all the fossiliferous strata, but are most numerous in the coal, Jurassic, chalk, and tertiary formations; no fish with ctenoid scales (like the perch) or cycloid (like the cod) is found below the chalk. The forms of the earlier fishes were many of them very strange; the pectorals were small and always in advance of the ventrals; above the chalk, the ventrals begin to approach nearer the head; they were not so fully developed as our fishes, but seem to have been, like the sturgeon, arrested in their development. During this epoch the sea covered the whole surface of the globe, and all animals whose remains have been preserved were without exception aquatic, breathing by gills; the climate must have been uniform; the dry land had not appeared above the waters, and all creation was as silent as in mid ocean.—For the systematic classification of fishes, and the history of the science, see ICHTHYOLOGY.

FISHKILL, a township of Dutchess co., N. Y., opposite Newburg, on the Hudson river, and intersected by the Hudson River railroad; pop. in 1825, 8,764. It has a village of the same name situated about 5 m. from the Hudson on a small stream called Fishkill creek, and containing 4 or 5 churches, an academy, 2 newspaper offices, and a bank.—FISHKILL LANDING is situated on the Hudson river, at the mouth of Fishkill creek, and on the line of the Hudson River railroad; pop. in 1855, 1,100. It contains several churches, 10 or 12 stores, an iron foundry, a machine shop, and a few factories. A ferry connects it with Newburg.

FISK, PLINY, an American missionary, born in Shelburne, Mass., June 24, 1792, died in Beyroot, Syria, Oct. 23, 1825. He was graduated at Middlebury college in 1814, studied theology at Andover, and sailed as a missionary for Palestine. Nov. 8, 1819. On reaching Smyrna he

engaged in the study of the eastern languages, and soon went to Scio to study modern Greek; but as that island was desolated by the Turks in 1821, he went to Egypt, and thence across the desert to Judæa, visiting various places, perfecting himself in his studies, and preaching, till the time of his death. When overtaken by his last illness he was just completing an English and Arabic dictionary.

FISK, WILBUR, D.D., an American clergyman and educator, born in Brattleborough, Vt., Aug. 31, 1792, died Feb. 22, 1839. He passed his early youth in desultory reading, and it was not until he was in his 17th year that the advantages of a school were opened to him. In 1809 he went to a grammar school at Peacham, where he made rapid progress in his studies, and in 1812 he entered the sophomore class in the university of Vermont, at Burlington. The war with England interrupting the exercises of the institution, and finally resulting in the occupancy of the college building by the U. S. troops, he entered Brown university at Providence, R. I., where he was graduated in 1815. Soon afterward he entered the office of the Hon. Isaac Fletcher of Lyndon, and commenced the study of law, which, however, he did not long pursue. It being necessary for him in consequence of the expense which his collegiate course had involved to seek at once some profitable employment, on the recommendation of the president of Brown university he became a private tutor in the family of Col. Ridgely, near Baltimore, Md. While thus engaged he resolved upon entering the ministry of the Methodist Episcopal church. His first appointment was Craftsbury circuit, where he labored 2 years. In 1819 he was appointed to Charlestown, Mass. His labors in this field were too great for his feeble constitution, and he sunk under them during the second year, and was placed on the superannuated list. In 1824 he was a delegate to the general conference, and was chosen to write the address to the British conference. At the ensuing session of the annual conference he was recognized as the principal of the Wesleyan academy at Wilbraham, an institution which had already under his auspices risen to considerable eminence. He was a delegate to the general conference of 1828, and was by that body elected bishop of the Canada conference, which he declined. In 1829 he received the degree of D.D., and was elected president of Lagrange college, and also professor in the university of Alabama. These with other and more lucrative offices were tendered him, but such was his desire to advance the cause of education in the Methodist church, particularly in New England, that he declined them all and continued at his post until 1830, when he was elected president of the Wesleyan university at Middletown, Conn., which under his charge became exceedingly popular. At the general conference of 1832 his appeals in behalf of Indian missions resulted in the organization of the Oregon mission. But his labors had now

seriously impaired his health, and he consequently made a voyage to Europe in 1835-'6, and embodied the result of his observations in a volume of "Travels in Europe." During his absence the general conference elected him to the office of bishop of the Methodist Episcopal church, which after deliberation he declined.

FISTULA, an ulcer in the form of a narrow canal, more or less deep and sinuous, lined by a pale false mucous membrane, indolent and indisposed to heal, kept up by some local pathological condition of the soft parts or bones, or by the presence of some foreign irritating body, and leading or not to a suppurating cavity. There may be a single external or internal opening, or there may be a communication between the skin and the mucous, serous, or synovial cavity. Some writers restrict the term fistula to such of the above lesions as take their origin from some natural cavity or excretory duct, while those communicating with abscesses and caused by foreign bodies or disease of the bones are called fistulous ulcers or sinuses; but the distinction is of little importance, as the pathological conditions and the principles of treatment are the same. *Fistulæ* arise when abscesses are not thoroughly healed from the bottom, when any irritating substance (as a ligature or a piece of dead bone) remains in the tissues, or after wounds of excretory ducts. If superficial and of recent origin, *fistulæ* may heal of themselves; but if deep-seated or chronic, they generally require surgical interference. They are usually rather tedious and annoying than dangerous; but when large, deep, with several openings and profuse discharge, they may produce hectic fever and fatal exhaustion. The principles of treatment are, to remove any irritating cause, as a piece of dead bone or foreign body; to prevent the accumulation of matter, by counter openings, if necessary, and by properly directed compression; and to excite adhesive inflammation by pressure, stimulating injections and applications, setons, caustic, and, as a last resort, incision of the fistula, that the soft parts may have an opportunity of healing from the very bottom of the wound; the constitution should also be strengthened by nourishing diet and tonic medicines. The most common varieties are the anal, lachrymal, salivary, and urinary *fistulæ*.—Anal fistula is situated by the side of the *sphincter ani* muscle, and is difficult to heal both on account of the constant muscular contractions and the passage of fecal matter into it. There may be an opening into the bowel internally and externally, either or both; according to Brodie, this affection always begins by an ulceration on the side of the rectum into which the fecal matter escapes, causing abscess and consequent fistula; but in some cases there is no opening into the bowel, the sinus reaching only to its outer coat; this affection is frequently a painful complication of consumption. The simple and efficient remedy for this fistula is division of the walls from the internal opening

to the skin, so as to prevent muscular contractions; after this operation the introduction of lint allows the wound to heal by granulation from the bottom. This affection is considerably more common in males than in females.—Lachrymal fistula is situated at the inner corner of the eye, and communicates with the lachrymal sac; it begins by an obstruction of the nasal duct, followed by inflammation, abscess, and fistulous opening. Beside the usual remedies for acute and chronic inflammation, the obstructed duct may be restored by the introduction of a metallic or elastic style. In a similar manner the duct of Steno may be obstructed, so that the saliva dribbles out on the cheek instead of passing into the mouth; the remedy is to establish the passage from the fistula to the mouth by puncture and the introduction of silk or flexible wire, and then paring and uniting the edges of the external opening.—In urinary fistula there is an opening from the perineum into the urethra, through which the urine dribbles wholly or in part; it is generally caused by urinary abscess and extravasation into the soft parts. For its relief all strictures should be dilated, the urethra brought to a healthy condition, and the fistula stimulated to contract and granulate by external applications. Sometimes there is a communication between the urethra and the rectum. But the most disgusting and difficult to remedy are the vesico-vaginal and recto-vaginal fistulæ, in the former of which the bladder, and in the latter the rectum communicates with the vagina; both of these affections are the consequences of the laceration and sloughing after tedious labor; the most successful method of treatment is by paring the edges of the fistula and uniting them by sutures, but this succeeds only under the most favorable circumstances; the unfortunates thus affected are generally invalids for life. A fistula may communicate with any of the abdominal viscera, or with any part of the body, on the surface or deep-seated, which may be diseased from abscess, dead bone, or the presence of a foreign substance.

FITCH, EBENEZER, D.D., an American clergyman, the first president of Williams college, born in Norwich, Conn., Sept. 26, 1756, died in West Bloomfield, N. Y., March 21, 1833. He was graduated at Yale college in 1777, where in 1780 he was appointed tutor, and continued to act as such for several years. In 1790 he was chosen preceptor of the academy in Williamstown, Mass., and when in 1793 it grew into and was incorporated as Williams college, he was elected its first president, which office he filled with ability and success till 1815, when, resigning, he was chosen pastor of the Presbyterian church in West Bloomfield, N. Y. This charge he held till 1827, and after his resignation continued to preach occasionally almost till his death.

FITCH, JOHN, an American inventor, and the pioneer in steam navigation, born in Windsor, Conn., Jan. 21, 1743, died in Bardstown, Ky., in June or July, 1798. He worked on his father's farm, with slight opportunities for education and

under very unhappy influences, till the age of 17 years, when he was employed for some time on coasting vessels, and then became apprentice to a clock maker. His master so utterly neglected his instruction in the art that he was unable to pursue it, and on reaching manhood he commenced business as a brass founder in a small way, failed in an attempt to manufacture potash, married unhappily, separated from his wife and two children (toward the latter of whom he cherished the strongest affection, and in after life made persistent but ineffectual efforts for a reconciliation with them), and settled in New Jersey as a button maker and silversmith. When the revolutionary war broke out, he was elected a lieutenant in the New Jersey line, but on meeting with some real or supposed injustice he left the service, and was employed by New Jersey as armorer of the troops. Driven away by the invading army, he engaged in his trade of silversmith in Bucks co., Penn., till the approach of the enemy again made it necessary for him to shift his quarters. He next supplied the American troops at Valley Forge with tobacco, beer, and other articles, in which he drove a prosperous business, resulting in a considerable accumulation of depreciated continental money. With this he purchased Virginia land warrants and removed to Kentucky, where he was appointed deputy surveyor; was captured by the Indians, and was marched through the wilderness to the British post at Detroit. He was detained some time as a prisoner, but was at length exchanged, and finding his way again to Bucks co., formed a company for the survey and purchase of lands in Kentucky and Ohio. On his return from these surveys, by which he acquired several hundred acres of land, he petitioned congress for an appointment as surveyor, and while awaiting the unsuccessful result of his application prepared a map of the N. W. country. This he engraved on a sheet of copper and printed on a press of his own manufacture. In the month of April, 1785, the idea occurred to him of propelling a carriage along an ordinary road by the force of steam. After a week's study he abandoned it as impracticable, and devoted himself to the application of steam to the propulsion of vessels. He immediately sought to interest leading men in Pennsylvania in the project; in August following he addressed a petition to congress in regard to it, and in September presented a drawing of the boat, models, and tube boiler to the American philosophical society. He next petitioned the legislature of Virginia for aid. James Madison presented his memorial, and Patrick Henry, then governor, took an interest in the plan. But the legislature was slow, and Fitch conceived the plan of raising the necessary funds by the sale of his map. He accordingly executed a bond to Gov. Henry in the sum of £350, conditioned that if he should sell 1,000 copies of his map at 6s. 8d., he would in 9 months thereafter exhibit a steamboat in the waters of Virginia. Nothing came

practical success in steam navigation was made by John Fitch. It is probable enough that Rumsey had entertained the idea of propelling a boat by steam before it occurred to Fitch. It had previously occurred to others. In 1788 Fitch built a second boat for the old machinery, which made several passages between Philadelphia and Burlington at the rate of 4 miles an hour. More power was requisite for commercial success. A boat built for an engine of 18-inch cylinder was ready for trial in Aug. 1789. After several failures and changes in the machinery, this boat was successfully tried in the spring of 1790, and was run as a passenger boat on the Delaware, making during the season more than 2,000 miles at an average speed of 7½ miles an hour. But more money was wanted to introduce the invention, and the numerous stockholders in the enterprise could not be brought to respond to further assessments. The faith and enthusiasm of the inventor must be shared by the capitalist who undertakes the execution of his scheme; and faith and enthusiasm are not to be predicated of a joint stock association. Time ran on, and Fitch was cramped for the necessities of life. He felt and repeatedly asserted that the passenger traffic of the great western rivers would one day be carried on exclusively by steam; that ships of war and packet ships would navigate the Atlantic by steam;

the condition of his western property, he went to Kentucky, where he found his land overrun with squatters, and no encouragement for his steam projects. Mortified by his inability to carry out his great project, and wearied by the lawsuits in which he had engaged for the recovery of his lands, Fitch became despondent and desperate, and terminated his life by swallowing a dozen opium pills which had been left with him from time to time by his physician to use as anodynes. The sealed envelope was formally opened by the directors of the library company in 1823, and was found to contain a detailed history of his adventures in the steam-boat enterprise, which is inscribed: "To my children and to future generations," with a journal and other papers, from which an interesting biography was prepared by Thompson Westcott and published in Philadelphia in 1837. A memoir of Fitch by Mr. C. Whittlesey is also to be found in Sparks's "American Biography."

FITCH, RALPH, one of the earliest English voyagers to India, lived in the latter part of the 16th century. He was a London merchant who dealt in eastern goods, and, excited by the narratives of Drake and other voyagers, persuaded John Newbery and others to join him in an expedition to the East by way of the Mediterranean. The adventurers set sail in Jan. 1583, bearing letters of friendship from Queen Eliza-

both to the emperor of China and the Great Mogul Akbar. They landed at Tripoli in Syria, whence they went to Aleppo, and traversing Mesopotamia reached Bagdad. From that city they sailed down the Tigris and through the Persian gulf to Ormus, where they began a profitable traffic. But their success roused the jealousy of other European merchants in those parts, one of whom, an Italian, denounced them as heretics to the Portuguese inquisition. The Englishmen were thrown into prison, dispossessed of their goods, and afterward sent to Goa, where the governor kept them in prison for a month, partly on account of an alleged offence committed at Malacca by Sir F. Drake. They were finally released on professing the Roman Catholic faith, paying a heavy ransom, and giving bond in 2,000 pardaos not to quit the town without leave. Their business prospered, but impatient of continued taxes and seeing reason to apprehend further injustice, they secretly changed their goods for pearls and escaped from Goa, April 5, 1585. They visited Belgaum, and went to Bejapoor, of whose idols Fitch says: "Some be like a cow, some like a monkey, some like peacocks, and some like the devil." Thence, after passing through Golconda, they travelled north through the Deccan, and visited successively Burhampoor, the capital of Candeish; Mandoo, once the chief city of Malwah; Agra, where one of the party, William Leader, a jeweller, remained in the service of Akbar; Allahabad, Benares, Patna, Tanda in Bengal, and a country called by Fitch Couche, which appears to be at the foot of the mountains of Bootan. They travelled S. to Hoogly and through Orissa, passing by a port called Angeli, which they described as the seat of a great trade. It cannot now be identified. Returning to the Ganges, they saw Serampore and other towns on its lower branches, made an excursion into Tipperah, and took passage in a vessel to Nagrais, in Pegu. They visited Malacca, went back to Bengal, shipped for Ceylon, and thence doubling Cape Comorin sailed to Cochin and Goa, and returned to England in 1591, by the same route they had come, after having performed the most extensive journey that had yet been made by any Europeans in India. Fitch's narrative of his travels, which may be found in Hakluyt and in Purchas's "Pilgrims," is exceedingly interesting not less for its quaint style than for the mass of information which it contains.

FITCHBURG, a township of Worcester co., Mass., on a branch of Nashua river, 50 m. N. W. from Boston; pop. in 1855, 6,486. It is a terminus of 3 railroads: the Fitchburg, to Boston; the Fitchburg and Worcester, to Worcester; and the Vermont and Massachusetts, to Brattleborough. It is furnished with abundant water power, and is a flourishing manufacturing place, the principal branches of industry being the making of cotton goods and paper. In 1855 it contained 8 paper mills, with \$137,500 capital, employing 121 hands, and producing \$287,533 worth of paper yearly; 4 cotton mills, with

\$151,000 capital, employing 202 hands, and producing \$252,025 worth of goods; 1 woollen mill, with \$50,000 capital, employing 50 hands, and producing \$75,000 worth of cassimere; and 5 factories of machinery and boilers, with \$63,500 capital, employing 149 hands, and producing \$125,400 worth of machinery, &c. The town has numerous other factories of various sorts, and in 1858 contained 8 churches (1 Baptist, 4 Congregational, 1 Methodist, 1 Roman Catholic, and 1 Universalist), 2 banks, 1 savings bank, 2 newspaper offices, an athenæum, and a high school. The town house is a handsome building 100 feet long and 65 feet wide. The principal village is lighted with gas.

FITZ (old form of Fr. *fila*, son), prefixed to proper names, corresponds to the Celtic *Mac*, the Irish *O'*, the Hebrew *Ben*, and the Aramaic *Bar*, and indicates descent (usually illegitimate) from the ancestral name following it. Thus the Fitz-Clarences were the children of the late duke of Clarence (afterward William IV.) by the actress Mrs. Jordan.

FITZGERALD, EDWARD, lord, an Irish soldier and politician, 5th son of the first duke of Leinster, born near Dublin, Oct. 15, 1763, died June 4, 1798. Evincing an early predilection for military affairs, he entered the army, and distinguished himself for intrepidity as aide-de-camp to Lord Rawdon, in the latter part of the American revolutionary war, and was severely wounded in the battle of Eutaw Springs. After sitting for some time in the Irish house of commons, and travelling on the continent, he rejoined his regiment in Canada, where he befriended the celebrated William Cobbett, a sergeant-major under him, by procuring his discharge. Returning in 1790, he was again elected to parliament, and in 1792 visited Paris, where he became associated with some of the leading revolutionists. At a banquet given by Englishmen in Paris, he publicly renounced his nobility, and proposed a toast to the success of the republican arms, and was consequently dismissed from the British army. He then returned to Dublin, joined the society of united Irishmen, encouraged other political and military organizations, defending them in the Irish parliament, and negotiated with the French directory, till a warrant was issued by government for his apprehension. He refused to abandon his associates by escaping, but secretly directed the revolutionists from a place of concealment in Dublin, after the other principal leaders had been arrested, and was at length discovered and captured after a desperate struggle. He was severely wounded, and died in prison. His biography was written by Thomas Moore (London, 1831).—PAMELA, lady, wife of the preceding, reputed daughter of Mme. de Genlis and Philippe duke of Orleans (Egalité), died in Paris in Nov. 1831. She was educated with the children of the duke of Orleans, being reported an English orphan. She was married to Lord Fitzgerald at Tournay in 1790, and after his death was again married to Mr. Pitcairn, Amer-

ican consul at Hamburg. A separation ensued, and she resumed the name of Fitzgerald, and lived in retirement at Montauban till 1830, when, the associate of her childhood being called to the throne of France, she went to Paris. But Louis Philippe refused to receive her, and she died in indigence.

FITZHERBERT, SIR ANTHONY, a learned lawyer of the reign of Henry VIII., born in Norbury, Derbyshire, died in 1538. After a distinguished career at the bar, he was appointed in 1523 a justice of the court of common pleas. He had the courage to oppose the alienation of church lands by Cardinal Wolsey, when that ecclesiastic was at the height of his power. He was the author of the "Grand Abridgment of the Law" (1514), and was the first English writer on practical agriculture. His "New Treatise for all Husbandmen" (4to., London, 1523) has passed through more than 20 editions.—**THOMAS**, a learned English Jesuit, grandson of the preceding, born in Swinnerton, Staffordshire, in 1552, died in Rome in 1640. After various fruitless attempts to induce the Roman Catholic powers of Europe to aid the Roman Catholics of England, he entered the society of the Jesuits, and for the last 22 years of his life presided over the English college at Rome. He wrote a number of treatises of a religious and controversial character.

FITZHERBERT, MARIA, wife of George IV. of England, born in July, 1756, died in Brighton, March 29, 1837. Her father, Waller Smythe of Brambridge, Hampshire, was of an old Catholic family, and she was married successively to Edward Weld of Dorset and Thomas Fitzherbert of Stafford, being left a widow a second time in 1781. In 1785 the prince of Wales, afterward George IV., first saw her, and in December of that year they were privately married by a clergyman of the established church, in the presence of witnesses. The prince found no difficulty a few years later in disregarding this alliance, which, as to its civil effects, was contrary to law; but after his quarrel with Queen Caroline he returned to Mrs. Fitzherbert, who was advised by the Roman see to live with him. His excesses subsequently compelled her to leave him, and she retired to Brighton, where she passed the remainder of her life, much respected by all classes of society.—See "Memoirs of Mrs. Fitzherbert," by the Hon. Charles Langdale (London, 1856).

FITZPATRICK, BENJAMIN, U. S. senator from Alabama, born in Green co., Ga., June 20, 1802. He was left an orphan when very young, and in 1815 removed with an elder brother to the Mississippi territory. They settled in the valley of the Alabama river, near where the city of Montgomery, Ala., now stands. The educational advantages of that region were then very limited, and Benjamin had to rely mainly upon himself, and by diligent application he acquired a good practical education. He then studied law, and in 1821 obtained license to practise. He was soon afterward elected state's

attorney, and held that office until 1829. On account of declining health he then abandoned his profession, and settled on a farm in Autauga co., devoting his time to the improvement of his estate and quiet study until 1840. In that year he served as a democratic candidate for presidential elector for the state at large. In 1841 he was nominated for governor, and after a warm contest was elected by a majority of over 10,000. In 1843 he was reelected without opposition. At the close of his second term, in Nov. 1845, he was complimented by the legislature with a unanimous vote of thanks for the manner in which he had administered the affairs of the state. In Nov. 1848, he received from the governor the appointment of U. S. senator to fill the vacancy occasioned by the death of Dixon H. Lewis. He served during the short session of 1848-'9, and the special executive session of the senate which was called at the beginning of President Taylor's administration. Again, in Jan. 1853, he was appointed senator in the place of William R. King, who had been elected vice-president. At the meeting of the legislature in Nov. 1853, Gov. Fitzpatrick was elected for the remainder of Mr. King's term, which expired March 3, 1855. In November of that year he was reelected for a full term of 6 years. He seldom engages in the debates of the senate. He is a plain, practical working member, a man of cool judgment and agreeable manners. His personal popularity is shown by the uniformity with which he is called to the chair of the senate as president *pro tem*.

FITZROY, ROBERT, rear admiral in the British navy, second son of Gen. Lord Charles Fitzroy, born in June, 1805. He entered the navy in 1819, and obtained his first commission Sept. 7, 1824. After serving on the Mediterranean and South American stations, he was appointed to the command of one of the vessels which had been sent by the British government to explore and survey the coasts of Patagonia, Chili, and Peru. In 1831 Capt. Fitzroy's vessel was fitted out for another surveying expedition, and sailed from Plymouth in November of that year. Having accomplished, as far as practicable, the objects of the expedition, he returned to England in Oct. 1836. In 1841 he represented the city of Durham in parliament, and in the following year was appointed acting conservator of the river Mersey. In 1843 he became governor and commander-in-chief of the colony of New Zealand, which offices he held for 3 years, when he was superseded by Sir George Grey. He was made rear admiral in 1857. He is the author of several works, the most important of which is a "Narrative of the Surveying Voyages of H. M. S. Adventure and Beagle, between the years 1826 and 1836" (2 vols. 8vo., London, 1839), the 1st vol. being by Capt. King, and the 2d by Fitzroy.

FITZWILLIAM, WILLIAM WENTWORTH FITZWILLIAM, 4th earl of that name in the peerage of Ireland, and 2d in that of England, an English statesman, born May 30, 1748, died Feb. 8, 1833.

He opposed the ministry of Lord North in the American war of independence, but did not take office when his uncle, the marquis of Rockingham, formed a new cabinet in 1782. Although a political friend of Fox, he abandoned him upon hearing his eulogies of French revolutionary principles, and took office as president of the council, July 11, 1794, when the duke of Portland became the nominal head of the cabinet. In 1795 he was lord lieutenant of Ireland, in the height of the disturbances which then agitated that portion of the kingdom; but was recalled after a few months, against the decided wishes, it is said, of the Irish people, for having supported a bill presented by Grattan in favor of Catholic emancipation. He was president of the council for a short time in 1806, on the death of Mr. Pitt, but his liberal views kept him out of office during the greater part of his career.

FIUME (Illyrian, *Reka*; Lat. *Fanum Sancti Viti ad Flumen*; Germ. *St. Veit am Flaum*), formerly the capital of the Hungarian Littorale (Adriatic coast), now the capital of a circle (pop. 96,800) of the Austrian crownland of Croatia, situated in a valley on the gulf of Quarnero, at the mouth of the Fiumara, 38 m. S. E. of Trieste; pop. 15,000. The old part of the town, on the slope of the hill, is poor looking and gloomy; the new part, which stretches along the coast, is well built, cheerful, and neatly paved. It has a provincial and district court, a chamber of commerce and industry, several schools, gardens, promenades, and many remarkable buildings, including churches, the government house, the city hall, a market hall with colonnades, a nunnery, a hospital, and the casino, which contains concert and ball rooms, and a theatre. In the vicinity is an ancient castle. The harbor admits only small vessels, larger ones anchoring in the gulf at a distance of 3 miles. The products of Fiume consist chiefly of linen, woollens, leather, earthenware, sugar, wax, beer, and rosoglio; its exports, mostly the produce of Hungary, are wheat, wine, tobacco, hemp, timber, rags, &c. The imports and exports comprise about 160,000 tons annually. Its refineries, mills, tanneries, and paper manufactories are extensive, one of the latter producing paper valued at \$250,000 annually. The construction of a railroad, to connect Fiume with the lower Danube, was long the favorite plan of Kossuth and other Hungarian patriots, in the years previous to the revolution, and a matter of lively agitation. Fiume became a free port in 1722, and is now one of the principal seaports of Austria. Entrances in 1855, 6,116 Austrian vessels, tonnage 84,642; 557 foreign vessels, tonnage 30,106. Clearances, 6,210 Austrian vessels, tonnage 99,091; 550 foreign vessels, tonnage 30,310.

FIXTURE, a word of frequent use, and in regard to which some little confusion exists, because the exact legal definition is precisely opposed to the meaning commonly given to the word. A fixture, in law, is a personal chattel in some way annexed to the realty, but such, or so annexed, that he who put it there may

take it away. We apprehend that the common meaning of the word is, a thing so fixed to the realty that it cannot be taken away. That is, an ornament, or utensil, or addition of any kind, is commonly called a fixture, if so affixed to the land (or to the house) that the owner of the land necessarily owns the thing, and it cannot be removed without his permission. Kent uses the word in both senses, but rather inclines to the common meaning; and for convenience, through this article, we shall mean by fixtures things so fastened to the land (or to a house which is fastened to the land) that they cannot be removed against the will of the owner of the land.—The first remark to be made is, that the whole modern law, which permits a great number of things to be attached to the land and thence removed by the occupier without reference to the will of the owner of the land, is in derogation of the common law. That originally regarded land as almost every thing, and personals as of little value; and it was a nearly invariable rule, that any thing which was once attached or annexed to the land, or made a component part of any thing so annexed, became at once the property of the owner of the land. This is certainly not the law now in England or the United States. It may be said that we have gone further from the ancient rule than have the English, and are more liberal in permitting removals of this kind; but the law is much the same in both countries. Whether a thing was a fixture or not, was formerly made to depend almost entirely upon the intention with which it was put up or annexed; and this was gathered from slight indications. Thus, the same thing was a fixture if nailed on that remained personal property if screwed on, because the use of screws, which can be unscrewed, indicated the intention of removing it. Intention still remains a very important test; but another has come to be of almost equal value, viz., the capability of removal without injury to the premises; or the possibility of taking the thing away and restoring the premises to the same order and condition in which they were before it was annexed.—The earliest relaxations from the ancient rule were made in favor of what are sometimes called trade fixtures; by which is meant all those additions which the tenant of a house or land makes for the purpose of carrying on his trade or business. It cannot now be denied that a very wide power of removal has been allowed to tenants in cases of this kind. To illustrate this by instances: it has been adjudged that a tenant might take away (having put them on the land for purposes of trade or manufacture) furnaces, iron backs to chimneys, grates, pumps, vats, cisterns, coppers, tubs, blinds, verandas, fire engines, steam and gas machinery, or even sheds, shops, and other buildings, and the like, even when these things are built into brick walls or rooms, or set on stone or brick foundations. Indeed, we doubt whether the courts of the United States would now stop short of

saying that any implements or instruments of trade may be taken away by an outgoing tenant, if he can remove them and restore the premises substantially to their original condition. Not long after the relaxation in favor of trade, it was admitted by the courts that many things might be taken away by an outgoing tenant which he had put up and fastened to the house, either for mere ornament or for domestic convenience. Under this head are now included a great variety of things, such as mirrors, marble slabs and chimney pieces, window blinds, doors, windows, baths, gas pipes and lights, stoves, fire grates, and ranges. It is difficult to draw an exact line here, but it must be said that the law is not so liberal in permitting things of ornament or convenience to be removed, as things of trade; and the rule is more strictly applied, that the premises are not to be disfigured or injured by the removal. There are certain things about which the adjudication is as yet conflicting, such as trees planted out, conservatories, hot-houses, and other structures for gardening. Here we should say that a nurseryman who put these things up for trade might certainly remove them, on the same conditions of putting the premises in good order as before. But a mere tenant for occupation, who had put them on the land for his own enjoyment, might be obliged to leave them, although we incline to think that he would be permitted to take them away, leaving, of course, the premises wholly unimpaired by the removal.—The same thing will be a fixture as to some persons, but not as to others. Thus a man who sells a house most certainly sells with it, and therefore cannot take away from the buyer, very many things which an outgoing tenant who put them there might remove when he goes. Here the law, instead of being liberal, professes to be strict; and the seller would be permitted to claim and sever from the land only those things which were evidently as free from all attachment to it as mere articles of furniture. And if he had fastened any things down, so as to give them the appearance of being a part of the house, it might be doubted whether he would be permitted to remove them. The same strict rule would be applied as between the heir who takes the land and the executor or administrator who takes the personals; and so it would be between lessor and lessee or mortgageor and mortgagee. Indeed, it may be said, in general, that in the matter of fixtures the law is extremely liberal as to the right of outgoing tenants to remove things of trade, and nearly as much so as to the same persons in respect to things of convenience or ornament; but very strict as to any disposition made of the land by the owner of it. A building, if placed on blocks or other movable foundations, is in almost no case a fixture, and it may be doubted whether even one who sells the land might not have the right of removal; but this question would probably be determined in each case by its peculiar circumstances.—It is common, and always pru-

dent, to provide in leases for the removal of things which the tenant expects to put up and take away; for although the law is liberal on some points, it is rather strict, and perhaps uncertain, as to others. Thus it is very clear that a tenant has the same rights of removal, and no more, whether he be a tenant at will, or for a short term of years, or a longer. But on one point the law is not certain. The general rule laid down in the books is, that a tenant who has the right of removing any chattels must carry them all away during his term; and if after his lease expires he enters upon the land to remove them, he is a mere trespasser, having no more right there than any other person. This rule would probably be adhered to and applied by our own courts, with perhaps two exceptions. One might be, where the tenant was prevented by unavoidable hindrances, or by great obstructions, from removing the chattels during his lease, and his delay could not therefore be attributed to his default. If the court could not on this ground give him a legal right to enter on the lands (and we doubt whether they could), they might at least make the damages recoverable from him as trespasser only nominal. The other exception is where a tenant has his lease determined by the will of the landlord, or some other event, unexpectedly. We should say, as matter of law, that an outgoing tenant was entitled to sufficient notice to exercise all his rights with reasonable convenience; and among them, that of removing whatever he had a right to take down and carry with him.

FLACIUS, MATTHIAS, surnamed ILLYRICUS, a German Protestant theologian, born in Albona, Istria, in 1520, died in Frankfort-on-the-Main in 1575. He was induced to abandon his first purpose of entering a convent, and to visit the German universities. At Wittenberg he heard Luther and Melanchthon, adopted their opinions, and was appointed professor of Hebrew. After the death of Luther he resisted with great energy the formulary known as the *Interim*, opposed the conciliatory measures of Melanchthon, and established himself at Magdeburg at the head of a party of rigid Lutherans. In 1557 he was appointed professor of theology in the newly founded university of Jena, and engaged in a violent dispute with Strigel concerning hereditary sin and the synergetic power of the human will, which resulted in his being deposed. He retired to Ratisbon, and afterward preached in several German cities. He was one of the most prominent of the reformers, and beside producing numerous polemical writings, distinguished for their severity, was the originator and one of the principal authors of the famous "Centuries of Magdeburg."

FLAG, the common name of a large family of the lowest order of plants, known as *algæ*. These algæ have all flagging habits, like the common sea weeds, which are usually fixed to rocks by their roots, and their branches are borne up by the tides, falling again and lying in confused

masses one upon another at its recess. The propriety of this homely term is better seen in the ulva or laver, of which *ulva latissima*, very common on the American coast, having a broad, ovate or oblong, undulated, bright green frond, may be seen lying on the soft ooze at low tide, and floating near the bottom at high water. *Enteromorpha*, with tubular, membranaceous, green, netted fronds, is still more flaccid, and is easily collected from rocks and beaches, when thrown up by the winds. A rich, dark purple kind (*porphyra vulgaris*, Agardh) may be frequently noticed on the piles and posts of wharves, hanging loosely down, like broad shreds, growing also on rocks between high and low water mark. Even in fresh water, in running streams, the flags are to be met with, such as *batrachospermum moniliforme* (Roth.), with very delicate, branching filaments, composed of violet-colored beads, and having a plumy, flagging aspect. So the *confervæ*, resembling confused and tangled skeins of silk, have the same appearance; and even in the more highly developed bright crimson and red kinds, or in the fuscous and inelegant *fuci*, and in the larger forms, equalling in size trees and shrubs, the name of flags is not an inapt one. Beside these lower plants, the name of flag is given to the iris family, which bear conspicuous flowers, some of great splendor. (See IRIS.) The sword flags are stiff, erect, very long-leaved plants, with spikes of extremely showy purple, scarlet, rosy, or white blossoms, and with large flat tubers (*cormi*), requiring heat, moisture, and sunshine while growing, but entire rest and dryness when dormant. Natives of the Cape of Good Hope, few garden flowers exceed them in gorgeousness or beauty, and few require so little care. The Belgian florists have succeeded in raising many splendid hybrids and varieties, of every hue; and the flower catalogues afford the names of the choicest of these, which command high prices. *Gladiolus communis* is hardy enough to survive our winters; it is a slender-growing species, with pretty purplish or crimson blossoms, and this and one or two others found in the south of Europe are exceptional; the rest are natives of the hot regions, particularly of the Cape. The ixias are smaller, dwarf irids or flags, with open, showy blossoms upon spikes, and variously colored. They are finely suited for winter flowering in greenhouses; their bulbs or *cormi* are planted early in the autumn; the plants, on rising from the soil, are exposed to the air and light, and on approach of frost placed just beneath the sashes of the roof, where they blossom toward spring. These also require extremes of treatment, being kept perfectly dry and warm when in a state of repose.

FLAGELLANTS, also called whippers (*verberantes*), brethren of the cross (*crucifratres*), cross-bearers (*cruciferi*), penitents who, in the 13th, 14th, and 15th centuries, went about in procession day and night, naked to the waist, with heads covered, singing penitential psalms, and whipping themselves until the blood flowed.

They were incited to these practices partly by the wars of the Guelphs and Ghibellines, which the people hoped to arrest by extraordinary penances, partly by the zeal of monks and clergymen who recommended in the confessional and in their sermons self-flagellation as a means of appeasing the wrath of God. They took their rise at Perugia in 1260. At first the pope placed no obstacles in their way, because they belonged to the party of the Guelphs, and by giving alms, reconciling themselves with their enemies, and other works of charity, seemed to exercise a salutary influence. But soon both the ecclesiastical and the secular authorities declared themselves against the large procession of flagellants (*Geisslerfahrt*) which in 1261 visited Austria, Poland, and Hungary, the members of which whipped themselves for 88 days, in commemoration of the number of years which Christ lived upon earth. The measures taken against them caused their disappearance in the same year. The flagellants were most numerous in the 14th century, especially after 1349, when the "black death" had swept over Europe, and had carried off in Germany alone 1,200,000 persons. When the first procession made its appearance in Magdeburg, during the week after Easter in that year, they spread with amazing rapidity over all Germany, and even to England and Denmark. Women were found in the processions; and in one case even 200 boys, about 12 years old, went about as flagellants. At first the sympathy with these processions was general and enthusiastic. Thousands of people were present and shed tears at the bloody ceremonies. At Spire they were entertained at the public expense, and the coronation of Charles IV. had to be transferred from Aix la Chapelle to Bonn in consequence of the presence of a large number of flagellants. In several places they excited a persecution against the Jews, who were regarded by the people as the cause of the black death. Gradually a stricter organization was effected. Every member of a procession was obliged to confess his sins, to be reconciled with his enemies, to get the consent of his wife, and to be provided with money for about 30 days. This increased, however, the aversion which the ecclesiastical authorities had already conceived against them. The people, on the other hand, began to consider the extraordinary numbers passing through the towns, and partly at least entertained by them, a great burden. In France the king and the university condemned them, and Pope Clement VI. issued a bull against them, when, in 1349, a procession approached his residence at Avignon. Gregory XI. designated them in 1372 as heretics, because they were said to deny the sacraments. Henceforth they generally disappeared in Germany. At the beginning of the 15th century a considerable number of crypto-flagellants collected in Thuringia, but were at once suppressed. Some of them were even burned. The processions which, toward the close of the 14th century, took place in Italy and Spain, were also of short duration.

Dominican friar Vincent Ferrerius, who part in new processions in the 15th century and for some time protected them by his position, was prevailed upon by the council of the Inquisition to withdraw from them.—See J. J. G. de la Harpe, *Historia Flagellantium* (Paris, 1700); J. J. G. de la Harpe, *Die Christlichen Geisslergesellschaften* (Halle, 1828), the best work on the subject, based on a thorough study of all the documents relating to it. The documents which have since been discovered have been carefully collected by Dr. Zacher in his article on the subject in the encyclopædia of Ersch and Gruber.

FLAGEOLET, a small wind instrument of flute or pipe species, emitting a shrill sound. It is played with a mouthpiece, the holes and keys are stopped with the fingers.

FLAHAUT DE LA BILLARDERIE, AUGUSTE CHARLES JOSEPH, count, a French general and diplomatist, born in Paris, April 21, 1772.

His father succeeded Buffon as director of the *jardin du roi*, now *jardin des plantes*, which was executed by the revolutionists. The property of his widow was confiscated; she retired to England with her only son, supporting herself by literary labor, and afterward repaired to France.

Flahaut enlisted in 1800 in a regiment of volunteers, joining Napoleon's army in 1801, became successively aide-de-camp of Murat, Berthier, and Napoleon, fought in Portugal, Spain, and Germany, and gained particular distinction at the battle of Leipsic, on which occasion he was promoted to the rank of general of division, with the title of count. Subsequently he made a peer of France, advocated the succession of Napoleon II. to the throne, and was retained in his position after the revolution of 1830.

For a short time ambassador in Berlin, 1831, he officiated in the same capacity in Vienna from 1841 to 1848, when he was removed by the provisional government by decree of April 17, which in 1849 however was reversed by the legislative assembly; but he did not resume public life until after the *coup d'état* of 1852, 1851. He then became a member of the consultative commission, senator in 1853, and in 1854 a member of the commission charged to collect the correspondence of Napoleon I., which has since been published.

In England he married (July 28, 1817) Margaret Mercer Elphinstone, who succeeded to peerages of the United Kingdom and Scotland as Baroness Keith in 1823, and to the Scottish barony of Nairne in 1838. The saloon of the countess de Flahaut was for a long time a favorite and fashionable resort of eminent politicians. The count was one of the intimates of Louis Napoleon's mother, Queen Hortense, who is said to have composed for him the popular air *Partant pour la Syrie*; and he is believed to be the father of M. de Flahaut.

—ADÈLE FILLEUL, a French authoress, daughter of the preceding, born in the chateau of Préville in Normandy in 1760, died in Paris, 16, 1836. Her second husband was the marquis José Maria de Souza Botelho (born in Oporto, March 9, 1758, died in Paris, June 1, 1825), who was for some time Portuguese ambassador in Paris, and who prepared the best edition of Camoëns' "Lusiad." Her first and best work, *Adèle de Sénanges, ou lettres de Lord Sydenham*, appeared in London in 1794, with a preface by the marquis of Montesquieu. It was followed in 1799 by *Émilie et Alphonse*, and by a series of other works, a complete edition of which appeared in Paris in 1821-'2. As a charming and pure writer she holds about the same position in French literature as Madame de Lambert and Madame de Lafayette.

FLAIL, an implement for threshing grain from the straw. It consists of a hand staff about 1½ or 2 inches in diameter, and from 4 to 5 feet long, to which is coupled a shorter staff called a swingel, by the striking of which upon the sheaves the corn is threshed. Flails are very ancient implements, and are divided into two classes according to the kind of the coupling between the hand staff and swingel. In one class the caplins or untanned leather thongs of this coupling are fastened on the hand staff in such a way that it remains stationary in the hands while these caplins revolve around it with each revolution and fall of the swingel; and in the other class these thongs pass through a hole in the hand staff, which consequently turns in the hands with each stroke upon the sheaves. The middle bands of the coupling, being the part which connects the thongs of the hand staff with the caplins on the swingel, are generally made of eel skin. The use of flails in the United States and Great Britain is now for the most part supplanted by the introduction of the modern threshing machines.

FLAMBOROUGH HEAD, a promontory on the coast of Yorkshire, England; lat. 54° 7' N., long. 0° 5' W. It consists of a range of steep, and in some places perpendicular chalk cliffs, some of which rise to a height of 450 feet. On the headland stands a lighthouse 214 feet above the sea, with a revolving light visible at a distance of 30 m. The cliffs are perforated by numerous caverns, which during the summer are resorted to by immense numbers of sea fowl. The ruins of an ancient tower and a Danish intrenchment are to be seen on the summit, and the village of Flamborough stands near the centre of the promontory.

FLAME, the luminous appearance commonly accompanying the rapid combustion of bodies in a state of vapor. All ordinary flames are produced by the combustion of hydrogen and carbon; yet these may be made to combine with the oxygen of the air without the appearance of flame, as when a coil of platinum wire heated to redness is suspended over alcohol, or over a mixture of alcohol and ether. The vapors arising slowly consume, generating sufficient heat to keep the wire red-hot, but not enough to burst into flame. A more rapid combustion is required for the production of flame; and this even when so little luminous that it is

FLAMBOROUGH HEAD, a promontory on the coast of Yorkshire, England; lat. 54° 7' N., long. 0° 5' W. It consists of a range of steep, and in some places perpendicular chalk cliffs, some of which rise to a height of 450 feet. On the headland stands a lighthouse 214 feet above the sea, with a revolving light visible at a distance of 30 m. The cliffs are perforated by numerous caverns, which during the summer are resorted to by immense numbers of sea fowl. The ruins of an ancient tower and a Danish intrenchment are to be seen on the summit, and the village of Flamborough stands near the centre of the promontory.

FLAME, the luminous appearance commonly accompanying the rapid combustion of bodies in a state of vapor. All ordinary flames are produced by the combustion of hydrogen and carbon; yet these may be made to combine with the oxygen of the air without the appearance of flame, as when a coil of platinum wire heated to redness is suspended over alcohol, or over a mixture of alcohol and ether. The vapors arising slowly consume, generating sufficient heat to keep the wire red-hot, but not enough to burst into flame. A more rapid combustion is required for the production of flame; and this even when so little luminous that it is

scarcely visible by daylight, as when pure hydrogen is ignited. This flame is nevertheless accompanied with so much heat, that iron wire is made red-hot and plainly luminous by it. If the heat be abstracted, as by encircling a small flame with a coil of wire, the flame will expire. Solid bodies heated in it, as carbon in fine particles, increase its luminousness. The hydrogen is converted into aqueous vapor by uniting with the oxygen of the air, and the carbon, heated to such a degree that it too is disposed to unite with the same atmospheric element, also disappears in invisible vapor. Combustible bodies commonly furnish the two elements of luminous flame combined or intimately mixed, so that they assume the gaseous state together, as they unite in the air with its oxygen. Anthracite and charcoal, however, by their deficiency in hydrogen, lack one of the materials of ordinary flame, and the carbon alone of which they consist unites slowly with oxygen. An imperfect combustion first ensues, and carbonic oxide is generated. This gas plays over the surface of the ignited coal, and receiving from the air with which it comes in contact another atom of oxygen, it gives forth the pale blue flame which is seen proceeding from the surface of this fuel in ignition. Thus the combustion is completed by the production of carbonic acid. The flame of carbonic oxide in combustion is often seen by night hovering over the mouths of lime kilns, too pale to be visible by day. When the gases are poured out from the tall flues of steam engines or other furnaces burning anthracite, the carbonic oxide bursts into a volume of flickering, unsteady flame, as it meets the atmospheric oxygen at the top of the flues, sending out a strange glare into the darkness around. It is this flame which is economically produced under the boilers of engines connected with blast furnaces for smelting iron ores, the unconsumed gases being passed from the mouths of the furnaces into a large chamber, where they meet the air required for their complete combustion. In the production of illuminating gases, whether formed from oils, bituminous coal, or other substances, a portion of carbon is dissolved in the hydrogen, and carried along with it to the point where it is exposed to atmospheric air and the heat required to decompose the compound. The hydrogen at once begins to enter into the new combination with oxygen. In so doing heat is developed, by which the particles of carbon it leaves, and which at once assume the solid form of this element when uncombined, are rendered incandescent, and produce the yellow light of the flame. They are swept upward by the ascending heated current, and, as they come in contact with the air on the margin of the flame, they disappear in the form of carbonic acid gas. The internal part of the flame is a cone of unconsumed gas, which, though transparent, appears dark; it is protected by the outer portions from contact with the air. No combustion takes place within it, as may be shown by placing a white

stick across a saucer in which alcohol is burning; the wood will be blackened by burning only at the two points which were against the outer edges of the flame. The wick of a candle in this position does not consume. Gunpowder may be introduced on a small metallic surface into the centre of the flame without ignition. By introducing a small tube into this portion, the gas may be made to pass up any distance, and be ignited at the top, like the gas meeting the air at the top of a chimney stack. The presence of the aqueous vapor may be shown by the dew deposited upon a piece of cold glass held a little way above the flame; and the solid carbon may be caught before its conversion into invisible gas, by placing a piece of white porcelain across the flame, and thus chilling the particles, so that their further chemical change is prevented. A piece of wire gauze being substituted for the porcelain, the inflammable vapors pass through this, but not the flame. They may, however, be ignited above the gauze as well as below, and two independent flames be thus obtained; or in case of a jet of gas being the combustible material, this may be ignited only above the gauze.—As flame is limited in its extent by the amount of surface of gaseous matters exposed to the action of oxygen, it may be increased by directing a current of air through its interior part, thus producing combustion within as well as without. Argand burners are designed to produce this effect. The blowpipe also serves the same purpose, concentrating at the same time that it increases the heat. In the luminous jets which it makes the different qualities of the different portions of the flame are plainly exhibited, the greatest heat being produced just without the point of the yellow flame, where is the most intense combustion. Outside of this, particles submitted to the action of the blowpipe flame are oxidized by contact with the atmospheric oxygen; within it, at the point of the interior flame, they are deoxidized, and oxides of many metals are reduced to a metallic state. (See BLOWPIPE.) The form of the chimney surrounding the flame is also designed to cause the air rising through it to be turned by striking against its shoulder and impinge upon the outer portion of the flame, thus increasing its intensity. This effect is the more decided from the high temperature of the ascending current. Various substances impart characteristic hues to flame; sulphate of strontian gives a beautiful purple, copper filings and sal ammoniac a greenish tint, zinc a fine blue, &c. (See PYROTECHNY.) The appearance of such colors in the use of the blowpipe serves as an indication of the presence of the substances that commonly produce them. (See BRIDE LIGHT, and DRUMMOND LIGHT).

FLAMEL, NICOLAS, a French scribe and reputed alchemist, born in the first half of the 14th century, died in Paris, March 22, 1418. He combined the occupations of copyist and bookseller, married Pernelle, a widow of some property, and also received pupils in his house, to whom he taught writing and the ru-

diments of letters. The means which he thus acquired were profitably invested, and the products of his industry and rents enabled him to build hospitals, found chapels, and endow churches, which he often adorned with paintings and sculptures, especially with bass-reliefs of himself and wife. One of his free lodging houses was still standing in 1856, in the rue de Montmorency, in Paris, with the original inscription. He seems to have been a sagacious citizen, skilful in making money, ambitious of renown, and imitating the devout and ostentatious benevolence of the princes of his time. His fame increased after his death, and the attempt to account for a fortune which had perpetuated itself in many monuments, and been magnified by popular credulity, resulted in attributing to him the possession of the philosopher's stone, and the secret of making gold. In 1561 the *Sommaire philosophique*, a metrical treatise on alchemy, was published probably by Gohorry, under the name of Flamel; and it completely established his reputation as an alchemist till Vilain critically investigated his history (1761). It has been supposed that the Jews, who were then much persecuted in France, made him the depositary of their wealth; and others have supposed that the cabalistic book of *Habraham Jelf*, which he is said to have studied, contained emblematic signs of the various places where the Jews, expelled from the kingdom, had buried their treasures.

FLAMEN, in Roman antiquity, a member of an ancient college of priests, established by Numa, each of whom was confined to the service of a particular deity. The original 3, the *dialis*, *martialis*, and *quirinalis*, consecrated to Jupiter, Mars, and the deified Romulus, were afterward distinguished as *maiores*, and chosen from a select class of the patrician order (see *CONFARREATIO*); while the later 12, called *minores*, were elected from the plebeians. Their dignity was for life, but could be forfeited by neglect of duty, or lost in consequence of an ill-omened event disturbing any of their sacred performances. Their official dress was the *apex*, a cap, either conical or close-fitting, having at the top a pointed piece of olive wood, surrounded at its base by a lock of wool (*flum*, whence, according to some, their name, while Plutarch derives it from *pileum*, hat), the *læna*, or mantle, and the laurel wreath. The most distinguished member of this college of priests was the *dialis*, honored with the privileges of a seat in the senate, the *tega prætoris*, a lictor, and the higher prerogative of procuring pardon or respite for criminals who came to him for refuge; but he was also burdened by several restrictions, being forbidden, for instance, to leave the city even for a single night, to swear an oath, to wear a ring, to ride or touch a horse, and to remarry after the death of his wife, who assisted him in the performance of some of his sacred functions, and was called *fluminica*. In later times the deified emperors of Rome had particular flamens appointed to their worship.

FLAMINGO, a wading bird of the order *anseræ*, family *anatidæ*, sub-family *phænicopterina*, and genus *phænicopterus* (Linn.). The bill is longer than the head, high at the base, compressed, suddenly bent at a right angle in the middle, the sides growing narrower, and rather obtuse at the tip; the lateral margins are incurved and finely laminated; the base to around and behind the eye is covered with a soft and delicate skin, finer than the finest kid, the end being corneous; the nostrils are near the base, linear, $1\frac{1}{2}$ inches long; length about 5 inches; beyond the curve the color is black, the base being orange and yellow. The wings are moderate, with the 1st and 2d quills nearly equal and longest; the tail is 6 inches long; the tibia is lengthened and naked, and the tarsi very long and slender, and both covered by transverse scales; the toes are short, the anterior ones united by a membranous web; the hind toe is very short, almost touching the ground, and free; the claws are short and flat. There are 5 or 6 species, inhabiting the warmer parts of the globe, frequenting the sea-shore and marshes in considerable flocks; one acts as sentinel while the rest are feeding or resting, and on the approach of danger gives the alarm by a trumpet-like noise, and starts off leading all the rest; they fly either in triangular lines like the wild goose, or in Indian file when they are about to alight; they can run quickly, but when walking are said to assist themselves by placing the upper mandible on the ground; though web-footed, they do not swim, the webs serving to support them in wading over soft mud. The food consists of mollusks, crustaceans, fish spawn, marine insects, and small fish; the singular form of their bill enables them, by turning it toward the body, to place the upper mandible downward, and thus to collect their food as in the bowl of a spoon. The small head, angular-shaped bill, long and slender neck, stilt-like legs, comparatively small body, and brilliant colors, render the flamingo one of the most extraordinary forms among birds.—The American flamingo (*P. ruber*, Linn.) is about 4 feet long from bill to end of tail, and $5\frac{1}{2}$ feet to end of claws; the extent of wings is $5\frac{1}{2}$ feet, each wing being $16\frac{1}{2}$ inches; the tarsus $12\frac{1}{2}$ inches; bill along gape 5 inches, along the curve 6 inches; middle toe $3\frac{1}{2}$ inches; the circumference of the body is only 24 inches, and the weight about $7\frac{1}{2}$ lbs.: the female is considerably smaller. The space between the bill and eye is bare, but the plumage generally is compact and the feathers rounded, those on the neck being short; the color is a bright scarlet, deepest on the wings; the quills are black, the legs red, the feet lake color, and the iris blue. The habits of the flamingo are more nocturnal than those of the herons; over the water they fly low, but over the land very high, with neck and legs extended, alternately flapping their wings and sailing; before alighting they generally sail around the place, and come down in the shallow water, often wading to the shore; they are very shy.

and difficult to approach. The nest is made on a hillock of mud about 2 feet high, in the hollow top of which the eggs are laid on the bare earth; they are 2 or 3 in number, of a white color, and about the size of a goose egg; the bird covers the eggs standing, with one foot in the water, and the young are hatched about the end of May; as soon as born they are said to take to the water, and cannot fly till they are 8 months old; they do not attain their full scarlet plumage until the 2d year, being rose-colored during the first. On account of its shyness the flamingo is rarely hunted, and then only for its handsome feathers. It is easily tamed, and in captivity feeds on rice, maize, and similar substances. It inhabits the warmer parts of America, especially the West Indies; it is not uncommon in West Florida and northern Alabama, and is rare to the north and west of these points. The European bird (*P. antiquorum*, Temm.) is smaller and less brilliant. It is a regular visitant to the shores of the Mediterranean, and sometimes wanders to France and Germany; it is extensively spread over the warmer parts of Asia, and is very common along the shores of northern Africa. Its appearance and habits are the same as in the American species. According to Gould, this species requires 4 years to reach maturity, during which the plumage changes greatly; before the first moult the color is uniform gray, with black tail and secondaries; in the male, the head, neck, upper and under surfaces, are a delicate rosy white, the centre of the wing bright scarlet, the primaries black, the bill reddish at the base and black at the tip, the tarsi and toes rosy red; the scarlet color is not assumed until the 3d or 4th year, and is brightest during spring and summer. Other species are the *P. Chilensis* (Mol.), *ignipal-liatus* (D'Orb.), and *parvus* (Vieill.). The flesh of the flamingo is savory, and its fatty tongue is considered a delicious morsel; they were especially esteemed by the ancient Romans, and many allusions to this dish are found in their writings.—The position of the flamingo among birds has been and is a subject of dispute; some authors place it among the waders or *grallæ*, from its long neck and legs, and consequent habits; while others, and the best authorities, rank it among the *anseræ*, or web-footed swimmers, on account of its lamellar duck-like bill, webbed feet, and muscular gizzard; if it be true that the young run to the water as soon as they are born, this of itself would seem to establish their rank among the *anseræ*.

FLAMINIAN WAY (Lat. *via Flaminia*), the principal road leading from ancient Rome to the northern provinces, constructed in 220 B. C., in the censorship of C. Flaminius, from whom it was named. It extended to Ariminum, now Rimini, on the Adriatic, a distance of about 220 m., where it joined the Æmilian way. It divided into 2 branches at Narnia, now Narni, in Umbria, which met at Fulginium (Foligno), again dividing at Nuceria (Nocera), and meeting at Fanum Fortunæ (Fano). It was a road of

great importance for commercial and military purposes, and still retains many of the bridges and other works erected by the Roman emperors.

FLAMININUS, TITUS QUINTUS, a Roman general, born about 230 B. C., died about 175. He was elected consul in 198, and undertook the conduct of the war against Philip II., king of Macedon. By pretending that his object was to remove from Greece the Macedonian yoke, he detached many of the Greek states from Philip, and defeated him at Cynoscephalæ (197), in Thessaly, where the Roman legion demonstrated its superiority over the famous Macedonian phalanx. By the treaty which was soon after concluded Philip surrendered all the Greek towns which he possessed in Europe and Asia, and paid a heavy contribution to the Romans. At the Isthmian games in 196 Flaminius proclaimed, to the great joy of the assembled Greeks, the freedom of those states which had been subdued by Macedon. In 195 he diminished the power of the tyrant Nabis of Sparta, after which he occupied himself in restoring internal peace and prosperity to Greece. The next spring he returned to Rome, where his triumph lasted 3 days. In 183 he was sent as ambassador to Prusias, king of Bithynia, to seek the surrender to the Romans of Hannibal, who had obtained an asylum there.

FLAMINIUS, CARUS, a Roman general, killed June 23, 217 B. C. He was tribune of the people in 232, consul in 228 and 217, and censor in 220. As tribune he carried against the opposition of the senate an agrarian law. In his first consulship he with his colleague attacked the Gauls beyond the Po, and was defeated. The senate then recalled the consuls, but Flaminius resisted the order by refusing to open the letter, and obtained a victory over the Insubriana. A triumph was refused him on his return, but he was rewarded with demonstrations of popular favor. The *circus Flaminius* and *via Flaminia* were the monuments of his censorship. In his second consulship he marched against Hannibal, and rashly giving battle, was slain, with the greater part of his army, on the border of Lake Thrasymenus.

FLAMSTEED, JOHN, the first English astronomer royal, born in Denby, near Derby, Derbyshire, Aug. 19, 1646, died in Greenwich, Dec. 31, 1719. He was educated at the free school of Derby, where his father lived, and at a very early age manifested a strong inclination for astronomical studies. His health was so delicate that he was not sent to a university, but continued for several years to prosecute his astronomical researches at home with great success. In 1667 he demonstrated the true principles of the equation of time, in a tract which Dr. Wallis subsequently appended to his edition of the works of Horrocks. Flamsteed appears to have been the first astronomer who brought into common use the method of simultaneously observing the right ascension of the sun and stars, a mode by which the true

place of any star is determinable by means of meridional altitudes and transits. In 1669 he communicated to the royal society his calculation of a solar eclipse that had been omitted in the ephemerides for the following year, together with several other astronomical observations. This communication was submitted to a committee of that body, who sent him a letter of thanks. In 1670 he visited London in company with his father, and was introduced to the savants of the metropolis. When returning to Derby, he passed through Cambridge, where he entered himself a student of Jesus college, and made the acquaintance of Wroe, Barrow, and Newton. In 1678 he composed his treatise on the "True and Apparent Places of the Planets when at their Greatest and Least Distance from our Earth," a work of which Newton availed himself in his first edition of the *Principia*. In 1674 appeared his *Ephemeris*, which, with 2 barometers previously constructed by him, was presented by his friend Sir Jonas Moore to Charles II., and his brother, the duke of York. In 1675, having long before decided on entering the church, he was admitted to holy orders. Soon after this period, the king's attention having been called to the enormous errors of the astronomical tables then in use, he resolved to found an observatory, of which Flamsteed, through the mediation of Moore, was appointed the first director. The erection of the observatory was completed in 1676, but the astronomer had already entered on the discharge of his duties, having established himself in Greenwich. The new observatory received the name of Flamsteed house. It was so inadequately supplied with astronomical apparatus that its principal, out of his scanty salary of £100 a year, often not regularly paid, and his other limited resources, had to provide most of those instruments which were indispensable to the successful prosecution of his researches. Here, however, notwithstanding every disadvantage, Flamsteed composed his great work, *Historia Cœlestis*, the period of whose publication forms an epoch in the annals of modern astronomy. In 1684 he was presented by the lord keeper North to the small living of Burslow in Surrey, the only ecclesiastical preferment he ever obtained. Mr. Francis Baily's discovery of his papers and correspondence, in 1832, has thrown much light on the history of his differences with Newton and Halley. These documents give us Flamsteed's version of those unseemly squabbles, and it is not at all favorable to the reputation of those great masters of science; but there is another account of these matters in Sir David Brewster's "Memoirs of the Life, &c., of Sir Isaac Newton," which makes their conduct toward him appear less culpable, though neither just nor generous, than Flamsteed would lead us to suppose. His *Historia Cœlestis Britannica* (3 vols. fol., London, 1725) was not published complete till after his death, though a partial edition had been issued in 1712, against his protest, by Halley, under authority

of a committee composed of Sir Isaac Newton, Sir Christopher Wren, and others. The 1st volume contains his observations on the fixed stars, planets, comets, &c.; the 2d, the transits of stars and planets over the meridian, with their places; the 3d, an account of the methods and instruments used by Tycho Brahe and himself, and various catalogues of fixed stars, including his own catalogue of 2,934 stars. He also prepared an *Atlas Cœlestis*, as an accompaniment to the above work, which appeared in 1729.

FLANDERS (Fr. *Flandre*, Flemish *Flan-dern*, Dutch *Vlaanderen*), formerly a part of the Netherlands or Low Countries of western Europe, now included in Belgium, Holland, and France. Stretching along the German ocean from the W. inlet of the Scheldt to the entrance of the straits of Dover, it was bounded N. and E. by that river and its branch the Dender, while on the S. it joined the province of Artois, the old country of the Atrebates. The name occurs for the first time in the 7th century, when Eligius, bishop of Noyon and treasurer of King Dagobert I., visited northern Neustria. By the treaty of Verdun, 843, Flanders was included in the kingdom of France, and in 863 it was erected into a county under the rule of Baldwin of the Iron Arm, son-in-law of King Charles the Bald. Baldwin's successors took rank among the 6 lay peers of France, and figured conspicuously in French history. His family having become extinct in 1119, the county was held until 1127 by Charles I. the Good, son of Canute, king of Denmark; then for a year by William Cliton, the nephew of Henry I. of England; and finally by Thierry, son of the duke of Lorraine, whose dynasty, known as the Alsatian, reigned until 1280. A last family of counts was inaugurated by Guy de Dampierre, and lasted until 1384, when Flanders was united to the states of Philip the Bold of Burgundy, who had married the heiress of the last count. At the death of Charles the Bold in 1477, his daughter Mary, by marrying the archduke Maximilian, brought Flanders to the house of Austria. It was incorporated by the emperor Charles V. among the 17 provinces which formed the circle of Burgundy. On his abdication it became one of the dependencies of Spain, which lost a portion of it by its northernmost section being annexed to Seeland when the 7 United Provinces declared their independence. Afterward a portion of its southern territory was conquered by Louis XIV., and received the name of French Flanders. In 1713 the peace of Utrecht transferred Flanders from Spain to Austria. In 1792 it was invaded by the French, who held it until 1814, during which period it formed the departments of Lys and Scheldt. On the fall of the French empire, it was given to the king of the Netherlands, who divided it into 2 provinces, East and West Flanders, which since 1831 have constituted an important part of the kingdom of Belgium. In spite of so many revolutions, Flanders has always been

distinguished for its industrial, commercial, and agricultural prosperity. As early as the 12th century its cities had acquired considerable importance through their manufactures, and had secured a certain degree of freedom. The democratic spirit kept even pace with the progress of trade and industry; and in the following centuries the Flemish cities were so many republican communities, governing themselves, and paying little more than a nominal obedience to their counts. They more than once took the management of affairs into their own hands, and successfully resisted their lord paramount, the king of France. Such was the case in 1337, when Jacques van Artevelde, the brewer of Ghent, expelled Count Louis I. from the country, caused his countrymen to acknowledge Edward III. of England as king of France, and held for a while the balance between the two great contending nations. Even when the cities of Flanders consented to submit to their sovereigns, they protected their liberties and privileges against any encroachment, which fact is clearly evidenced by their repeated revolts during the 14th and 15th centuries. The interest of their lords, however, was to deal mildly with subjects from whom they could obtain immense sums of money by voluntary taxation. It was through them indeed that the house of Burgundy became the wealthiest in Europe, for they had then reached the height of their prosperity; many burgesses of Ghent, Ypres, and Bruges had princely fortunes, and plenty was apparent everywhere. Charles V., by forbearance and skilful management, conciliated the Flemings, and even the despotism of Philip II. could not entirely alienate them from Spain. Flanders is still a well cultivated country, famous for its industry and commerce, and forming the richest part of Belgium; but the indomitable spirit of old times has been tamed into a moderate love of political liberty. (See FLEMISH LANGUAGE AND LITERATURE.)

FLANDERS, EAST, a province of Belgium, bounded N. by Holland, E. by the Scheldt (separating it mostly from the province of Antwerp) and by South Brabant, S. by Hainault, and W. by West Flanders; area, 1,154 sq. m.; pop. in 1856, 776,960. It forms an extensive plain, drained by the Scheldt and its tributaries, which, being united by canals, afford ample water communication. Its soil is not of superior quality, but is industriously cultivated, and it gives excellent crops of flax, hemp, wheat, rye, colewort, hops, beets, potatoes, and other vegetables. Great numbers of cattle are raised. Manufactures are in a prosperous condition, and comprise linen, woollen, and cotton fabrics, and beet-root sugar. Capital, Ghent; other chief towns, Oudenarde, Termonde, Eecloo, Alost, and St. Nicholas.

FLANDERS, WEST, a province of Belgium, bounded N. W. by the German ocean, S. W. by France, and E. by the Belgian provinces of Hainault and East Flanders; area, 1,250 sq. m.; pop. in 1856, 624,912. Beside the Lys and the Scheldt,

by which it is watered on the S., it has only small streams emptying into the sea. Its surface is generally flat; and although most of its soil is sandy and poor, it has been, through untiring industry, so much improved that it yields abundant crops of wheat, oleaginous plants, flax, and tobacco. Cattle and horses are abundant. The manufacture of linen and damask is the principal branch of industry. Capital, Bruges; other chief towns, Ostend, Furnes, Ypres, Courtray, and Dixmude.

FLANNEL, the plainest fabric of woollen yarns, commonly slightly woven. It is well adapted for under clothing where the temperature is changeable, the material being a poor conductor of heat, and readily absorbing perspiration, which slowly evaporates from its surface without chilling the body. Flannels are also made of yarns into which cotton is introduced in various proportions; and again of a warp of cotton thread crossed by woof of woollen yarns. A most delicate flannel for the wear of infants consists of silk and wool. Cotton or Canton flannel is a twilled fabric, wholly composed of cotton, a nap being raised on one side of the stuff.

FLAT, in music, the character *b* used to denote that the note before which it is placed is to be depressed a chromatic semitone below its natural pitch. Thus *D b* signifies a semitone below *D* natural (*n*).

FLATBUSH, a post village and township of Kings co., N. Y., memorable for a British victory over the Americans in 1776; pop. in 1855, 8,280. It is the seat of an academy called Erasmus Hall, and contains several churches.

FLATHEAD INDIANS, a term applied to some of the aboriginal tribes inhabiting Oregon near the mouth of the Columbia river, and along the N. W. coast of America from Salmon river in lat. 53° 30' N. to Umqua river in 46° N.—the Nootka Columbians of Dr. Scouler. The name is derived from the practice of flattening the skulls of their infants by various mechanical contrivances; the model of the deformity is the same in all the tribes, and much like that observed in the ancient Peruvian crania. The forehead is depressed and indented; the upper and middle parts of the face are pushed back so that the orbits are directed a little upward; the head is so elongated that in extreme cases the top becomes nearly a horizontal plane; the parietals are bent so as to form an acute angle, and instead of the occiput constitute the posterior portion of the head; the breadth of the skull and face is much increased, and the two sides are in most cases unsymmetrical. The best known tribes which flatten the heads of their children are the Chinooks, Calapuyas, Clickitats, Clatsops, Cowalitsk, and Clatsani. Among the Chinooks the child is placed in a wooden cradle, and a pad of grass is tightly bandaged over the forehead and eyes, so that it is impossible for him to see or move; and when bandaged and suspended in the usual way, the head is actually lower than the feet.

A more cruel way is practised in other tribes by binding a flat board obliquely on the forehead. These processes continued for several months produce the coveted deformity, which, however, according to Dr. Pickering, disappears with age, so that most adults present no trace of it. This shape of the head is so highly prized among the Chinooks that their slaves are not allowed to practise artificial flattening. The internal capacity of the skull is not diminished by the flatness, and the intellect is not affected, as all travellers agree that these nations are remarkably shrewd and intelligent; it is said, however, that they are particularly subject to apoplexy. The Chinooks are the best known of the Flatheads; they inhabit the S. shore of the straits of Fuca, and the deeply indented territory as far as and including the tide waters of the Columbia river. They are commonly of diminutive stature, with ill-shaped limbs and unprepossessing features; the oblique eye and the arched nose are occasionally seen among them; their complexion is darker than that of the more northern tribes who do not flatten the head. They have the filthy habits and the usual vices of the N. W. Indians, but are said to be superior to the hunting tribes of America in the useful and ornamental arts; their climate is comparatively mild and moist from the prevalence of westerly winds, and they are a fishing and maritime people. They differ from the northern tribes in language as well as in physical characters; they speak in a quiet, deliberate manner, and their words can hardly be represented by any combinations of known letters. Dr. Pickering says they have no method of salutation or of expressing approbation. They are regarded as a dangerous race by travellers. Dr. Morton, in plates 42 to 50 of the *Crania Americana*, gives descriptive illustrations of several skulls of the Columbia river tribes. They are rapidly diminishing in numbers from diseases and vices introduced by the whites; there is probably not a tribe that can number 500 individuals, and many in Mr. Schoolcraft's tables are placed below 100; the whole Indian population of Oregon is not much above 20,000. The Flatheads S. of the Columbia river, or the Salish, are only about 300 souls; they are said to occupy 60 lodges on St. Mary's river, in Washington territory, E. of the Cascade mountains. The custom of flattening the head is very ancient, but the modern Indians, except those of the N. W. coast, do not generally practise it; it was a custom in Peru before the arrival of the Incas, and was practised also by the Inca Peruvians to a comparatively recent date. It seems to have been principally employed by the Toltecan branch of the American nations, including the semi-civilized race of Mexico, Peru, and Central America, and the ancient mound builders of the Ohio and Mississippi valleys; the Natchez tribe of Florida and the southern states, the Choctaws, and the Caribs (both insular and continental) flattened the skulls of their children by various devices either in a

vertical direction (as in the Natchez) or a longitudinal one (as in the ancient Peruvians). The flattened skull must be classed among the strange whims of nations, with the small feet of the Chinese, the perforated ears and lips of savages, and the tapering waists of Europeans.

FLAVEL, JOHN, an English clergyman and author, born in Broomsgrove, Worcestershire, about 1627, died in Exeter, June 26, 1691. He was educated at Oxford, and became a curate at Diptford, from which place he was called in 1656 to Dartmouth. He was one of the 2,000 clergymen who refused to subscribe to the "Act of Conformity," passed in 1662, and was therefore expelled from his benefice. He continued, however, to preach as opportunity offered, in private dwellings, obscure neighborhoods, or forests, till 1687, when the royal license being granted to worship without molestation, he resumed his public labors in a new church erected by his people. Most of his works, which are held in high esteem and have been many times reprinted, were composed during the period of his persecution. "Husbandry Spiritualized" is one of the most popular; among his other chief works are: "A Treatise of the Soul of Man," "The Fountain of Life," "The Method of Grace," "A Token for Mourners," &c. An edition in 6 vols. 8vo. appeared in London in 1820.

FLAX, the common name of the plant *linum usitatissimum*, and also of its most important product, the filaments obtained from the fibrous covering of its hollow stems, used from the remotest times in the manufacture of linen thread. The coverings of the Egyptian mummies testify that the linen mentioned by the most ancient writers was the product of the flax plant, still cultivated for its valuable fibre. This, however, is not the only useful product of the plant. Its seeds furnish the important oil called linseed oil; and of the residue, after this is expressed, is made the oil cake which is extensively used for feeding and fattening cattle. On account of its mucilaginous character, flax seed is also employed in medicine, its infusion in boiling water having a soothing effect in cases of inflammation of the lungs, intestines, &c.; and when ground to meal and mixed with hot water, it forms an excellent emollient poultice. The flax plant is a slender annual, growing from 2 to 3 feet in height, bearing small lanceolate leaves distributed alternately over the stalks. These terminate in delicate blue flowers, which are succeeded by globular seed vessels of the size of small peas, containing each 10 seeds. These are oval and flat, of brown color, and remarkably bright, smooth, and slippery. The outer portion or husk is mucilaginous, yielding 52.7 per cent. of a pure gum soluble in cold water; and the interior portion yields the peculiar oil already referred to. The plant, now cultivated in almost all parts of the world, is supposed by many to have been first known in Egypt, or possibly in the elevated plains of central Asia; but though no doubt a native of warm climates,

the fibre attains its greatest fineness and perfection in temperate regions. The seed, however, is richer in the tropics. Near the northern limits of its cultivation the product of the flax is abundant, but the quality is inferior. The flax of Holland and Belgium is rated as worth from \$750 to \$900 per ton, while that of Russia, whose export is from 40,000 to 50,000 tons annually, brings only about \$240 per ton. This difference is, however, to be attributed in part to the extreme care given by the Hollanders and Belgians to its preparation. The Irish, who have cultivated the crop from the early period when the plant was introduced into their country, and who would seem to possess as great natural advantages for its successful culture as any people, rarely furnish so valuable an article as the Belgians. The reason is thus given in a document published by the Belgian government in 1841: "The flax of Ireland, when first pulled, is as good as ours, but the Irish are negligent. Our flax is immediately put in water; theirs is left to get heated in the air, while they go away to drink and enjoy themselves. Our peasants are watchful, and take the flax at the end of 5 or 8 days, according to the condition they find it in; the Irish do it just when they please. Our flax, when covered with mud, is spread out carefully in a fine meadow, when the first shower cleanses it; in Ireland it is thrown down almost anywhere. The women with us often take the preparation of the flax upon themselves; but in Ireland the flax is prepared in mills." The product of Ireland is estimated at from 25,000 to 30,000 tons per annum; and with what is grown in Yorkshire, Somersetshire, and the south of Scotland, the whole produce of the British isles is rated at about 35,000 tons, while the consumption varies from 80,000 to 105,000 tons. The greater part of the importation is from Russia, and the countries bordering on the Baltic. About 5,000,000 lbs. are obtained from Belgium, which is about $\frac{1}{3}$ of its whole product, the total value of which is calculated at \$12,500,000. The rich soil of the valley of the Nile is well adapted for its cultivation, and the product of Egypt is increasing under the encouragement given by the English, who find it more economical to procure their supplies from foreign countries than from their own. Flax appears to have been cultivated in New Netherlands as early as 1626. The seed of flax was ordered to be introduced into the colony of Massachusetts in 1629, and flax was cultivated in that state soon after the war of independence, particularly at a distance from the coast. Manufactories for making sail cloth were established at Salem and Springfield in 1790. In Virginia flax was annually cultivated, spun, and woven by Capt. Matthews prior to 1648. Bounties for its production in that colony were offered in 1657. Flax was among the products for the encouragement of whose cultivation the British parliament made considerable grants to the patentees of Georgia in 1733, 1743, and 1749. Early attention was given to the cultivation and man-

ufacture of flax in Ohio, Kentucky, and Indiana. The amount of flax seed exported from Philadelphia increased from 70,000 bushels in 1752 to 110,412 in 1771. The production of flax in the United States according to the last census (1850) was 7,709,676 lbs., of which 2,100,116 lbs. were raised in Kentucky, 1,000,450 in Virginia, and 940,577 in New York; and of flax seed 562,307 bushels, of which 75,801 bushels were raised in Kentucky, 52,818 in Virginia, and 57,963 in New York. The amount of flax raised in the Union in 1853 was estimated at 8,000,000 lbs. The production has hitherto been entirely for home consumption, but efforts have lately been made to increase it. The imports of unmanufactured flax during the year ending June 30, 1858, were valued at \$197,934.—The flax crop thrives upon almost any good soil thoroughly pulverized and well drained, but more especially upon rich sandy loams regularly supplied with moisture during the spring months. In Ohio, 8 pecks of seed are sown to the acre, which yields from 6 to 12 bushels of seed and from 1 to 2 tons of straw, which is manufactured into tow for rope walks and paper mills. It may be sown very early in the spring, and to good advantage succeeding a crop of grain. As it is gathered in July or early in August, another crop may be obtained from the same land during the season. A common practice with the Belgians is to sow the white carrot broadcast with the flax, and when the latter is gathered, which is done by pulling the plants by the roots, the soil is loosened around the young carrots, and being then top-dressed with liquid manure, they thrive luxuriantly. Grass or clover seed is also often sown immediately upon the flax seed. The better soils take 8 bushels of seed to the acre, the poorer 2 bushels. The finest fibre is obtained by a thick growth of slender stalks. The Dutch take great pains to weed the crop by hand, when the plants are 2 or 3 inches high. In June the plants are in bloom, and the fields present a beautiful appearance, covered with the delicate blue flowers. The time for gathering is indicated by the leaves beginning to drop off, and by the bottom of the stalks becoming yellow; also by the condition of the seed bolls, which should be examined almost daily about the time of maturity of the crop. When the ripest on being cut open with a sharp knife do not appear within whitish and watery, but firm and dark green, the flax is fit for pulling. Soon after this the seeds would begin to fall, and the fibre would lose its silkiness and elasticity. But if it be desired to obtain seed for sowing, the plants must be allowed to fully ripen at the cost of the deterioration of the fibre. As the flax is pulled, it is gathered in bundles to dry; and then if the seeds are thoroughly ripened, they may be separated by the threshing mill. The ordinary course, however, is to strip the seeds by the process called rippling, which is drawing the stalks, a handful at a time, through a set of iron teeth standing in a row, $\frac{1}{2}$ inch apart at top and $\frac{1}{4}$ inch at bottom.

Four men with two rippling combs will separate the seeds, it is estimated, from more than an acre of flax in a day. The seed bolls should be well dried, and then stored away in bags in an airy place. At convenient times they are threshed and winnowed to separate the seed from the capsules, preparatory to obtaining by expression the oil and the oil cake. The culture of flax and its preparation for market involve more labor than almost any other crop. The seeds are preferred which are brought from Riga, and next to these the Dutch; the American produce a coarser stem. The soil should be thoroughly prepared by repeated harrowing after deep ploughing. The weeding requires peculiar care, that it may be sufficient without injury to the young plants. The soil should be kept rich by judicious manuring; for flax is commonly regarded as an exhausting crop. The plan of returning to the soil the water in which the stalks are steeped, by which it is estimated $\frac{1}{2}$ of the nutritious matter taken away are restored, is highly recommended. The pure fibre yields no ashes, so that it takes nothing from the soil, and the manure of the cattle fed upon the oil cake will restore much of the solid constituents of the seeds. Dr. Ure gives the following mixture of salts, "which it has been said will replace chemically the constituents of the plants produced from an acre of land, viz.: muriate of potash, 80 lbs.; common salt, 28; burned gypsum, powdered, 34; bone dust, 54; sulphate of magnesia, 56." The preparation of the flax for market finds occupation for the cultivators in the winter season; but this can be economically conducted only where many are engaged in the culture, and mills are provided with the requisite machinery. In the flax districts of Belgium it is stated there are no paupers, as the whole population find employment during the winter.—The first process in the preparation of the fibre is to steep the stalks in water, until fermentation takes place. This causes the glutinous matter, which binds the harl or the fibrous portion to the woody core, called the boon, to be decomposed, and the fibres are thus set free. The water most suitable for this purpose is soft river water. The flax is left more free from color by a stream of water flowing over the bundles than if these are steeped, as is often done, in a pool, the water of which is kept to be applied to the soil. This process is called water-retting or rotting. The result is sometimes obtained by exposing the flax on grass plots to the dew and rain, when the operation is called dew-retting. This requires much longer time, and also the control of extensive grass fields. It is an excellent method to combine the two processes, commencing with the water-retting, and when the boon is partially rotted and the gummy matter loosened, to complete the operation upon the grass; the risk of carrying the fermentation too far and injuring the fibre is thus avoided. When the steeping process alone is employed, the flax is removed from the water as soon as the harl

is found to separate by the fingers from the boon, and this breaks without bending. At this stage also several stalks knotted together sink in the water. The duration of the process is from 6 to 20 days. The riper the plant, the longer is the time required; hence the necessity of sorting the stalks into bundles of similar qualities. The bundles, being lifted out of the water by hand, are set on end to drain for 24 hours, and the stalks are then spread upon grass, and occasionally turned, to be softened and ripened by exposure for several days. When again gathered and made into sheaves, these may be kept for years in stacks, the quality of the fibre continuing to improve for some seasons. Though the fermenting process is not intended to pass to the putrefying stage, a disagreeable odor is given out from the flax, which even contaminates the air of the district, and the waters are so affected that the fish are poisoned. A more expeditious and agreeable process was therefore highly desirable, and such was devised by the late Mr. R. B. Schenck of New York, and successfully introduced into the flax districts of Ireland in 1847. This consisted in steeping the stalks in water heated by steam pipes to a temperature of about 90° F. The gummy matter is thus rapidly decomposed, so that in about 60 hours the operation is completed without the escape of any disagreeable odors. The mucilaginous water is then drawn off, and the flax is set to dry upon frames, the waste steam of the engine being used, if necessary, to heat the air for hastening the drying. By this process time is economized, a serious nuisance is abated, and the fibre of the flax is rather improved in strength and color, if care has been taken that the water be not over-heated or the operation too long continued. Other improvements have also been introduced, as that of Mr. Bower of Leeds, which consists in rolling the stalks after they have been steeped in cold or warm water, again steeping, and again rolling. The glutinous matter is thus more thoroughly removed. The addition of a pound of caustic ammonia or of common salt or Glauber salt to every 150 pounds of rain water is recommended; and the temperature being kept at from 90° to 120°, the operation may be completed in 80 hours. The most rapid process, however, is to steep the flax for a short time, and then exhaust the air from its fibres by the action of an air pump. Twice steeping and twice exhausting the air serve to remove the glutinous matter in a few hours. Attempts have been made to substitute for the retting mechanical methods of separating the fibre from the boon, but they have not been successful, owing to the inferior quality of the filaments thus prepared. The introduction of chemical matters to hasten the fermentation has been greatly objected to from their liability to weaken the fibres. The reducing of the fibre to the condition of cotton by the process of the chevaller Claussen has excited strong opposition on this account. He had observed that the flax caught in the branches overhang-

ing a stream in Brazil, which ran through his flax fields, was by repeated wetting and exposure converted into a substance exactly like cotton. He then contrived a way of attaining the same result by exposing the flax to the action of a weak alkaline solution, and afterward removing the alkali by boiling in water to which $\frac{1}{300}$ to $\frac{1}{200}$ of sulphuric acid is added. The straw is next steeped in a strong solution of bicarbonate of soda; and when the fibres are filled with this salt, it is transferred to a solution of sulphuric acid, weak like the former. Carbonic acid gas is generated throughout the substance, and this bursts and splits the fibre in a remarkable manner, giving it the appearance of cotton. Samples of various fabrics of this material, both alone and mixed with cotton, and others with wool, and also with silk, were placed by Clausen in the London exhibition, and attracted much attention. The same article, however, appears to have been made in England and Germany during the last century, and a factory was established near Vienna in 1780 for its manufacture. Berthollet, Gay-Lussac, and Giobert have experimentally investigated the subject, and Berthollet states that as fine cotton may be obtained from the commonest refuse tow as from the best flax. For some reason, however, possibly the expense of the process or the inferior quality of the fibre, the operation does not seem to have prospered. A favorable account of it is given in Tomlinson's "Cyclopædia of Useful Arts." Dr. Ure treats it as uncertain of success.—After the flax has been retted and dried, it is submitted to the process called breaking, by which the straws are cracked repeatedly across, the effect of which is to produce the separation of the brittle woody portion, which falls away in pieces from the filaments, as these are afterward beaten by a broad flat blade of wood in the operation called scutching. A variety of machines are used for cracking the boon. The most simple of them is made with a large wooden blade worked by a handle at one end, and fastened by a pivot at the other into a block with a cleft into which it fits; across this block the flax is laid, a handful together, broken by the blade, and moved along, as straw or hay is chopped in a common cutter. Other brakes are worked by the foot—a grooved block being brought down by each impulse upon the flax, which is held across a fixed block with corresponding grooves; a rude spring jerks the movable block up again as the foot releases it. In the winnowing or scutching the Germans make much use of a thin sabre-shaped wooden knife, with which they strike the flax as a handful of it is held in a horizontal groove in an upright board. The coarse tow and woody particles are thus removed, those which adhere most firmly being scraped or rubbed off by laying the flax upon the leather worn for this purpose upon the leg of the operator. It is estimated that 100 lbs. of dried retted flax should yield 45 to 48 lbs. of broken flax; and from this when the boon waste is further removed by scutching

about 24 lbs. of flax are obtained and 9 or 10 lbs. of tow. The breaking of 100 lbs. of straw by the machine described requires the labor of 17 to 18 hours; and the cleaning of 100 lbs. of broken flax by the swinging knife requires about 130 hours. Flax is broken also upon a larger scale by machines consisting of fluted rollers, variously contrived; and other labor-saving machines with rotating blades have been applied to the process of scutching. The next process is hatchelling or carding. As performed by hand, a wisp of flax, held in the middle and well spread out, is thrown so as to draw one end of it over a set of sharp steel teeth which are set upright and serve the purpose of a comb. One end of the bundle being hatchelled, it is turned round, and the other is treated in the same way; and the process is repeated on finer hatchels. By this means about 50 per cent. of tow and dust and woody particles are separated from the long fibre, now called line. This is fit for spinning into linen threads, and the tow may be used for the same purpose for coarser fabrics. Machine hatchelling, however, has for the most part taken the place of hand labor, and is conducted upon a large scale and with many modifications in the extensive linen mills. The flax, being cut in lengths of 10 or 12 inches, is arranged in flat layers called stricks, the fibres parallel and ending together. Each of these is held by two strips of wood clamped together across its middle, or sometimes across one end. They are placed around a revolving drum, within which another drum armed with teeth rapidly revolves in a contrary direction, and combs the flax as the ends fall among the teeth. When hatchelled on one side, the strick is turned over and the process is repeated on the other. The outer drum revolves slowly, and discharges the stricks when they have been carried over the top of the inner drum, beyond the point where the fibres could no longer fall among the teeth. Much ingenuity is displayed in the modifications of this machinery, and also of a preparatory machine for dividing the fibres into equal lengths and sorting the lower ends, the middles, and the upper ends, each by themselves. The stricks when hatchelled are sorted according to the fineness of the fibres, those made up of the lower ends being the coarsest; the divisions, however, are much more minute than those of each fibre into 3 lengths. In making this separation the line sorter, as the operator is called, is guided entirely by the sense of feeling, this indicating the quality of the fibres more delicately than the sight. The next operation preparatory to spinning is to lay the fibres upon a feeding cloth, each successive wisp overlapping half way the one preceding it. The feeding cloth conveys them to rollers between which they are flattened and held back as a second pair more rapidly revolving seizes the part in advance and draws out the flax. A tape or ribbon of flax is thus formed, which is discharged into a tin cylinder, a row of which stands upon the floor in front of

the machines. The tapes or slivers are afterward joined several together, and at the roving frame are slightly twisted, when they are wound upon bobbins, which is the last process before spinning. (See LINEN.)—The principal treatise upon this subject is the prize essay of James MacAdam, jr., secretary to the society for the promotion and improvement of the growth of flax in Ireland. The prize was awarded to it by the royal agricultural society of England, and the essay was published in vol. viii. of their "Journal." It has furnished a great part of the data of many of the valuable papers published in the English scientific dictionaries already referred to.

FLAXMAN, JOHN, an English sculptor, born in York, July 6, 1755, died in London, Dec. 7, 1826. In the workshop of his father, a moulder of figures, who had established himself in London, he acquired his first ideas of form. Being a boy of delicate health, he was allowed to follow his own tastes, and showing a strong inclination for modelling, he was placed at the royal academy. After many years of severe study, during which he supported himself by designing for the Wedgwoods and others, and produced some meritorious works, including a monument to the poet Collins, he went in 1787 to Rome. He had previously read the Greek poets in the original, and soon testified his sense of their beauty and of the purity of antique art by his two series of outline illustrations of Homer and Æschylus, by which he is perhaps more widely known than by any of his other works. A series of illustrations of Dante, almost equally celebrated, was subsequently executed for Mr. Thomas Hope. After 7 years' sojourn in Rome he returned to England, and commenced a series of scriptural compositions, remarkable for religious fervor and pathos. Of the numerous statues which he executed, those of Nelson, Howe, Sir Joshua Reynolds, Mansfield, and Kemble are the best known. His "Shield of Achilles" is one of the finest achievements of modern art. Flaxman was a member of the royal academy, in which he also filled the chair of professor of sculpture, to which he was appointed in 1810.

FLEA. See EPIZOA.

FLECHIER, ESPRIT, a French pulpit orator and prelate, who was called the Isocrates of France, born in Pernes, June 10, 1632, died in Montpellier, Feb. 16, 1710. Of a poor family, he was educated at Avignon, in the college of the "Fathers of the Christian Doctrine," of which his maternal uncle was superior. He gave special attention to the culture of eloquence, was noted for the elegance of his language, taught rhetoric for a time at Narbonne, and in 1661 repaired to Paris, where without fortune or friends he became catechist in a parish. A Latin poem which he wrote describing the famous tournament celebrated by Louis XIV. in 1662 was much admired, and he soon after became preceptor in the house of Caumartin, a councillor of state, made distinguished friends by his grace-

ful language and polished manners, and was admitted into the society of the hotel de Rambouillet. Devoting himself to preaching, many of his sermons were highly esteemed, but his funeral oration on the duchess of Montausier in 1672 was his first great triumph. His funeral oration on Turenne, delivered in Paris in 1676, was a masterpiece of art, and placed him, in the opinion of many of his contemporaries, by the side even of Bossuet. Among his other funeral orations, those on the first president Lamoignon, on Queen Maria Theresa, and on the chancellor Le Tellier, were most admired. From the time when he was recognized as an honor to the church and to letters he was rewarded by Louis XIV., first with the abbey of Saint Severin, then with the position of reader to the dauphin, with the bishopric of Lavaur in 1685, and with that of Nîmes in 1687. He had been admitted into the French academy in 1673 at the same time with Racine. The edict of Nantes having been revoked just before the appointment of Fléchier to his last diocese, which contained numerous Protestants, he found great difficulty in the ecclesiastical government of it. His conduct, however, made him equally dear to the Catholics and Protestants of the province, who united in mourning his death. Beside his funeral orations, he left *Panegyriques des saints*, in 3 volumes; *Vie de Théodose le Grand*, composed for the education of the dauphin; and *L'histoire du cardinal Ximènes*, in which the minister and politician are forgotten in the portrait of the saint. The charity and amiability of Fléchier appear especially in his letters, which are composed with the same care as his other productions.

FLECKNOE, RICHARD, a British poet, contemporary with Dryden, died about 1678. Little is known of his life, and he is remembered only because his name furnished Dryden the title of his satirical poem against Shadwell, "MacFlecknoe." He is believed to have been an Irish Catholic priest, and wrote several comic plays, among which are "Damoiselles à la Mode," "Love's Dominion," and "Ermina, or the Chaste Lady." He wrote also a volume of "Epigrams and Enigmatic Characters." His poems are of little value, though some of them have been praised by Southey.

FLEETWOOD, CHARLES, an English republican, son of Sir William Fleetwood, died in 1692. At the commencement of the civil war he enlisted as a trooper in the parliamentary army, and in 1645 rose to the rank of colonel, and was appointed governor of Bristol. In the same year he was returned to parliament for Buckinghamshire, and in 1647 he was named one of the commissioners to treat with the king. After the establishment of the commonwealth he was appointed lieutenant-general, distinguished himself at the battle of Worcester, and, in consequence of his great influence with the army, after the death of his first wife, Cromwell gave him his eldest daughter, the widow of Ireton, in marriage. In 1652

he was appointed commander-in-chief of the forces in Ireland, and afterward lord deputy; but his opposition to the ambitious projects of his father-in-law soon caused him to be recalled to England. He was however subsequently appointed one of the major-generals to whom the internal government of the country was committed during the latter days of the protectorate. On the death of the protector he endeavored by his influence with the troops to supplant Richard Cromwell, but in the midst of his intrigues the Stuarts were restored, and he narrowly escaped being executed as a rebel. He retired to Stoke-Newington, and passed the rest of his life in obscurity. He is described as a man of slender capacity, cunning, timid, and irresolute, with but little military skill.

FLEMING, a N. E. co. of Ky., bounded S. W. by Licking river, and intersected by the Lexington and Maysville railroad; area estimated at 500 sq. m.; pop. in 1850, 13,916, of whom 2,139 were slaves. It has a diversified surface, the E. part being hilly and the W. undulating. The soil is generally good, and suitable for grain and hemp. In 1850 the county produced 926,708 bushels of Indian corn, 105,854 of oats, 52,283 of wheat, and 4,500 lbs. of wool. There were 33 churches, and 1,063 pupils attending public schools. Near Licking river is found a remarkable deposit of iron fulgurites, the oxide being formed into regular tubes of various diameters, from that of a pistol barrel to several inches. The county was organized in 1798, and named in honor of Col. John Fleming, one of the pioneer settlers of the state. Capital, Flemingsburg.

FLEMING, JOHN, a Scottish naturalist, born at Kirkroads, near Bathgate, Linlithgowshire, in 1785, died in Edinburgh, Nov. 18, 1857. Although possessing in his youth an unusual taste for the natural sciences, he yielded to the desire of his mother that he should look to the ministry as a profession, and about 1807 was licensed as a preacher in connection with the church of Scotland. He did not, however, neglect the interests of science, and in 1808, while engaged in a survey of the economical mineralogy of the western isles, so won the regards of the members of the presbytery of Lerwick that he received the offer of the living of Bressay in Shetland, over which congregation he was ordained in the same year. About the same time appeared his "Economical Mineralogy of the Orkney and Zetland Islands," considered in many respects a remarkable performance for a young man of 23; and thenceforth for nearly 30 years his attention was pretty equally divided between the duties appertaining to his office and his scientific pursuits. In 1810 he exchanged the remote living of Bressay for that of Flisk, in Fifeshire, contiguous to which was the parish of Kilmany, over which Dr. Chalmers was settled, between whom and himself a lasting friendship was soon established. His contributions to public journals and to learned societies now became frequent, and before he had attain-

ed the age of 30 his reputation as a zoologist was second to that of no other naturalist in Scotland. In 1822, having previously furnished the article "Ichthyology" for the "Encyclopædia Britannica," and those on "Helminthology" and "Insecta" for the "Edinburgh Encyclopædia," beside numerous papers for the "Proceedings" of the Wernerian society and the royal society of Edinburgh, and the "Edinburgh Philosophical Journal," he published his first important work, the "Philosophy of Zoology" (2 vols., Edinburgh), in which were embodied the matured thoughts of many years. In the 2d volume he enunciated a system of classification at variance with those of Linnæus and Cuvier, and known as the binary or dichotomous system, the leading feature of which consists in arranging animals according to their positive and negative characters. The publication of his "History of British Animals" (Edinburgh, 1828), in which the first decided attempt was made by a British naturalist to exhibit the palæontological history of animals, by the side of those belonging to our epoch, added to his scientific fame. The subject had occupied the author's attention since boyhood, and the scientific value of his work is exemplified by the frequent references to it in treatises in various departments of zoology and palæontology. The great principle laid down by him, and one from which he never receded, is that the revolutions which have taken place in the animal kingdom have been produced by the changes which accompanied the successive depositions of the strata. Although a rearrangement of some portions of the work is necessary in order to bring it up to the present scientific point of view, the late Prof. Forbes of Edinburgh asserted so recently as 1848 that it had been "his text book and constant companion, and upon it all his knowledge of British animals had been based." In 1832 he was presented to the parish of Clackmannan, but had scarcely entered upon his new sphere of labor when he received an offer to fill the chair of natural philosophy at King's college, Aberdeen, which he accepted, notwithstanding the male communicants of his parish to the number of 418 united in urging him to remain with them. He discharged the duties of this office with much acceptance until 1843, when, having identified himself with the Free church, he found himself obliged to retire from his professorship. Two years later he was asked to take the chair of natural science in the New (Free church) college, Edinburgh, with which he remained connected until his death. In addition to the works enumerated, Dr. Fleming published "Molluscan Animals, including Shell Fish" (Edinburgh, 1837), "The Temperature of the Seasons" (1851), "The Lithology of Edinburgh" (1858), and considerably more than a hundred papers, principally on zoology, palæontology, and geology, nearly every one of which contains a record of some original observation, his aim through life having been to interpret nature strictly and to avoid hypotheses. His

contemporaries, the most eminent of whom consulted him in various branches of zoology and geology, bear testimony to the comprehensiveness and precision of his information. Prof. Agassiz says "that he should have been abundantly recompensed for his visit to England had he gained no more by it than what he saw and learned during his few hours' visit to Dr. Fleming."

FLEMISH LANGUAGE AND LITERATURE.

The *Vlamsch* or *Duytsch*, one of the many Teutonic dialects, is the vernacular of the Vlamingen (about 2,200,000) in the Belgian provinces of E. and W. Flanders, Antwerp, and Limburg, in North Brabant, Holland, as well as in some parts of the French department of Nord, and also scattered in the Wallonic (Gallo-Romanic) provinces of Belgium; French also being spoken in the large cities and used in official documents. It is akin to the Frisian and to the Hollandish or Dutch, which is its younger branch. Goropius Becanus (1569) said that Adam spoke Flemish in paradise. It is more palatal and nasal than the language of Holland, which is more guttural; but the differences are not essential. The first monument of Flemish literature is an ordinance of the dukes Henry I. and II. of Brabant (1229). The *Rymbybel* (Bible in rhymes) and the *Spiegel historicael* (Historic Mirror) of Jacob van Maerlant (born in 1235), the civic laws of Antwerp (1300), the chronicle of J. van Clere and many others, a translation of Boethius by Jacob Velt of Bruges of the 15th century, and the "Hive of the Catholic Church" by Philip van Marnix (1569), are the most remarkable among the earlier Flemish works. Many French forms of speech were introduced during the Burgundian reign, and also many Hollandish during the sway of the Hapsburgs. Since the independence of Belgium (1830) great efforts have been made to promote Flemish literature. Among the most prominent writers are: Van Ryswyck, Ledeganck, Rense, Van Duyse, F. Blicck, Serrure, the abbé David, Bormans, Snellaert, Lebrocquy, and Conscience.—See Vandenbossche, *Nouvelle grammaire raisonnée pour apprendre le flamand et le hollandais* (Lille, 1825); J. Desroches, *Grammaire flamande* (Antwerp, 1826); the grammars of Van Beers and Van Heremans; Noel de Berlemont, *Vocabulaire françois et flameng* (Antwerp, 1511); Plautin, *Thesaurus Teutonicæ Linguae*, perfected by O. Kilian (Antwerp, 1573); Corlewa, *Trésor de la langue flamande* (Amsterdam, 1741); Halma, *Grand dictionnaire françois et flamand* (Leyden, 1778); Desroches, *Nouveau dictionnaire françois-flamand et flamand-françois* (Ghent, 1805); Olinger, *Nouveau dictionnaire françois-flamand* (Malines, 1834). Slecx on the "History and Relations of the Flemish to other Languages" may also be consulted.

FLENSBORG, or FLENSBURG (Lat. *Flenopolis*), a seaport and market town of Denmark, in the duchy of Schleswig, at the head of Flensborg fiord (an inlet of the Baltic, 20 m. long, from 2 to 10 m. broad, and from 5 to 12 fathoms

deep), 20 m. N. N. W. of Schleswig; lat 54° 46' N., long. 9° 26' E.; pop. 16,500. After Copenhagen, it is the chief commercial mart of the Danish dominions. It manufactures sugar, tobacco, paper, soap, and iron, has breweries and distilleries, and builds ships for the West India trade. A railway connects it with Tønning, and another with Altona, Rendsborg, and Schleswig. The harbor is deep enough for large craft, but is difficult of entrance. Between 200 and 800 vessels, many of which are employed in the Greenland whale fishery, are owned here. Flensborg was a wealthy town as early as the 12th century, but it afterward suffered much from wars and conflagrations. In 1848 it was occupied by the Germans, in 1849 by the Swedes, and restored to Denmark in 1850.

FLETOHER, ANDREW (commonly called Fletcher of Saltoun), a Scottish statesman and author, born in Saltoun, East Lothian, in 1658, died in London in 1716. He was educated under the care of Gilbert Burnet, then minister of the parish of Saltoun, and spent several years in travels on the continent. In 1681 he obtained a seat in the Scottish parliament for his native county, and distinguished himself by his inflexible opposition to the tyrannical tendencies of the English government. He soon found it necessary to withdraw to Holland, was then summoned before the privy council at Edinburgh, and failing to appear, was outlawed, and his estate confiscated. He accompanied the unfortunate expedition of the duke of Monmouth to England in 1685, but went immediately abroad again in consequence of shooting the mayor of Lyme-Regis in a scuffle. In Spain he was imprisoned, but escaped by the aid of an unknown friend, and in Hungary he gained distinction as a volunteer in the army against the Turks. At the Hague he was prominent in forwarding the scheme of the revolution of 1688, which restored him to his country. He soon recovered his estate and resumed his seat in the Scottish parliament, but became as vehement an opponent of the government of William as he had been of that of his two predecessors. He exerted himself to the last against the union of the two kingdoms, and because the 12 "limitations" which he proposed failed to be adopted, he retired from public life. Though the most honest, fearless, and uncompromising republican of his time, he yet, says Macaulay, hated both democracy and monarchy. Proud of his descent from an ancient Norman house, his favorite project was to make Scotland an oligarchical republic, in which the king was to be a mere pageant, and the lowest class of the people bondsmen. He possessed fine scholarly accomplishments, and his writings sometimes display a high degree of literary excellence. The principal of them are: a "Discourse of Government with Relation to Militias" (Edinburgh, 1698); two "Discourses Concerning the Affairs of Scotland" (Edinburgh, 1698); *Discorso delle cose di Spagna* (Naples, 1698); "Speeches," &c. (Edinburgh, 1708); and an "Account of a Conversation

concerning a Right Regulation of Governments for the Common Good of Mankind" (Edinburgh, 1704). His collected writings were published at London in 1 vol. 8vo. in 1737, and an essay on his life and writings, by the earl of Buchan, in 1797.

FLETCHER, GILES, an English poet, cousin of Fletcher the dramatist, born about 1580, died in Alderton, Suffolkshire, in 1623. He was educated at Trinity college, Cambridge, and became rector of Alderton, where his life passed with little variety of incident. The single poem which he left, entitled "Christ's Victory and Triumph" (Cambridge, 1610), possesses peculiar and original beauties, with many of Spenser's characteristics.—PHINEAS, brother of the preceding, a poet and clergyman, born about 1584, died in Hilgay, Norfolk, in 1650. After being educated at Eton and Cambridge, he was presented in 1621 to the living of Hilgay, which he retained till his death. He wrote "Piscatory Eclogues," and a drama called "Sicelides," but his chief work is a poem entitled the "Purple Island," an anatomical and allegorical description of the human body and mind. Both of these brothers were disciples of Spenser, and influenced the style of Milton. "They were endowed," says Hallam, "with minds eminently poetical, and not inferior in imagination to any of their contemporaries. But an injudicious taste, and an excessive fondness for a style which the public was rapidly abandoning, that of allegorical personification, prevented their powers from being effectively displayed."

FLETCHER, JOHN, an English dramatic poet, the associate of Francis Beaumont in authorship, born in 1576, died by the plague in 1625. His father, Dr. Richard Fletcher, was successively bishop of Bristol, Worcester, and London. He was educated at Cambridge, and may have first met Beaumont, who was 10 years his junior and whom he survived about 10 years, at the famous Mermaid club, the members of which "used to leave an air behind them sufficient to make the two next companies witty." Their connection was singularly close, and they are said to have lived in the same house and to have had many of their possessions in common. Of the 32 plays published under their joint names, it is probable that Beaumont shared in the writing of only 17; but those which are assigned wholly to Fletcher are fully equal to their common productions. It has however been generally believed that Beaumont furnished the plots, and by his graver judgment and more correct taste controlled the exuberant vivacity and wit of Fletcher, who after the former's death is said to have consulted Shirley on those points. Their plays, though praised for their chasteness by contemporary critics, frequently contain, in the midst of passages of great beauty, others of a coarseness and obscenity highly offensive to modern taste. Dryden was of opinion that they understood and imitated the conversation of gentlemen much better than Shakespeare. The last

and one of the best of Fletcher's plays, the "Two Noble Kinsmen," which according to the title page of the earliest edition (1634) was "written by the memorable worthies of their times, Mr. John Fletcher and Mr. William Shakespeare," has long exercised the ingenuity of critics, and it is not agreed that Shakespeare had any share in it, though Dyce ascribes to him the whole of the 1st and parts of the 3d and 5th acts. The first complete collection of Beaumont and Fletcher's works appeared in 1679. An edition by Weber was published in 1812 (14 vols. 8vo., London), and one by Dyce in 1843 (11 vols. 8vo.). An edition was published in Boston in 1854 (2 vols. royal 8vo.). A judicious selection, by Leigh Hunt, forms a volume of Bohn's "Standard Library."

FLETCHER, JOHN WILLIAM, an English clergyman and author, born in Nyon, Switzerland, Sept. 12, 1729, died in Madeley, England, Aug. 14, 1785. His original name was De la Flechère, which was Anglicized to Fletcher. He studied at the university of Geneva, and afterward, contrary to the wishes of his parents, who designed him for the ministry, went to Lisbon, and entered the Portuguese army. But a few days before embarking for a distant post whither he had been detailed, he was disabled by an accident, and the ship sailed without him. The vessel was never heard of afterward, and was supposed to have perished at sea. Fletcher returned to Geneva, accepted a commission in the Dutch army, and immediately set out for Flanders; but before reaching this post the war was closed by the peace of Aix la Chapelle. He then directed his steps to England, where he commenced the study of the English language, and was soon able to speak and write it with remarkable purity. In 1757 he was inducted into the ministry, being ordained deacon, and soon after a presbyter of the church of England by the bishop of Bangor, in the chapel royal at St. James's. His first religious exercise after ordination was to assist Wesley in administering the sacrament at West street chapel. Having been for several years a tutor in the family of Mr. Hill of Shropshire, he was, as a testimony of respect, presented by that gentleman with the living of Madeley. He had offered him the living of Dunham, a parish in which, according to Mr. Hill's statement, the "duty was light and the income good;" but he declined to accept it, remarking that "it would not suit him, as there was too much money and too little labor." In his obscure parish Fletcher labored with untiring zeal and devotion; but his labors were attended with the greatest discouragement, for never, perhaps, had pastor a more dissolute and intractable flock. He frequently corresponded with John and Charles Wesley, and also with Whitefield, from whom he received greater sympathy than from any clergymen of the establishment. In 1770 he visited Italy, and on his return he preached at the place of his birth to vast crowds. In 1768 he was chosen by Lady Huntingdon president of

a theological institution which she had founded at Treveca in Wales. His connection with this institution involved him in a defence of Arminianism, which resulted in an elaborate work on the subject. All the time he was connected with this school of theology he sustained his pastoral relation to Madeley, and hence he was enabled to serve the former gratuitously. He visited Italy again for the benefit of his health, and before returning to England spent 3 years in Switzerland. An edition of his works, in 8 vols. 12mo., appeared in London in 1803. His writings have been often reprinted.

FLEURUS, a town of Belgium, near the left bank of the Sambre, 7 m. N. E. of Charleroi; pop. 8,297. It has been the scene of 4 great battles; the first took place Aug. 30, 1622, between the Spaniards under Gonzales of Cordova and the army of the Protestant union, under Mansfield, the victory being claimed by both; the 2d, July 1, 1690, between the French under Marshal Luxembourg, and the Germans under the prince of Waldeck, the latter being defeated; the 3d was fought June 26, 1794, when the republican French general Jourdan defeated the imperialists under the prince of Coburg; and the 4th, generally known as the battle of Ligny, in which Blücher was worsted by Napoleon, occurred June 16, 1815, 2 days before the battle of Waterloo.

FLEURY, ANDRÉ HERCULE, cardinal de, a French prelate and statesman, born in Lodève, June 22, 1653, died in Paris, Jan. 29, 1743. He was educated at a Jesuit college in Paris, and by the aid of influential friends secured the appointment of almoner to the queen Marie Thérèse, then to Louis XIV., who unwillingly promoted him to the bishopric of Fréjus in 1698, at the request of the archbishop of Paris. On the king's death the regent appointed him preceptor to Louis XV., then about 5 years of age. On the death of the regent in 1723 he advised the young king to take the duke of Bourbon as first minister, reserving for himself a seat in the privy council, and the dispensation of ecclesiastical preferments. In 1726 he caused the duke of Bourbon to be dismissed, and, notwithstanding he was himself in his 73d year, assumed supreme power, with the title of minister of state, and superintendent of the general post office. In the same year the pope made him a cardinal. Under his administration France was generally at peace, the disorders of the past reign disappeared, reforms were made in the government, arts and sciences were fostered, and the country enjoyed comparative prosperity at home. But abroad she lost the high place she had held in the councils of Europe, her army degenerated, her navy decayed, and toward the close of his life the cardinal had the chagrin of hearing himself charged with involving France in the war of the Austrian succession, which had been begun against his wishes, and up to the time of his death had been little more than a series of disasters for his country. He sought to introduce into the public adminis-

tration the same frugality which he practised in his own household; and with all his opportunities for self-emolument, he died poor. In a less exalted station Cardinal Fleury would have left a greater name. He loved peace more than power, and, without the broad views and active spirit of a great statesman, looked with an uneasiness akin to apprehension upon those bolder characters who might have supplied his own deficiencies.

FLEURY, CLAUDE, abbé, a French ecclesiastical writer, born in Paris, Dec. 6, 1640, died July 14, 1723. He was at first an attorney, and for 9 years followed the legal profession, giving meanwhile great attention to literary and historical pursuits. His acquaintance with Bossuet, Bourdaloue, and several other clergymen of high character, probably turned his mind toward the church. In 1672, having received orders, he became, on the recommendation of Bossuet, preceptor to the sons of the prince de Conti. In 1674 he published *L'histoire du droit Français*; in 1677, *L'institution au droit ecclésiastique*; in 1678, a Latin translation of Bossuet's *Exposition de la foi Catholique*; and from 1681 to 1683, *Les mœurs des Israélites, les mœurs des Chrétiens*, and *Le grand catéchisme historique*, 3 excellent little books which he had carefully prepared for the use of his pupils. In 1685 he accompanied Fénelon in his mission to Saintonge, and evinced here true Christian charity. In 1689 Fénelon procured his appointment as his assistant in the education of the dauphin's son, which task he fulfilled with the utmost zeal and devotion. In this employment he remained 16 years, during which he was also engaged in preparing his great *Histoire ecclésiastique*, the first volume of which appeared in 1691. He spent no less than 30 years in bringing this work down to the beginning of the 16th century. In 1684 Fleury received the abbacy of Loc-Dieu, which in 1706 he resigned on receiving a priory at Argenteuil. In 1696 he was elected to the French academy to succeed La Bruyère. He always lived with evangelical simplicity. He was a fluent writer and a faithful historian. His *Histoire ecclésiastique* ranks among the best and most candid histories of Christianity.

FLINDERS, MATTHEW, an English navigator, born in Donington, Lincolnshire, in 1760, died in July, 1814. In 1795 he was midshipman on board the vessel which conveyed Capt. Hunter, the governor of Botany Bay, to Australia. Soon after arriving in Port Jackson he embarked with the surgeon of the ship, George A. Bass, in a small boat, not more than 8 feet long, in which they explored the estuary of George's river. The discoveries made by them on this occasion determined them to explore the whole Australian coast. They embarked in a large decked boat with only 6 men, and sailing S. through a passage afterward named Bass's straits, first discovered that Van Diemen's Land was a separate island. In July, 1801, Flinders, now a captain, again sailed from England, sur-

voyed the whole Australian coast as far as the eastern extremity of Bass's straits, then proceeded to Port Jackson, where he refitted, and in the summer of 1802, steering N., explored Northumberland and Cumberland islands, and surveyed the Great Barrier reef of coral rocks. While attempting to make his way back to England he was seized by the governor of the Isle of France, in spite of a French passport, and detained a prisoner for 6 years; after which his health was so impaired, and his spirit so broken, that he expired in London on the day when the narrative of his discoveries and adventures was published ("Voyage to Terra Australis, &c., in the years 1801, '2, and '3," 2 vols. 4to., London, 1814).

FLINT, a variety of the mineral species quartz, of dull colors, frequently black, of conchoidal fracture, easily broken into splintery fragments, which from the sharpness and hardness of their edges are well adapted for striking fire with steel. Beside silica, flint contains about one per cent. of water, and one per cent. divided among lime, oxide of iron, and alumina. Berzelius also detected potash in its composition. Its hardness slightly exceeds that of pure quartz. It is remarkable for the facility with which, when freshly quarried, it is broken by the hammer in any direction. By this property the thin gun flints are fashioned with great rapidity, the workmen breaking up the rough nodules as they are extracted from their repositories in the chalk beds, and chipping off with a pointed hammer from the rough lumps scales which, being skilfully applied upon the edge of a chisel set upright in a block of wood and struck, are converted with wonderful precision into their peculiar form. After the flints have been long quarried, their facility of being thus accurately worked is lost. So great skill was attained in the manufacture of gun flints before the introduction of percussion caps, that a workman could with his hammer and chisel produce 1,000 well formed flints in 3 days. But the flint must be of good quality, of uniform grain and color, and so translucent that letters may be read through a slice $\frac{1}{8}$ of an inch thick. The colors preferred are from a honey yellow to blackish brown. Flint is found so abundantly in the chalk formation in England, that it has been applied to purposes which are served here by better materials. It was formerly thought an essential article in the production of flint glass, but is now superseded by pure granular quartz or sand. It still continues to be used in the manufacture of porcelain; and the rough nodules are found to be well adapted for the construction of substantial walls of masonry, as may be seen in the counties of Kent, Suffolk, and Norfolk, England. These nodules constitute a peculiar feature in the chalk cliffs of the coast of England. They occur in horizontal layers scattered through the upper portion of the chalk formation, and in a few instances, as noticed by Lyell, have been seen in vertical rows like pillars, at irregular distances from

each other, the nodules not being in contact either in the horizontal or vertical arrangement. They commonly contain a nucleus of parts of marine fossils, such as are abundant in the chalk, as shells, sponges, echini, &c.; and they also present the forms of hollow geodes, their cavities lined with quartz crystals, iron pyrites, carbonate of iron, chalcedony, &c.—Flint is a common mineral production in the United States, but it is converted to no use. It abounds in the tertiary formations of the southern states, and is met with in the older rocks, even to the metamorphic quartz associated with the lowest stratified rocks. Upon the Lehigh mountain in Pennsylvania, at Leiber's Gap, is exposed in loose fragments in the soil a vast amount of flint rock, associated with cherty quartz incrustated with chalcedony and mammillary and botryoidal crystallizations. In the woods west of the road some 20 acres of surface have in ancient times been dug over by the Indians, their object being to obtain the flint for arrow and spear heads. Piles of broken flint still lie uncovered by the sides of the excavations, which remain unfilled. The stone was evidently highly prized by them, and they certainly possessed great skill in fashioning it into the forms they required.

FLINT, a village and township on Flint river, and the capital of Genesee co., Mich.; pop. in 1853, about 2,000. It is surrounded by a fertile country, possesses abundance of water power, and has an active trade. It is the seat of the Michigan asylum for the deaf, dumb, and blind, and contains a U. S. land office and 2 newspaper establishments.

FLINT, TIMOTHY, an American clergyman and author, born in North Reading, Mass., in July, 1780, died in Salem, Aug. 16, 1840. He was graduated at Harvard college in 1800, and having entered the ministry of the Congregational church, was settled at Lunenburg, Mass., in 1802. He was a diligent student of the natural sciences, and his chemical experiments led some ignorant persons to charge him with counterfeiting coin. He prosecuted them for slander; an ill feeling increased by political differences sprang up between him and his parishioners, and he consequently resigned his charge in 1814. He then preached in various parts of New England, and in Sept. 1815, set out for the West as a missionary. He passed 7 or 8 years in this capacity in the Ohio and Mississippi valleys, but losing his health tried to unite the avocations of farmer and schoolteacher, at first near New Orleans and afterward on Red river. In 1825 he returned to Massachusetts, broken in health and fortune; but the change of climate soon restored the former, and he turned to literary pursuits to repair the latter. His first work was "Recollections of Ten Years passed in the Valley of the Mississippi" (8vo., Boston, 1826), which was favorably received in America and England, reprinted in London, and translated into French. In the same year he brought out a novel, "Francis Berrian, or the Mexican Patriot." His next

publication was a "Condensed Geography and History of the Western States in the Mississippi Valley" (2 vols. 8vo., Cincinnati, 1828), forming, with the "Recollections," one of the best accounts of that region ever written. In 1828 he removed to Cincinnati, where he edited for 8 years the "Western Review." In 1833 he went to New York and conducted a few numbers of the "Knickerbocker Magazine." He afterward took up his residence in Alexandria, Va., spending most of his summers in New England. His writings are spirited and powerful, but somewhat wanting in polish. His principal works, beside those mentioned above, are: "Arthur Clenning," a novel (2 vols. 12mo., Philadelphia, 1828); "George Mason, or the Backwoodsman;" "Shoshonee Valley" (2 vols. 12mo., Cincinnati, 1830); a translation of Droz, *Essai sur l'art d'être heureux* (Boston, 1832); "Indian Wars in the West" (12mo., 1833); "Lectures on Natural History, Geology, Chemistry, and the Arts" (12mo., Boston, 1833); "Memoir of Daniel Boone" (18mo., Cincinnati, 1834). He also contributed to the London "Athenæum" in 1835 a series of papers on American literature.

FLINT RIVER (Indian name, *Thronateeska*), a river of Georgia, rising in the W. part of the state, near Fayetteville, flowing S., and uniting with the Chattahoochee at the S. W. extremity of the state, to form the Appalachicola. It is about 300 m. long, and is navigable as far as Albany, a distance of 250 m. from the gulf of Mexico. Principal towns on its banks, Lanier, Oglethorpe, and Albany.

FLINTSHIRE, a N. E. co. of Wales, consisting of 2 separate portions, lying at a distance of 8 miles from each other, with a part of Denbighshire between them, the larger portion bordering on the Irish sea and the estuary of the Dee; aggregate area, 289 sq. m.; pop. in 1851, 68,156. It is the smallest but most populous county in Wales. The surface near the coast is low, and elsewhere is diversified, though there are no great elevations. A range of hills runs alongside the S. W. boundary, and sends off a branch which traverses the county in a N. E. direction. Between these ridges are fertile valleys, including the well known vale of Clwyd, watered by several rivers, which flow on the one side into the Clwyd and Alyn, and on the other into the Dee, which forms the N. E. boundary. The greater part of the county rests upon the coal measures, which exist chiefly on the coast of the estuary of the Dee. Lead mines, the ore from which also yields a little silver, are worked near Holywell and Bagillt, and are esteemed the richest in the kingdom. The other minerals are copper, iron, zinc, and calamine. Agriculture employs about 8 per cent. of the population. The shipping trade is not extensive, as the ports are accessible only by small craft. The Chester and Holyhead railway traverses the county, and the Chester and Mold railway penetrates to its centre. The chief towns are Mold, the capital, Flint, St.

Asaph, Holywell, Rhyddlan, Hawarden, and Bagillt. One member is returned to the house of commons for the county, and one for the town of Flint.

FLOATING ISLANDS. An early notice of this phenomenon is recorded in an interesting letter of the younger Pliny to Gallus, in which he describes the appearance of a number of them he had observed in the lake Vadimon, now Laghetto di Bassano, near Rome. They were covered with reeds and rushes, and were of such consistence, that the sheep grazing upon the borders of the lake passed upon them to feed, and were often floated away from the shore. Upon the lake Gerdau, in Prussia, the extent of such islands is said to be sufficient for the pasturage of 100 head of cattle; and on one in the lake Kolk, in Osnabrück, fine elms are said to grow. These islands are produced by accumulations of drift wood, among which drifting sands and earth collect and form a soil, in which plants take root and flourish, sometimes becoming trees. The great "rafts" of some of the western rivers are of this nature, though for the most part these do not float from place to place. Masses are occasionally detached, however, and drifted out from the mouth of the Mississippi, carrying with them into the gulf the birds, serpents, and alligators that had taken refuge upon them. Such islands have been seen floating 100 miles off from the mouth of the Ganges, from which they had been discharged. Upon the great rivers of South America they are very often met with, carrying with them the prolific productions of the vegetable and animal life of the tropics, to deposit them in new localities. Thus they may have been the means of distributing species of the larger animals among the islands of the South Pacific, upon many of which their introduction by any other mode is difficult to account for. Prescott describes the floating gardens or *chinampas* of Mexico as an archipelago of wandering islands. The primitive Aztecs adopted the plan suggested by these natural objects, and attaching the reeds and rushes together, they covered the raft thus formed with the fertile sediment drawn up from the lake. Upon these gardens, gradually extended to 200 or 300 feet in length, the Indians cultivated flowers and vegetables for the market of Tenochtitlan. Some of the *chinampas* were even firm enough to sustain small trees and a hut, and could then be moved about with a pole or remain anchored by the same.

FLODDEN FIELD, BATTLE OF, fought Sept. 9, 1513, between the Scots under King James IV. and the English under the earl of Surrey. Henry VIII. was on the continent engaged in his expedition against France when the border feuds between England and Scotland broke into open war, and, according to Scott, "prudence, policy, the prodigies of superstition, and the advice of his most experienced counsellors, were alike unable to subdue in James the blazing zeal of romantic chivalry." He crossed the Tweed, Aug. 22. at the head of the feudal array of his

kingdom, captured 4 border fortresses, and encamped, Sept. 6, on Flodden, the last of the Cheviot hills, in the county of Northumberland, 8 miles S. E. of Coldstream. The earl of Surrey, to whom was intrusted the defence of the English border, summoned the gentlemen of the northern counties to join him at Newcastle, where he set up his standard, and reached Alnwick Sept. 8, with 26,000 men, where, according to the practice of chivalry, he offered battle to James in a message sent by a pursuivant-at-arms. By a skilful countermarch he placed himself, on the morning of Sept. 9, between James and his own country, so that

The English line stretched east and west,
And southward were their faces set;
The Scottish northward proudly prest,
And manfully their foes they met.

The battle began between 4 and 5 o'clock P. M., and was decided in little more than an hour. The Scottish army, setting fire to its tents, descended the ridge of Flodden to secure the eminence of Brankstone, and was met by the English army, which advanced in 4 divisions under the command of Surrey, his 2 sons, Thomas and Sir Edmund Howard, and Sir Edward Stanley. Earls Huntley and Home, who led the Scottish left wing, charged the Howards so successfully with a body of spearmen that Sir Edmund was unhorsed and his division put to flight. The battle was restored in this quarter by the advance of Lord Dacre with the reserve of cavalry. On the right wing the highlanders were unable to stand against the severe execution of the Lancashire archers. James, surrounded by some thousands of chosen warriors, charged upon Surrey in the centre of his army with such resolution as to penetrate within a few yards of the royal standard, when he was attacked in the flank and rear by Stanley, already victorious over the Scottish right. James fell by an unknown hand within a lance's length of Surrey, and all of his division perished with their king, not one of them being made prisoner. Before dawn the Scots abandoned the field in disorder. Their loss was about 10,000 men, which included the prime of their nobility, gentry, and even clergy. "Scarce a family of eminence," says Scott, "but had an ancestor killed at Flodden, and there is no province of Scotland, even at this day, where the battle is mentioned without a sensation of terror and sorrow." The English lost about 7,000 men, but of inferior note. Scott's "Marmion, a Tale of Flodden Field," contains, in the last canto, an accurate and most animated description of the battle of Flodden.

FLOOD, HENRY, an Irish orator and politician, born in 1782, died Dec. 2, 1791. He was a son of the chief justice of the court of king's bench in Ireland, and was educated first at Trinity college, Dublin, and afterward at Oxford. In 1759 he became a member of the Irish house of commons, where his eloquence made a remarkable impression, and his activity in support of all measures beneficial to his country won him great popularity. His rela-

tions to the government, however, exposed him to the charge of inconsistency. He was reelected to parliament in 1761, and was made a privy councillor for the 2 kingdoms, and vice-treasurer of Ireland in 1775, but resigned in 1781. In 1783 he held the celebrated discussion with Mr. Grattan in the house of commons, which was carried to a degree of bitterness almost unparalleled, and became so personal in its character that Flood was interrupted by the speaker. In the same year he was returned to the English parliament for the city of Winchester, and in 1785 he represented the borough of Seaford. His speeches were logical, pure in style, and rich in figures and classical allusions. He left a Pindaric "Ode to Fame," and a poem on the death of Frederic, prince of Wales, to be found in the Oxford collection. His property was finally bequeathed to Trinity college, Dublin.

FLOOR CLOTH, strong canvas made of flax, with more or less hemp intermixed, covered on both sides with a heavy coating of paint, and printed on one side after the manner of the calico block printing. It is much used for the covering of floors of halls and passages, for which it is well adapted by its durability and cleanliness. Made with picked long flax, it is a good material for covering the roofs of verandahs and light structures. The canvas is prepared of all widths, from a yard to 9 yards, so that an extensive apartment may be covered by a single piece of it. The looms for producing pieces of great width require two men, one on each side for throwing the shuttle forward and back. The length of the pieces sometimes exceeds 100 yards. From these large pieces suitable lengths of 60 to 100 feet are cut off at the painting establishments, and then stretched tightly upon substantial upright wooden frames, a row of which is built up in the frame room, each one separated from the next by a space of a few feet. Ladders and platforms are conveniently arranged to afford access to every part of the surface of the cloth. Being strained and well secured in the frame, the surface is tight like a drumhead, and an increase of dampness may even cause the cloth to split. The first application, which is made to the back of the canvas, is of a solution of glue size, laid on with brushes. This enters the pores of the cloth, and is rubbed smooth, while still damp, with pumice stones. When this is dry, a coating of paint of linseed oil and ochre, or any cheap coloring matter, made with little or no turpentine, and so thick that it cannot be spread with a brush, is laid on with a steel trowel, and well worked into the cloth. In the course of two weeks this becomes dry, so as to be fit for receiving a second coat; and on this, when dry, the private marks of the manufacturer are made. During this time similar operations have been going on upon the face of the cloth, no less than 8 coats of paint being applied with the trowel, and finally a 4th coat is laid on with the brush, which is intended to form the ground of the design to be afterward printed. Each

coat of trowel color on this side is carefully pumiced, when dry, before the next is laid on. For the best cloth 2 or 3 months are required to complete these operations, and the materials laid on amount to nearly 8 times the weight of the canvas. The heavy pieces are received from the frames upon rollers set upright, the face being protected by a covering of paper, and are then conveyed to the printing room, where they are drawn upon a long table as fast as the printing upon the portions in advance progresses. This is accomplished by blocks of pine, faced with some close wood, as that of the pear tree, and engraved, each one to print all those parts of the pattern which are in one color, the portions corresponding to the other colors being cut away. As many blocks are applied in succession, therefore, as there are colors to be printed, the operation being nearly the same as that described in CALICO PRINTING. The blocks are for the most part heavy, 18 inches square, and when applied are struck several blows with a heavy hammer. When designed to print a broad uniform surface, their face is made by indented lines crossing each other; the paint is taken up more uniformly and is more evenly spread than it would be with a plain surface. As in calico printing, the stock of blocks required to be kept on hand involves the outlay of a large capital. Before applying them to the cloth, the surface of this is roughened with a steel scraper and hard scrubbing brush, that it may better take the color. As fast as the pattern is completed the cloth is moved on, and in some establishments passes through the floor into the drying room, where it is kept for months to thoroughly dry. If drying oils are used, the cloth is likely to be brittle and of inferior quality.—During the present year (1859) a patent has been secured in England for the following method of making ornamental floor cloth. On cloth which has been first printed upon or dyed like calico a transparent ground or coating is put by applying several coats of clarified linseed oil, rendered "drying" in the usual way with sulphate of zinc or acetate of lead. When this transparent coating is dry, it is rubbed smooth with pumice stone, and a hard varnish put on the top, copal varnish being employed for light colors and asphalt varnish for black glazed cloth.

FLORA, the Roman goddess of flowers and spring. She was worshipped in Rome from the very earliest times. Her temple stood near the *circus maximus*; and her festival was celebrated annually on the 8 last days of April.

FLORA, a term corresponding to fauna, indicating the plants belonging to any country, as that does the animals. Its application is extended to the groups of plants, the fossil remains of which are found belonging to any geological formation or period.

FLORENCE, a post village and the capital of Lauderdale co., Alabama, situated at the head of navigation on the Tennessee river, nearly opposite Tusculum; pop. in 1853, about 1,500. Though not a place of large population, it is ex-

ceedingly prosperous and has an extensive business, being the chief shipping point for the productions not only of the county but of a large part of Tennessee. It is near the line of a railroad connecting it with Arkansas, Tennessee, Mississippi, Georgia, South Carolina, and the northern and middle states. The river is here crossed by a handsome bridge, about $\frac{1}{4}$ m. long, which cost \$150,000. Immediately above it are the Muscle Shoals. Steamboats ascend to this point from the mouth of the Tennessee, a distance of 800 m. In 1850 the village contained 8 large brick churches, the Wesleyan university, a female seminary, 1 newspaper office, and 2 large cotton factories, each having a capital of \$45,000.

FLORENCE (Ital. *Firenze*), a celebrated city of Italy, the capital of Tuscany, in lat. $43^{\circ} 46'$ N., long. $11^{\circ} 16'$ E., 182 m. from Genoa, 293 from Turin, 244 from Milan, 186 from Venice, 190 from Rome, and 365 from Naples; pop. in 1858, 114,081. The city lies in a beautiful, well wooded, well cultivated valley, surrounded by the Apennines. It is encircled by an old wall 5 or 6 m. long, with 8 gates. The river Arno flows through it, dividing it into two parts of unequal size, the larger of which is on the right or N. bank. The river within the city is crossed by 4 fine stone bridges, of which the most noted is the *ponte di Santa Trinita*, which was built in 1566-'9. It is adorned with statues, is 323 feet long, and the centre arch has a span of 96 feet. This bridge is a favorite evening walk of the people. The *ponte Vecchio* is 75 feet wide, and the carriage way in the middle is lined on each side by a row of shops occupied chiefly by goldsmiths and jewellers. In the older parts of the city the streets are narrow and irregular, and the houses for the most part meanly built; but the newer and larger portions are very handsome and stately, and the streets wider than is common in the cities of southern Europe, and solidly paved with blocks of stone. The churches of Florence are 170 in number, and many of them of great size, but few are completely finished, and their general appearance is neither elegant nor picturesque. The principal church is the Duomo, or cathedral, a vast and superb structure, which is surpassed in architectural grandeur only by St. Peter's at Rome. Its foundations were laid in 1298; the great dome was erected by Brunelleschi in the 15th century, but the façade was not completed till the middle of the 17th. The length of the building is 454 feet; its greatest breadth is 334 feet; its height from the pavement to the summit of the cross is 389 feet; the height of the nave is 153 feet, and of the side aisles 97 feet. The exterior of the church is covered throughout with red, white, and black marble, disposed in panels and variegated figures; and the pavement is also of many-colored marble, much of which was laid under the direction of Michel Angelo. The dome of this cathedral is the largest in the world, its circumference being greater than that of the dome of St. Peter's, and its comparative

height greater, though its base is not placed at so high an elevation above the ground. It excited the emulation of Michel Angelo, who endeavored to surpass it in the dome of St. Peter's. This church is richly adorned by statues and pictures, most of which are by eminent masters. Among the statues is an unfinished group by Michel Angelo, representing the entombment of Christ. Among the paintings is a portrait of Dante, executed in 1465. Near the cathedral stands the *campanile* or belfry, which was designed by Giotto, and begun in 1334. It is a square tower, 276 feet high, light and elegant, in the Italian-Gothic style, and divided into 4 lofty stories. Charles V. used to say that it deserved to be kept in a glass case. The lower story contains 2 ranges of tablets, designed by Giotto and executed by him and by Andrea Pisano and Luca della Robbia. Opposite the principal front of the cathedral stands the baptistry, whose 8 great bronze portals adorned with bass-reliefs by Andrea and Ghiberti Pisano were declared by Michel Angelo worthy to be the gates of Paradise. The church of San Lorenzo has attached to it a sacristy which contains 7 statues by Michel Angelo. Adjoining the same church is the costly Medicean chapel, begun in 1604 by Ferdinand I., grand duke of Tuscany, as the mausoleum of his family, on which, it is said, \$17,000,000 have been expended. It is an octagon 94 feet in diameter and 200 feet high, and is lined throughout with lapis-lazuli, jasper, onyx, and other precious stones. The church of Santa Croce, a huge edifice 460 feet long and 184 feet wide, whose foundation stone was laid in 1294, is the Pantheon or Westminster abbey of Florence. It contains the tombs of Michel Angelo, Macchiavelli, Galileo, Leonardo Aretino, the historian Guicciardini, the poet Alfieri, and of many other illustrious men. Florence abounds in palaces of a singularly solid, heavy style of architecture, resembling prisons or fortresses. They were built in ages of turbulence and civil strife, for defence and security rather than for display or luxury. Their great size and height, the rough massiveness of their lower stories, and the huge cornices frowning over their fronts, give them a very impressive appearance. The two principal palaces, the Palazzo Vecchio and the Palazzo Pitti, contain celebrated collections of works of art. The Medicean gallery, built in 1564, contains a number of masterpieces of painting and sculpture, among them the Venus de' Medici, the "Knife-Grinder," the group of "Niobe and her Children," and various paintings by Raphael, Titian, Michel Angelo, and others of the highest eminence. Beside these famous collections, the city abounds in galleries, museums, and choice works of art. There are several large libraries, the Magliabecchian with 150,000 volumes, the Laurentian with 120,000 printed volumes and 6,000 valuable MSS., the library of the Pitti palace with 70,000 volumes, and the Marucellian library with 50,000 volumes. There are many literary institutions, the chief of which is the academy *Del-*

la Crusca, founded in 1582, whose object is the improvement of the Italian language. There are agricultural and fine-art academies, a medical college, and an athenæum. Charitable institutions are numerous, including asylums for the blind, for the deaf and dumb, and for orphans, and an ancient association of the nobles and gentry for the relief of the sick and suffering poor.—The trade of Florence at the present day is chiefly in the produce of the surrounding country, oil, wine, and raw silk, and in her own manufactures, of which the principal are silk stuffs, straw hats, artificial flowers, musical and scientific instruments, jewelry, and fine porcelain. The climate is mild and healthy. The environs are like beautiful gardens, and abound in delightful places for excursions. The people are lively, polite, and intelligent, with a refinement of manner and language which extends even to the lowest classes, whose style of speech is singularly graceful, delicate, and expressive. The climate, the cheapness of living, the galleries of art, and the refinement of the people, render Florence a particularly pleasant place of residence, and have attracted to it great numbers of foreigners, especially English and Americans. Florence is remarkable for the number of its distinguished citizens, among whom have been Dante, Petrarch, Boccaccio, Macchiavelli, Michel Angelo, Leonardo da Vinci, Benvenuto Cellini, Galileo, Guicciardini, Amerigo Vesputius, Cosmo and Lorenzo de' Medici, and Filicaja, the chief of the lyric poets of Italy. Benjamin Disraeli says of Florence: "You cannot stroll 50 yards, you cannot enter a church or a palace, without being favorably reminded of the power of human thought. In Florence, the monuments are not only of great men, but of the greatest. You do not gaze upon the tomb of an author who is merely a great master of composition, but of one who formed the language. The illustrious astronomer is not the discoverer of a planet, but the revealer of the whole celestial machinery. The artist and the politician are not merely the first sculptors and statesmen of their time, but the inventors of the very art and the very craft in which they excelled."—Florence by the Romans was called *Florentia*. It is supposed to have been founded by the dictator Sylla, about 80 B. C.; but it seems to have been of little importance till the later ages of the Roman empire. In 405 it was a considerable city, and was besieged by Radagaisus, king of the Goths, at the head of a great army. It was delivered by Stilicho, who raised the siege and captured and put to death the barbarian monarch. In 542 it was laid in ruins by the army of Totila, king of the Ostrogoths. Charlemagne rebuilt it at the end of the 8th century, and during the next 2 centuries it gradually grew in importance, till in the 10th century the people acquired the right of electing their own magistrates. The city was governed by a senate of 100 persons, with an executive of 4, and afterward of 6 consuls. In 1207 the chief executive functions were assigned to a

is *podesta*. In 1215 take part in the civil wars and Ghibellines. After a contest with the pope or papal legate from the city, in 1215 against the nobles, and their fortified palnocratic government, elected "the captain of and various councils of population. In 1282 a system of government was changed for several years between the Neri ensued, in spite of which grew very rich and financial capital of the island was carried on an immense scale. The population, 100,000, and the armed forces together by the toll of 25,000. In 1349, a pestilence, which bore the name of the lord of Florence, after a year of plague and driven from the island by the revolution of the people. The revolution, which continued to flourish in the island, and civil and military, which the island gained a controlling influence, which resulted in the island institutions in the island, and TUSCANY.—A. H. E. Napier (6 vols. London in 1846-'7. Once see "European wars (12mo., Boston, in Italy," by George Boston, 1858). Most of the Azores ocean; lat. 39° 25' with 30 m., breadth 9 was given it by the the multitude of flowers to be adorned. Santa Cruz. FLORES, or MANGARAI, an island, E. of Java, bearing 120° and 123° out 200 m., average of Flores on the E. of Solor and Adonara, and like all the islands of volcanic formation. One of which has an area of 1,500. However, according to native all quantities of gold amount to be profitable. The island is wooded and a Jotton

is exported to Celebes to be manufactured. The other principal articles of trade are benzoin, ambergris, beeswax, slaves, and ship's provisions, payment for which is made in cutlery, gunpowder, glassware, and linen. The natives are divided into a number of distinct nations, all speaking different languages. The principal towns are Ende, with about 200 houses, Mangarai on the N. coast, Pota on the same side, the site of a Dutch fort and trading post, and Larantuka on the S. E., where the Portuguese have a small settlement. The Portuguese visited the island at an early period, and gave it the name of Flores. It was subordinate for a time to the Dutch presidency on Timor island, but in 1812 the Bugis expelled all the European settlers. Christianity has obtained a foothold by the labors of Portuguese missionaries, and the native traders generally sail under the Portuguese flag.

FLORIAN, JEAN PIERRE CLARIS DE, a French miscellaneous author, born at the chateau de Florian in Languedoc, March 6, 1755, died in Sceaux, Sept. 18, 1794. His uncle, the marquis de Florian, who had married a niece of Voltaire, placed him when 13 years old at Ferney with the philosopher, where he remained 3 years, when he became page to the duke de Penthièvre, who subsequently procured him a commission in a regiment of cavalry. He left his troop to attach himself as a *gentilhomme de cour* to the duke, at whose residence he pursued his literary avocations. Several of his dramatic writings were performed at the theatre of D'Argental, whose house in Paris was then the centre of attraction for men of science

W.; bounded N. by Alabama and Georgia, E. by the Atlantic ocean, S. and W. by the gulf of Mexico and the Perdido river, the latter dividing W. Florida from the gulf section of Alabama; area, 59,268 sq. m., or 37,981,520 acres. The state is divided into 33 counties, viz.: Alachua, Benton, Brevard (formerly St. Lucie), Calhoun, Columbia, Dade, Duval, Escambia, Franklin, Gadsden, Hamilton, Hernando, Hillsboro, Holmes, Jackson, Jefferson, Leon, Levy, Liberty, Madison, Manatee, Marion, Monroe (which includes the Florida keys), Nassau, Orange, Putnam, St. John's, Santa Rosa, Sumter, Volusia, Wakulla, Walton, Washington. Key West (called by the Spaniards *Cayo Hueso* or Bone Key) is the largest town in Florida, and is a place of great commercial and military importance. Tallahassee is the seat of the state government. Pensacola, Appalachicola, and St. Mark's are ports of W. Florida. Cedar Keys, Tampa, and Charlotte Harbor are the principal outlets on the W. side of peninsular Florida. St. Augustine, on the Atlantic coast, is the oldest town in the state, and is much resorted to by invalids on account of the equability of its climate. Jacksonville is a thriving commercial town on St. John's river. Fernandina is a new town at the N. end of Amelia island, and the Atlantic terminus of the railroad which has its gulf terminus at Cedar Keys. The population of the state at 4 periods was as follows:

U. S. Census.	White.	Free Colored.	Slaves.	Total.
1830	18,885	844	15,501	34,780
1840	27,943	817	25,717	54,477
1850	47,203	932	39,810	87,445
State census.				
1855	60,493	804	49,526	110,823

Of the white population in 1850 there were 25,705 males and 21,498 females; of the free colored (blacks 229, and mulattoes 703), 418 males and 514 females; and of the slave (black 36,288, and mulattoes 3,022), 19,804 males and 19,506 females. Density of population, 1.48 to a sq. m.; proportion of population to that of the whole Union, 0.38 per cent. Families (white and free colored) 9,107, and dwellings 9,022. Of the total population, 47,833 were under 20 years of age, 38,690 between 20 and 70, 779 between 70 and 100, 86 over 100, and 45 unknown; of those over 100, 5 were free colored and 29 slaves. White and free colored (total 48,135) born in Florida, 20,563; in other states, 24,755; in foreign countries, 2,757; unknown, 58. Of 13,135 males (white and free colored) over 15 years of age, 2,880 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 5,977 in agriculture; 2,666 in labor not agricultural; 423 in the army; 708 in sea and river navigation; 357 in law, medicine, and divinity; 302 in other pursuits requiring education; 268 in government civil service; 12 in domestic service; 42 not specified. Slaveholders, 3,520, viz.: holders of 1 slave, 699; of 1 and under 5, 991; of 5 and under 10, 759; of 10 and under 20, 588; of 20 and under 50, 849;

of 50 and under 100, 104; of 100 and under 200, 29; of 300 and under 500, one. Paupers in 1849-'50, 76; cost for the year, \$937. Criminals convicted, 39; in prison, June 1, 1850, 11. Federal population (all the free and $\frac{1}{2}$ of the slave), 71,721, which entitles Florida to one representative in congress.—Florida consists of a long narrow strip of territory extending S. from Georgia and Alabama from 30 to 80 m., and from the Atlantic ocean to the Perdido river about 360 m.; and of a peninsula extending from the mainland S. through 5° of latitude between the Atlantic and gulf of Mexico. Its coast line is of much greater extent than that of any other state, having a length of 472 m. on the Atlantic and 674 m. on the gulf; but this immense stretch of sea front is almost inaccessible on account of shallow soundings, and has few good harbors. S. from the mainland a chain of small rocky islands, called cays or keys, extends to the W., ending in a cluster of rocks and sand banks called the Tortugas. S. of the bank upon which these keys rise, and separated from them by a navigable channel, is a long narrow coral reef known as the Florida reef, which here constitutes the left bank of the Gulf stream. The most important of the keys is Key West, called also Thompson's island. For a long period the haunt of smugglers and pirates, it is now a naval station of great importance, and the seat of a band of wreckers whose business it is to assist vessels in distress. This key is about 6 m. in length and 2 in breadth, with a large, well-sheltered harbor. The extensive ponds thereon yield annually a large amount of salt. The Tortugas derive their name from the vast number of turtles found in the neighboring waters. The most important harbors are: on the gulf coast, Pensacola, Appalachicola, St. Mark's, Cedar Keys, Tampa, Charlotte, and Key West; and on the Atlantic coast, St. Augustine and Fernandina. Jacksonville on St. John's river has also a good harbor.—The rivers of Florida are numerous, and many of them afford great facilities for internal navigation. St. John's river rises in the great southern marsh, and reaches the ocean after a N. course of 300 m. in lat. 30° 20' N.; for nearly 100 m. from its mouth it is a wide sluggish sheet of water, more resembling a lagoon than a river. It is navigable to Lake George, a little higher up, for vessels drawing 8 feet of water, and nearly to its head for smaller craft. Indian river is a long lagoon having much the same character, and communicates with the ocean by an outlet in lat. 27° 30'. It is now proposed to connect these two waters by a short canal, and by this means secure an inland navigation from the mouth of the St. John's to Jupiter inlet, a distance of about 250 m. Charlotte and Amazura are the principal rivers on the W. side, the whole of which S. of the Suwannee contains only small streams. The Suwannee is formed by the Withlacoochee and Allapaha from Georgia, and reaches the gulf at Wacasa bay. The Ockloconee also rises in Georgia. The Appalachi-

cola, formed on the N. frontier by the junction of the Chattahoochee and Flint, falls into the bay of the same name after a navigable course of 80 m. The Choctawhatchee, Escambia, and Perdido rise in Alabama and flow S., the first into Choctawhatchee bay, the second into Pensacola bay, and the last into Perdido bay, severally arms of the gulf of Mexico. The Perdido forms the boundary between W. Florida and Alabama. The St. Mary's in the N. E. is common also to Georgia; it flows into the Atlantic in about lat. $30^{\circ} 40'$ N., and is navigable for steamers to the town of St. Mary, and much further for sloops.—The S. portion of peninsular Florida from about lat. 28° is mostly an extensive swamp or marsh, called the Everglades, which during the rainy season between June and October is impassable. N. of this tract to Georgia the surface is generally a dead level, but in some parts it is undulating, and even presents eminences worthy the designation of hills. W. of the neck of the peninsula the ground is more uneven and rugged; but still the elevations are inconsiderable, and, where occurring, of very limited extent. The substratum of the E. part of the peninsula is clay mixed with sand, and that of the W. a kind of rotten limestone, which in many places is undermined by subterranean streams. The central district is the most productive, but even here a large portion is composed of poor pine barrens; yet in the midst of these are found gentle eminences (here called hummocks) of fertile land supporting a vigorous growth of oaks and hickories, while numerous rivulets of pure water flow through the country or expand into beautiful lakes. Further W. the land is more generally poor. Thus it appears that a small portion only of the state can be said to be available for cultivation; yet the warmth and humidity of the climate compensate in a great measure for the inferior character of the soil, and give it a vegetation of great variety and luxuriance. The climate of Florida has been extolled as one of the finest in the world. In the S. the temperature scarcely changes the year round, and summer is only distinguished by the copiousness of its showers. The average mean temperature of the state is about 73° F., and in no part does the difference between summer and winter exceed 25° , while at Key West it is not more than 11° . The average rain fall is 83 inches.—The productions of Florida are chiefly those which require a tropical sun to mature them. It is now ascertained that the sea island cotton (the production of which was formerly confined to a few small islands off the coasts of S. Carolina and Georgia) will grow luxuriantly even in the centre of the peninsula, and a fine quality of this staple has also been produced on the Suwannee. The soils are also adapted to the successful cultivation of the coffee plant, the cocoa palm, the sugar cane, cottons generally, Cuba and other tobaccos, rice, indigo, arrow root, Sisal hemp, New Zealand flax, &c.; and the climate is suitable for the cochineal insect and silkworm. The

principal forest trees are red, live, and water oaks, mahogany, palmetto, magnolia, dogwood, and in the swamps pines, cedars, and cypresses. The fruits produced are of the most delicate descriptions; among them are oranges, lemons, limes, pineapples, olives, grapes, &c., all of which flourish luxuriantly; and garden vegetables are produced in the greatest abundance. The driest seasons are relieved by heavy dews, and the sun that would bake the earth in other parts, and wither vegetation, is here so tempered by the pervading moisture as to cover the surface with perennial verdure. The prairies afford excellent pasture. Here cattle require little care from their owners, and no housing in winter; and in most parts of the state hogs fatten without any other support than that which they derive from the roots and mast of the forests. Deer of various kinds abound, and smaller game is found in all parts of the country. The coast waters are productive of the finest fish, including the sheepshead, grouper, redfish, mullet, green turtle, and oysters, and the numerous lakes and rivers of the interior teem with fresh water species. On many parts of the coast sponges are found, and in this product the trade is constantly increasing. Among the mineral productions are amethysts, turquoises, lapis-lazuli, ochre, pit coal, and rich iron ore.—Among the most remarkable of the natural curiosities of Florida are the hollows called "sinks," worn in the soft limestone by subterranean streams, and varying in size from a few yards to several acres. The great sink of Alachua county, by which the waters of the Alachua savanna are supposed to flow into Orange lake, is a large basin almost surrounded by hills, into which the drainage of the savanna is conveyed by several conduits, uniting before they reach the basin in a single stream. From the basin the waters descend slowly by 8 great vent holes into the bowels of the earth, and are carried by underground channels to other basins. Numerous springs, bursting from great depths, some of them with sufficient force to turn a mill, are found in different parts of the state, and have led to the supposition that the parts of the country in which they exist may be undermined by vast caverns through whose roofs the springs well up with violence wherever an opening can be found. About 12 miles from Tallahassee there is a lake of icy cold transparent water which is fed by a subterranean source of this kind.—In 1850 Florida contained 4,804 farms and plantations, which covered 1,545,289 acres of land, and of this 849,049 acres were improved. Cash value of farms \$6,823,109, and of farming implements and machinery \$658,795. The number of cotton plantations was 990, and of sugar planters 958. (The census of 1855 returned 2,265,503 acres of land, valued at \$13,910,981.) The live stock in 1850 consisted of horses 10,848, asses and mules 5,002, milch cows 72,876, working oxen 5,794, other cattle 182,415, sheep 23,311, and swine 209,453; which were valued at \$2,830,058. Value of animals slaughtered in the year, \$514,685. The products of agri-

culture for the year ending June 1, 1850, were as follows: wheat 1,027 bushels, rye 1,152, oats 66,586, Indian corn 1,996,809, and buckwheat 56; potatoes, Irish, 7,828, and sweet, 757,226 bushels; hay 2,510 tons; hops 14 lbs., butter 371,498, and cheese 18,015; peas and beans 135,859 bushels; products of market gardens \$8,721, and of orchards \$1,280; beeswax and honey 18,971 lbs.; home-made manufactures \$75,582; flax 50 lbs.; cane sugar 2,750,000 lbs.; molasses 252,893 galls.; ginned cotton 45,131 bales of 400 lbs.; rough rice 1,075,090 lbs.; tobacco 998,614 lbs.; wool 23,247 lbs.; silk cocoons 6 lbs.; wine 10 galls. The total value of agricultural products in 1840 was \$1,817,718, and in 1850 \$3,865,059. Average crops to the acre: wheat 15 bushels; Irish potatoes 175 bushels; rice 1,850 lbs.; seed cotton 250 lbs.; cane sugar 750 lbs. But little progress has been made in manufactures and the mechanic arts. In 1850 there were only 103 establishments in all the state, and the capital invested therein amounted only to \$547,070; value of raw material used \$220,611; hands employed 991, viz., males 876, and females 115; cost of labor \$190,452; products of the year \$668,335. Under this head are included 15 fisheries, capital \$13,975, and one saltery, capital \$19,000. Including domestic manufactures, the value of products in 1840 was \$587,167, and in 1850 \$924,495. The exports (all domestic products) from Florida for the year ending June 30, 1858, were valued at \$1,877,552, viz.: in American vessels \$1,380,960, and in foreign vessels \$546,592; and the imports from foreign countries at \$164,950, viz.: in American vessels \$151,859, and in foreign vessels \$13,091. The amount of shipping employed in this trade was 128,801 tons, viz.: outward 58,633 tons (American 50,887, foreign 7,746), and inward 70,168 tons (American 62,450, foreign 7,718). The chief articles exported were boards, planks, scantling, lumber, cotton, tobacco, and fish. The shipping owned in the state (including 1,534 steam) amounted to 20,909 tons, of which 13,714 was registered and 7,195 enrolled and licensed. There were built in the year 5 vessels, aggregate burden 549 tons. The coasting trade is also very extensive, employing numerous steamers, which with other craft carry immense freights to Savannah, Charleston, Baltimore, Philadelphia, and New York. It must be remembered, however, that a large portion of the material exported from Pensacola and Appalachicola originates in southern Alabama and southwestern Georgia. The great bulk of foreign merchandise consumed in the state is also entered coastwise, chiefly from the northern ports.—There are no banks of issue in Florida. Of internal improvements Florida has until within a few years been remarkably destitute, but recently she has taken active measures to remedy the defect by the construction of railroads. The principal lines are: the Florida railroad, across the neck of the peninsula from Fernandina on the Atlantic to Cedar Keys on the gulf, 154 m., with

a branch to Tampa, 150 m.; the Florida and Alabama railroad, 45 m., from Pensacola to the Alabama line, where it will join the Alabama and Florida railroad, extending thence to Montgomery, 116 m. further; the Florida, Atlantic, and Gulf central railroad, 59 m., and the Pensacola and Georgia railroad, 259 m., which together will form a line from Jacksonville on the St. John's, *via* Alligator and Tallahassee, to Pensacola; and the Tallahassee railroad, from Tallahassee to St. Mark's, on Apalachee bay, 21 m. The whole system will comprise about 688 m., of which on June 30, 1859, there was completed 216 m., and the remaining portions will all be in operation within the next 3 years. These works are of the highest importance to the domestic industry of the state, and will give a beneficial impulse to all its interests. The Florida railroad will also facilitate and shorten the duration of travel between the Atlantic seaboard and the gulf ports, and avoid the necessity of a dangerous navigation round the southern point of the peninsula. Ultimately the Florida system of roads will be connected with that of Georgia by means of a branch of the main trunk line of the latter state, which has its eastern terminus at Brunswick and Savannah, and with Mobile and New Orleans by extensions westward from Pensacola. The average cost of the Florida roads will be about \$20,000 per mile, and the several companies owning them are aided to the extent of \$10,000 per mile from the state internal improvement fund—a fund based on congressional grants of land and the vast swamp lands which have been ceded to the state. On June 30, 1858, the mail routes in Florida had a length of 4,545 m., of which 120 m. was railroad, 1,971 steamboat navigation, 784 coach road, and 1,670 other road.—In 1850 Florida contained 177 churches, of which 56 belonged to the Baptists, 10 to the Episcopalians, 87 to the Methodists, 16 to the Presbyterians, 5 to the Roman Catholics, and 3 to other denominations; these afforded accommodation for 44,960 persons, and as property were valued at \$165,400. The educational institutions in the state at the same period consisted of 34 academies and private schools, with 49 teachers and 1,251 pupils, and an annual income of \$13,089; and 69 primary and public schools, with 73 teachers and 1,878 scholars, and an income of \$22,886. The number of children (white and free colored) attending school during the year 1849-'50, as returned by families, was 4,812; and the number of persons of the same classes over 20 years of age, who were unable to read and write, was 4,129. There are no colleges in the state. On July 1, 1856, there were 20,261 children between 5 and 18 years of age, and in the same year \$6,059 was appropriated to common schools. The return does not state the number then at school. The number of newspapers issued in 1850 was 10, of which 9 were weekly and 1 tri-weekly, and 7 were political and 3 religious. The total circulation was 5,750. or annually

319,800 copies.—The constitution of Florida secures the right of voting to every free white male citizen of the United States who has resided in the state 2 years and in the county 6 months next preceding an election, and whose name is on the electoral register. The general election is held on the 1st Monday in October, biennially. The legislature consists of a senate of 19 members, elected for 4 years (one-half biennially), and a house of representatives of 40 members, elected for 2 years. Senators must be 30 and representatives 21 years of age, and are paid \$3 per diem. Sessions are biennial, commencing on the 4th Monday in November (even years). The governor is chosen for 4 years, and has a salary of \$1,500 and \$500 for a residence. He must be 30 years of age, have been a citizen of the United States 10 years, and a resident of the state 5 years. In case of disability or death, he is succeeded by the president of the senate or speaker of the house. The secretary of state (salary \$500 and fees), comptroller (salary \$1,100), and state treasurer (salary \$800) are elected by joint vote of the assembly, the first for 4 years, and the last 2 for 2 years. The judiciary consists of a supreme court, circuit courts, and justices of the peace. The supreme court is composed of a chief and 2 associate justices, and holds 4 sessions annually, viz., at Tallahassee, Tampa, Jacksonville, and Marianna. The jurisdiction of this court is entirely appellate. For circuit court purposes the state is divided into the western, middle, eastern, and southern circuits, each of which has a judge who is president of the court. These courts have original jurisdiction in all matters, civil as well as criminal. All judges are elected by the people, and have each a salary of \$2,000. The receipts into the treasury, mostly from taxes and sales of land, during the year ending Oct. 31, 1856, amounted to \$94,022, and the expenditures to \$76,430, of which sum \$20,408 was on account of the judiciary, \$7,482 of the executive, \$10,862 of criminal prosecutions, \$15,057 of jurors and witnesses, \$2,592 of Indian hostilities, \$10,826 of the legislature, &c. The public debt (not including the repudiated territorial debt) amounted in the same year to \$193,000; in Oct. 1858, it was stated at \$380,000. The resources of the state are ample, consisting of vast tracts of railroad lands, swamp lands, and other property. The valuation of taxable property in the state in 1850 was \$23,198,734, and in 1856, \$49,461,461.—The name of Florida (which signifies the florid or flowery, and was given by the Spaniards in allusion to the aspect of the country, and partly also because it was first visited by them on *Pascua Florida*, or Easter Sunday) was originally not confined to the state now known by that appellation, but extended over an indefinite region northward and to the Mississippi. The first visitant to the actual territory of Florida was Ponce de Leon, who landed near St. Augustine in 1512. It was subsequently visited in 1520 by Vasquez, a Spaniard; in 1523

by Verazzani, a Florentine; and in 1524 by De Geray, a Spaniard. Two years later Pamphilo de Narvaez obtained a grant from Charles V. of all the lands from Cape Florida to Rio Panuco. In 1528 he landed with a numerous army at Appalachee, but met with a formidable resistance from the Indians, and at last perished on the coast near the Panuco by shipwreck, only 10 of his followers returning to Spain. In 1539 Fernando de Soto explored Florida, and after visiting many remote regions, and having passed through a series of romantic adventures, appears to have died on the banks of the Mississippi in 1542. About the middle of the 16th century many Protestants of France sought refuge in Florida, but only to experience greater evils than they had endured at home. In 1564 they were attacked by the Spaniards, and many were hung on the trees with an inscription purporting that they were destroyed "not as Frenchmen, but as heretics." This barbarity was soon afterward avenged by a party of Frenchmen, who attacked the Spanish fort, and hung up the garrison on the same trees that sustained the mouldering bones of their countrymen, inscribing over them that they were executed "not as Spaniards, but as cut-throats and murderers." The Spaniards, however, persevering in their attempts to obtain a foothold in Florida, established a fort at St. Augustine in 1565, which they held until 1586, when it was captured by Sir Francis Drake. Two years earlier Captains Barlow and Amidas had taken nominal possession in right of England of the country on the N. coast of Florida. From this period for nearly a century, history is silent in relation to this country. In 1682 La Salle visited W. Florida or Louisiana. In 1696 Pensacola was settled by the French. The Spanish settlements on the E. coast suffered greatly from the buccaneering inroads of the English. In 1702 the Carolinians made an unsuccessful attack on St. Augustine, but in 1704 captured Fort St. Mark. The subsequent expedition of Oglethorpe against the Spanish settlements will be spoken of in the article GEORGIA. In 1763 the whole province of Florida was ceded to Great Britain in exchange for Cuba, which the English had then recently taken. Soon after the cession the British divided the territory into two provinces, the river Appalachicola being the boundary between them, and by a proclamation invited settlers. Many Carolinians emigrated in consequence thereof; and about 1500 Greeks, Italians, and Minorcans were brought from the Mediterranean and settled at a spot about 60 m. S. of St. Augustine, where they began the cultivation of indigo and the sugar cane. During the revolutionary war privateers were fitted out at the ports of Florida, by which the trade of the southern provinces was severely harassed, and the Indians were encouraged to a barbarous hostility against the Americans. In 1778 Gen. Prevost marched from Florida into Georgia and captured Savannah and other towns. While engaged on this

expedition, however, he left his province open to incursions from Louisiana. In 1779 the Spaniards invested the garrison and settlement of Baton Rouge, and compelled them to surrender, and in May, 1781, Pensacola was captured. By the treaty of 1783 Florida was retroceded to Spain, and the greater part of the inhabitants deserted the country and settled in the United States. When Louisiana was ceded to the United States by France in 1803, it was declared to be ceded with the same extent that it had in the hands of Spain, and as it had been ceded by Spain to France. The terms of this cession gave rise to a claim on the part of the United States to the country west of the Perdido river; and to prevent the occupation of this territory by any other power, the government of the Union took possession in 1811 of the principal posts. The rest of Florida, however, remained unmolested until the second war between the United States and Great Britain. In 1814 a British expedition having been fitted out from Pensacola, Gen. Jackson marched against that town and captured it. In 1818 it was again taken by Jackson, and also Fort St. Mark, but they were subsequently restored to Spain. Finally in 1819 Spain ceded the whole province to the United States, and possession was surrendered to that government in July, 1821. Immigration now set in to the territory, but the unsurveyed state of the lands, the uncertainty of titles, &c., militated against its rapid settlement; and the Seminoles, a fierce and warlike Indian race, occupied the best lands, rendering it impossible to obtain them for cultivation. Yet in spite of these obstacles, a considerable population planted themselves in the country. In 1835, however, a deadly war between the Indians and settlers broke out, and suspended what progress had hitherto been effected. A long contest ensued between the savages and the U. S. troops, which is known as the Seminole war, and resulted in 1842 in a treaty by which the greater number of the Indians were removed to the west of the Mississippi. The few remaining Indians continued to be a great trouble to the country, and on several occasions committed great depredations on the settlers; but on May 4, 1858, the whole body was removed, and on the 8th of the same month Gen. Loomis, then commanding in Florida, issued a proclamation declaring the war closed. It is supposed that these Indian wars have cost the nation not less than \$30,000,000, beside thousands of lives. Florida was erected into a territorial government by act of congress, March 3, 1819, and was admitted into the Union, March 3, 1845.

FLORIN (It. *florino*), in the 11th century, in Florence, a gold coin of about the value of a ducat, bearing an impression on the obverse of a lily, and on the reverse of John the Baptist. It was soon imitated in other cities of Italy and in France and Spain, and in Germany gave origin to the mediæval *Goldgulden* and the later *Gulden*, which are still distinguished by the abbreviation (Fl.). The florin is now the ap-

pellation both of gold and silver coins in Europe, which vary in value in different countries. (See COINS.)

FLORUS, LUCIUS ANNÆUS, a Roman historian, probably of Spanish birth, lived under the emperors Trajan and Hadrian. He is the author of an epitome of Roman history, in 4 books, extending from the foundation of the city to the time when Augustus closed the temple of Janus. The work is conceived in a philosophical spirit, and characterizes the times and the men with justness and precision; but the style is declamatory, abounding in extravagant conceits and metaphors. The *Pervigilium Veneris* and 8 other short poems are with little authority ascribed to this writer.

FLOTOW, FRIEDRICH VON, a German composer, born in Teutendorf, Mecklenburg-Schwerin, in 1811. He was destined for diplomacy, but a fondness for music led him in early youth to Paris, where he was instructed in composition by Reicha. During the revolution of 1830, he returned to Germany, but soon after found his way back to Paris with several operas composed in his absence. He tried in vain to have these produced at one of the theatres of Paris, and it was only after their performance in private had excited the attention of amateurs, that he received a commission in 1838 to furnish the music for the "Shipwreck of the Medusa." The opera proved highly successful, having been performed 54 nights at the *théâtre de la renaissance*. Since that time he has much increased his reputation by the *Forestier*, *L'esclave de Camoëns*, *Albin*, *Alessandro Stradella*, *L'âme en peine*, and *Martha*; the last, which has been reproduced in several modern languages, being one of the most popular operas now on the stage.

FLOTSAM, an old word, used in connection with others equally barbarous, as jetsam and legan (or ligam), to designate different kinds of wrecked goods. Whether lawyers made them, or adopted them from seamen, is not certainly known; but the latter is supposed to be the case. Goods flotsam are goods which floated away when a ship was wrecked. Goods jetsam were those cast over from a ship in peril. Goods legan were goods which were cast out, but, because they would sink and be lost, were tied to wood or a cask or some other substance which would float. These words are now seldom if ever used; but the word jettison, formed probably from jetsam, is often used in insurance law and practice. It means properly the act of casting goods overboard; thus goods are said to be jettisoned, and a loss is said to be by jettison; and more rarely and inaccurately, the goods cast over are called the jettison; as, "the jettison consisted of such and such goods."

FLOUNDER, a flat fish of the family *pleuronectidae* or *planida*, which also includes the halibut, sole, and turbot. This family, containing about 150 species, is found generally in comparatively shallow water, where the bottom is sandy; but the halibut and turbot are caught

in deep water. The body is flat, compressed vertically, so that the dorsal and ventral surfaces are mere fin-bearing edges, the sides forming ovate disks variously colored, the darkest being popularly called the back and the white side the belly, while in reality these surfaces are the sides. The most remarkable character of the family is the want of symmetry in the mouth and head, both eyes being turned to that side which is uppermost when the animal swims, and which is always the darkest; the bones of the head, especially the presphenoid and the middle frontal, are distorted to allow this arrangement of the parts; behind the scapular arch there is no want of symmetry in the vertebral column. The dorsal fin fringes the whole back, from near the tail to as far forward as the nostrils, the anal fringing the lower edge in a similar manner; the jaws and the ventrals are generally unsymmetrical, the latter being smaller on the pale side. The branchiostegal rays are 8; the air bladder is absent, and the vent is very far forward. The flounder belongs to the genus *platessa* (Cuv.); in this the eyes are generally on the right side, one above the other; the teeth are broad and cutting, and in a single series in the jaws, but generally pavement-like on the pharyngeals; the dorsal commences over the upper eye, and neither it nor the anal extends to the caudal; there are 3 pancreatic caeca. The common flounder of Massachusetts (*P. plana*, Mitch.) varies in length from 10 to 22 inches, and in color (on the right side) from dull slate to rusty and blackish brown; the scales are small, and the surface smooth. This species is considered excellent for the table in the summer and autumn, and is caught in considerable numbers from wharves and bridges. Another species is the rusty dab (*P. ferruginea*, Storer), from 12 to 20 inches long, of a reddish slate color, with rusty spots, and the lower surface tinged with yellow. The New York flounder is the *P. dentata* (Mitch.), of about the same size, but considered inferior for the table; the color is reddish brown. Among species with eyes on the left side are the *P. oblonga* (Mitch.), growing to a length of 30 inches; and the *P. stellata* (Pallas), an arctic flounder, of a liver-brown color and about a foot in length. These species are said to be "reversed" when the eyes are on the left side in the first series, and on the right in the second; they are said to be "doubled" when both sides are colored; according to Dekay, the *P. melanogaster* (Mitch.) is a doubled variety of the *P. dentata* (Mitch.). Flounders extend, though in diminished numbers and of smaller size, into high northern latitudes; they are very abundant on the coasts of New Brunswick and Nova Scotia in the summer season. Like all the family, flounders are very tenacious of life, may be transported considerable distances, and may be naturalized in brackish and even in fresh water. The distortion of the flounder family admirably adapts them for swimming upon the bottom, where the situation of both eyes on the upper

surface of the head allows an extensive range of vision; having no means of defence, the coloration of one side, resembling the bottom on which they swim, serves as a protection against enemies. The food consists of minnows and other small fry, young fish, soft-bodied marine animals, and aquatic insects. There are as many as 16 species in the British islands, which are gradually reduced to 13 in the Baltic, 10 on the coast of Norway, 5 at Iceland, and 3 in Greenland. The English plaice (*P. vulgaris*, Flem.), called also fluke in Scotland, is a much esteemed fish; the spawning time is in February or March, and it is in the best condition for the table at the end of May. The English flounder is the *P. fesus* (Flem.), and may be distinguished from the plaice by the rough lateral line. The common dab (*P. limanda*, Flem.) derives the specific name from the roughness of its scaly surface, and, with other species, is considered an excellent fish; they are taken both by hook, spear, and in nets.

FLOURENS, MARIE JEAN PIERRE, a French physiologist, born in Maureilhan, Hérault, in 1794. He was graduated as M. D. when only 19 years old, repaired to Paris, where he became acquainted with Chaptal, the Cuviers, and Geoffroy St. Hilaire, and in 1821 delivered a course of public lectures upon the physiological theory of sensation, and presented to the academy of sciences a series of papers upon the organization of men and animals. He was already a contributor to the *Revue encyclopédique*, and to the *Dictionnaire classique d'histoire naturelle*. In 1822 his essay upon the *Détermination des propriétés du système nerveux, ou recherches physiques sur l'irritabilité et la sensibilité*, was highly praised by Cuvier for accuracy and originality. His reputation was further enhanced by his *Recherches sur les conditions fondamentales de l'audition et sur les diverses causes de surdité* (1824), and by his *Recherches expérimentales sur les propriétés et les fonctions du système nerveux dans les animaux vertébrés*, which he completed in 1825 by his *Expériences sur le système nerveux*. The two last papers present a very ingenious and thorough method of determining the relations of the individual organs to the various phenomena of intellect, sensation, and motion. In 1828 he was admitted to the academy of sciences, and was at the same time appointed assistant professor of natural history in the college of France. Two years later he became assistant lecturer on comparative anatomy at the *jardin du roi*, and in 1832 he was made titular professor at the museum. The next year he succeeded Dulong as perpetual secretary of the academy of sciences, and in 1840 the French academy elected him a member. From 1841 to 1854 he published a series of small works, giving in a condensed form and perspicuous style the history and philosophy of several branches of science, which he thus made accessible to the general reader. These popular publications did not interfere with his special

researches, lectures, and reports to the academy of sciences. Among the last may be cited the paper which he read in 1847 on chloroform. His *Cours sur la généalogie, l'ovologie, et l'embryologie*, delivered at the museum of natural history and published in 1836 by Deschamps, and his *Cours de physiologie comparée: de l'ontologie, ou étude des êtres*, are equally remarkable for perspicuity and fulness. His *Anatomie générale de la peau et des membranes muqueuses* (4to., Paris, 1843), intended to demonstrate anatomically the physical unity of mankind, and his *Théorie expérimentale de la formation des os* (Paris, 1847), which contains a demonstration of the principle that "matter changes and renovates incessantly, while form and force persist," greatly added to his reputation in the scientific world. But his most popular book is that entitled *De la longévité humaine et de la quantité de vie sur le globe*, which appeared in 1854, and passed through 3 editions within a few months. Flourens was a deputy of the department of Hérault in 1838, and was made a peer of France by Louis Philippe in 1846, without however taking much part in politics.

FLOWER, in botany, that portion of the plant where the organs of reproduction are found. These may be present in the simplest condition, or with all the accompanying modifications, as style or pistil, stamens, petals, sepals, &c. The flower seems to be the portion of the vegetable on which nature has bestowed the most pains. The least conspicuous flowers reveal under the microscope an exquisite beauty. The origin and development of the flower may be thus stated. In the angle formed by the leaf and stem, called the axil, small aggregations appear called buds; these are of two kinds, leaf buds and flower buds. (See Bud.) As all buds originate in the axils of previous leaves on the stem, it follows that the floral organs issuing from the flower buds must observe the same law. The floral leaf, from whose axil the flower bud issues, is called the bract, and all the rudimentary leaves of similar character which are borne between the bract and upon the stem of the flower, are *bracteolæ*, or small bracts. The color does not form any criterion of the floral organs, because even these bracts are often more highly colored than the flower itself. Thus, in the *arum*, the bract, which is greatly expanded, is deeply colored and wrapped around the base of the cluster of flowers as if to afford some kind of protection; and in the *calla* the bract is similar, but of a snowy white. In such instances the bract is called the spathe. Sometimes several bracts are formed in the shape of the spokes of a wheel around the cluster of flowers, which arrangement is called the involucre. It often happens that such bracts, whatever their size, shape, or arrangement, are the most showy portions of the plant, and, being in the vicinity of the flowers, are mistaken for parts of them. In *Poinsettia pulcherrima* the bracts are large, numerous, and of a splendid scarlet, while the flowers are small and of a greenish hue. From such instances we

can descend to others where the bracts are so meagre that they resemble mere chaff, like the glumes and paleæ of the grasses. The mode in which the flower bud expands itself is called the inflorescence. The following may serve for illustration. The flower is solitary and axillary when a single flower bud unfolds in the axil of a leaf and its stem lengthens; but if there is no lengthening of the stem beyond the development of the flower bud, the flower is terminal. When all the buds on a newly formed branch develop as flowers, we have the spike; and when beside this each flower has a flower stalk, we have a raceme. When the flowers are closely packed together upon a succulent branch, we have the spadix. When there are numerous flower buds upon the same branch, sometimes the uppermost first expands, and the inflorescence is centrifugal; but if the lower ones open first in order, the inflorescence is centripetal. Other variations of form have appropriate terms. There are portions of the flower called floral envelopes; they are found to be in whorls, and though really only modified leaves, yet they differ in size, color, and uses. When a single whorl is present, it is termed the calyx; but when there are two or more, the inner is the corolla. In some plants the calyx and corolla look alike, and structurally there is no difference in any case. These envelopes may be highly developed and possess signal beauty, as in the lily and tulip, or become almost obliterated like the aigrette of the composite flowers, where the calyx is a mere rim. It is sometimes almost impossible to distinguish the calyx and corolla, in which case the envelopes are called perianth or perigonium. They may be entirely wanting, when the flowers are called achlamydeous or naked. Great variations in the growth, appearance, and shape of these envelopes may occur, which give rise to distinctive names. Immediately within the row of petals is a whorl of organs, called stamens, considered essential in the process of fecundation. These also vary essentially in numbers, size, form, &c., in suppression of their parts, and in their mode of connection with the floral envelopes. Next in order, the disk is to be noticed, which consists of whatever comes between the stamens and the central parts. In some plants it would appear that the disk was only an abortion produced by the suppression of an inner row of stamens. The nectary of the Linnæan botanists is the same as the disk. The pistil is the fruit-bearing organ of the flower, and is situated in its centre, and within the circle or whorl of stamens, and inside the disk if there be any present. The pistil is divided into stigma or summit, style or filament, stalk or support, and ovary, a hollow case containing the ovula. The pistil, like the stamens, is a modified leaf, which is converted into the carpel. Sometimes many carpels are present, and they are subject to an almost infinite variety of forms and shapes, which at length form the fruit. A large number of plants have hitherto been con-

FLOYD, the name of counties in several of
the United States. I. A S. W. co. of Va.,
lying on the N. W. slope of the Blue Ridge;
area, 279 sq. m.; pop. in 1850, 6,458, of whom
443 were slaves. Almost the entire surface is
elevated, rough, and mountainous, some of the
land being unfit for cultivation, though much
of it is well adapted to pasturage. The mineral
productions are chiefly copper and iron. Water
power is abundant, and there are numerous
mills in operation. In 1850 the county yielded
104,680 bushels of Indian corn, 28,992 of wheat,
92,654 of oats, and 3,226 tons of hay. There
were 9 churches, and 832 pupils attending pub-
lic schools. Organized in 1881, and named in
honor of the Hon. John Floyd, then governor
of Virginia. Capital, Jacksonville. Value of
real estate in 1856, \$1,615,068. II. A N. W.
co. of Ga., bordering on Alabama; area, 540
sq. m.; pop. in 1852, 12,079, of whom 4,259
were slaves. It has a beautifully diversified
and well watered surface, rising in some parts
into mountains, the highest of which is Taylor's
ridge. The Etowah and Oostenaula rivers unite
at the county seat to form the Coosa. The land
along their banks is of excellent quality, and
yields large crops of cotton, grain, and potatoes.
In 1850 the productions amounted to 1,976 bales
of cotton, 254,722 bushels of Indian corn, 15,370
of oats, and 36,818 of sweet potatoes. There
were 2 newspaper offices, and 409 pupils attend-
ing public schools. Iron, plumbago, galena,
slate, satin spar, and agate are found in the
county, and in the S. W. part there is a valu-
able mineral spring. Organized about 1838, up
to which time the land had been occupied by
the Cherokee Indians. Capital, Rome. Value
of real estate in 1856, \$2,056,096. III. An E.
co. of Ky.; area, about 750 sq. m.; pop. in 1850,
5,714, of whom 149 were slaves. It has a hilly
surface, and a soil suitable for pasturage. It is
rich in mines of hard coal, and its staple pro-
ductions are Indian corn and pork. In 1850 it
yielded 208,825 bushels of corn, 17,521 of oats,
and 18,541 lbs. of flax. There were 4 churches,
and 802 pupils attending public schools. Formed
in 1799, and named in honor of Col. John Floyd,
an officer in the revolu-
burg. IV. A S. E. co.
the Ohio river, which

E. co. of Iowa, trav-

area, about 550 sq. m.; pop. in 1856, 2,444. It produces grain and pasturage. In 1856 the harvest amounted to 3,842 tons of hay, 5,889 bushels of wheat, 7,759 of oats, 64,097 of Indian corn, and 10,666 of potatoes. Capital, Webster.

FLOYD, GEN. JOHN, an American statesman and soldier, born in Virginia, Oct. 8, 1769, died in Camden co., Ga., June 24, 1839. His father, having suffered severe pecuniary losses during the revolutionary war, brought up his son to the trade of a carpenter, and about 1791 emigrated with him to Georgia, where young Floyd was engaged for many years in building boats near the mouth of the Santilla river. Retiring with a competency, he served in the state legislature, was chosen representative from Georgia in the general congress in 1826, served there 2 years, and was afterward appointed a major-general of militia. During the war of 1812 he rendered efficient service in protecting the state, and also during the Indian wars which followed.

FLOYD, JOHN BUCHANAN, U. S. secretary of war, born in Montgomery (now Pulaski) co., Va., in 1805. He was graduated at South Carolina college in 1826, studied law, was admitted to the bar in 1828, and in 1836 removed to Helena, Arkansas, where he practised his profession for 2 or 3 years. In 1839 he returned to Virginia, and settled in Washington co. In 1847 he was elected to the lower branch of the Virginia legislature, and was reelected in 1849. In December of that year the general assembly chose him governor of the state for the term expiring Jan. 1, 1853. In 1855 he was again elected to the legislature. In 1856 he was chosen a presidential elector, and voted for James Buchanan, for whose nomination he had exerted himself at the democratic national convention at Cincinnati, and in whose favor during the contest preceding the election he had made many speeches. In March, 1857, he was appointed by President Buchanan secretary of war.

FLOYD, WILLIAM, an American general, and one of the signers of the declaration of independence, born in Suffolk co., N. Y., Dec. 17, 1734, died in Western, Oneida co., Aug. 4, 1821. He was the son of an opulent land owner, whose ancestors had immigrated from Wales, and settled on Long island. On the outbreak of the differences between Great Britain and her American colonies, Floyd ardently espoused the cause of the latter, and was appointed to the command of Suffolk county, and a delegate to the first continental congress in Philadelphia. During his absence the British assembled a naval force in Gardiner's bay, with the intention of invading Long island and levying contributions; but just as they were about to carry out their object, Gen. Floyd returned, assembled the Suffolk militia, and displayed so much energy and daring that the enemy abandoned their enterprise. In 1775 he was again appointed a delegate to the general colonial congress, and continued a member by successive elections for 8 years. In 1777 he was chosen a senator of the state of New York, retaining at

the same time his seat in congress. He was a member of the first congress under the constitution, which met in New York in 1789, and at the close of his term declined a reelection. He was one of the presidential electors in 1801, giving his vote to Mr. Jefferson. In the same year he was chosen a member of the convention to revise the constitution of his native state, and was afterward twice presidential elector.

FLÜGEL, GUSTAV LEBRECHT, a German orientalist, born in Bautzen, Feb. 18, 1802. He devoted himself to philological, and especially to oriental studies at Leipsic, Vienna, and Paris, and in 1832 obtained a professorship at Meissen, which he held till 1850, when he resigned it on account of his feeble health. His most important work is an edition of Hadji Khalfa's Arabic bibliographic and encyclopædic lexicon, with a Latin translation and commentary, published at Leipsic and London, at the expense of the oriental translation fund (1835-'54), in 7 volumes. He has made other translations from the Arabic, and published works on the Koran and on Arabic authors.—JOHANN GOTTFRIED, a German lexicographer, born at Barby, near Magdeburg, Nov. 22, 1788, died in Leipsic, June 24, 1855. He was employed as a merchant's clerk until 1810, when he repaired to the United States, returned to Germany in 1819, and officiated as professor of the English language at the university of Leipsic from 1824 to 1838, when he was appointed U. S. consul in Leipsic. He is the author of *Triglotta, oder kaufmännisches Wörterbuch in drei Sprachen* (German, English, and French, 2d ed., 1854), *Praktisches Handbuch der englischen Handelscorrespondenz* (6th ed., 1858), and other writings. His most popular work is his "Complete Dictionary of the English and German, and German and English Languages," which has passed through several editions, and is extensively used in Germany, England, and the United States.

FLUOR SPAR, fluoride of calcium, a mineral species consisting of fluorine 48.7, and calcium 51.3 per cent., named from the Latin *fluere*, in reference to its property of flowing when used as a flux. It is met with in crystals of cubical form, which easily cleave into octahedrons and tetrahedrons by removal of the solid angles. These crystals, collected in groups, their faces presenting a fine splendid lustre, and some brilliant shade of red, blue, green, or purple, constitute some of the most beautiful mineralogical specimens. They are sometimes transparent, but commonly translucent. They are of brittle texture, breaking into splintery and conchoidal fragments. The hardness of the mineral is 4; its specific gravity 3.14 to 3.19. Coarsely pulverized and heated, it emits phosphorescent light of various colors, which are best exhibited in a dark room. Before the blowpipe it decrepitates and fuses to an enamel. It is met with in veins in the metamorphic rocks, and in the limestones of formations as recent as the coal. In the north of England it is a common gangue of the lead veins which

are found in the strata of the coal formation; and it is there most conveniently applied as a flux for the reduction of these ores, for which it is peculiarly adapted. The coal beds also associated with them furnish the fuel for this process. The most famous locality of fluor spar is at Castleton, in Derbyshire, England, whence the name of Derbyshire spar has been given to the mineral. It is there found in the fissures of the limestone of deep blue and purple colors, in specimens so large and beautiful, that they are wrought into vases, inkstands, cups, tables, &c., which present fine colors and polish, but which, from the softness of the stone, are liable to be soon defaced by scratches. The blue color is often so intense that the articles cannot be worked thin enough to exhibit the shade; but by heating the stone nearly red hot, the intensity diminishes, and the blue changes to smethystine. By continuing the heat the color disappears. The workmen call the stone blue John. They chip the rough block into a rude shape with a steel point and mallet, and then heat it, so that on applying rosin over its surface, this will fuse and penetrate slightly into the mass, the object of which is to check the tendency to cleave as the stone is afterward worked in the lathe; and as the particles are removed in this operation, the rosining is occasionally repeated. The manufacture is described as a difficult one, from the crystalline structure with its fourfold cleavage causing the lamine to split up in unexpected places. The best workmen often fail in turning very thin hollow articles. Fluor spar is found at many localities in the United States, but has been very little used for practical purposes. Fine crystals, commonly of green color and very large size, are found in different places in Jefferson and St. Lawrence counties, N. Y., and at Rosie they have been used as a flux in smelting the lead ores found there. In Illinois, below Shawneetown on the Ohio, it is found in large purple crystals, with the same associations of lead ores and coal that accompany it in the north of England. The lead veins of the metamorphic rocks of New England often contain it as one of the gangues. From fluor spar is obtained fluorine, which, combined with hydrogen in the form of hydrofluoric acid, is used to etch glass.

FLUORESCENCE, an appearance of emitted light from certain bodies, solid or liquid, due to impingement on such bodies of differently colored light, or of chemical rays. The solar beam is a sheaf of rays of 3 kinds: 1, thermal rays, invisible; 2, luminous rays, visible; 3, actinic or chemical rays, invisible; and of these 3 kinds the degree of refrangibility is in the order in which they are here named. The first and third of these also overlap and mingle with the luminous. Again, a beam of light transmitted through a medium is seen only in the line of emergence; or if the medium be colored, and the illuminated portion give out light in all directions, this has in all ordinary cases

the color of the medium. The phenomena now to be detailed furnish a marked exception to the principle just stated; and they are among the most significant of modern optical discoveries.—Sir David Brewster, in 1833, having thrown a beam of sunlight, concentrated by a lens, through an alcoholic solution of chlorophyll contained in a transparent vessel, found that while the emergent beam was, as should be expected, of the color of the solution—a fine emerald green—the path of the beam through the liquid was marked to a certain depth by a bright blood-red light, which was emitted in all directions. Supposing this effect due to a reflection of part of the admitted light by minute solid particles suspended in the liquid, he termed the phenomenon one of internal dispersion. He discovered similar results in fluor spar and some other media; the new colors, however, not being always the same. In 1845 Sir John Herschel found that a weak solution of bisulphate of quinine, about 1 part of the salt to 200 of water, acidulated by addition of a little sulphuric acid, when viewed by transmitted solar light, appeared colorless; but that, at the same time, it emitted from a thin stratum at the surface at which the beam entered a beautiful sky-blue light, which in various other directions was seen as if emanating from the liquid. Beyond the thin stratum thus seen, the peculiar blue rays no longer marked the course of the beam, nor did they appear in a second or third medium of the same kind into which the beam was successively passed; whence it was evident that at a certain depth the beam had lost the power of exciting them. Herschel, therefore, proposed for the phenomenon the name of epipolic (surface) dispersion. The character of the change occurring was not understood until, in 1852, Prof. Stokes submitted the subject to a more careful investigation. He reasoned that the facts observed by Brewster and Herschel were the same, the rays which produced the red dispersed light possessing the power of penetrating to a greater depth before being exhausted than did those producing the blue. The latter he found to be exhausted within a film about $\frac{1}{8}$ of an inch thick, but the blue light to which they gave rise traversed the liquid with perfect freedom; hence there must be a difference of nature between the producing and the produced rays. Such differences could, probably, only be explained by polarization or change of refrangibility; but the supposition of polarization was found untenable, and the case was not one of phosphorescence. In order to test the remaining hypothesis, Stokes obtained a pure luminous spectrum by means of an achromatic lens and two or more flint-glass prisms, and in place of receiving the colors on a screen, held the quinine solution in these successively. In the less refrangible colors no effect was observed; but at about the middle of the violet space the blue diffused light made its appearance at the entering surface, as if the liquid medium had there become self-luminous.

This result appeared in all parts of the upper violet, and until the tube had been carried to some distance into the ordinarily dark space beyond, occupied by the chemical rays. The depth of the stratum thus luminous at first exceeded the thickness of the vessel used, but it rapidly diminished in the upper parts of the space to a minute fraction of an inch. The blue light, turned aside and again dispersed by a prism held obliquely in its course, yielded in some degree rays having various refrangibilities, with color corresponding, the higher colors being most abundant. By other experiments, also, the blue dispersed light was separated from the inducing violet rays; and it was found that the former always corresponded to a band of colors below the place of the latter. The light thus acted on, then, had its refrangibility always lowered. Thus the remarkable conclusion was arrived at, that, by passing light through particular media, certain rays belonging to the violet space have their refrangibility, and of course their color, let down in the scale, while portions of the invisible chemical rays in like manner become let down so as to fall within the range of visibility, and to appear as colored light. In the undulatory theory, these results are explicable only by an increase of the wave-length and time of vibration, with a consequent diminution of the velocity of the rays thus affected. The case is one of degradation of light; in the chlorophyll solution there is a fall from higher colors to red; in the quinine solution, from invisible or violet to a mixture whose predominant hue is blue; in canary glass, colored yellow by oxide or salts of uranium, from invisible or violet to green. The striking feature in these results is the conversion of the unseen ray-power, which ordinarily induces chemism only, as in the decomposition of carbonic acid and fixation of carbon within the green leaves of plants, and in the blackening of the photographic plate, into common light, thus proving the intimate relation, if not the identity, of the two. Stokes has given to the phenomenon the name of fluorescence, as having been seen in fluor spar; and this name, conveying no theory of the case, is preferred. It is conveniently observed by pencilling over, by candle light, a sheet of white paper with the quinine solution, or by tracing with it letters on the paper; nothing unusual is observed on the paper, which is as white as before, until it is brought into some light well supplied with chemical rays, and not too brightly luminous for witnessing the effect (as into a beam in an otherwise dark room), when fluorescence appears; and when in such a room the beam is decomposed, the luminous spectrum hidden from the view, and the paper brought into the ultra-violet space (which is of itself, of course, dark), its sudden lighting up with a pale blue radiance is an effect apparently little short of the supernatural. Other fluorescent media are infusion of horse-chestnut bark, or its active principle, *æsculine*, the infusion of seeds of *da-*

tura stramonium, tincture of turmeric, &c. Gas and candle light excite little or no visible fluorescence; hence these are poor in actinic rays. The flames of hydrogen and of sulphur burning in alcohol give very distinct results; hence these abound in those rays. But so rich in this respect is the light of the voltaic arc from metallic points, that it produces fluorescence through a space 6 or 8 times the length of the luminous spectrum. It is worthy of remark, however, that the fluorescent space can be detected to any considerable distance above the violet, only when the prisms employed are of quartz; glass at once cuts down the effect within narrow limits, proving that it is highly opaque to the chemical rays, for which quartz serves as the true glass. In 1858 Mr. Robinson of Armagh found the light of the aurora borealis to produce, for its intensity, very marked fluorescence—another fact favoring the electrical origin of that phenomenon.—M. Niepce, the younger, claims (1859) that he has preserved during 6 months the photogenic power of light, in card paper impregnated with tartaric acid or nitrate of uranium, exposed for half an hour to sunlight, and then at once sealed up in a tin tube. It is certain that, at the end of this time, this card removed in the dark, placed over sensitized or photographic paper, with a partially translucent drawing or printed sheet interposed, and left so for many hours, gives a very good negative picture on the sensitized paper, the latter being darkened through the lights, and protected by the shades of the interposed figure. It is yet, however, a question whether this effect is due to preserved light, or rather actinism, or to the effect of hydrogen gas set free from compounds in the prepared card, and acting chemically on the photographic paper. Invisible drawings in fluorescent substances, exposed to the sun and immediately or soon after applied in the dark, acted more powerfully; but interposed fluorescent bodies, as well as glass, arrested the action.

FLUORINE, a colorless or yellowish gaseous body separated from fluor spar or fluoride of calcium by the action of sulphuric acid. It is regarded as an elementary substance, and its chemical equivalent, calculated from the supposed simple combination of one atom each of calcium and fluorine in fluor spar, is given as 19. It is found in the teeth and bones of animals, in sea and some mineral waters, and in many phosphates and other minerals. On account of the great difficulty of preventing fluorine, when driven from its combination with one substance, from immediately combining with any other with which it comes in contact, it has been impossible to investigate its qualities in its isolated state, and hence the slight uncertainty as to its elementary nature. Louyet obtained it by decomposing dry fluoride of silver by means of chlorine gas in vessels of fluor spar. He found the dry gas possessed affinities analogous to those of oxygen and sulphur; it acted upon almost all metals, but attacked glass feebly or

dockyards, a town hall, and an exchange, near which is a statue of Admiral de Ruyter, who was a native of this place. The principal manufactures are beer, soap, and oil; but the inhabitants are chiefly engaged in commerce, and branches of industry subsidiary thereto. The port of Flushing is formed by 2 moles which break the force of the sea. The town is connected with the river by 2 large and deep canals, one of them being navigable for first-class merchant ships. The French took possession of the town in 1795, and made it a principal station for their fleets. In 1809 it was bombarded and taken by the British under Lord Chatham, but was soon after evacuated. It is the seat of an admiralty board.

FLUTE, a wind instrument, which under different forms and names has been in use for more than 4,000 years. It was familiar to the Egyptians from a remote period of their history, and among the Greeks and Romans was a favorite pastoral instrument, employed also on sacred and festive occasions, in military bands, and at funerals. Its present name is derived from the Latin *fluta*, meaning a lamprey, an eel caught in the Sicilian waters, whose side is perforated with 7 holes like the flute. The Egyptian flute was from 2 to 3 feet long, and was generally played by the performer sitting on the ground; while that of the Greeks probably did not exceed, if it equalled, a foot in length. At Athens it was once in great repute, but was finally superseded by the lyre, the use of which did not distort the face, while it allowed the accompaniment of the voice. In Thebes, Sparta, and other places, however, it continued a favorite. The Spartan flutists were a hereditary order, and the Spartan soldiers are said to have marched to battle to the sound "of Dorian flutes and soft recorders." The Egyptians appear, from their ancient pictures and sculptures, to have blown the instrument through a lateral opening near one end, and to have produced the necessary modulations of sound by means of holes on the side; hence their instrument probably differed little from the modern fife. The flute of the Greeks and Romans was probably more in the nature of the pipe, and was double as well as single, being often composed of 2 tubes of reed or wood, perforated with holes and played together. Until the early part of the 18th century it retained the form of the pipe, and was called the English or common flute, and sometimes the *flûte à bec*, from the resemblance of the mouthpiece to the beak of a bird. It was played in the manner of the clarinet, and had 7 finger holes, but no keys. This gave place somewhat more than a century ago to the German flute, which in its most perfect form consists of a tube of hard wood or ivory about 27 inches in length, separable into 4 joints, and having from 6 to 12 finger keys for semitones. It is blown through a lateral hole at one end, and has a compass of nearly 2 octaves, from C below the treble staff to C in altissimo. The modern flute is highly effective in an orchestra,

but has fallen into some disrepute for the performance of solos, in consequence of the flimsy and tasteless character of the music too frequently written for it, and which serves to exhibit the skill of the player rather than the capacity of the instrument.—The OCTAVE FLUTE, called also the *piccolo*, is a small shrill instrument of the flute species, an octave higher than the common flute. Its piercing sounds are only effective in a large orchestra or in military bands.—FLUTE STOP, on the organ, a range of pipes tuned in unison with the diapason, and intended to imitate the sounds of the flute.—One of the best German flutists of the 18th century was Quantz, the flutist of Frederic II. of Prussia. Devienne (died in 1802) and Berbiguier acquired a high reputation in France; and among the great flutists of the present century in Germany were Fürstenau and his son (died respectively in 1819 and 1852), and in England Charles Nicholson, whose father had also been celebrated in the preceding century. Among celebrated living flutists are the following: Theobald Böhm, flutist of the king of Bavaria, born about 1802, who invented about 1833 a new flute known as the Böhm flute, which is said to combine improvements in nearly every part of the instrument, and wrote in 1847 a treatise on recent improvements in the manufacture of flutes, which was translated into French (*De la fabrication et des derniers perfectionnements des flûtes*, Paris, 1848). His new flute, at first neglected, is now almost generally adopted. Jean Louis Tulou, born in Paris in 1786, and professor of the conservatory there. Louis Drouet, born in Amsterdam in 1792, for some time Tulou's rival in Paris, has resided since 1831 in Belgium engaged in manufacturing musical instruments. The principal flute manufacturers of the present day are Koch and Ziegler, Vienna; Clair Godfroy, Paris; and Rudall, Rose, Carte, and co., London.

FLUVANNA, a central co. of Va., bounded S. by James river, and intersected by the Rivanna; area, 170 sq. m.; pop. in 1850, 9,487, of whom 4,737 were slaves. Between the rivers there are some level tracts, but elsewhere the surface is generally rough. The soil of the river bottoms is fertile; in many other parts it is sterile. Gold is found in the vicinity of Palmyra, the capital. The productions in 1850 were 1,054,974 lbs. of tobacco, 200,174 bushels of Indian corn, and 92,657 of wheat. There were a number of mills and factories, 14 churches, and 355 pupils attending public schools; value of real estate in 1856, \$2,106,489. The James river canal passes along the border of the county. Fluvanna was formed from Albemarle co. in 1777.

FLUX (Lat. *fluo*, to flow), a substance used to facilitate the fusion of minerals, and frequently their decomposition. A great variety of materials serve this purpose, and one or another is used according to the nature of the body to be treated, and the chemical action desired. Some by their ready fusibility induce the same condition in bodies in contact with them, which are difficult to melt; others, though they may be

as infusible as the compounds they are brought in contact with, present ingredients which possess affinities for some of those in the body to be acted upon, and fusion then takes place with mutual decomposition and recombination of elements. Thus in treating the common silicious ores of iron, which are extremely difficult to melt, limestone, still more infusible, is employed, and the lime uniting with the silica enters at once into fusion, while the oxide of iron, freed from its original combination, is at the same time decomposed by the carbon of the fuel combining with its oxygen, and the iron flows free. The carbon itself may be regarded also as a flux, its action being to facilitate this process in the same manner as the limestone does. Should the iron ores be calcareous, the mineral flux to aid their decomposition must be silicious, that the same fusible silicates may be produced. Borax is a flux of very general application, from the readiness with which it forms fusible compounds with silica and other bases. The subject will be considered, as to the application of particular fluxes, in describing the metallurgic treatment of the ores of the various metals. (See also BLACK FLUX, and BORAX.)

FLUXIONS. See CALCULUS, and DIFFERENTIAL CALCULUS.

FLY, the popular name of the *diptera*, or two-winged insects, of which a familiar example is the common house fly. They have a sucking proboscis, 2 veined and membranous wings, and 2 poisers behind the wings; they undergo a complete transformation. The characters of the order have been sufficiently detailed in the article DIPTERA, and therefore only some of the most common flies of the family *muscidae* will be noticed here. The house fly (*musca domestica*, Linn.) of Europe is considered distinct from the American species by Dr. Harris, who calls the latter *M. harpyia*; it begins to appear in houses in July, sometimes a little earlier, becomes very abundant toward the end of August, and does not disappear until killed by cold weather; the eggs are deposited in dung, in which the larvæ undergo their transformations; consequently this species is most numerous in the vicinity of stables and unclean places. The swarms of summer are doubtless the progeny of a few individuals which have survived the winter in some protected nook, and are not produced from eggs laid the preceding season; it is possible that a few may pass the winter in the pupa state, and be developed by the warmth of spring. Among the thousands of domestic flies, all are of the same size, those larger or smaller being of different species, and neither very old nor very young individuals of the *M. domestica*; the house fly is such a constant companion of man, that its presence in a coral or other island is sufficient evidence that human inhabitants are not or have not been far distant. This common and despised creature offers to the microscopist and naturalist some of the most striking proofs of creative design. The 2 compound eyes contain as many as 4,000 facets,

ocellus; the tracheae formed by the tracheae; the anterior portion of the upper portion of the pieces of the fly sucks the saliva poured down that flies, the power of surfaces, and backs down is provided membranous merous hairs, the extremity. Difference of in which this in opposition Home, Kirby, alvilli act as teeth, and the of the atmospheres have ne to a viscid of the foot. assert that the with minute ht in contact e a vacuum, owing to the hooks. Mr. ical Science," parently con- sion that the ividual hairs eting a non- sion perfect urther scale in eetles. Mr. of Selborne," iews of Der- e year when sluggish and r able to lift glued to the lity to over- phere. It is scess a sim- is to account nd living in to brush off ther, and to wings by its hich resem- ilar purpose, ny summer's nerally trou- cover every ls by night; and putting

eatables beyond their reach, a dish of strong green tea, well sweetened, will be eagerly tasted by them, and prove a certain poison; according to Mr. Spence, a netting of large meshes stretched across a window of a room lighted only on one side will not be passed by flies. —The blue-bottle or blow fly (*M. calliphora vomitoria*, Linn.) is a large, buzzing species, of a blue-black color, with a broad, steel-blue, hairy hind body; it is found in summer about slaughter houses and all places where meats are kept, which it frequents for the purpose of depositing its eggs on animal substances. The eggs, usually called fly blows, are hatched in 2 or 3 hours after they are laid; the larvae increase so rapidly in 3 or 4 days, and are so voracious, that Linnæus did not greatly exaggerate when he said that the larvae of 8 females of this species will devour the carcass of a horse as quickly as would a lion; they pass the pupa state in the ground or in some crevice, the larval skin not being cast off, but changed into an egg-shaped case; from this they emerge as flies in a few days, or, if hatched late in the season, remain unchanged through the winter. A smaller, brilliant, blue-green fly, with black legs, much resembling the *M. (Lucilia) Cassar* of Europe, lays its eggs on meat and the carcasses of animals. —The flesh fly (*sarcophaga carnaria*, Meig.), somewhat longer than the blow fly, is ovo-viviparous, that is, it drops the living larvae on dead and decaying animal matter, a wise provision which enables these active little scavengers to commence at once their work of purification. A single female will produce about 20,000 young, which have been ascertained by Redi to increase in weight nearly 200 fold in 24 hours; Réaumur found the assemblage of embryo flies in this insect to be coiled like a watch spring or a roll of ribbon, when unrolled about 2½ inches long; the larvae arrive at maturity in succession, and the mother as usual dies soon after the brood is hatched. The color of this European species is black, with lighter stripes on the shoulders, and grayish black abdomen checkered with lighter squares. Another species of Europe is the *S. mortuorum* (Linn.), 5 or 6 lines long, with a golden head, grayish black thorax, steel-blue abdomen, and white wing scales. Both of these sometimes deposit their young on wounds and ill-conditioned ulcers of the living human body, as most surgeons have had occasion to witness. The largest American species is the *S. Georgina* (Wiedemann), the females of which are about ½ an inch long; the face is silvery white, with a black spot between the copper-colored eyes; the thorax light gray, with 7 black stripes; the hind body, conical and satiny, is checkered with black and white; they appear about the end of June, and continue till after the middle of August. In this genus the bristles on the antennae are plumose. —The dung fly (*scatophaga stercoraria*, Meig.), of a yellowish olive color, deposits its eggs in soft dung; at the upper end they have 2 divergent processes which prevent

their sinking too far into the nidus. The *S. furcata* (Harris) of the United States has the same habits, and has been erroneously charged with producing the potato rot, simply because the larvæ are found upon the stalks of this plant, developed from eggs laid in the surrounding manure. The males are yellow, with hairy body and legs, and long narrow wings, and are about $\frac{1}{4}$ as large as a honey bee; the females are smaller, less hairy, and olive-colored; both young and adult insects live upon dung, and do not injure plants.—The stable fly (*Stomoxys calcitrans*, Meig.) is a well-known tormentor of animals and man, whose skin it perforates by a painful bite in sultry weather and just before rains; it resembles very closely the house fly, except that the antennæ are feathered, the proboscis very long and slender, and the size smaller; it attacks the legs, piercing through thick stockings and the thickest hair, returning to the attack as soon as driven away; it is solitary, not social like the house fly, and seldom enters houses unless driven in by bad weather; it is most abundant in August and September, when it is a great pest to horses and cattle; it is about $\frac{1}{4}$ of an inch long, and lays its eggs in dung, in which the young are hatched and undergo their transformations;—The cheese fly (*Piophilæ casei*, Fallen.) is only $\frac{3}{8}$ of an inch long, of a shining black color, with transparent wings and yellowish hind legs. By its long ovipositor it penetrates the cracks of cheese, and deposits about 250 eggs, which are developed in a few days into maggots or skippers; these larvæ have 2 horny hooked mandibles, which they use for digging into the cheese, and for locomotion instead of feet; their proportions are considered so elegant and so characteristic of design that Swammerdam lays stress upon them as proofs of creative power and wisdom. The cheese skipper leaps 20 or 30 times its own length, first erecting itself on the tail, then bending into a circle and seizing the skin near the tail with its hooked jaws, and finally projecting itself forward by suddenly throwing itself into a straight line. The droppings and decay caused by these larvæ give a flavor to old cheese which is much relished by epicures.—There are several species of flower flies, of the genus *anthomyia*, of small size and feeble flight, which sport in the air in swarms like gnats, and which in the larva state are very injurious to vegetation; some of these maggots are like those of common flies, others are fringed on the sides with hair. The *A. ceparum* (Meig.), of an ash-gray color, with black dorsal stripes, and about $\frac{1}{4}$ the size of the house fly, lays its eggs on the leaves of the onion close to the earth; its smooth white larvæ bore into the bulb, and entirely destroy it. The *A. brassica* and *A. lactucarum* are equally destructive to the cabbage and lettuce; the *A. raphani* (Harris) attacks in the same way the radish. The *A. scularis* and *canicularis* give rise to fringed maggots, which have been not unfrequently ejected from the

human body, having probably been swallowed with vegetables in which decay had commenced; as the eggs in many instances belong to species depositing in the ordure of privies, the larvæ might remain alive for a considerable period in the intestines of man; eggs of other *muscada* might be introduced on meats, fruits, salads, vegetables, and in impure water. In the "Transactions" of the entomological society of London (vol. ii., 1887), Mr. Hope gives a tabular account of 37 cases in which maggots of the *muscada* infested the human body, many of which were recognized as belonging to *M. domestica*, *C. vomitoria*, and *S. carnaria*; and many cases have since been recorded in medical journals.

FLYCATCHER, the popular name of many denti-rostral or tooth-billed birds, of the order *passeres* and family *muscipida*. They have bills of various lengths, generally broad and flattened at the base, with the culmen curved and the sides compressed to the emarginated tip; the gape is furnished with long and strong bristles, for the easier securing of their flying prey; the wings are usually long, as also is the tail; the tarsi short and weak; the toes long, the outer generally united at the base. The family, according to Gray, contains the following sub-families: *querulina*, or mourners, of tropical America; *alacturina*, peculiar to South America; *tyrannina*, or tyrants, American and principally tropical; *tityrina*, or becarda, of tropical America; *muscipina*, or flycatchers, found the world over; and the *vireonina*, or greenlets, American. The sub-family *muscipina* includes the following genera: *conophaea* (Vieill.), with 7 species, found in the thick woods of tropical America; *platyrhynchus* (Desm.), with about 20 species, in the brushwood and trees of tropical America; *platysteira* (Jard. and Selby), African, with a dozen species; *todirostrum* (Less.), with 15 species, South American; *muscivora* (Cuv.), 8 species, South American; *hipidura* (Vig. and Horsf.), 40 species, found in India and its archipelago, New Zealand, and Australia; *tchitrea* (Less.), 20 species, in Africa, India, and its archipelago; *monarcha* (Vig. and Horsf.), 10 species, in Australia and the islands of the Indian ocean; *seisura* (Vig. and Horsf.), 8 Australian species; *myiagra* (Vig. and Horsf.), 14 species, in Australia and India; *hemichelidon* (Hodgs.), 2 species, in the hills of Nepal; *niltava* (Hodgs.), 20 species, in India and its archipelago; *muscipa* (Linn.), with 70 species, in most parts of the old continent; and *setophaga* (Swains.), nearly 20 species, in North and South America. The last is a very active genus, pursuing swarms of flies from the top to the bottom of a tree in a zigzag but nearly perpendicular direction, the clicking of the bills being distinctly heard as they snap up the insects in the course of a few seconds; the American redstart, (*S. ruticilla*, Swains.), placed in the family *sylvicolida* by Prof. Baird (in his Pacific railroad report), is a good example of the genus.—There is probably no family of birds about which systematic writers on ornithology differ more than

on that of the flycatchers; and to attempt here to follow the subject to anything like a satisfactory result would be alike tedious and unprofitable, and would after all be little else than a question of authority in the science. As far as the American flycatchers are concerned, it will be sufficient to give Prof. Baird's classification in the report above cited. He follows Burmeister in adopting the order *insectores*, and Cabanis in placing most of them in the sub-order *clama-toræ*; he calls the whole family *coleopteridæ*, of which the sub-family *tyranninæ* is what chiefly interests us here. The fork-tailed and swallow-tailed flycatchers belong to the genus *milvulus* (Swains.); the Arkansas, Cassin's, and Couch's flycatchers to the genus *tyrannus* (Cuv.); the great crested, Mexican, Cooper's, and Lawrence's, to the genus *myiarchus* (Cab.); the black, pewee, and Say's, to the genus *sayornis* (Bonap.); the olive-sided to the genus *contopus* (Cab.); Traill's, the least, the small green-crested, and the yellow-bellied, to the genus *empidonax* (Cab.); the last 4 genera are included in the genus *myiobius* of Gray. The Canada and Bonaparte's flycatchers are warblers, belonging to the genus *myiodiocetes* (Aud.) or *setophaga* (Swains.); the solitary, white-eyed, warbling, yellow-throated, red-eyed, Hutton's, and the black-headed flycatchers are vireos; the blue-gray flycatcher belongs to the family of titmice, and to the genus *polioptila* (Sclater.). The flycatchers are active and fearless birds, and tyrannize over the insect world as the hawks do over weaker and smaller birds; they are very beneficial to man by destroying flies, moths, and various insects and grubs injurious to vegetation, and annoying to animals.

FLY WHEEL, a large heavy wheel attached to machinery and running with it for the purpose of equalizing the power and the resistance, and producing uniformity of motion when the power is unevenly applied, or when the resistance is greater at intervals. If power be applied to cause a heavy wheel to revolve, this power, slowly accumulated, is slowly expended in the continued revolution of the body. The momentum of the wheel carries it on when the power ceases to be applied, maintaining uniformity of motion if the application be by impulses, and carries it also without apparent retardation past the dead points of the machinery, overcoming any sudden increase of resistance. Thus the fly wheel distributes the power uniformly, and is of great importance as a regulator in all works where the demands upon the machinery are very irregular, or where the power applied is not uniform. In large engines it is commonly made to run separate from the rest of the machinery, though connected with it. In smaller engines it is often the main driving wheel, the power being communicated directly either by gearing or by a belt. If the power is variable, the fly wheel should be as near as possible to the prime mover; if the resistance is variable, it should be near where this is met, thus avoiding the strain on intermediate shafts.

FLYING FISH (*exocetus*, Linn.), a genus of fishes belonging to the order *pharyngognathi* and the family *scomberesocidæ* (Müller), containing, according to Valenciennes, 88 species. This genus is at once recognizable by its large pectoral fins, capable of being used as parachutes, and to a certain extent as wings; other fish have the faculty of leaping out of the water and of sustaining themselves in the air for a short time, but the *exoceti* far excel these, and approach much nearer in this act the true flight of birds than does the flying dragon or the flying squirrel. Navigators in all tropical seas are familiar with these sprightly fishes, which relieve the monotony of ocean life as birds do the silence of the woods. The characters of the long pectorals, the strength of the muscles which move them, and the size of the bony arch to which they are attached, are the essential conditions of their flight, which is not always to escape their enemies, as has been generally believed, but also to fulfil the end of their curious organization; though undoubtedly intended in part as a means of safety, numerous observations prove that these shining bands pursue their flights when no danger threatens, in the full enjoyment of happiness and security, for mere sport, and probably as a necessity of their structure. Their lot indeed would be far from enviable, were their flights the frantic attempts to escape from pursuing bonitos and dolphins (*coryphæna*), for in the air their danger is quite as great from the albatross, frigate pelicans, petrels, and other ocean birds; but it cannot be that this beautiful provision is wholly devoted to avoiding such dangers; this habit belongs to the same class of phenomena as the flying of the dragon and squirrel, the climbing of trees by the anabas, and the travelling across the land by the common eel. Humboldt, 60 years ago, drew attention to the great muscular force necessary for the flight of these fish; he recognized that the nerves supplying the pectorals are 3 times as large as those going to the ventrals; the muscular power is sufficient to raise them 15 or 20 feet above the surface, and to sustain them with a velocity greater than that of the fastest ship for a distance of several hundred feet. The pectorals strike the air with rapid impulses, scarcely more perceptible than the quick vibrations of the humming bird's wing. Humboldt states that they move in a right line, in a direction opposite to that of the waves, but other observers assert positively that they can turn nearly to a right angle from this course before settling into the water again; though they generally come out on the top of a wave, they can pass over several of their summits before descending. The size of the swimming bladder is enormous, occupying more than half the length of the body; though this, not communicating with the intestine, is of no advantage in making the exit from the water, it contributes to prolong the flight by rendering the body more buoyant. The flying faculty of these fish, the pleasing spectacle of

their troops sporting around the bows of vessels, the glittering of their beautiful colors in the tropical sun, the delicate flavor of their flesh, and the fact of their frequently leaping on board ships, have attracted the attention of mariners from early times; but until a comparatively recent period only 2 species were admitted by naturalists, who gave them a distribution as wide as the tropical and temperate seas. The order to which the flying fish belongs is characterized by having the lower pharyngeal bones united to form a single bone. The generic characters of *exocoetus* are: a head and body covered with scales, with a scaly keel on each flank; the pectoral fins nearly as long as the body; the dorsal over the anal; the head flattened, with large eyes; both jaws with small pointed teeth, and the pharyngeals with numerous compressed ones; upper lobe of the tail smaller than the lower; the fins without spines; the intestine straight, without pyloric cæca.—The common flying fish of the Mediterranean (*E. volitans*, Linn.) is recognized by its long white ventral fins; the body is generally short and thick, robust in the pectoral region, rounded above, flattened on the sides; the head is large, the muzzle obtuse, the lower jaw the longer, the mouth small, the teeth in the anterior part of the jaw, the palate smooth, the tongue free, the gill-openings large, and the branchial rays 10 to 12; the humeral bones are large and firmly articulated to the head, and the pectorals, which are attached to them, are so arranged that when the flexors contract the fins are spread horizontally, and are applied along the sides when the wings are shut; the movements do not differ from those of other fishes except in the freedom permitted by the articulation; the fin rays are very long, and not deeply divided; the ventrals, inserted in front of the middle of the body, are completely abdominal and well developed; the dorsal is small, low, and triangular; the anal very short, and the caudal deeply forked; the swimming bladder extends along the spine even under the last caudal vertebrae, protected by their lower bony arches, a disposition found in no other fish. The general color is a leaden gray, with greenish tints on the upper half of the body, and silvery white below; the pectorals have a wide whitish border; the dorsal is gray, the caudal brown, the anal bluish, and the ventrals whitish. The largest specimens are rarely more than 16 inches long, and they are found in all parts of the Mediterranean. The *E. volitans* (Linn.) is found in so many parts of the world, that it may be called cosmopolitan; specimens have been obtained from the Mediterranean, the coast of France and England, the Gulf stream in the neighborhood of Newfoundland, the West Indies, the east coast of South America, the Cape Verd islands, the tropical parts of the Atlantic, Pacific, and Indian oceans, Australia, New Zealand, and the Polynesian islands. The average length is between 8 and 9 inches; the eye is of moderate size, the teeth

very small, the dorsal and anal fins long and low, the pectorals extending to the caudal, the ventrals very short and attached to the anterior third of the body; the color on the back is rich ultramarine blue, and silvery on the abdomen; the fins are of a darker blue, the pectorals being unspotted. There are 5 species on the coast of North America, which have recently been divided into 3 genera by Dr. Weinland. The common species (*E. exiliens*, Gmel.), found from the gulf of Mexico to the coast of New Jersey, is from 12 to 16 inches long, with dusky pectorals and ventrals, banded with brown in young specimens; the ventrals are longer than the anal, and nearer the vent; the dorsal and lower lobe of the caudal are spotted with brown and black. The New York flying fish (*E. Notorboracensis*, Mitch.), about a foot long, has been found from the middle states to Newfoundland; the color above is dark green, the pectorals brown with the end bordered with white; the ventrals are very long, nearest to the vent, and the wings reach to the tail.—Some species have the lower lip much developed, with one or two tough appendages hanging from the chin; these have been separated as the genus *cypselurus*, and include 2 species of our coast. The *C. comatus* (Mitch.) has a black cirrus on the chin extending half the length of the body, which is about 5 inches; the pectorals do not extend to the end of the ventrals, the latter touching the caudal; it has been found from New York to the southern states. The *C. furcatus* (Mitch.) has 2 appendages from the lower jaw; it is 8 to 5 inches long, and extends from New York to the gulf of Mexico; the pectorals are large, and the ventrals very long. The middling flying fish Dr. Weinland has made the type of a new genus *halocypselus*; this species (*H. mesogaster*, Weinland) is found in the West Indies, varying in length from 4 to 7 inches; the ventrals are very short, about $\frac{1}{2}$ as long as the pectorals, situated anterior to the middle of the body, between the anus and the pectorals; the lower jaw is angular.—The flying gurnard (*dactylopterus volitans*, Cuv.), a spiny fish of the family *triglida* or *sclerogenida*, has also been called flying fish by navigators. The species has been described as occurring in the Mediterranean, in the tropical seas, in the West Indies and the gulf of Mexico, and along the American coast from Newfoundland southward; probably more than one species will be found over such an extended range. These flying fish or sea swallows behave very much like the *exocoeti*, swimming in immense shoals, leaping out of the water for sport and for safety, preyed upon by marine and aerial enemies, and falling in consequence into equally cruel hands on board vessels which come within their range. From the rapid drying of their pectorals and their less muscular power, they fall into the water again sooner than do the true flying fish; their pectorals serve merely as parachutes. They vary from 6 to 8 inches in length.

FLYING SQUIRREL (*ptarmica*, Cuv.; Gr.

pteron, wing, and *mys*, mouse), a genus of the family *sciuridae*, differing from common squirrels principally in the expansion of the skin between the fore and hind feet, by means of which the animal sails in a descending line from one tree to another, supported as by a parachute. There are 2 subdivisions of the genus: *pteromys*, with rounded tail and complicated molar teeth; and *sciuropterus* (F. Cuv.), with flattened tail and molars simple as in other squirrels. The species of the United States and the single one found in Europe belong to the last subgenus. The dentition and general appearance are like those of squirrels; the head and ears are round, and the eyes large; there are 4 elongated toes with sharp claws, and the rudiment of a thumb, on the fore feet; 5 long toes, fitted for climbing, on the hind feet; the sailing membrane is attached in front to a slender movable bone about an inch long, extending at a right angle from the hand; the membrane is hairy on both sides. The common flying squirrel (*P.* or *S. volucella*, Pallas) is about 10 inches long, of which $\frac{1}{4}$ is the tail; the color above is light yellowish brown, the tail being rather smoke-colored, and white beneath; the fur, as in all the species, is very soft and fine. It is a nocturnal animal, rarely appearing until sunset, at which time its gambols and graceful flights may be often seen in places frequented by it; the large eyes indicate its habits, which make it rather an uninteresting pet, as it is lively only at night; it is harmless and gentle, and soon becomes tame, eating the usual food of squirrels. There is nothing resembling the act of flying in its movements, as we see in the flying fish; it sails from a high to a lower point, a distance of 40 or 50 yards, and when it wishes to alight the impetus of its course enables it to ascend in a curved line to about $\frac{1}{3}$ of the height from which it descended; running quickly to the top of the tree, it redescends in a similar manner, and will thus travel a quarter of a mile in the woods in a few minutes without touching the earth. Flying squirrels are gregarious, 6 or 7 being found in a nest, and considerable numbers in the same hollow or artificial cavity, associating with bats and other nocturnal animals; the food consists of nuts and seeds, buds, and even meat and young birds. They produce from 8 to 6 young at a time, and have 2 litters in the southern states, in May and September. This species extends from Upper Canada and northern New York to the extreme southern limits of the United States, east of the Mississippi. The northern flying squirrel (*P.* or *S. Hudsonius*, Gmel.), found from Maine to Minnesota and to the north, is considerably larger; the length of the head and body is 8 inches and the tail $5\frac{1}{4}$; the color above is yellowish brown, mixed with cinereous, the hair lead-colored at the root, beneath white. It is common in Lower Canada; in the Lake Superior copper region, at any rate in the new and remote mining locations, where rats and mice have not yet penetrated, this species lives familiarly in the walls of the log cab-

ins, coming out at night in quest of food, and sometimes committing sad havoc among the miner's scanty stores. Other American species are the *P.* or *S. alpinus* (Rich.), from the Rocky mountains, resembling the last, but a little larger, and the membrane with a straight border; and the *P.* or *S. Oregonensis* (Bach.), in Oregon and California, about the size of the northern species, with a very broad membrane. —The European species (*P.* or *S. volans*, Linn.), found in Siberia, Poland, and Russia proper, is a little larger than the *S. volucella*, whitish gray or cinereous above, and white below; it lives wholly on trees, eating the tender shoots of resinous and other trees. The species of *pteromys* inhabiting India and its archipelago attain a larger size than any of the preceding. The taguan (*P. pectorista*, Pall.) is as large as a half-grown cat; the male is bright chestnut above, and red beneath; the female brown above, whitish below. There are several species in Java, of which the best known are the *P. genibarbis* (Horsf.) and *P. sagitta* (Penn.). The former is remarkable for the radiated disposition of long slender bristles on the sides of the head; though living in a hot climate, the fur is thick and downy; the general color is gray above, with a tawny tint on the back, and white beneath; it is about as large as the common red squirrel. The second species, like the first, is rare, and lives principally on fruits; the color is brown above, and white below. Several other species are described.

FÆTUS. See EMBRYOLOGY.

FOG, a body of aqueous vapor in the atmosphere, like the clouds seen in the sky above, and distinguished from them only by its position near the earth. It forms when the conditions are favorable for rapid evaporation, and the atmosphere, already at its dew point, can contain no more vapor in an invisible state. If the quantity of vapor thus added is too great to be buoyed up in the atmosphere, the fog passes into rain. The formation of fog over bodies of water during cool nights, and especially toward morning, is explained by the air becoming chilled more rapidly than the water, when the stratum lying upon the surface of the water receives from it heat and moisture, and becoming specifically lighter, rises and mixes with the colder air above. The temperature is then reduced, and its moisture is precipitated in visible vapor. As masses of air of different temperatures are brought together by any cause and intermix, the formation of fog is a common result from the temperature of the warmer portions being reduced below the dew point. It is generally understood that the formation of fog over any moist surface is dependent upon its temperature being somewhat warmer than that of the superincumbent atmosphere, as also upon the atmosphere itself being nearly saturated with moisture. Whether this is a law of universal application appears to be rendered questionable by observations of Dr. W. M. Carpenter upon the occurrence of fogs upon our southern rivers,

as the Mississippi, during the spring months and early part of the summer. At this season the water has the temperature of a more northern latitude, often many degrees below that of the atmosphere immediately over it, and below that over the land; yet fogs originating during the day under these circumstances are of frequent occurrence from February to May, and none are observed at this season when the water is not cooler than the air. These fogs rarely extend over the land, being almost wholly limited to the air over the river. They commence near the surface of the water, and increase in depth by additions from above. Dr. Carpenter attributes the production of the fog in these instances to the refrigeration of the air in consequence of communicating its heat to the water; this chilling gradually extends upward, notwithstanding the low conducting power of atmospheric air, and moisture is precipitated in consequence. These observations of Dr. Carpenter are contained in a paper published in the "American Journal of Science" (vol. xlv. p. 40, 1843).—The production of fog is a phenomenon of almost daily occurrence during the warm season in northern mountainous forests; and in the cool early morning succeeding a warm day, the phenomenon may be observed to great advantage from an elevated point overlooking the woods, lakes, and water courses. As the day dawns, the vapors are seen to be gathered over all the low places, and covering the moist lands and the surface of the water with an impenetrable mist. Out of this rise like islands the more elevated portions, some trees here and there taller than the rest spreading their branches and foliage above the fog, and resembling ships lying idly upon the still water, their canvases hanging loosely about the masts. As the sun rises, the tops of the mists melt away in the warmth of its rays; but in the deep valleys and under the shelter of the high mountains the fog long continues, defining by its presence the course of the streams it covers along their meanderings through the dense woods and among the distant hills. Gradually disappearing, it prevents the rays of the sun from striking too suddenly upon the moist vegetation, thus producing a rapid evaporation that would engender frosts. (See EVAPORATION, and FROST.) The warmth finally reaches the cool air that has collected in the lowest places, and the mists wholly disappear. But in very moist places, particularly over large surfaces of water, or when the day is cool and the air filled with moisture, the fog does not so readily disperse. It contends successfully with the sun, appearing and disappearing; swept away for a time by the wind, and again shrouding the surface with its dense curtain. As it lifts for a few moments, the vessels enveloped in it seize the opportunity to secure the bearings of prominent points before it again shuts down upon them. The eastern American coast in the summer months is particularly subject to fogs, the waters of the ocean continuing at a higher temperature than

the land, which sooner parts with its heat to the cool breezes. They become more prevalent further eastward, and at last at the banks of Newfoundland the most favorable conditions are found for their production, in the warm waters of the Gulf stream swept around from the tropics, and meeting the air chilled by the icebergs which the polar current here discharges. The lifting of the colder waters also from the depths of the ocean upon the shoals reduces the temperature of the air, causing condensation of the vapors which rise from the warmer waters around. Fogs are also very prevalent in some portions of the equinoctial regions, particularly along the western coast of South America, where they make up to some extent the want of rain. Lima, as stated by Humboldt, is enveloped in fog the greater part of the time for 6 months together, particularly in the morning and evening.—A theory has been advanced by M. Peltier that the electric condition of the air has much to do with the production of a class of fogs, the origin of which cannot be accounted for by a difference between the temperature of the air and that of the moist surface of the earth. The opposite electrical conditions of the earth and atmosphere he regards as favoring the transfer of aqueous particles from one to the other; and when the different electrical states are very decided, the vapors rising from the surface must be hurried upward with increased force. Thus vapors may be raised into the higher regions of the atmosphere, and be brought down to the surface of other parts of the world, where their appearance cannot be accounted for by the usual cause of fogs. M. Peltier distinguishes fogs which have been produced by negative, and those by positive electricity; the earth itself being negative, the vapors that arise assume the same condition; but the particles charged with this electricity are repelled, and the strata near the surface are positive by induction. The views of M. Peltier have been received as proper subjects of speculation, without the conclusions he draws being regarded as established.—Fogs which appear suddenly without any apparent cause of difference of temperature or of being swept in by winds, and extend at once to great heights, are referred by Sir John Herschel to a fall of temperature of a mass of air, not by radiation, contact of a cold body, or mixture with colder air, "but by the simple effect of its own expansion. This may take place in two ways, viz.: 1, by a rapid and considerable relief of barometric pressure from above; or, 2, by its own ascent into a higher region of the atmosphere." Such fogs, which disappear when the atmospheric equilibrium is restored, are of the same nature as the cloud produced in the receiver of an air pump by a rapid partial expansion of the air. For these Sir John Herschel proposes the name of barometric fogs.—It is a question with meteorologists whether the particles of fog vapor are hollow or solid globules, or a mixture of both. De Saussure thought he had detected the hollow vesicles in the clouds

upon the Alps; and Kratzenstein affirms that by examining with a microscope the vapor rising in the sunlight from the surface of hot water, he could recognize the beautiful colored rays, such as are developed at the highest point of the common soap bubble, as it floats in the rays of the sun, and which would not appear if the spheres were drops. He argues, moreover, that if the globules were solid drops, rainbows would occasionally be seen when the sun and cloud were in favorable positions relatively to the observer for their development; but this never occurs. On the other hand, Sir John Herschel states, that on descending under a full moon a few yards below the surface of the mist collected in a valley, a lunar rainbow is frequently seen; that the finest he ever saw, which was on Nov. 12, 1848, "was formed in a dense fog, evidently close at hand, and when not a drop of actual rain was falling. On this occasion the exterior or secondary bow was seen."—A thick state of the atmosphere resembling fog, except that it is not accompanied with aqueous vapors, is often seen, sometimes obscuring the heavens for weeks together, to which the name of dry fog has been given. In north Germany it was long observed to recur periodically before its course was traced to the great burnings of peat beds, which for agricultural purposes are carried on over a large extent of country, filling the atmosphere of distant regions, in the direction toward which the prevailing winds blow, with the smoky haze. The greater portion of New England has many times been covered with the same haze, the cause of which has been attributed to extensive fires spreading through the forests of Maine or of the provinces to the eastward. An extraordinary dry fog is recorded to have covered the whole of Europe in 1783 for nearly two months, which was remarkable for its acrid odor, and the blue color it imparted to objects. This was a season of terrible volcanic eruptions and earthquake convulsions in southern Italy and other parts of Europe, and the fog was no doubt the fine volcanic ashes with which the whole atmosphere was filled.

FOGARASSY, JÁNOS, a Hungarian jurist, grammarian, and lexicographer, born in Kásmark in 1801. He studied at Sáros-Patak, was admitted to the bar in 1829, and held several offices before, during, and after the revolution of 1848-'9. He wrote a number of valuable judicial manuals, but is distinguished chiefly for his linguistic contributions to Hungarian literature, of which his *A magyar nyelv szelleme* ("Spirit of the Hungarian Language," Pesth, 1845) is the most important.

FOGGIA, a city of Naples, capital of the province of Capitanata, in the plain of Apulia (La Puglia), 76 m. N. E. of Naples; pop. 24,058. It is well built, with wide clean streets, handsome houses and gateways, but no walls. It has about 20 churches, and a cathedral originally Gothic, but rebuilt in a different style after its partial destruction by an earthquake in 1781. The main streets and public squares are under-

mined by capacious vaults called *fosses*, in which quantities of grain are stored from year to year. There are many schools, including one of agriculture and a seminary for girls. The city is surrounded by fine plantations and vineyards, but the climate is unhealthy. Foggia is supposed to have been founded about the 9th century, and peopled from the ancient Arpi or Argyrippa, 4 m. distant, the ruins of which are still visible. It was one of the favorite residences of the emperor Frederic II.

FOIL (Lat. *folium*, a leaf), the bright, highly colored metallic leaf, used by jewellers for increasing the brilliancy of pastes and inferior stones. It is made of sheet copper covered with another of silver, and rolled or hammered thin. The silver side is then burnished or varnished; and it is either so used or is coated with transparent colors mixed with isinglass size. Thin sheet copper may also be prepared by heating it between two iron plates and then boiling it in a solution of equal parts of tartar and salt. By proper care in the duration of the heating and boiling, the copper may be made to assume a white appearance, which may be rendered very brilliant by polishing with whiting upon a very smooth copper plate. (For tin foil, see **TIN**.)

FOIX, the capital of the French department of Ariège, and of an arrondissement of its own name, on the left bank of the river Ariège at its junction with the Arget, in a narrow valley at the foot of the Pyrénées, 404 m. from Paris; pop. of the arrondissement in 1856, 84,733, and of the town 4,612. It has considerable trade and various manufactures, the principal of which is iron. It was founded probably about the 2d century, and in the 11th century became the capital of a county of the same name, and was a stronghold of importance.

FOIX, **COUNTS DE**, a French family who ranked among the most powerful in southern France, and figured conspicuously in history from the 11th to the 15th century.—**RAYMOND ROGER** reigned from 1188 to 1223. He engaged in the 3d crusade among the followers of Philip Augustus, and distinguished himself by his bravery at the taking of Acre. After his return to France, he sided with the count of Toulouse and the Albigenses against the crusading forces led by Simon de Montfort, and contributed to the raising of the siege of Toulouse, during which Montfort was killed.—His son, **ROGER BERNARD II.**, styled the Great, who succeeded him in 1223, followed his example, but in 1229 was forced into submission to the king and the pope.—**ROGER BERNARD III.** (1265-1302) gained considerable reputation as a troubadour, but was unsuccessful in his wars with the kings of France and Aragon; he was several times imprisoned.—**GASTON II.** (1329-1343) did good service to Philip VI. of France in his war with the English, and assisted Alfonso XI. of Castile against the Moors.—**GASTON III.**, son of the preceding, succeeded his father in 1343, when only 12 years old. He was called

Phébus on account either of his light hair or of a sun he bore on his escutcheon. He signaled himself against the English in Guienne and Languedoc, and in 1356 was imprisoned for a while at Paris, for complicity in the intrigues of Charles the Bad of Navarre, his brother-in-law. On his release he fought bravely in the ranks of the Teutonic knights against the Prussians. Returning to France in 1358, he contributed to the defeat and destruction of the rebellious Jacquerie, who were besieging the royal chateau at Meaux. In 1362, by his victory at Launac over the count d'Armagnac, he secured for himself possession of Béarn; and the magnificence of his court at Orthez and afterward at Pau was greatly admired by the chronicler Froissart. In 1380 he was appointed governor of Languedoc by Charles V., but his dignity was contested by the duke of Berry, whom he defeated at Revel. In 1382, suspecting his son of an attempt to poison him, he had him cast into prison, where the boy is said to have died of starvation. Gaston Phébus was a famous huntsman, and as an evidence of his knowledge left a book entitled *Miroir de Phébus, des déduits de la chasse des bestes sauvages et des oyseaux de proie* (Paris, fol., 1507).

FOKSHANY, a frontier town of Moldavia and Wallachia, European Turkey, 92 m. N. E. of Bucharest, divided by the river Milkov into 2 parts; pop. variously estimated from 6,000 to 20,000. The smaller part belongs to Moldavia. The best Moldavian wine is produced in its vicinity. A congress between Russian and Turkish diplomatists was held there in 1772. The larger part belongs to Wallachia. Here the Greek Hetairists were defeated by the Turks, June 1, 1821.

FOLDVAR DUNA, a city of Hungary, in the county of Tolna, on the right bank of the Danube; pop. about 12,000. Commanding the communication between the upper and lower Danube, it is a place of strategical importance. The surrounding district is fertile, producing grains and wine. The chief occupation of the inhabitants is agriculture.

FOLEY, JOHN HENRY, A. R. A., an Irish sculptor, born in Dublin, May 24, 1818. At an early age he entered the drawing and modelling schools of the royal Dublin society, and in 1834 went to London and became a student at the royal academy. In 1839 he first appeared as an exhibitor there, and his models of "Innocence" and the "Death of Abel" were admired. The most popular of his imaginative works are: "Ino and the Infant Bacchus" (1840), "Lear and Cordelia" and the "Death of Lear" (1841), "Venus rescuing Æneas" (1842), "Prospero relating his Adventures to Miranda" (1843), &c. His statue of Selden was placed in the new palace of Westminster in 1855 near that of Hampden, considered his masterpiece.

FOLIGNO (anc. *Fulginia* or *Fulginium*), a walled city of the Papal States, in a beautiful valley of the Apennines, 20 m. S. E. of Perugia; pop. 15,400. It is large, but poorly built. In

1881-'2 it was nearly destroyed by earthquakes. The celebrated picture of Raphael, *La Madonna di Foligno*, took its name from this place.

FOLKESTONE, a market town, seaport, and parish of England, co. of Kent, built partly on the level shore and partly on a cliff on the straits of Dover, 7 m. S. W. of Dover, and 88 m. S. E. of London by the S. E. railway; pop. in 1851, 6,726. It was anciently a place of importance, and still has traces of Roman works of defence. In the 18th century it was the seat of extensive fisheries, and drew still greater wealth from various branches of the smuggling trade, on the suppression of which it fell into decay. Since the opening of the railway, however, which connects at this port with a line of steam packets for Boulogne, it has recovered its prosperity. The harbor has been improved, a fine pier has been built, a custom house established, new warehouses and hotels have been erected, and streets opened. It is said that the town formerly contained 5 churches, 4 of which were swept away by the sea. There are now 2, one of which was built in 1850, while the other is a cruciform structure of early date. An old castle, founded by the Saxon kings of Kent and rebuilt by the Normans, has been almost totally destroyed, together with the height on which it was erected, by the gradual encroachment of the sea. Harvey, the discoverer of the circulation of the blood, was born here. Folkestone is a sub-port of the cinque port of Dover.

FOLLEN, August, afterward ADOLF LUDWIG, a German poet, born in Giessen, Hesse-Cassel, Jan. 21, 1794, died in Bern, Switzerland, Dec. 26, 1855. After studying philology and theology in his native town, he served in the campaign of 1814 against France. On his return he studied law for 2 years at Heidelberg, in 1817 began to edit the *Allgemeine Zeitung* at Elberfeld, in 1819 was involved in political attempts for which he was imprisoned 2 years in Berlin, and went thence to Switzerland, where he taught the German language and literature at Aarau, and subsequently became a citizen of Zürich and member of the chief council. In 1847 he purchased the castle of Liebenfels in Thurgau, whence in 1854 he removed to Bern. He translated the Homeric hymns (in connection with K. Schwenck, Giessen, 1814), and a volume of old Latin ecclesiastical hymns (Elberfeld, 1819). His other principal productions are a romance of chivalry and magic, *Malagys und Vivian*; adaptations of *Tristan und Isolde*, and of the first part of the *Nibelungenlied*; *Freie Stimmen frischer Jugend* (Jena, 1819); *Bilder-Saal deutscher Dichtung* (Winterthur, 1837); 6 sonnets entitled *An die gottlosen Nichts-Wätherriche* (Heidelberg, 1846), directed against the critical tendencies of Ruge; and a romantic epic, *Tristans Eltern* (Giessen, 1814).

FOLLEN, CHARLES, an American clergyman, brother of the preceding, born at Romrod in Hesse-Darmstadt, Sept. 4, 1796, perished in the conflagration of the steamer Lexington in

metaphysics. While at Chur and Basel a demand was made by the allied powers for his surrender as a revolutionist. It was twice refused, but on its renewal a third time, with a declaration that the good understanding between the governments would be destroyed if it were not complied with, Basel yielded, and a resolution was passed for the arrest of Follen. He escaped from the city, concealed by a friend in the boot of a chaise, and soon after sailed from Havre to the United States. In Jan., 1825, he arrived at New York, and in the autumn of that year received the appointment of teacher of the German language at Harvard college. In 1828 he was appointed teacher of ecclesiastical history and ethics in the divinity school, having in the mean time been admitted as a candidate for the ministry. In 1830 he was appointed to the professorship of German literature at Harvard, which position he held for 5 years. He was afterward the pastor of a Unitarian society in New York, and in East Lexington, Mass., and was settled over the latter, when on Jan. 13, 1840, he was a passenger in the steamboat Lexington which was burnt in Long Island sound, and was one of the victims of that terrible catastrophe. While in Cambridge Dr. Follen published a German grammar and reader; he was a frequent contributor to the reviews, and occasionally gave courses of lectures upon various subjects. His sermons and lectures, and a sketch of a work on psychology which he never finished, with a memoir of his life by Mrs. Follen, have been published in 5 vols. (Boston, 1841). During his life in the United States he was an earnest adherent of the anti-slavery movement.—ELIZA LEE, wife of the preceding, daughter of Samuel and Sarah Cabot, born in Boston, Aug. 15, 1787, was married to Dr. Follen in 1828. In the winter of 1827-'8 she published "Selections from Fénelon," and the "Well Spent Hour." In 1829 she edited the "Christian Teacher's Manual." During the next 6 years she published several little books for children. In 1835 she wrote "The Sceptic" for the "Sunday Library." In the winter of 1838-'9 she published "Married Life," "Little Songs," and a volume of poems; and in 1841 the memoir of Dr. Follen, as the first volume of his collected works. From 1843 to 1850 she was the editor of the "Child's Friend," and in 1857 published "Twilight Stories." She has now (1859) in press a "Second Series of Little Songs," and a compilation of "Home Dramas."

FONBLANQUE, ALBANY W., an English

acquired distinction as one of the ablest political writers of his time. Hunt in his autobiography, alluding to his retirement from the "Examiner" in 1820, says: "I had an editorial successor, Mr. Fonblanque, who had all the wit for which I toiled, without making any pretensions to it. He was, indeed, the genuine successor, not of me, but of the Swifts and Addisons themselves; profuse of wit even beyond them, and superior in political knowledge." In the "Noces Ambrosianæ" for Oct. 1832, Lord Jeffrey is made to say of Fonblanque: "I admit he is a very able fellow, and much regret I did not find him out a few years ago, to nail him to the 'Edinburgh Review,' where he would have been more useful than even Tom Macaulay, I suspect. He too is a gentleman, and, therefore, however he may foam away just now, I don't despair of seeing him wear round on a seat at the board of control, or the like, some pretty morning." In 1837 Fonblanque published in 8 vols. "England under Seven Administrations," a selection of his editorial articles in the "Examiner." In 1852 he was appointed director of the statistical department of the board of trade, which office he still holds, having in 1846 resigned the editorship of the "Examiner" to Mr. John Forster.

FOND DU LAC, an E. co. of Wisconsin, situated at the S. end of Lake Winnebago; area, 754 sq. m.; pop. in 1855, 24,784. It is drained by Fond du Lac river, and by the sources of Red and Milwaukee rivers. A steep ledge of limestone, running from N. E. to S. W., divides the county into two unequal portions, the easternmost of which is heavily timbered, while the other contains extensive prairies. The soil is calcareous and generally fertile. Grain, pork, and butter are the staples, and the productions in 1850 amounted to 166,718 bushels of wheat, 74,861 of Indian corn, 101,825 of oats, and 1,347,479 lbs. of butter. There were 2 newspaper offices, 17 churches, and 2,844 pupils attending public schools. The county was first settled in 1835, since which time its growth has been exceedingly rapid.—FOND DU LAC, the capital of the above county, a township and city, at the S. end of Winnebago lake, 72 m. N. N. W. from Milwaukee, and 90 m. N. E. from Madison; pop. of the township in 1855, 5,083; of the city proper, 4,230; in 1859, about 8,000. It has grown up almost wholly since 1845, although there was a trading post here at an early date. The town occupies a pleasantly wooded slope reaching toward the lake, and contains 8 churches, 2 newspaper and one job printing office, 10 steam saw mills, 2 steam flouring mills and 5 water mills in the immediate vicinity, 1 steam woollen factory, and 70 or 80 stores. It has a great number of Artesian wells, of depths varying from 80 to 100 feet. The Chicago, St. Paul, and Fond du Lac, and the Milwaukee and Fond du Lac air line railroads connect it with the principal cities and towns in the state, and steamboats ply between it and

the mouth of Fox river, thus placing it in communication with the great boat channel between Lake Michigan and the Mississippi river. Since the completion of the "Fox river improvement" vessels are enabled to pass from Lake Michigan up Green bay and Fox river (which flows through Lake Winnebago) to a canal $1\frac{1}{2}$ m. long connecting that stream with the Mississippi.

FONK, PETER ANTON, a Cologne merchant, born at Goch, near Oleva, in 1781, died there, Aug. 9, 1832. He was involved in a criminal trial which created at the time much sensation in Germany. He was associated in the brandy and liquor business with an apothecary of Crefeld, who sent an agent to Cologne for the purpose of investigating the accounts of his partner. This agent, named Cönen, who seemed to have discovered considerable frauds in Fonk's transactions, suddenly and mysteriously disappeared on the night of Nov. 9, 1816. Fonk was indicted for having murdered him, assisted by his cooper, Hamacher. The latter confessed the guilt, but afterward withdrew his evidence. The trial was transferred to Treves, in order to avoid the influence which was brought to bear upon it in Cologne, where Fonk's friends held a high position. Hamacher was sentenced to 16 years' hard labor (Oct. 31, 1820), and Fonk, after having escaped conviction in several trials which took place in connection with the case, was at length found guilty of murder by 7 jurymen out of 12 (June 9, 1822), and sentenced to death. His appeal against the verdict was rejected by the supreme court of Berlin, but he was pardoned by the king (Aug. 20, 1827); and by a royal order, dated Oct. 9, he was even released from the payment of costs, which exceeded \$30,000. The pardon was granted on the ground that the act of murder had not been clearly established.—The name of Peter Fank, applied to fraudulent traders in America, has been supposed to be derived from this merchant.

FONT, or FOUNT (Fr. *fonte*, from *fondre*, to melt or cast), in printing, an assortment of types of one size, in which there is a due proportion of all the requisite letters and characters. The quantity of a font is indefinite; it may consist of but a few sets of characters, as of large wood type or fancy type seldom used, or of many thousand pounds for the printing of books or newspapers.

FONTAINE, JEAN DE LA. See LA FONTAINE.

FONTAINEBLEAU, a town of France, department of Seine-et-Marne, 85 m. S. S. E. from Paris, on the S. E. railway, in the midst of the forest to which it gives its name; pop. in 1856, 8,272. It has a college, a public library, 3 handsome barracks for cavalry and infantry, a hospital founded by Anne of Austria, an asylum for girls established by Mme. de Montespan, an obelisk erected on the marriage of Louis XVI. with Marie Antoinette, and the old residence of Gabrielle d'Estrée. Its manufactures of porcelain and earthenware have some reputation; and the delicious grapes

the bloody tyranny of Collet d'Herbois. This becoming known, he was obliged to conceal himself, and did not reappear in public until the 9th Thermidor. He now became one of the contributors to the *Mémorial*, a newspaper in the royalist interest. On the 18th Fructidor he took refuge in England, where he met Châteaubriand, then a penniless and unknown exile, and a lasting friendship grew up between them. Being allowed to return to France after the 18th Brumaire (Nov. 1799), he was appointed by the first consul to deliver a panegyric on Washington. He became a member of the legislative body in 1802, and was chosen its president in 1804. On the reestablishment of the French university in 1808, Napoleon placed him at its head with the title of grand master, and employed him as his spokesman on many public occasions. In 1810 he appointed him senator and showed him many favors. Fontane, however, who had always been a royalist at heart, deserted his protector in 1814, voted against him in the senate, and joined the new king. He thus secured the tenure of his offices and dignities, and was promoted to the peerage by Louis XVIII. During his later years he devoted his leisure hours to an epic poem, *La Grèce délivrée*, which he did not complete. The sudden death in a duel of his adopted son, M. de St. Marcellin, so preyed upon his mind that he died broken-hearted, at the age of 64. His finished style of oratory and the purity and terse elegance of his poetry have given him the title of "Racine's last descendant." A collection of his speeches was published in 1821, and his works were edited by Sta. Beuve in 1839, with a biography.

FONTARABIA. See FUENTE RABIA.

FONTENAY, or FONTANET, a village of France, department of Yonne, noted for a battle which the sons of Louis le Débonnaire fought there, June 25, 841, and in which Lothaire, then emperor, was defeated with great slaughter by Louis of Bavaria and Charles the Bald. This battle was soon followed by the treaty of Verdun (843), which terminated the war of the brothers and divided the empire of Charlemagne.

FONTENAY-LE-COMTE, a town of France, formerly the capital of a department in Poitou, now that of an arrondissement in the department of Vendée; pop. in 1856, 7,815. It has several remarkable churches, a college, and 8 yearly fairs, and carries on a considerable trade in wine and timber. During the French revolution its name was changed to Fontenay-le-Peuple.

Racine and Boileau. In 1688 he published the *Dialogues des morts*, which was the beginning of his reputation. In 1686 his *Entretiens sur la pluralité des mondes*, and in 1687 his *Histoire des oracles*, an abridgment of a voluminous book of Van Dale in Dutch, rendered him popular among those who were fond of scientific matters expounded in an elegant and somewhat affected style. His *Histoire de l'académie des sciences* and *Éloges des académiciens* are still admired for their clearness, perspicuity, and elegance. D'Alembert wrote a eulogy, and Villemain has a vivid sketch of him in his *Tableau de la littérature au 18^e siècle*.

FONTENOY, a village of Belgium, province of Hainault, 5 m. S. E. from Tournay, noted for a victory of the French over the English, Dutch, and Austrians, May 11, 1745, fought by the latter for the relief of Tournay, then besieged by the French. The French, 76,000 strong, led by Marshal Saxe and animated by the presence of the king and the dauphin, were posted on a hill with Fontenoy before them, the village of St. Antoine and the river Scheldt on the right, and a small wood on the left. Their naturally strong position was so fortified by art as to be deemed almost impregnable. The allies, numbering 50,000, more than half of whom were English, were under the duke of Cumberland. They attacked the French outposts on the 10th, passed the whole night under arms, and early the next morning began the engagement by a fierce cannonade. The Dutch undertook to carry St. Antoine and Fontenoy by assault, but were driven back in disorder. Gen. Ingoldsby, who had been ordered to pierce the wood with a British division, retired with dishonor, while the duke of Cumberland, with 14,000 British and Hanoverian infantry marching in columns of 30 or 40 front, led the assault upon the main body. With bayonets fixed they plunged down a ravine which separated them from the French line, and while artillery mowed down their ranks from right and left, marched steadily forward with rapidly diminishing numbers but unflinching courage. They gained the hill in a solid mass, cut down every thing before them, and had nearly won the day by intercepting the French retreat to the Scheldt, when Saxe, having in vain urged the king to fly, collected his force for a last effort. By the advice of the duke of Richelieu, 4 pieces of cannon were brought to bear upon the British front, while the household troops, the reserve, and foremost of all the brigade of Irish exiles, charged on either flank. Exhausted and unsupported, the English fell back, but their retreat was as firm as their advance. Their cavalry now came to the rescue, and they reached the allied position with unbroken ranks, having twice cut through more than 5 times their number of the enemy. The allies retreated to Ath, leaving 7,400 killed, wounded, and prisoners, while the French acknowledged about an equal loss. The young duke de Grammont was one of those who fell. Tournay surrendered June 21.

FONTÉVRAULT, ORDER OF, a monastic order in the Roman Catholic church, founded in 1096 at La Roc, in the forest of Craon, by Robert of Arbrissel, who called his followers *Pau-pères Christi* (the poor of Christ). They were transplanted in 1099 to the desert of Fontévrault. As the rule of St. Benedict was adopted, the order may be considered as one of the numerous branches of the Benedictines. The founder established at Fontévrault 4 buildings, one for 300 nuns, one for 120 sick, one for penitent females, and one for monks, with one church for them all in common. The most remarkable feature in this order is its constitution. In honor of the Holy Virgin and the authority which Jesus gave to her over John when he said to the latter, "Behold thy mother," the government of the whole order was conferred upon the nuns with an abbess at their head. The monks rendered the service of obedient sons. The founder placed himself under the authority of the first abbess. The order was ratified by the pope in 1106, and exempted from the jurisdiction of bishops. It soon spread over France, Spain, and England, and counted at the death of the founder 8,000 nuns. The relation of the sexes to each other led to many disorders, the monks making repeated attempts to emancipate themselves. When, in 1459, the abbess Marie de Bretagne saw herself unable, even with the assistance of the pope, to overcome the opposition, she retired with some sisters to Orleans and there restored the old discipline. This reformed branch was confirmed in 1475, and soon counted 28 convents, while the rest of the order was divided into several congregations. The continued differences existing in the order induced the king of France in 1520 to decree that the abbess should be elected for life, but that the visitation of all the convents should be transferred to a member of another order, to be designated by the pope. The reformation put an end to the convents in England, and the French revolution to the rest of the order. The last abbess died at Paris in 1799. The extensive abbey buildings of Fontévrault are now used as a *maison de détention* by the French government. The church is famous for possessing the monumental effigies of two English kings, Henry II. and Richard Cœur de Lion, and of Eleanor of Guienne, queen of the former, and Elizabeth, consort of John Lackland, who were buried here.

FOO-CHOW, Foo-choo, or Foo-chow-foo, Fu-chu, or Fu-chu-fu ("happy city"), a populous city of China, capital of the province of Fokien, and one of the 5 ports thrown open to the British by treaty in 1842; pop. about 600,000. It stands on a plain on the left bank of the Min, 25 m. from its mouth, surrounded by an amphitheatre of hills about 4 m. distant, and defended by a wall the circuit of which cannot be less than 10 miles. This wall is 30 feet high, 12 feet thick, and overgrown with grass. It has towers at short intervals in which a few pieces of cannon are placed and guards constantly stationed.

The entrance to the city is by 7 gates, each commanded by lofty towers, and the defences are still further strengthened by fortifications on 2 hills, one within the city, and the other rising from the plain outside the walls. The suburbs, which are equal in extent to the city itself, stretch along both banks of the river, and communicate with each other by means of a stone bridge 420 paces long, resting on a small island in the stream, supported also by 49 stout piers, and lined with shops. One small suburb near the Tang-mun, or Bath gate, contains a number of public hot baths. The city proper is regularly built, with low tile-roofed houses, vast granaries, and some handsome buildings, among which are the residences of the civil and military officers of the province. The temples are numerous, the largest being that known as the Ohing-hwang-miau; the most popular deities are the god of war and the goddess of mercy. The shops, of which there are very many, are stocked with a profusion of goods of rather poor quality. They are quite open, and with the full display of their contents, the jostling and noise of the hucksters, and the crowded state of the streets, give the thoroughfares much the appearance of a market place. One of the most singular features of Foo-chow is the great number of watch towers erected in all parts of the city—on the walls, over the streets, and even on the house-tops—some of them covered with grotesque ornaments, and one in particular attracting the notice of strangers by its great height and its clock dial with Roman letters. The streets are planted with trees, and regularly laid out, but there is little else to be said in their praise; the most abominable filth accumulates in them without seeming to cause the inhabitants the slightest inconvenience, beside which they are infested with beggars, whose squalid and loathsome appearance is beyond description. Fully one-half the population is said to be addicted to opium-smoking, the annual expenditure for which amounts to \$2,000,000. In the city and vicinity there are 500 furnaces for making porcelain, in addition to factories of blue cloth, cotton goods, screens, combs, &c. There are lead mines near by, and a great tea-growing district lies within 70 miles, so that black tea can be purchased here 25 per cent. cheaper than at Canton. The commerce of the city is chiefly with Japan, the Loo-choo islands, and the maritime provinces of China. Timber, tea, paper, bamboo, fruits, spices, corn, copper, and lead are the principal exports; the imports are salt, European manufactures, sugar, and a great variety of other goods. The approach to the harbor from the sea is difficult, but there is good anchorage at Pagoda island, 9 miles below the city. The port is much frequented, the channel of the river and a sheet of water called Li-hu, or West lake, on the W. side of the city, being crowded with fishing and trading vessels, ferry boats, and floating habitations. The merchant shipping is estimated at 20,000 tons, and the value of import and return

cargoes is supposed to amount to \$7,000,000 per annum, in addition to which an extensive trade is carried on by land.—There is another city in China of the same name, 240 m. N. W. of this, in the province of Kiang-si.

FOOD. See ALIMENT, and DIETETICS.

FOO-SHAN, or FU-SHAN, a large city on the island of See-kiang, province of Quang-tung, China. It is said to contain upward of 200,000 inhabitants, many of whom live in boats.

FOOL, or JESTER, a character in mediæval courts and noble families, whose business it was to entertain the household by amusing sallies. Somewhat similar were the parasites of antiquity, who were wont to pay for their dinners by jests and flatteries. Court fools do not appear distinctly and officially till after the crusades, and may have been introduced into Europe from the East. They were at first either misshapen, half imbecile dwarfs, who were themselves ridiculous objects, and whose senseless replies were welcomed with laughter; or quick-witted, half-mad fellows, such as are not unfrequently found among the deformed; or poor and merry poets, who devoted themselves to this part for the income which it obtained. Among the insignia of the office were the fool's cap, party-colored, adorned with 3 asses' ears and a cock's comb, and worn on a shorn head; the variously shaped fool's sceptre or bauble; the bells, which decorated the cap and most other parts of the costume; and a wide collar. One of the most celebrated of fools was Triboulet, a favorite of Francis I. of France, who amused his master often by giving him most impertinent counsels. He carried tablets with him on which he inscribed the names of those courtiers who had committed any act of folly. His successor was Brusquet, who combined other offices with that of fool, who suffered much from the tricks of the courtiers whom he mystified, and whose bon-mots have been often repeated. Earlier French fools of renown were Caillette, Thony, Sibilot, Chicot, and the female Mathurine, and the annals of the office in France terminate with Angely, who was the titular fool of Louis XIII., and who became by his refined and cynical pleasantry one of the most formidable personages at court. Jodel der Narr, who was taken by the emperor Ferdinand II. to the diet in 1622, and Klaus Narr of Saxony, are famous among German fools. The office ceased in most European countries about the close of the 17th century, but continued longer in Russia, where Peter the Great often had 12 fools, and the empress Anne 6, among whom were the Portuguese Da Costa and the Italian Pedrillo. In England the fools were long distinguished by a calf-skin coat, which had the buttons down the back, and which protected them from the anger of those whom they provoked by their jests. By the illuminators of the 13th century they are represented as squalid idiots, wrapped in a blanket, and holding a stick with an inflated bladder attached to it, which served as a bauble. It was not till the 16th century that they were often men of ability, when,

as appears from Shakespeare and other dramatists, the entertainment that they afforded consisted in witty retorts and sarcastic reflections. Though their license was very extensive, they were liable to correction or discharge from office. Thus Archibald Armstrong (called Archy), jester to Charles I., was ordered for "certain scandalous words, of a high nature, spoken by him against the lord archbishop of Canterbury, to have his coat pulled over his head, and be discharged the king's service, and banished the court."

FOOLAHIS, FULBE (sing. PELLO), FELLANI, or FELLATAH, a people of W. and central Africa, comprising many tribes scattered over the region which lies between Bondoo and Senegambia, and the great desert and Guinea. Originally they were a nomadic race, whose chief occupation was cattle-breeding, but about the middle of the 18th century, most of them becoming converts to Islamism, they began to found independent states, and to prosecute a course of conquest which they are still pursuing. About 1802 one of their chiefs, called Othman or Danfodio, began to emulate the career of Mohammed, and, aided by a religious enthusiasm which he excited among his followers, laid the foundation of an empire at Sackatoo, between Bornou and the river Niger. He died in a sort of fanatical ecstasy in 1818. According to Dr. Barth, the revenue of the provinces subject to his successors is about \$50,000 in shell money, and as much more in slaves and goods, which is less than it was at a more flourishing period of the empire. The military force consists of about 25,000 cavalry, but on account of the rebellious spirit of some of the provinces, all these troops could not be concentrated in the field. Gando, 30 or 40 miles from Sackatoo, is the seat of a Foolah prince of equal power with the above; and at Timbo, the capital of Fouta Jallon, resides a third. It is the opinion of modern travellers that the Foolahs are destined to become the dominant people of Negroland, and they have excited more interest and scientific research than almost any other African race. In language, appearance, and history, they present striking differences from the neighboring tribes, to whom they are superior in intelligence, but inferior, according to Barth, in physical development. Mr. Golbéry described them as robust and courageous, of a reddish black color, with regular features, hair longer and less woolly than that of the common negroes, and high mental capacity. Lander, who saw them near Borgoo, was struck by their resemblance to the Caffres, and says that they differ little in feature or color from the negroes; other travellers speak of them as having tawny complexions and soft hair. Dr. Barth found great local differences in their physical characteristics, and Bowen describes the Foolahs of Yoruba as being some black, some almost white, and many of a mulatto color varying from dark to very bright. Their features and skulls were cast in the European mould. They have a tra-

dition that their ancestors were whites, and certain tribes call themselves white men. Some of them relate that they came from the country around Timbuctoo, and the prevailing opinion has been that their course of conquest was from central or E. Africa westward; but Dr. Barth, while supposing the cradle of the race to have been E. of the territory which they now occupy, agrees with Clapperton in thinking that they made a second migration from the Senegal toward their birthplace, in the course of which they absorbed or conquered the tribes which lay in their march. The notion has been entertained that they are descendants and derived their name from Phut, grandson of Noah; and Bowen identifies them with the ancient Paylli or *Ψυλλαι*, who once attempted to migrate across the desert from the south. M. d'Eichthal, judging from certain linguistic analogies, maintains that the Foolahs are an offset of the Malaya, but this opinion has been vigorously opposed, and appears to rest on insufficient foundation. Prichard considers them a genuine African race, probably differing less than is commonly supposed from the black Soodanian nations. Their language is peculiar, being neither African nor Semitic. Many of the tribes which have become consolidated with them have so far lost their nationality as to be looked upon as aboriginal Foolahs, and in some cases form the aristocracy, while others have become degraded. Foolahs are found in the suburbs of most of the towns of Soodan, pursuing the avocation of dairymen and cattle breeders. Most of them are Mohammedans. The usual dress of the men is a red cap with a white turban, a short white shirt, a large white robe, white trousers trimmed with red or green silk, and a pair of sandals or boots. The women wear a striped garment falling as low as the ankles, are fond of ear rings, bracelets, and trinkets, and take great pains in dressing the hair. The children of both sexes of the better classes are taught to read and write Arabic, in which language the Mohammedan Foolahs say their prayers. The men wear swords at all times, and even go armed with bows and arrows on horseback. The sovereign of each Foolah state appoints governors of the provinces at pleasure, and on their death succeeds to all their effects. The Foolahs are in continual hostility with the Arabs, and in general have something of a republican spirit, with all the air and manner of free-born men.—See, beside the narratives of the travellers above mentioned, and the ethnological works of Prichard and Latham, *Histoire et origine des Poulhas ou Fellans*, by Gustave d'Eichthal (8vo., Paris, 1842).

FOOLS, FEAST OF, a mediæval grotesque religious ceremony, celebrated for several centuries, chiefly in France, at the festivals of the Nativity, the Circumcision, the Epiphany, the Murder of the Innocents, and especially at Christmas and Easter. The customs and amusements usually connected with the pagan Saturnalia had continued in spite of prohibitions to be observed among Christians both in the East

and West, and gradually attached themselves to the Christian festivals occurring in December and January, which had been the months of the pagan celebrations. Though encouraged and participated in by the clergy, the *festum fatuorum* or *foliorum* was a mixture of farce and piety, and a sportive travesty of the offices and rites of the church. The priests and clerks elected a pope, archbishop, or bishop, and conducted him in great pomp to the church, which they entered dancing, masked, disguised as women, animals, and merry-andrews; they sung infamous songs, converted the altar into a buffet, where they ate and drank during the celebration of the holy mysteries, played with cards and dice, burned old sandals instead of incense, ran about leaping, and amused the populace by indecent sallies and postures. The feast of fools was prohibited by the papal legate Peter of Capua in the diocese of Paris in 1198, but was celebrated until its condemnation by the Sorbonne in 1444, and did not entirely disappear till toward the end of the 16th century. It was known in Germany only in the cities on the Rhine. It hardly equalled the feast of asses in fantastic disorder, but was more uncouth than the festival of the boy-bishop which was observed in England on St. Nicholas's day.

: FOOSEE, Fousi, or Fusi, a volcano of Japan, commonly called by the natives Fooseeyama. It stands in an isolated position on the island of Nippon, and is the loftiest mountain in the empire, its height, according to Siebold, being 12,440 feet. It is covered with perpetual snow. It was formerly the most active volcano in Japan, but no eruption has taken place since 1707. Native historians assert that in the year 283 B. C. an extraordinary natural revolution produced in a single night both the mountain of Foosee and the basin of the great lake Oits Mitsoo; the elevation of surface caused by the former, as it rose from the bosom of the earth, being exactly counterbalanced by the depression which constitutes the latter. The Japanese hold this mountain in religious veneration. Some of its ravines are consecrated to the worship of Buddha, and every August crowds of devotees make pilgrimages to the idols in these spots.

FOOT, a measure of length indicating its origin by its name, in general use in all civilized countries, and supposed to be adopted from the length of the human foot, possibly at first of some reigning sovereign. The length is very variable within moderate limits in different countries. The Roman *pes* has been calculated from several sources, as ancient measures, measurements of recorded distances along roads, and measurements of buildings of recorded dimensions. From the first source their foot appears to have been .9718 of the English foot, from the 2d .97082, and from the 3d .96994; the average of which would be 11.6496 inches. The Greek *πους* as used at Athens is believed to have been to the Roman foot as 25 is to 24, making it 12.185 English inches. The English standard is now referred to the length of a

pendulum beating seconds, in London. The foot is 12 inches, and the seconds pendulum in that latitude is 39.18842 inches. The United States standard is a brass rule made for the coast survey by Troughton of London, from the English standard. The following are a few of the principal feet, with their value in decimals of the English foot: the French old *pied du roy* equals 1.07, the modern *pied usuel*, 1.093; Amsterdam old foot, 0.98—since 1820, if used, 1.093; Denmark Rhineland foot, 1.04; Hamburg, .941; Stockholm, .97; St. Petersburg, 1.145; Riga, .89; Canton, 1.05; Lisbon, .927, or according to others, .72; Turkey, 1.16; Constantinople, 1.23. As used by surveyors and engineers, the foot is decimally divided. Architects and artificers employ it with these divisions, and their scales are also made with inch divisions, and these subdivided into eighths and sixteenths of an inch.

FOOT, SOLOMON, an American statesman, born in Cornwall, Addison co., Vt., Nov. 19, 1802. He was graduated at Middlebury college in 1826, was principal of Castleton seminary in 1826 and 1828, and in 1827 was tutor in the university of Vermont. From 1828 to 1831 he was professor of natural philosophy in the Vermont academy of medicine at Castleton. In 1831 he was admitted to the bar, and settled in Rutland, where he has resided ever since. In 1836, '7, and '8, and in 1847, he represented the town of Rutland in the Vermont legislature, and in the last 3 years of his service was speaker of the house. In 1835 he was a delegate from Rutland to the constitutional convention, and made an elaborate speech in favor of creating a senate as a coördinate branch of the legislature. The measure was adopted by a close vote after an able and protracted debate. In 1842 and again in 1844 he was elected a representative in congress. In 1846 he declined a reelection, and resumed the practice of his profession. In 1850 and again in 1856 he was elected to the U. S. senate. He has made many elaborate speeches in the senate, and bore a conspicuous part in the great Lecompton debate of 1858. In 1854-'5 Mr. Foot was chosen president of the Brunswick and Florida railroad company in Georgia, and during the recess of congress visited England, negotiated the bonds of the company, and purchased the iron for the railroad, after which he resigned his post as president.

FOOTA, a territory of Senegambia, W. Africa, extending from Dagana on the N. W. to North Guererr on the S. E., between lat. 15° and 16° 26' N., long. 12° 36' and 16° 36' W. It is a fertile, well watered country, producing rice, cotton, tobacco, and various kinds of grain. Large forests are spread over the surface, pasture lands support sheep and cattle, and there are several mines of iron. The inhabitants are mostly negroes, active and industrious, but, like most of their race, extravagantly superstitious. They profess Mohammedanism, and are firm believers in witchcraft. They cultivate the ground with considerable skill, and are active

fishermen. Their manufactures are confined to cotton cloth and earthenware. The country is divided into 3 parts or provinces, viz.: Foota Tora on the N., Foota proper in the middle, and Foota Damga on the E. Each of these has its chief, subject to the *almamy* or sovereign of the whole territory. The latter is chosen from a few privileged families by a council of 5. His authority is both secular and sacerdotal, but the council has the right of reprimanding, deposing, or in some cases putting him to death.

FOOTA JALLON, or FUTA JALLON, a large territory of Senegambia, W. Africa, situated about the sources of the Gambia, Rio Grande or Jeba, and Niger or Joliba, and intersected by lat. 13° N. and long. 13° W. It is mountainous and rocky, but about $\frac{1}{3}$ of it is extremely fertile, producing rice, maize, oranges, bananas, dates, wine, and oil, while large flocks of sheep pasture on the highlands. Iron ore is wrought and manufactured into a very malleable species of metal. The inhabitants are Mohammedans of the Foola race, remarkable for their fanatical hatred of all infidels except the whites, from whom they claim descent. Their houses are neat and well built; the principal towns contain manufactories of articles of dress, of iron, silver, wood, and leather. Trade is carried on with Timbuctoo, Cassina, and other places, and the merchants frequently make long commercial journeys. Timbo, the capital, contains 7,000 inhabitants, and there are several other towns with a population of between 3,000 and 5,000. The government is elective.

FOOTE, HENRY STUART, an American statesman, born in Fauquier co., Va., Sept. 20, 1800. He was graduated at Washington college, Lexington, Va., in 1819. After leaving college he studied law, and obtained license to practise in 1822. In 1824 he removed to Alabama and settled at Tuscumbia. He resided there two years, practising law and editing a democratic newspaper. In 1826 he removed to Mississippi and established himself at Jackson. In 1847 he was elected to the U. S. senate, took his seat in December of that year, and was placed at the head of the committee on foreign relations. In 1850 he took an active part in favor of the "compromise measures." In 1851 he became the candidate of the union party for governor of Mississippi, and after a very exciting canvass he was elected by about 1,000 majority over his competitor, Jefferson Davis. He resigned his seat in the senate and entered upon his duties as governor in Jan. 1852. In 1854 he removed to California, and in 1856 supported Mr. Fillmore for the presidency. In the spring of 1858 he returned to Mississippi and settled at Vicksburg. In May, 1859, he attended the southern convention at Knoxville, Tenn., and made speeches against disunion which attracted much attention throughout the country. Mr. Foote has been engaged in three "affairs of honor." In his first duel, with Mr. Winston of Tuscumbia, Ala., he was slightly wounded in the left shoulder. He afterward fought in Mississippi with S. S. Prentiss,

and was again slightly injured; and still later he exchanged shots with J. F. H. Claiborne, when neither party was hurt.

FOOTE, SAMUEL, an English dramatist and actor, born in Truro, Cornwall, in 1720, died in Dover, Oct. 21, 1777. His father was a magistrate and a member of parliament, and his mother was a sister of Sir John Dyneley Goodere, whose murder by his brother, Capt. Goodere, caused a profound sensation in the early part of the 18th century. Foote was entered at Worcester college, Oxford, but his powers of mimicry involved him in indiscretions which led to the severance of his connection with the university when he was 20 years of age. He soon afterward became a student at law in the Temple, and, plunging into a career of pleasure, in less than 4 years dissipated, at the gaming table and by reckless extravagance of all kinds, two fortunes which he had successively inherited from his uncle and his father. Obligated to live by his wits, he determined to become an actor, and in 1744 made his debut at the Haymarket theatre in the character of Othello. He attracted little attention in tragedy or in comedy, which he subsequently attempted, and it was not until he brought the political and social notabilities of the day upon the stage by his wonderful gift of mimicry that he discovered the true road to success. In the spring of 1747 he opened the Haymarket theatre with a piece called "The Diversions of the Morning," written by himself, and in which he was the principal actor. The reputation he had already acquired for brilliant and ready humor drew a crowded house, and the piece was successful almost beyond precedent. The licensing act having been applied against him by those whose foibles he had thus publicly portrayed, he made his piece a morning entertainment, and under the title of "Mr. Foote taking Tea with his Friends," it was repeated for 50 successive mornings. A similar piece, entitled "The Auction of Pictures," proved equally successful, and the author was complimented with the title of the English Aristophanes. He kept the Haymarket theatre open without a license for 10 years (during which he found time to dissipate a 3d fortune), furnishing a constant supply of new plays to replace the old ones, and became the admiration and the terror also of the town, as a person whose character possessed any vulnerable points was safe from his mimicry. In 1767 a fall from his horse occasioned the amputation of one of his legs; and the duke of York, who witnessed the accident, procured him a regular patent to open a theatre. He still wrote and acted, but less frequently than before, and in 1777, with a constitution undermined by ill health and mental suffering, he undertook a journey to France, and died on the way at Dover. By a sort of poetical justice his unsparing ridicule of prominent personages at last recoiled upon his own head, and his death was undoubtedly hastened by the monstrous charge, subsequently disproved, which the notorious

essay on his life and genius by John Forster was published in the "Quarterly Review," No. CXG.

FORBES, DUNCAN, a Scottish statesman, born near Inverness, Nov. 10, 1685, died Dec. 10, 1747. Though living within the highland line, the Forbes family were of lowland origin, and were Presbyterians, and strongly attached to the principles of the revolution of 1648. After being educated at Inverness and Edinburgh, young Forbes, in conformity with the then prevailing custom of Scotland, was sent to the continent to study the Roman law, and entered the university of Leyden. In 1708, soon after his return to Scotland, he married Mary Rose, daughter of the laird of Kilravock, who had an estate near Culloden, and in 1709 Forbes became a member of the faculty of advocates. At an early period he won the friendship of the famous John, duke of Argyle; and in 1715 he took an active part in suppressing that rebellion of which Mar was the head, and which Argyle crushed at Sheriffmuir. He was appointed to aid in prosecuting

efficient than any other man in restraining the rebels till the government was prepared to take the field. He succeeded partly in keeping Lord Lovat quiet, and had him arrested. After the battle of Culloden, which took its name from Forbes's family estate, he sought to moderate the ferocity of the victors, but his remonstrances were treated with "the utmost scorn and contempt." He was insulted by Cumberland, who called him "that old woman who talked to me about humanity." The government used him with baseness. He had advanced large sums of money in aid of it, and had borrowed from others; and it is believed that none of his advances were returned, and that the money he borrowed, both principal and interest, was repaid from his estate, after his death, by his son. Forbes saw the changes that were forced upon Scotland after the rebellion with regret, and his death, which happened 20 months after the battle of Culloden, is supposed to have been caused by "heartbreak," the consequence of the humiliation of himself and his country. He was an author in a small way, and being himself a Hebrew scholar, wrote in illustration of the works of John Hutchinson, and other religious books. Few names stand so high in Scotland as that of Duncan Forbes. His biography has been written by Mr. John Hill

Burton, an eminent Scottish historian and lawyer.

FORBES, EDWARD, an English naturalist, born in Douglas, in the isle of Man, in 1815, died at Wardie, near Edinburgh, Nov. 18, 1854. From early childhood he manifested a strong taste for the study of natural history, and at the age of 7 had collected a small museum, the contents of which he named according to the system of Linnæus. At 12 years of age he had read the geological works of Buckland, Parkinson, and Conybeare; and about the same time he compiled a "Manual of British Natural History," which, although never published, was made the repository of scientific notes during his whole life, and was frequently consulted by him with advantage. In his 17th year he went to London with some idea of becoming a painter, and in the studio of Mr. Sass acquired a facility in drawing which afterward proved of great assistance in his scientific explorations. But finding that the pursuit of this art would not give scope to his love for the natural sciences, he repaired in 1831 to Edinburgh, where he studied medicine, and was for several years under the instruction of Professors Jameson and Graham in his favorite branches. At this period, and indeed throughout his whole life, he was not less remarkable for his success in inspiring his fellow students with a taste for natural history, than for the energy with which he organized and conducted excursions on land and water in search of new objects to add to his large collections, or to illustrate his own studies. Dredging in the waters for specimens of submarine zoology, which at the commencement of his studies was a comparatively new occupation to naturalists, became under his hands the means of opening a new field of research, if not a new branch of science; and the results of his labors, published in the 8th and 9th vols. of the "Magazine of Natural History," under the title of "Records of the Results of Dredging," were among his earliest contributions to scientific literature. In his 18th year he made a summer excursion with a fellow student to Norway, bringing back abundant specimens of its rocks, plants, and mollusca, which formed the basis of an article in the "Magazine of Natural History," under the title of "Notes of a Natural History Tour in Norway." He remained connected with the university of Edinburgh until 1839, varying his residence there by excursions to southern Europe, the Mediterranean, and Algeria. The greater part of 1837 he passed in Paris studying geology, mineralogy, and zoology, under Prevost, Geoffroy St. Hilaire, and others, and working in the museum and collections of the *jardin des plantes*. During this period he published also papers on the "Mollusca of the Isle of Man," the "Land and Fresh Water Mollusca of Algiers," and on the "Distribution of the Pulmonifera of Europe," beside several on miscellaneous subjects in zoology and botany. Although nominally a student of medicine at Edinburgh, he never took the degree of M.D.,

having determined before the close of his academic career to devote himself to the study of botany and zoology, particularly of the submarine kingdom, and of the natural sciences generally. In 1841 he published his "History of British Starfishes," a work not less remarkable for the many new species which it mentioned, than for its genial style and the illustrations and tail pieces, 120 in number, designed by himself. The grace and humor which distinguished the latter showed that the author might have attained eminence as an artist, had he chosen to confine himself to that profession. In the spring of 1841 he embarked in the capacity of naturalist on the surveying ship *Beacon*, destined for the coast of Asia Minor, where, among other duties, she was to receive the Xanthian marbles, the existence of which had then recently been made known by the explorations of Sir Charles Fellows. During the 18 months that Mr. Forbes remained on board the vessel he established by innumerable dredging operations in various depths of water the important law that the distribution of marine life, like that of terrestrial animals and vegetables, is determined by certain fixed laws, and that the zones which the different species inhabit are as distinctly marked in the one case by the climate and the depth and composition of the water, as in the other by temperature, altitude, and other influences. The results of these researches were given in a paper entitled "Report on the Mollusca and Radiata of the *Ægean* Sea, and on their Distribution, considered as bearing on Geology," which was read before the meeting of the British association in Cork in 1843. He also assisted in the excavations of the Xanthian cities, the ruins of 20 of which he was instrumental in discovering. In 1846 he published, in conjunction with Lieut. Spratt, "Travels in Lycia, Milyas, and the Cibyratia," the numerous illustrations in which were from his pencil. In the latter part of 1842 he was contemplating a dredging expedition to the Red sea, when he was recalled to England by his appointment as professor of botany in King's college, London. He delivered his inaugural address in May, 1843, and about the same time was appointed curator of the museum of the geological society, and palæontologist of the new museum of practical geology, established in connection with the ordnance geological survey. He subsequently became professor of natural history at this institution. Among the first fruits of his labors in this congenial sphere was an important treatise, "On the Connection between the Distribution of the Existing Fauna and Flora of the British Isles, and the Geological Changes which have affected their Area" (1846), in which the conclusions arrived at, after investigations in an unusually wide field of speculative research, are that the fauna and flora of Britain, both terrestrial and marine, are members of families inhabiting a contiguous continent, which at no very remote period existed in the Atlantic, whence they migrated before, during, or after the glacial

the preparation of the "History of British Mollusca" (4 vols. 8vo., 1858), the descriptions in which were written by himself, and contributed important information respecting the distribution of plants and animals to the last edition of Johnston's "Physical Atlas." He also possessed a considerable knowledge of general literature, which in the intervals of his scientific labors he assiduously cultivated; and after his death his friends were surprised to learn that for a number of years he had been a regular contributor of miscellaneous articles to the columns of the London "Athenaeum" and "Literary Gazette," a collection of which was published under the title of "Literary Papers by the late Edward Forbes, with a Memoir by Huxley" (12mo., 1855). His other posthumous publications are: "Zoology of the Voyage of H. M. Ship Herald" (3 vols. 4to.), and "Mollusca and Radiata of the Voyage of H. M. Ship Herald," the latter written in conjunction with Prof. Huxley. Although in the universality and grasp of his knowledge and in the variety of his accomplishments he showed himself preëminent, it has been truly said of him that he made no memorable discovery, initiated no critical movement, and never showed himself inventive like Linnaeus, or Cuvier, or even Buffon. In the

served in the medical department of the navy, receiving a war medal for his participation in several engagements, and in 1817, in company with his friend and fellow-student, Sir James Clark, took the degree of M.D. at the university of Edinburgh. After practising his profession at Penzance and Chichester, he removed to London, where he has since resided. His career as an author commenced in 1834, when he published translations of the works of Avenbrugger and Laennec on auscultation, following them up by an original work of his own on the subject. The appearance of these works, which have gone through several editions, formed an era in the practice of medicine in England. He was instrumental in founding the British medical association, one of the objects of which was to obtain information of the physical character of the country, with reference to its effect upon the health of the inhabitants, and to the "Transactions" of which he contributed an interesting paper on the "Medical Topography of the Hundred of Penrith." He was also the chief editor of the "Cyclopaedia of Practical Medicine," a work of great value, and for 12 years conducted the

"British and Foreign Medical Review," with signal ability and independence, retiring in 1848 a loser by the enterprise. He is the author of "Observations on the Climate of Penzance and Land's End" (London, 1828); "A Manual of Select Medical Bibliography" (8vo., London, 1835); "Illustrations of Modern Mesmerism" (8vo., London, 1846); "Treatise on Diseases of the Chest," and "Nature and Art in the Cure of Disease" (8vo., 1857); and of the following books of travel, which have enjoyed considerable popularity: "A Physician's Holiday; or, a Month in Switzerland during the year 1848" (8vo., 1849); "Memoranda made in Ireland in 1852" (1852); "Sight-seeing in Germany," &c. (8vo., 1855). He is physician in ordinary to the household of the queen, by whom he was knighted in 1853, physician extraordinary to Prince Albert, and a member of the principal medical societies of Europe and America.

FORCE, PETER, an American journalist and historian, born in New Jersey, Nov. 26, 1790. He removed to New York when a child, became a printer, and resided in that city till, in Nov. 1815, he removed to Washington, D. C. In 1820 he began the publication of the "National Calendar," an annual volume of national statistics, which he continued until 1836. From Nov. 12, 1823, to Feb. 2, 1830, he published the "National Journal," a political newspaper, which was the official journal during the administration of John Quincy Adams. From 1836 to 1840 he was mayor of Washington, and was afterward president of the national institute for the promotion of science. In 1833 he made a contract with the U. S. government for the preparation and publication of a documentary history of the American colonies, of which 9 folio volumes have since appeared, under the title of "American Archives." This work has occupied Mr. Force for 30 years, and in its prosecution he has gathered a collection of books, manuscripts, maps, and papers relating to American history, which in completeness and value is not equalled by any other collection in the world on the same subject. Mr. Force has also published 4 volumes of historical tracts, relating chiefly to the origin and settlement of the American colonies.

FORCELLINI, EGIDIO, an Italian lexicographer, born near Padua, Aug. 26, 1688, died April 4, 1768. Admitted into the seminary of Padua, his progress in the ancient languages induced his master Facciolato to make him his assistant in lexicographical labors. In 1718 they conceived the project of publishing a universal dictionary of the Latin language; but Forcellini being sent in 1724 to Ceneda as professor of rhetoric and director of the seminary, the execution of the task was suspended till his return in 1731. This great work, which was almost wholly executed by Forcellini, was designed to be complete for all ages of the language, in which every meaning assigned to a word should be illustrated by an appropriate example; and to this end Forcellini read with

pen in hand not only the whole Latin literature, but all the collections of inscriptions and medals. He died before the work appeared in 1771, under the title of *Totius Latinitatis Lexicon, consilio et cura Jac. Facciolati opera et studio Egid. Forcellini lucubratum*.

FORCHHAMMER, JOHANN GEORG, a Danish geologist and chemist, born in Husum, Schleswig, July 26, 1794, became secretary of Oersted of Copenhagen, accompanied him on a mineralogical expedition to the island of Bornholm (1818-'19), and subsequently made several journeys in Great Britain, France, and Denmark at the expense of the Danish government. He occupies a high position in Copenhagen as a professor of geology and as a member of the academy of sciences, and has officiated as its secretary since the death of Oersted (1851). His principal works are *Danemarks geognostiske Forhold* (1835), and *Skandinaviens geognostiske Natur* (1848). He also excels as a lecturer on chemistry and mineralogy, and has written a manual of universal chemistry (*Laerebog i Stof-fernes almindelige Chemie*, 1834-'5).

FORCIBLE ENTRY. In law, the phrase forcible entry and detainer means the unlawful and violent entry upon and taking possession or keeping of lands or tenements, with actual or threatened force or violence. In nearly all, and indeed, in some form, in all our states, there are laws respecting this which are usually very stringent. 1. It is regarded generally as an offence and made indictable, or treated as being so at common law. 2. An action is given for damages, or remedial process provided, by means of which the party entitled to possession may have it with the least delay compatible with sufficient inquiry into questions of right and title. The entry and detainer are usually spoken of together; but it seems to be settled that they are distinct offences. (1 Sargent and Rawles's Rep. 124; 8 Cowen's Rep. 226.) The Roman civil law, in its anxiety to preserve the peace of the community, made it a punishable offence even in an owner of an estate to take forcible and violent possession of it.

FORD, JOHN, an English dramatist, born probably in Ilington, Devonshire, in 1586, died there about 1640. At the age of 16 he was entered a student of law in the Middle Temple, and 4 years later he published a poem of little merit, entitled "Fame's Memorial," an elegy on the death of the earl of Devonshire. The taste for authorship which this production engendered did not, however, divert him from his professional duties. Having been regularly called to the bar, he practised law until 1638 or 1639, when he is supposed to have retired to his native place, as all trace of him ceases after this date. Poetry and dramatic composition were the recreations of his leisure hours, and after his professional labors had secured him an independent position, he became indifferent to the pecuniary profits of his plays, but finished them carefully and deliberately, appearing upon the stage at wide and irregular intervals, and mak-

ing little effort to court the popular taste. In accordance with the practice common among the Elizabethan dramatists, at the outset of his career he wrote several plays in conjunction with some of his associates, not venturing before the public as an independent author until 1629. He is said to have assisted Webster in "A late Murther of the Sonne upon the Mother," a play which has been lost, and Decker in the "Fairy Knight" and the "Bristowe Merchant," which have likewise disappeared. He joined with Decker in writing the "Sun's Darling," a moral masque acted in 1623-'4, and published in 1657; and of the "Witch of Edmonton," written in conjunction with Rowley and Decker, the last act is ascribed to Ford. His own plays are: "The Lover's Melancholy" (1629), "'Tis Pity she's a Whore," "The Broken Heart," and "Love's Sacrifice" (1633), "Perkin Warbeck" (1634), "The Fancies Chaste and Noble" (1638), and "The Ladie's Triall" (1639). With the exception of the first and two last, these are of a deeply tragic character, and the horrible and even revolting stories which are developed in them are characteristic of the author's saturnine temperament. Lamb estimates him as of the first order of poets; but in the judgment of Hazlitt, Gifford, Jeffrey, Hartley Coleridge, and Hallam, he ranks after several of his contemporaries. The last places him at a considerable distance below Massinger. His versification is easy and harmonious, his declamation frequently elevated; and in his love passages, and particularly in the expression of deep sorrow—"the power over tears," as Hallam calls it—he had no superior among the dramatists of his age, although the emotion he portrays is never excited by heroic impulses, but by guilty or unfortunate love. He had not, in fact, the true dramatic fire, nor the elevation of a great poet. He wrote with extreme care, and hence there is an artificial elaborateness in his style, and a monotony in his poetry, which contrast unfavorably with the grace and vigor of several of his contemporaries. Of comic ability he was entirely destitute. "The Broken Heart," and "Perkin Warbeck," are commonly esteemed his finest plays. His complete dramatic works were first published in 1811, in 2 vols., edited by H. Weber. In 1827 appeared Gifford's edition in 3 vols. 8vo., and in 1847 an expurgated one in Murray's "Family Library." The most recent edition of Ford's works is that published in Moxon's series of the old English dramatists.

FORD, RICHARD, an English author, born in London in 1796, died at Heavitree, near Exeter, Sept. 1, 1858. He was educated at Winchester and at Trinity college, Cambridge, and was called to the bar at Lincoln's Inn, but never practised. The opening of the continent on the overthrow of Napoleon enabled him to gratify a taste for travel and collecting works of art, and he remained abroad for a number of years absorbed in those pursuits. In 1880 he visited Spain, where he spent several years in the study of the country and the people.

Returning to England, he became a regular contributor to the "Quarterly Review," in which his articles on the life, literature, and art of Spain attracted much attention. He was the author of the "Handbook for Spain," published by Murray of London. The work appeared in 1845, in 2 vols. 8vo., and several editions have since been published, that of 1855 being much enlarged and partly re-written. It is the most learned and complete work of its class yet published, embodying within comparatively narrow limits a synopsis of the social and political condition and progress of the Spanish people, as well as full descriptions of places and events, and has been highly praised in England and America—in this country by Irving, Prescott, Ticknor, and other authorities on Spain. Mr. Ford's remaining publications are "Gatherings from Spain" (8vo., 1846), and "Tauromachia, the Bull Fights of Spain, with 26 illustrations" (imp. fol., 1852). His collection of books, prints, and pictures was one of the choicest in England.

FORDHAM, a post village in the town of West Farms, Westchester co., N. Y., on the New York and Harlem railroad, about 10 m. from New York city, and 8 m. from the Hudson river. It is the seat of St. John's college and St. Joseph's theological seminary, two prominent Roman Catholic institutions. The college, which stands on an eminence surrounded by magnificent grounds, was founded by the Rt. Rev. John Hughes, bishop (now archbishop) of New York, and was opened for students June 24, 1841, most of the professors being secular clergymen, and the Rev. John McCloskey, now bishop of Albany, first president. The college was invested by the legislature with university privileges, March 17, 1846; the first commencement for conferring degrees was held in July of the same year, and immediately afterward the place was transferred to the Jesuits, who broke up their establishment at St. Mary's college in Kentucky, and took charge of the institution at Fordham in Sept. 1846. The organization of the college combines the ordinary features of preparatory and grammar schools with those of a university. Students are received at any age, and there is a separate course of studies for those who do not wish to follow the classical branches. The younger pupils are kept apart from the elder, the 8 divisions into which the students are separated according to age and proficiency being allowed to have no communication with one another. In the senior class Latin is altogether spoken in the lectures and recitations. In July, 1859, the college contained 125 students, 86 of whom were in the university course. There were 18 professors and tutors, all but 3 of whom were Jesuits. The library has about 12,000 volumes. Connected with the college the Jesuits have a house of studies for members of the order, and a community of lay brethren, many of the former being also employed as professors or prefects in the college, and the latter having the principal charge of the domestic affairs, farm, gardens,

&c. The lay brethren number about 25, and the scholastics (inmates of the house of studies), 12. There are 2 terms, the first lasting from the first Monday of September until Christmas, and the second from Jan. 2 until about July 15, when the annual commencement is held. The institution owns 40 acres of ground, stretching E. to the river Bronx, and laid out in beautiful pleasure grounds, gardens, orchards, woods, and cultivated fields. The buildings have little pretension to elegance, consisting mainly of an old country mansion and out-houses, to which many additions have been made as occasion has demanded, but it is designed soon to erect a handsome edifice on the same ground.—The theological seminary was founded by Bishop Hughes in 1841, and has always remained under his control. The Jesuits were employed to direct it when they took charge of the college, but they resigned their chairs in 1855, and the officers are now appointed by the archbishop. The faculty consists of a president, procurator, and professors of moral and dogmatic theology, French, rhetoric, and sacred music. The number of students in 1859 was 32. The seminary is an imposing building of gray stone, and has attached to it a parish church of the same material with a tall spire. The village contains 2 or 3 other churches, and is a favorite summer residence.—In Oct. 1776, immediately after the evacuation of New York by the British troops, the American army occupied a series of intrenched camps on the hills from Fordham heights to White Plains. Several pieces of cannon have been dug up, and the remains of earthworks and other fortifications are still seen in the vicinity.

FORDYCE, DAVID, a Scottish philosopher, born in Aberdeen in 1711, died in 1751. He was educated at the university of his native city, where in 1742 he became professor of moral philosophy. He afterward went abroad and travelled through France, Italy, and other countries of Europe, but was lost in a storm off the coast of Holland. His most important works are: "Dialogues concerning Education" (2 vols. 8vo., London, 1745-'8); "Theodorus, a Dialogue concerning the Art of Preaching" (12mo., 1752); "Elements of Moral Philosophy" (12mo., 1754).

FORE, a nautical term, signifying a vessel's frame and machinery which lies near the stem.—**FORE AND AFT**, from one end of the vessel to the other.—**FORE BRACE**, a rope applied to the foreyard arm for the purpose of changing occasionally the position of the foresail.—**FORE TACKLE**, the tackle which belongs to the foremast.

FORECLOSE, in law, to shut out, or exclude. Foreclosure means in law the act or method whereby a mortgagee finally terminates the mortgageor's equity of redemption, or whereby a mortgagee shuts out, or for ever excludes, the mortgageor's right to annul the mortgage and repossess himself of the property mortgaged by payment of the debt or obligation to secure which the mortgage was given. (See **MORTGAGE**.)

FOREST, a N. W. co. of Penn., formed about the year 1851 out of the N. part of Jefferson co.; area, 876 sq. m. It is traversed by Clarion river, which is navigable by small boats. The surface is hilly and irregular. Some of the land is too rocky for cultivation, but the rest is moderately productive. The chief articles of export are pine timber and hard coal, the former of which is very abundant. Capital, Marion.

FORESTALLING. The original and exact meaning of this word, as a law term, was the buying of goods, and especially of any kind of food, on its way to market, with a view to sell it again at an enhanced price. Other law terms were used in a similar sense, as engrossing, which meant, probably, buying of a producer more than the buyer wanted for himself, to sell again at a profit to a consumer; also regrating, said to mean originally fraudulently lessening or dividing goods to sell again. These 3 terms were generally used together in the law. The third has dropped out of use in law and elsewhere. The second has become of common use in writing and speaking, in the sense of monopolizing and getting more than one's share of a thing. The first is not unfrequently used out of the law, in the sense of a wrongful and injurious anticipation; and in the law it seems to be extended to cover every device or act, or conspiracy with another, by any means to enhance the price of provisions above what might be deemed the natural price. This might be done by buying to sell again, or by spreading false rumors, or by misrepresentations as to facts which would affect the market, or by conspiring with others to obtain a monopoly or a command of the market, or to keep any articles of food out of the market. In all the United States there are statutes against forestalling, and it is sometimes regretted that they are not more frequently applied and enforced. But in this country it seems to be the practice, if not the theory, generally, if not always, to leave the regulation of these matters to the public intelligence and to the influence of a free and fair competition.

FORESTI, E. FELICE, an Italian patriot, born in Conselice, near Ferrara, about 1798, died in Genoa, Sept. 14, 1858. After going through a course of study at the university of Bologna, he received the degree of doctor of laws, and found employment as a criminal lawyer before the tribunals of Ferrara. In 1816 he was appointed prætor of Crespino, which by the treaty of Vienna had been transferred from the papal to the Austrian dominions. The reaction incident to the reestablishment of the latter authority had aroused an intense opposition, which led to an organized national movement for the liberation of Italy from foreign rule, and into this scheme Foresti entered with enthusiasm. The treason of an associate betrayed that section of the party to which he belonged, and he was arrested at about the same time with Silvio Pellico, Gonfalonieri, Maroncelli, and other well known patriots. On Jan. 7, 1819, he was taken

to Venice and incarcerated in the Piombi prison. After 2 years of suspense and captivity, aggravated by total isolation from family and friends, and frequent inquisitorial visits directed to the discovery of others implicated, which attempts were baffled by the prisoner's firmness, Foresti and his companions were conducted chained in couples to the square of San Marco, Dec. 24, 1821. There they mounted a scaffold while one of the judges read the sentence of death, which was followed however by an edict commuting their punishment to imprisonment for 20 years. They were detained until Jan. 12, 1822, in the island of St. Michael, and then escorted, again chained two and two, to Spielberg in Moravia, where they arrived after a painful journey of a month. The severe discipline of their long confinement in this fortress has become memorable through the record of Silvio Pellico, entitled *Le mie prigioni*. The emperor Ferdinand, on his accession in 1835, commuted the imprisonment of the Italian conspirators to perpetual exile in America. At the end of Nov. 1835, their chains were removed, and after a few months spent under guard at Gradisca in order to recruit their health, they were transported to Trieste, and thence sailed for New York. They landed on the last of Oct. 1836, and were received with respect and hospitality. Foresti soon became a favorite in society. He was appointed professor of the Italian language and literature in Columbia college, and for more than 20 years was the popular teacher of both in academies and private circles. For the use of his pupils he published an Italian reader (*Crestomazia Italiana*, 12mo., New York, 1847). In 1848 he went to Europe, but the reaction which followed the revolutions of that year obliged him to return to America. Failing health having impelled him to seek a milder climate, he sailed for Genoa, where he was appointed U. S. consul, in the spring of 1858. He died of a disease contracted in the discharge of his official duties, retaining to the end the firmness of will, clearness of mind, and affectionateness of disposition which had endeared him to so large a circle in Europe and America. His body, wrapped in the American flag, was borne to the cemetery of Staglieno by the sailors of the U. S. frigate Wabash, followed by a vast concourse of foreigners and natives.

FORESTS, SUBMERGED. Remains of the growth of forests are found abundantly in the coal and in most of the formations of stratified rocks of more recent date. The occurrence of some of these collections has been referred to in the article **Bog**, and of the older deposits in **Coal**; see also **ALLUVIUM**. Several instances are recorded of forests having been submerged in historic times, and being afterward seen still standing beneath the water. Lewis and Clark made mention of a forest of pines standing erect in the Columbia river about the year 1807. So extensive were these that some travellers were of opinion that a tract of land more than 20 miles in length had subsided vertically. Fre-

mont, who visited the locality in 1845, satisfied himself that the forests had been submerged in consequence of immense land slides. De la Beche ("Geological Manual") cites numerous instances of submarine forests on the coasts of Cornwall, Yorkshire, Somersetshire, Scotland, and the Hebrides. These are often buried beneath alluvial deposits of sand, clay, and marl, and are only occasionally exposed to view, or brought to light when excavated in their continuation inland beneath the surface. They contain trunks, stems, branches, and leaves of trees of species resembling those growing upon the land. The vegetable stratum is sometimes a bed of peat and moss. Lyell refers to the upward and downward movement to which the crust of the earth is subject as a cause that might produce this phenomenon; and also mentions one instance where it might have occurred by the washing out and removal by the tide of a gravelly stratum supporting a peat bed.

FOREY, ÉLIE FRÉDÉRIC, a French general, born in Paris, Jan. 10, 1804. His mother was a daughter of an officer of Louis XVI. His uncle placed him in the college of Dijon, and he was subsequently admitted to the military school of St. Cyr, where Benret, who was killed at the battle of Montebello, was in the senior class. He fought at Algiers, became a colonel in 1844, a general in 1848, aided in the *coup d'état* of Dec. 2, 1851, was appointed general of division in 1852, and officiated for a short time at the head of the French army at Sebastopol in 1854. Commander of the 1st division of the French army from 1857, he led it in the campaign of 1859 in Italy, drove back the Austrians who had attacked the advanced posts of Marshal Baraguay d'Hilliers, and gained the battle of Montebello, the first of the campaign (May 20), by holding the village of that name after a hand-to-hand combat of several hours' duration, inflicting a loss of about 2,000 men upon the Austrians, and capturing 200 of their soldiers and officers, while the French and Sardinian loss was estimated at not over 700. A note accompanying the great cross of the legion of honor, which was conferred on him by the emperor on May 21, certifies that he has been employed 36 years in active service, taken a part in 14 campaigns, and that he has been wounded 8 times. He took an active part in the subsequent battles in Italy, and was slightly wounded at the battle of Solferino (June 24, 1859), where the division under his command gained important advantages.

FORFAR, or **ANGUS**, a maritime co. of Scotland, bounded N. by Aberdeen and Kincardine, E. by the German ocean, S. by the frith of Tay, and W. by the county of Perth; length 36 m., breadth 30 m.; area, 889 sq. m.; pop. in 1851, 191,264. The surface of the N. W. division is in general mountainous and barren, but the great valley of Strathmore, which lies between the Benchennin and Sidlaw hills, is celebrated for its fertility, and that portion of the county which borders on the sea is level, fruitful, and highly cultivated. Agriculture is in a very advanced state. Wheat, oats, barley, potatoes,

and turnips are extensively grown. With the exception of limestone and slate, there are no minerals of any importance in this county. Forfarshire is noted for its manufacture of coarse linen, the chief seat of which is at Dundee. Its rivers contain some valuable salmon fisheries. The principal towns are Forfar, Dundee, Montrose, Aberbrothwick, and Brechin.—**FORFAR**, a parliamentary and royal borough of Scotland, capital of the above county, is situated in the valley of Strathmore, 13 m. N. of Dundee; pop. in 1851, 9,349. It has linen manufactures, and is a place of great antiquity.

FORFEITURE, in law, the loss of property as a consequence of some act which the law forbids and attaches this penalty to, or which the party has agreed not to do under the same penalty. Forfeiture is defined by Blackstone as a punishment which the law inflicts. It is so undoubtedly in all cases of forfeiture by crime; but we apprehend that it can be called punishment in the ordinary cases of civil forfeiture only as all consequences of wrong doing may be called punishment. Forfeiture was annexed by the law of England to many offences, as treason, felony, misprision of treason, *præmunire*, drawing a weapon upon a judge, or striking any person in the presence of any of the king's courts of justice. Lands and hereditaments were forfeited only upon attainder or corruption of blood; but forfeiture of goods and chattels took place upon conviction. Attainder, and the consequent forfeiture, were the most powerful instruments by which the greatest tyrants among the English monarchs endeavored to confirm and increase their power. Our fathers held them in so much dread and detestation, that the constitution of the United States (art. iii., sec. 3) declares that no attainder of treason shall work corruption of blood or forfeiture, except during the life of the person attainted. By the act of April 30, 1790, entitled "An act for the punishment of certain crimes against the United States," in which nearly all important offences are enumerated, section 24 provides "that no conviction or judgment for any of the offences aforesaid shall work corruption of blood or any forfeiture of estate." Forfeiture by crime is equally unknown in the legislation of the several states; so that it may be said to have no practical existence in this country.—Civil forfeiture may occur in 3 ways: 1. By operation of law, the principal instance of which at common law was the forfeiture of estates which were less than a fee, which was incurred when the holder made a conveyance of a greater estate than he held; as for example, if a tenant of land for life or years conveyed the land in fee, the grantee took nothing, but the whole estate of the grantor was forfeited to the remainderman, or reversioner. In the United States, however, a more just and rational rule prevails. With some diversity in its details, it may be generally expressed thus. 1. A grant of more than the grantor has operates as a grant

of all he has, and as to all that is more it is void. 2. When certain conditions are annexed to an estate, either in the deed or devise or otherwise, at the original creation, the penalty of forfeiture may be annexed to those conditions, and will take effect if they be broken; as if A grants to B land, on condition that neither he nor any one claiming by or through him shall put up a certain building, or any building within a certain distance of one of the boundaries, or any other thing of like kind, then if any thing is done which violates the condition, the land is forfeited. It may be remarked, however, that the law does not favor conditions of this kind; and courts would construe them, where it could properly be done, either as giving a right to the grantor to abate and remove whatever thus violates the agreement, or as an injury for which compensation may be had in damages, leaving, in both cases, the estate undisturbed. 3. One may agree to pay a certain sum in case a less sum be not paid, or some other certain thing be not done, at a certain time. This is usually done by a bond; and the sum thus agreed to be paid is a penalty, which the courts of England and of the United States will reduce to the amount actually due. So one who becomes surety for another in a certain sum, that this other shall appear at a certain time, forfeits the sum if that other does not appear. The recognizance may then be estreated, as it is called. (See *ESTREAT*.) But on good cause being shown, courts have the power, and are usually willing to exercise it, to mitigate the penalty, and remit the forfeiture in whole or in part.

FORGE, a manufactory in which iron or steel is softened by heat and worked under the hammer. The term is also applied to works in which the native oxides of iron are reduced without fusion to a metallic state, and then forged into blooms or bars. Several forms of these are noticed in the article *BLOOMERY*. Forges differ from founderies and blast furnaces in their products being articles of wrought iron, while those of the latter are castings. The works in which the pig iron, obtained from the blast furnaces, is converted into malleable iron by the process termed puddling (see *IRON*), are commonly called puddling furnaces from one department of the operation; but they are also called forges from the hammering or rolling which succeeds the reduction process in the furnace. The term forging is equally applicable to the working of other malleable metals, as gold, silver, and copper, when these are heated and hammered into desired shapes.—The immense variety of articles into which iron is fashioned requires forges of various dimensions, and many of them adapted for special uses. They agree, however, in the general character of the apparatus with which they are furnished. The smith's forge, fitted for all sorts of small work, is the best representative of the smaller forges. It is provided, first, with a small open fireplace or hearth, upon a sort of table in brick work, 2

feet to 2½ feet high. A chimney, open at the base, stands at one end, and a hood of sheet iron prevents the escape into the room of the vapors from the fire. Two fires are sometimes arranged under the same hood, and a double hearth is again obtained by building two hearths back to back, the same chimney having a flue for each fire. In the back wall of each hearth is fitted a cast iron plate or back, through which the perforated nozzle of the tuyere, or piece forming the extremity of the blast pipe, projects into the fire. The pipe connects with the bellows, which is so placed that the smith can work it with one hand, as he attends to the fire upon the hearth and the articles heating in it with the other. The fuel may be charcoal, bituminous coal, coke, or anthracite. Good hard wood charcoal is an excellent material, not only for its great calorific property, but more particularly for its freedom from sulphur, the presence of which in the mineral fuels often results in serious detriment to the iron exposed to its action. Upon the hearth are laid the various kinds of tongs required for holding the differently shaped pieces of iron. At the end opposite the chimney is a trough for water, into which the tools and work are dipped, as may be convenient, to cool them. It serves also, if kept scrupulously free from grease, for tempering articles of steel; and the water is also frequently sprinkled with a broom dipped in it over the fire, to check the combustion of the fuel at the surface. A stock of fuel is kept on the hearth by the trough, and as wanted it is drawn forward upon the fire. Conveniently near the hearth, and at the same height, is set the anvil, upon which the smith places the heated iron as he takes it from the fire. This portion of the apparatus is particularly described under its own name in this work. As the smith holds the hot iron upon the anvil with his left hand, he hammers it with the right, directing his blows and turning the work to receive the precise effect in a manner to be acquired only by long practice. If the work is heavy, he requires an assistant to aid the forging by striking with a heavy sledge, while he turns the piece to receive the blows, and strikes himself in turn with his hand hammer, tapping it at last upon the face of the anvil as the signal, universally adopted, for the blows to cease. Hammers are employed of a great variety of shapes and sizes adapted to the different kinds of work. There are also punches for driving holes through the soft iron, chisels of numerous shapes, and swaging tools, which are generally in pairs, and called top and bottom tools, the latter fitting by a tang into a hole in the anvil. When one of these is thus placed, the work is laid on its upper surface, and is then driven by the hammer till the soft iron receives the reverse form of the swaging tool; or the top tool, secured to a handle of twisted rods of hazel or other suitable wood, is held upon the surface of the work, and the assistant striking it with the sledge gives to the iron the form due to both swaging tools.

By using two swaging tools, each presenting a straight semicircular groove, a square rod of iron may be beaten into a cylindrical form suitable for a round bolt. Pieces of iron hammered to a smaller size are said to be drawn down or reduced. The reverse process is called upsetting or jumping; in this operation the piece, heated either throughout, or only in the portion to be thickened, is set on end and struck. Another method of enlarging pieces of iron is by welding or building up; thus a head for a bolt may be made by bending a flat strip of iron around the end of the rod for the bolt, and causing these, when they are brought to the welding heat, to unite, by giving them a few light blows. The head may also be formed by heating the end of the rod and upsetting it, when it is soon enlarged by the hammer to the proper size. It may also be left on a large bar by drawing down the other portion of the bar to the required size.—For small operations a very convenient apparatus has within a few years been introduced, called a portable forge. It is a cast iron frame, supporting at top a small hearth and water trough, beneath which is the bellows, fitted with a treadle, by which it may be worked with the foot. This forge is much employed in various workshops, and is especially useful in operations requiring a forge for a short time only in any one place.—The great forges in which are fabricated the immense wrought iron shafts for ocean steamers present the same class of operations, with some new appliances, however, adapted to the gigantic scale upon which the work is done. The fires in these forges are either large reverberatories, or close furnaces, blown by a powerful fan blast. The work is commenced by introducing 15 to 20 pieces of square iron bound together, making, it may be, a bundle 6 feet long and 2 feet square, into the furnace. When one end is brought to a welding heat the mass is swung out suspended in chains from the great crane made for this use, and under the heavy hammer of 5 to 10 tons weight the pieces are made to unite. One long rod is left projecting on the line of the axis of the mass, and serves when swung in the crane as a guide rod, or porter, as it is called. By means of the pulleys which sustain the load running forward and back upon the jib of the crane, the mass is brought to any desired point within the area traversed by the swing of the crane; and by means of a cross lever or handle fixed to the end of the porter the men are enabled to turn the mass of iron while the other end of it is receiving upon the anvil the blows of the hammer. When the iron has been sufficiently hammered, it is returned to the furnace to be again heated, so as to extend the weld throughout the whole mass. After this a slab of wrought iron, called by the workmen a use, is welded on one side at the end of the piece, and under the hammer the shaft thus built up is drawn down to the required size. New additions are repeatedly made in this way until the desired length is obtained. Only the end of the shaft is thrust

into the furnace, and the aperture which remains open around it is stopped during the heating by fire brick and clay. The end outside remains supported in the chains from the crane. The recently invented steam hammers employed in this work are described in the article HAMMER. By the use of this powerful machine the heavy shafts of ocean steamers are fabricated, the largest masses of iron forged in single pieces. The weight of the intermediate paddle shaft of the Great Eastern, or Leviathan, which was launched Jan. 30, 1858, is upwards of 22 tons, and that of the cranks 11 tons. Its length is 23 feet, and its diameter 2 feet 2 inches, and it is 2 feet in diameter at the main bearings. The cranks are 7 feet long between the centres. The screw shaft is 2 feet in diameter, and about 178 feet long, and its whole weight about 135 tons. The largest shaft yet made in the United States was produced at a forge in Reading, Penn., for the Collins steamer Adriatic. At the Atlantic forge in New York and the Franklin forge, other shafts have been made nearly as large. One at the former, made for the steamer Niagara, had a crank worked in the middle portion, and one near each extremity. The largest diameter was 19 inches, average about 17 inches. The extreme length was $29\frac{1}{2}$ feet, to which should be added 3 feet more for the arms of each of the cranks, making $38\frac{1}{2}$ feet in all. The bearings were $14\frac{1}{2}$ and $15\frac{1}{2}$ inches. The total weight was about 25,000 lbs.

FORGERY, in general, means the illegal falsification or counterfeiting of a writing. Although this offence is the subject of a great variety of cases in England and the United States, the definitions do not quite agree. That given in East's "Pleas of the Crown" (vol. ii. p. 852) is: "A false making of any written instrument for the purpose of fraud and deceit." This definition, he says, results from a comparison of all the authorities. But by making we must understand also addition, subtraction, or other material alteration, which indeed East himself admits; and by instrument, some paper or document which is intended to have and apparently may have some efficacy in law as the foundation of legal right or liability. Hence we regard as the best definition of forgery which we know that in Bishop's "Criminal Law," vol. ii. sec. 432: "Forgery is the false making, or materially altering, with intent to defraud, of any writing, which, if genuine, might apparently be of legal efficacy in the foundation of a legal liability." For it is not every falsification of writing which constitutes forgery in a legal sense. If one writes letters and signs them with the name of another, which may be very injurious not only to the feelings of some other party but to his interests, he is not in law a forger, if no pecuniary rights, obligations, or engagements are or are intended to be directly affected by this falsehood. The falsification need not be of a name, nor of the whole of an instrument. It is forgery if it relate to a single word, or even to a part of a word, as a letter.

whereby the legal operation of it is materially changed; nor do we know why the same rule should not include a change only in the punctuation. Forgery may consist in the application of a false name to a true instrument, or of a true name to a false instrument, or even of a genuine name to a genuine instrument, if the name thus appended gives rights or imposes liabilities which the party appending it had no right to give or impose, and he appended the name falsely for the purpose of fraud and deception. If one employed to draw a will at the dictation of the testator, wrote it all as dictated, excepting that he inserted one or more legacies without direction, or one or more material provisions of any kind, and then presenting the will to the testator as written agreeably to his direction, thus obtained his signature, it has been held that this is a forgery. But in one case where a scrivener thus inserted a legacy to himself instead of to another, the English court of chancery, for the purpose of preserving the rights of the intended legatee, adjudged the legacy to the scrivener to be valid, and then ordered him to take it as trustee for the intended legatee. To constitute the forgery of a name, it must be the name of some person actually existing, or represented as actually existing; and if a name be written which belongs to a living man, but with an addition or description which corresponds to none that exists and prevents the name from attaching or belonging to any one, this is said not to be a forgery. The instrument need not be such that if genuine it would be certainly valid in law; but it must purport and appear on the face of it to have legal validity and efficacy; thus, in England, one may be convicted for the forgery of an unstamped note, although such a note could not be enforced any more than blank paper. It is said, however, that the falsification of an instrument which if genuine would be wholly illegal, that is, not merely void, but prohibited and itself an offence, is not forgery. When one forged the will of a living person, and, falsely representing him to be dead, obtained the money, this was held to be forgery; and on the other hand, when one falsely and fraudulently appended to a will the name of a person who never had existed, it was held to be forgery.—At common law, the publication or uttering of the forged instrument, or, in common phraseology, the making of any use of it, is not necessary to constitute forgery; thus, a man was convicted of forgery of a note, which he had made with fraudulent intent, but still retained in his pocket. In the United States, however, the statutes generally make the uttering or using the forged instrument essential to the offence. It may be well to remark that it is a well settled rule of law, that while an intent to deceive and defraud is an essential element of forgery, yet this intent is often conclusively presumed from the forgery itself; thus, if one forge a note, or any name upon a note, and cause it to be discounted, it is no defence whatever to the charge of

forgery that he intended to pay the note himself, and had actually made adequate provision to take it up so that no person should be injured.—The crime of forgery was so easily committed, and detected with so much difficulty, and attended in some instances with such ruinous consequences, that it was not only a capital offence in England, but it was one of those offences for which it was very difficult to obtain a pardon. But the severity of the laws in relation to forgery is now more mitigated in England, and it is not a capital offence in any part of the United States.

FORGET-ME-NOT(*myosotis palustris*, Roth), a pretty little European plant, which grows almost everywhere, and assumes a varied aspect according to its situation. It is dwarf, rough, and hairy in dry places, as on old walls; but becomes larger and smoother in muddy ditches. It does well when planted in shady places in the garden, or even if cultivated in pots. Its flowers are borne in slender curving racemes, bending at the top like a scorpion's tail, whence it was called *M. scorpioides* by some. It has been successfully raised in the United States in places where there was abundance of water, either standing and stagnant, or in a running brook, where it produces many fine racemes of bright blue blossoms throughout the summer, which in many countries are considered the emblem of friendship. Independent of its sentimental character, its flowers are much prized. There are also two species of *myosotis* common to the United States at the northward, viz.: *M. verna* (Nuttall), a little, grayish, pubescent annual, from 5 to 12 inches high, with a very small whitish corolla, which grows upon dry rocks, where the soil is very thin and parched, the plant disappearing on the approach of hot weather; and the scorpion grass (*M. laxa*, Lehm.), with a slender smoothish stem, from one to two feet long, branching, and bearing at the extremities of the branches racemes of bright blue, yellow-throated corollas, seen in summer in muddy bottomed ditches and rivulets, and near open springs of water. Professor Gray makes the latter a variety only of *M. palustris*.

FORK, an implement consisting of a handle and two or more prongs, used to lift certain substances more conveniently than with the unaided fingers. There are various kinds of forks, such as those used for agricultural, manufacturing, and domestic purposes. The last kind, which are of course the most used, possess a historical interest. Table forks do not seem to have been known in antiquity, though some archæologists, as Caylus and Grignon, have found articles among the rubbish in the Appian way and in the ruins of a Roman town in Champagne, which they considered to be table forks. The Jews and Etruscans did not use any at table, though they had forks for other purposes. The ancient Egyptians used a large fork for stirring the fire or water in the kitchens, and forks of wood were used by Egyptian peasants.

The Greek word *κρεαυρα* signifies a fork, but merely a flesh fork, employed to take meat from a boiling pot, and not one used at table. The Latin words *furca*, *fuscina*, *furcilla*, and *fuscinula* are equally inapplicable to our modern forks. The first two were probably instruments which approached nearly to our furnace and hay forks. The *furcilla* was large enough for a weapon. The word *fuscinula*, which in modern times is used chiefly for a table fork, is not to be found in that sense in any of the old Latin writers. The old translations of the Bible only explain the Greek *κρεαυρα* by *fuscinula*. According to some records, the use of table forks seems to have been known in the 12th century, but only exceptionally. They are mentioned in the inventory of a prince's plate in 1379, but they did not come into more general use in Italy till the end of the 15th century. Galeotus Martius, in a book which he wrote upon Matthias Corvinus, king of Hungary (1458–1490), at whose court he resided, praises the king for eating without a fork, yet conversing at the same time, and never soiling his clothes. Martius states that forks were used at that time in many parts of Italy, but not in Hungary. He adds that meat was taken hold of with the fingers, which on that account were much stained with saffron, a condiment then put into sauces and soups. In the 16th century forks were not yet used in Sweden, and at the end of that century they were entirely new even at the court of France. In the convent of St. Maur in France, the introduction of forks was opposed as sinful by the old and conservative monks, and advocated by the young and progressive brethren. In other monasteries, too, the use of forks was for a considerable time forbidden, and considered a superfluous luxury. Thomas Coryat, who travelled in 1608 on the continent, and published in 1611 an account of his travels under the title of "Crudities," says: "I observed a custome in all those Italian cities and townes through the which I passed, that is not used in any other country that I saw in my travels, neither do I thinke that any other nation of Christendome doth use it, but only Italy. The Italians, and also most strangers that are commorant in Italy, do alwaies at their meales use a little forke when they cut their meate. This form of feeding I understand is generally used in all places of Italy; their forkes for the most part being made of yronn or steele, and some of silver, but these are used only by gentlemen. The reason of this their curiosity is, because the Italian cannot by any means indure to have his dish touched with fingers, seeing all men's fingers are not alike cleane. Hereupon I myself thought good to imitate the Italian fashion by this forked cutting of meate, not only while I was in Italy, but also in Germany, and oftentimes in England since I came home; being once quipped for that frequent using of my forke by a certain learned gentleman, a familiar friend of mine, one Mr. Laurence Whitaker, who in his merry humour doubted not to call me at table *furcifer*

only for using a forke at feeding, but for no other cause." The use of forks was at first much ridiculed in England; in one of Beaumont and Fletcher's plays "your fork-carving traveller" is spoken of very contemptuously; and Ben Jonson has also ridiculed them in his "Devil is an Ass:"

The landable use of forks,
Brought into custom here as they are in Italy,
To the sparing of napkins.

Dr. Johnson asserts that among the Scotch highlanders even knives have been introduced at table only since the time of the revolution. The English, Dutch (*cork*), and French (*fourche*) have adopted the Italian names *forca* and *forchetta* for table forks, though these names were probably used at an earlier period to denote pitchforks, flesh forks, and other large instruments, for which formerly the Low German name was *Forke*. The German word *Gabel* is of great antiquity, and has often been doubtfully connected with the Latin *gabalus*. In Spain forks continued to be rarities till a comparatively late period. In the interior of Russia they are still not much in use. The Chinese use no forks, but have instead small sticks of ivory which are often of fine workmanship inlaid with silver and gold. Elsewhere in Asia and Africa, except among European settlers, forks are unknown.

FORLI, a legation of the Papal States, bounded N. by the legation of Ravenna, E. by the Adriatic, S. by San Marino and the legation of Urbino e Pesaro, and W. by Tuscany; area, about 900 sq. m.; pop. in 1853, 218,433. On the coast and for some distance inland the surface is low and level, but the W. part is traversed by branches of the Apennines. The principal productions are grain, hemp, flax, madder, saffron, anise, bees, and silkworms. No mineral of much value is found except sulphur, which is abundant. Earthquakes happen frequently. The interior suffers much from drought, while the inhabitants of the N. E. are perhaps equally afflicted by unwholesome marshes, which occupy a large proportion of the land. Manufactures have made more progress than in any other part of the Papal States.—FORLI (anc. *Forum Livii*), the capital of the above legation, is a handsome walled town on the ancient Æmilian way, 38 m. S. E. of Bologna, situated in a fertile plain at the foot of the Apennines, between the rivers Ronco and Montone; pop. 16,000. Its cathedral contains the tomb of Torricelli. Of the 9 other churches, the most interesting is probably that of San Girolamo, where rests the body of King Manfred. The town hall is remarkable for its council chamber, decorated with frescoes by Raphael. One of its palaces (the Palazzo Guerini) is built after designs by Michel Angelo. There are 28 convents. The manufactures are silk ribbons, silk twist, oil cloth, woollen goods, wax, nitre, and refined sulphur. The city is said to have been founded in 207 B. C. by the consul M. Livius Salinator, and to have been named in his honor. It constituted a republic at one period in the middle ages, changed

masters frequently during the wars of the Guelphs and Ghibellines, was added to the Papal States by Pope Julius II., taken by the French and made the capital of the department of the Rubicon in 1797, and restored to the Roman see in 1814.

FORLI, MELOZZO DA, an Italian painter, flourished in the 15th century. He was the first who applied the art of foreshortening to the paintings of vaulted ceilings. About 1472 he painted the "Ascension" in the great chapel of the Santi Apostoli at Rome for Cardinal Riario. In 1711, when the chapel was being rebuilt, this painting was cut out of the ceiling and placed in the Quirinal palace, where it still remains.

FORLORN HOPE, a military phrase, designating a body of men selected from an army for the performance of peculiarly dangerous or desperate duties, such as leading the assault upon a fortress or heading a perilous charge in battle. They are usually volunteers, and those who survive are generally liberally rewarded. The French term is *enfants perdus*. Lord Byron calls them

The full of hope, misnamed forlorn.

FORMES, KARL JEAN, a German vocalist, born in Mühlheim on the Rhine, Aug. 7, 1816. His father trained him to an ecclesiastical life, and for several years he discharged the duties of sacristan in his native town. Gifted by nature with a bass voice of great power and compass, he soon attracted attention by his singing in the church choir, and was induced to go upon the stage. He made his début at Cologne in 1841 in the part of Sarastro in Mozart's *Zauberflöte*. In 1845 he appeared in Vienna, and 5 years later was engaged as first basso singer at the Italian opera, Covent Garden, London, to compete with Lablache, then singing at the queen's theatre. During the next 6 or 7 years he sang with great success in the principal capitals of Europe, particularly London, and in the latter part of 1857 made a professional visit to the United States, in the chief cities of which he has since repeatedly appeared. In addition to his vocal powers, Formes possesses great dramatic abilities, and in serious parts is scarcely less distinguished as an actor than as a singer. Since the death of Lablache he is unsurpassed, if not unrivalled, for capacity of voice and finish and vigor of style. He assumes tragic or comic parts with equal facility. Among those which he has most thoroughly identified with himself are Marcel in the *Huguenots*, Leporello in *Don Giovanni*, Figaro in *Figaro's Hochzeit*, Sarastro in the *Zauberflöte*, Bertram in *Robert le Diable*, Figaro in the "Barber of Seville," &c.

FORMIC ACID (Lat. *formica*, an ant), so named from its being found in the bodies of ants, is artificially prepared by dissolving sugar, starch, or tartaric acid in water, adding sulphuric acid, and distilling the mixture on peroxide of manganese. Carbonic acid gas escapes, and formic acid mixed with water distils over. It is colorless and transparent, strongly acid, of

specific gravity 1.1168, its composition represented by the formula $\text{C}_2\text{H}_2\text{O}_2$.

FORMOSA (Portuguese, *Ilha Formosa*, beautiful island; Chinese, *Tai-wan*, the terraced harbor), an island in the China sea, between lat. $21^\circ 58'$ and $25^\circ 15'$ N., and long. 120° and 122° E., separated from the Chinese province of Fo-kien by a channel 80 m. wide; length 250 m.; greatest breadth about 80 m.; area 15,000 sq. m.; pop. probably about 2,000,000. A range of mountains occupies the eastern part of the island, running from N. to S. through its entire length. As some of the summits are covered with perpetual snow, their height cannot be less than 12,000 feet. Among these mountains are several extinct volcanoes, and sulphur, naphtha, and other volcanic products are found in abundance. The E. coast is high and bold, and is entirely destitute of harbors. The W. shore is flat, and has some good ports accessible to vessels of moderate draught. Ke-lung, at the N. end of the island, is the best harbor, and is accessible to large vessels, though it is not safe from the violent typhoons to which the sea around Formosa is peculiarly subject. The W. part of the island is a very fertile plain, watered by numerous small rivers, running from the mountains to the sea. It is well cultivated, and presents the appearance of a vast garden. The chief productions are rice, sugar, camphor, tobacco, wheat, maize, beans, radishes of great size, pepper, coffee, tea, indigo, cotton, flax, silk, and oranges, peaches, plums, and a great variety of other fruits. The wild animals are leopards, tigers, wolves, and deer. Pheasants are very plentiful. The ox and buffalo are used in tillage, and horses, asses, sheep, goats, and hogs are numerous. Gold is found in the mountains, and there are mines of bituminous coal in the N. part. Sulphur and salt are also found. The commerce of the island with the mainland of China is very extensive, and employs a great number of junks. Its exports are rice, of which 500 junk loads are annually sent to China, sugar, beans, sulphur, camphor, and timber. It imports saltpetre, opium, and manufactured goods of all kinds. Of late years it has been much visited by American ships for purposes of trade. The western and most fertile part of the island is inhabited by Chinese, who have emigrated to Formosa in great numbers during the last 2 or 3 centuries. They are industrious and prosperous, skilful cultivators of the soil, and enterprising merchants. Capt. Eagleston, a Salem shipmaster who visited Formosa in 1857, describes them as civil and hospitable, and living in plenty; beggars, so numerous on the mainland of China, being entirely unknown among them. The women are small and coarse in appearance, with universally small feet. The capital of the island is Tai-wan, on the S. W. side, several miles from the sea. Northward of Tai-wan is the town of Tam-swy, with a population of about 6,000. The E. and mountainous part of Formosa is independent of the Chinese, and is inhabited by a

warlike race of copper-colored barbarians, of whom the Chinese are in great dread, and with whom they are almost constantly at war. They resemble the aboriginal inhabitants of the Philippine islands in appearance, and are probably of the Malay division of mankind. They wear their hair long, have rings in their ears, and are clothed only with a piece of cotton stuff wrapped about the middle. They dwell in bamboo cottages raised on terraces 8 or 4 feet high. They have no written language, and do not appear to have any priesthood. Their government is patriarchal, petty chiefs and councils of elders ruling them in the manner of the American Indians. The Chinese represent them as honest and friendly among themselves, but as excessively fierce and revengeful. One of the officers of the U. S. steamer John Hancock, which visited Formosa in 1855, describes them as being of large stature, fine forms, copper color, high cheek bones, heavy jaws, with coarse black hair reaching to the shoulders, and a manly, independent bearing. Their arms are lances, bows and arrows, and a few Chinese matchlocks. In their language the island is termed Kaboski, and also Gadavia. Some of these people have been subdued by the Chinese, and are kept in small villages in a kind of prædial servitude.—Formosa does not seem to have been known to the Chinese till the 15th century. In 1582 a Spanish ship was wrecked there, and the survivors brought the first account of the island to Europe. In 1634 the Dutch took possession of it and built several forts and factories, but in 1662 they were driven out by a famous Chinese pirate, Coxinga, who made himself king of the W. part, and transmitted the sovereignty to his descendants, who, however, submitted in 1683 to the authority of the Chinese emperor, to whom it has since been tributary. The Chinese colonists have frequently rebelled, and in 1788 an insurrection broke out which cost the imperial government 100,000 lives and an immense expenditure of money before it was suppressed. Psalmanazar, whose extraordinary imposture excited so much attention in England in the early part of the last century, pretended to be a native of Formosa, and published an account of the island which was entirely fictitious.

FORREST, EDWIN, an American actor, born in Philadelphia, March 9, 1806. From an early age he manifested a predilection for the stage, and in his 12th year performed female parts in the old South street theatre in Philadelphia. A year later he assumed male parts, and on Nov. 20, 1820, made his début at the Walnut street theatre as young Norval in Home's tragedy of "Douglas." A protracted professional tour in the western cities of the Union ensued, and Forrest returned to the seaboard with considerable reputation for histrionic ability. After successful engagements at Albany and Philadelphia, he appeared before a New York audience in July, 1826, in the part of Othello. His fine natural capacities and the vigor of his per-

sonation made a favorable impression, and the popularity he subsequently enjoyed may be said to date from this occasion. For several years he acted in the principal theatres of the Union, appearing as Othello, Macbeth, Hamlet, Richard III., and in other prominent Shakespearean parts, and also in a number of plays by American authors, the most successful of which were "Metamora," written for the actor by John A. Stone, the "Gladiator," by Dr. Bird, and "Brutus," by J. Howard Payne. The part of Metamora, and that of Spartacus in the "Gladiator," continue to be among the most popular and effective that he has assumed. In 1834 he visited England and acted his principal characters with considerable success, for which he acknowledged his obligations to Mr. Macready, who had shown him much attention. During a second visit to England in 1837 he was married to Miss Sinclair, daughter of the well known singer of that name, with whom he returned to the United States in 1838. In 1844 he went a third time to England, remaining there 2 years. On this occasion a rupture occurred in the friendly relations which had previously subsisted between Mr. Forrest and Mr. Macready, and to the zeal with which Mr. Forrest's friends espoused his quarrel has been ascribed the serious riot which took place in Astor place, New York, May 10, 1849, during an engagement of Mr. Macready at the Astor place opera house. In the same year Mr. Forrest separated from his wife for alleged misconduct on her part. Subsequently she brought an action for divorce against him on the ground of infidelity, and in Jan. 1852, obtained a verdict in her favor, with an annual allowance of \$3,000 as alimony. The appeal which Mr. Forrest took from this decision is still (July, 1859) before the courts of New York. He withdrew from the stage in 1858, having played with undiminished effect until the close of his career, and accumulated a fortune by his professional labors. His fame rests chiefly upon his personation of characters demanding robust action and physical power, such as Jack Cade, Spartacus, and Metamora.

FORRESTER, ALFRED HENRY, better known by his *nom de plume* of Alfred Crowquill, an English author and artist, born in London in 1806. He was brought up to be a stock broker, but at the age of 15 commenced the career of an author by publishing a variety of papers in the magazines. A few years afterward he took up drawing with a view of illustrating his own works, and first appeared before the public in the joint capacity of author and artist in 1826 in "Eccentric Tales." He was afterward one of the contributors of the "Humorist" papers to Colburn's "New Monthly Magazine," and subsequently was connected with "Bentley's Miscellany" during the editorship of Dickens. He was also among the first illustrators of "Punch" and the "Illustrated London News." Of late years he has been an exhibitor of pen-and-ink drawings at the royal academy, and has

painted pictures in oil. He designed a statuette of the duke of Wellington, which was presented to the queen. Among his works are the "Wanderings of a Pen and Pencil," "Comic Arithmetic," "Phantasmagoria of Fun," "A Bundle of Crowquills," and a variety of scrap books and fairy tales, most of which are of a humorous character and are illustrated by himself.

FORSKAL, PETER, a Swedish traveller and naturalist, born in Kalmar in 1736, died in Yerim, Arabia, July 11, 1763. He studied in the university of Göttingen, and under Linnæus at Upsal, published a thesis in opposition to the then dominant philosophy of Wolf, and incurred the displeasure of government by a treatise on civil liberty. He was appointed to a professorship in the university of Copenhagen, and by recommendation of Linnæus was attached with Niebuhr and others to the scientific expedition sent to Egypt and Arabia by the king of Denmark. He departed in 1761, and during the 2 years preceding his death by the plague collected materials for 3 important works descriptive of the fauna and flora of the East, published under the editorial care of Niebuhr.

FÖRSTER, ERNST JOACHIM, a German painter and writer upon art, born in Münchengosserstädt, April 8, 1800. After studying theology, philosophy, and philology at Jena and Berlin, he devoted himself to painting, became the pupil of Cornelius at Munich in 1828, and was employed upon frescoes at Bonn and Munich till in 1826 he visited Italy. At Pisa, Bologna, and other cities, he collected interesting materials for a history of Italian art, and at Padua in 1837 discovered and restored the frescoes in the chapel of St. George, and made a valuable collection of designs from the old masters. Since returning to Munich he has written numerous works, chiefly on the history of art.

FORSTER, GEORGE, an English traveller, died in Nagpoor in 1792. He was in the service of the East India company, and in 1782 undertook an overland journey from India to Russia. Disguised as a Mussulman merchant, and able to speak Hindoo, Persian, and the Mahratta dialect with facility, he proceeded by Bellaspoor and Jambo through the vale of Cashmere, which had been visited before by no European traveller except Bernier. He passed by Cabool, Candahar, and Herat, to the southern coast of the Caspian sea, and travelled thence through Russia, arriving in England in 1784. After publishing "Sketches of the Mythology and Customs of the Hindoos" (London, 1785), he returned to Calcutta, where in 1790 appeared the first volume of his "Journey from Bengal to England," &c. It was republished in London in 1798, together with the second volume, which was printed from his manuscripts.

FÖRSTER, HENRICH, one of the greatest living pulpit orators of the Roman Catholic church in Germany, born at Grossglogau, Prussian Silesia, Nov. 24, 1799, studied theology in Breslau, was ordained as priest in 1825, appointed canon of the cathedral in 1837, afterward inspector

of the theological seminary and preacher at the cathedral, opposed with great zeal the influence of Ronge, became in 1848 a member of the Frankfort parliament, attended, in Nov. 1848, the synod of the German bishops of Würzburg, and was made in 1853 prince-bishop of Breslau.

FORSTER, JOHANN REINHOLD, a German traveller and naturalist, born in Dirschau, Prussia, Oct. 22, 1729, died in Halle, Dec. 9, 1798, was descended from an exiled Scottish border family. He was educated at Halle and Dantzic for the clerical profession, and in 1758 became pastor at Nassenhuben, near Dantzic, but devoted himself especially to the study of mathematics, philosophy, and geography. In 1765 he went with his son Johann Georg as an agent of the Russian government to investigate the condition of the colony at Saratov in southern Russia, but received only slight recompense for his labors, and in the following year repaired to London. He was for a time professor of natural history and of the French and German languages at Warrington, in Lancashire, and in 1772 accompanied Capt. Cook on his second voyage to the south seas, being engaged as naturalist of the expedition. After his return he furnished many materials to his son, the historian of the expedition, and published his botanical observations in a special work (London, 1776), and also "Observations made during a Voyage round the World on Physical Geography, Natural History, and Ethic Philosophy" (London, 1778). The government did not aid him in these publications, regarding the narrative of his son as an evasion of the conditions of his engagement, and not being satisfied with some reflections contained in that work. Imprisoned for debt, he was released chiefly through the interest of Duke Ferdinand of Brunswick, received the degree of doctor of laws from Oxford, and in 1780 was appointed professor of natural history at Halle, an office which he retained till his death. His quickness of temper and plainness of speech exposed him to many vexations, and his love of play and passion for increasing his collections at whatever expense also involved him in difficulties; but his intellectual acuteness and wonderful memory gave value and success to his lectures and publications. He wrote and spoke 17 languages, could be peculiarly charming in conversation, and was familiar with general and especially with classical literature. Among his works, beside those above mentioned, are *Liber Singularis de Byssu Antiquorum* (London, 1776); *Zoologia Indica* (Halle, 1781); *Beobachtungen und Wahrheiten* (Berlin, 1798); and *Geschichte der Entdeckungen und Schiffahrten im Norden* (Frankfort, 1784). The last was translated into English (London, 1786), and contains much useful information and ingenious conjecture, together with many ill-natured reflections, particularly on the English.—JOHANN GEORG ADAM, eldest son of the preceding, a German traveller and naturalist, born in Nassenhuben, Nov. 26, 1754, died in Paris, Feb. 12, 1794. After accompany-

ing his father to Saratov, he studied nearly a year in St. Petersburg, and went thence to England, where he gave instruction in French and German, and translated several works into English. He went with Cook on his second voyage round the world, a narrative of which he published after his return, receiving scientific notes for it from his father, thus eluding the agreement by which the elder Forster was virtually prohibited from publishing a narrative. After residing in Paris and Holland, he was for 6 years professor of natural history in Cassel, whence in 1784 he passed to the same professorship in Wilna. He was appointed historiographer to an expedition round the world under the patronage of the empress of Russia, but the project was prevented by the Turkish war. He became librarian to the electoral prince of Mentz, but in 1792, on the occupation of that city by the French, he engaged actively in support of republican principles, and in 1793 was sent to Paris as agent of Mentz to solicit its incorporation with France. After the recapture of that city by the Prussians, Forster lost all his property, his books, and his MSS., and resolved to go to India, but died while studying the oriental languages in Paris. He is accounted one of the classical writers of Germany. Alexander von Humboldt says in his "Cosmos": "The writer who in our German literature, according to my opinion, has most vigorously and successfully opened the path of the scientific study of nature, is my celebrated teacher and friend, George Forster. Through him began a new era of scientific voyages, the aim of which was to arrive at a knowledge of the comparative history and geography of different countries. Gifted with delicate æsthetic feelings, and retaining a vivid impression of the pictures with which Tahiti and the other then happy islands of the Pacific had filled his imagination, as in recent times that of Charles Darwin, George Forster was the first to depict in pleasing colors the changing stages of vegetation, the relation of climate and of articles of food in their influence on the civilization of mankind, according to differences of animal descent and habitation. All that can give truth, individuality, and distinctiveness to the delineation of exotic nature is united in his works. We trace not only in his admirable description of Cook's second voyage of discovery, but still more in his smaller writings, the germ of that richer fruit which has since been matured." Beside numerous translations, his most important works are on subjects of natural history and ethnology, as *Kleine Schriften, ein Beitrag zur Länder- und Völkerkunde, Naturgeschichte und Philosophie des Lebens* (6 vols., Berlin, 1789-'97), and *Ansichten vom Niederrhein, von Brabant, Flandern, Holland, England, und Frankreich* (8 vols., Berlin, 1791-'94). He was the first to translate into German the *Sacotala* of Kalidasa. His widow, the daughter of Heyne, afterward known as Therese Huber, published a collection of his letters (2 vols., Leipsic, 1828-'9). His

complete works were edited by his daughter, with a critical notice by G. G. Gervinus (9 vols., Leipsic, 1843-'4).

FORSTER, JOHN, an English journalist and author, formerly editor of the London "Examiner," born in Newcastle in 1812. He was educated at the university of London, and was a member of its first law class. With his classmates he established the "London University Magazine," out of which grew the "Englishman's Magazine," among his contributions to which was a series of biographical articles on the "Early Patriots of England," which were subsequently enlarged into his "Lives of the Statesmen of the Commonwealth," making 5 vols. in "Lardner's Cabinet Cyclopædia," and republished in New York, in 1847. It is especially exact in its facts, contains much information not before published, and forms a complete and lucid narrative of the political events of the period of which it treats. Mr. Forster pursued the study of law under Chitty, and was called to the bar, but soon became a valued contributor to periodicals. In 1834 he connected himself with the "Examiner," of which he became the sole editor in 1846, and from the time of his first connection he contributed largely to every number of it, in both the departments of politics and literary criticism. He was also for 4 years the editor of the "Foreign Quarterly Review," and for a short time of the "Daily News" after the retirement of Mr. Dickens. In 1848 appeared his "Life and Adventures of Oliver Goldsmith," which was enlarged into the "Life and Times of Oliver Goldsmith" (1854), a graceful and thorough biography, of which also an abridgment has been published with the same title. He has frequently contributed to the "Edinburgh" and the "Quarterly" reviews, from the former of which his lives of Defoe and of Charles Churchill have been reprinted. His historical and biographical essays were collected in 2 vols. in 1858. In 1856 he was appointed secretary to the commission of lunacy, a place worth about £1,600 a year, and the same year he married the widow of Mr. Henry Colburn (the well-known publisher), a lady of ample fortune.

FORSTER, THOMAS IGNATIUS MARIA, an English meteorologist, born in London, Nov. 9, 1789, died about 1850. He was early interested in natural sciences, and published a "Journal of the Weather" in his 16th year. He had attracted attention by publications on the influence of the atmosphere and of spirituous liquors upon health, and on the natural history of the swallow, when in 1812 he went to the university of Cambridge, where in the following year he produced an annotated edition of Aratus. He associated himself with Spurzheim in propagating the system of phrenology, edited an edition of Catullus (1816), and published "Observations on the Influence of Particular States of the Atmosphere on Human Health and Diseases" (London, 1817). On July 3, 1819, he discovered a comet which was seen on the same

night from the observatory at Greenwich. He soon after settled on his estate in Hartwell, Sussex, where he subsequently resided, frequently visiting the continent. Beside many papers in the "Philosophical Magazine," his principal writings are the "Perennial Calendar" (London, 1824); "Pocket Encyclopædia of Natural Phenomena" (London, 1827), a compendium of prognostications of the weather; *Beobachtungen über den Einfluss des Luft-Drucks auf das Gehör* (Frankfort, 1835); *Observations sur l'influence des comètes* (1836); the whimsical *Annales d'un physicien voyageur* (Bruges, 1850); *Epistolarium Forsterianum* (Brussels, 1852), a collection of original letters from eminent men (Locke, Tillotson, Warton, Cromwell) preserved in the Forster family; and several poems and philosophical writings.

FORSYTH. I. A N. W. co. of N. Carolina, bounded W. by Yadkin river, and drained by its affluents; area, about 250 sq. m.; pop. in 1850, 11,168, of whom 1,353 were slaves. The surface is much diversified. The soil is generally fertile, and the staples are wheat, maize, and oats. In 1850 the productions amounted to 40,735 bushels of wheat, 349,320 of Indian corn, and 97,659 of oats. The county contained 2 factories, 27 mills, and 16 churches. It was formed in 1849 of the southern part of Stokes co. Capital, Winston. II. A N. co. of Ga., bounded E. and S. E. by the Chattahoochee river; area, about 250 sq. m.; pop. in 1852, 8,579, of whom 1,020 were slaves. The surface is hilly, and in some places mountainous. The soil is everywhere of fair quality, and in the vicinity of the rivers is alluvial and extremely fertile. Cotton, grain, and potatoes are the staples, and in 1850 the productions amounted to 472 bales of cotton, 839,954 bushels of Indian corn, 72,855 of oats, and 78,333 of sweet potatoes. There were 28 churches and 405 pupils attending public schools. The county is remarkably rich in minerals. Silver, copper, and considerable quantities of gold are obtained, and diamonds and other precious stones have occasionally been found. Named in honor of John Forsyth, an eminent statesman of Georgia. Capital, Cumming. Value of real estate in 1856, \$786,228.

FORSYTH, JOHN, an American senator and secretary of state under Presidents Jackson and Van Buren, born in Frederic co., Va., about 1781, died in Washington, Oct. 21, 1841. He was graduated at Princeton college in 1799, and was admitted to the bar in Augusta, Ga., in 1802. He was elected attorney-general of the state in 1808, representative in congress in 1812, and U. S. senator in 1818. In 1820 he was sent to Spain as resident minister, where he conducted the negotiations concerning the ratification and execution of the treaty by which Florida was ceded to the United States. In 1823 he was again chosen to the house of representatives, and was one of the main supporters in congress of Gov. Troup of Georgia in his contest with the national government

concerning the removal of the Creek and Cherokee Indians. He became governor of Georgia in 1827, and in 1829 was again returned to the U. S. senate. He was a delegate to the anti-tariff convention called at Milledgeville in 1832, but withdrew from it on the ground that it did not fairly represent the people of Georgia; and he opposed the South Carolina movement of nullification from its beginning, and voted in favor of Mr. Clay's compromise act of 1833. In the debate in 1834 on the removal of the deposits from the U. S. bank, he supported the president, who afterward appointed him secretary of state, an office which he retained till the retirement of President Van Buren in 1841.

FORT BEND, a S. E. co. of Texas, intersected by Brazos river, which is navigable by steamboats during part of the year, and touched on the S. W. by Bernard river; area, 920 sq. m.; pop. in 1858, 4,134, of whom 2,714 were slaves. In the valleys of the streams the soil is alluvial and fertile. The rest of the county, consisting principally of prairies, is less productive, but furnishes abundant pasturage. Timber is found in the river bottoms, Brazos and Bernard rivers being skirted by a thick growth of oak, ash, elm, and red cedar. The staples are cotton, sugar, Indian corn, and live stock. In 1850 the productions amounted to 2,465 bales of cotton, 100 hogsheads of sugar, 185,205 bushels of Indian corn, and 53,830 of sweet potatoes. There were 4 churches, several academies, and 120 pupils attending public schools. Value of real estate in 1858, \$1,228,140. Capital, Richmond.

FORT DES MOINES, the capital of Iowa, a flourishing post town of Polk co., and one of the most important places in the interior of the state; pop. in 1856, 3,830. It is built at the junction of the Des Moines and Raccoon rivers, the former of which, on the completion of improvements now in progress, will be navigable thus far by steamboats. The water power furnished by the two streams is employed in several flour and saw mills. Timber is abundant in the vicinity, and productive coal mines have been opened. A newspaper is published in the town. For many years this was a military station in the midst of the Indian country, but the old fort was abandoned in 1846. The name of the town has recently been changed to Des Moines.

FORT LARAMIE. See LARAMIE.

FORT LEAVENWORTH, a military post of Kansas, on the W. bank of the Missouri, 296 m. above its mouth, and 31 m. above the junction of the Kansas river. It was established in 1827, is important as a general rendezvous for troops proceeding westward, and as a depot for all the forts on the great Santa Fé and Oregon routes. It is the intersecting point of nearly all the great military roads of the territories, one running S. into Texas, one S. W. to Santa Fé, one W. to Fort Riley, and a fourth N. W. to posts in Nebraska, Utah, Oregon, California, etc. It is rapidly improving in appearance, being laid out in

streets, on which stand buildings for the troops, warehouses, quartermaster's establishment, stables for 8,000 horses and 15,000 mules, &c. The barrack is a large edifice, 3 stories high, and the hospital was built at a cost of \$12,000 or \$15,000. Connected with the fort are several large farms. Leavenworth City is about 2 m. distant.

FORT MADISON, the capital of Lee co., Iowa, situated on beautiful rising ground on the Mississippi, 12 m. above the lower rapids; pop. in 1853, about 3,000. It was the site of a frontier fort erected by the government in 1808 as a defence against the Indians. The garrison was forced to evacuate it in 1813, when it was burned, and few traces of it now remain. The village is pleasant and healthy, well built, with a good proportion of brick houses, a substantial court house, and 5 or 6 churches. It is the seat of the state penitentiary, a fine limestone building, and is connected with the west side of the river by a steam ferry. In its manufactures it has progressed more rapidly than any other town in the state. Its commerce is extensive, and it is a depot and shipping point for immense quantities of lumber, grain, and pork. Two newspapers are published here.

FORT RILEY, a military post of Kansas, established in 1853, at the junction of Republican and Smoky Hill forks of Kansas river, on the great emigrant route to New Mexico and California, 140 m. from Fort Leavenworth. With the latter place it is connected by an excellent military road, completed to this point in 1854, and for the continuation of which W. to Bridger's Pass, on the boundary between Nebraska and Utah, an appropriation of \$100,000 was made by congress in 1855. The fort has accommodations for a large force of cavalry, and stone barracks for 8 infantry companies, and being situated in the midst of a fertile country, abounding in timber, forage, and water, has all the advantages requisite for an important frontier post. There is a Methodist mission in the neighborhood.

FORT ROYAL, a seaport of the French West Indies, and capital of Martinique, situated on a deep and well sheltered bay on the W. side of the island; pop. 11,300. It is defended by a fort which commands both the town and the harbor, is the residence of the French governor, and contains, beside the parish church and government offices, a prison, hospital, barracks, and an arsenal. In 1839 it was almost wholly destroyed by an earthquake, in which over 500 lives were lost.

FORT ST. DAVID, a town on the Coromandel coast, presidency of Madras, Hindostan. It stands near the mouth of the river Tripapalore, 12 m. S. S. W. of Pondicherry, and was formerly well fortified. A British factory was established here in 1691. It withstood a siege by the French in 1746, and from that period remained for 12 years the capital of the British possessions in this part of India. In 1758 the French under Lally besieged it again, captured

it after a short resistance, and destroyed its fortifications.

FORT WAYNE, a flourishing city, capital of Allen co., Ind., situated in a rich, beautiful, and well cultivated region at the confluence of the St. Mary's and St. Joseph's rivers, which here form the Maumee; pop. in 1859, about 15,000. It occupies the site of the old "Twilight village" of the Miami Indians. A fort was erected here by order of Gen. Wayne in 1794; it was abandoned in 1819, and in 1841 the Indians were removed W. of the Mississippi river. The town has grown up with great rapidity, and is now one of the most important places in the state. It is the point of intersection of 2 railroads, one running from Toledo on Lake Erie to the state line in Illinois, and the other from Pittsburg, Penn., to Chicago. The Wabash and Erie canal passes by it, and numerous plank roads open an easy communication with various towns of Indiana and adjacent states. It has an active trade, is the see of a Roman Catholic bishop, and contains a Methodist female college, a German Roman Catholic school for young ladies under the charge of the sisters of Providence, 2 daily and 4 weekly newspapers, and 15 churches.

FORTE, in music, an Italian word signifying strong, loud. It is the opposite of *piano*, soft, and implies that the passage to which it is affixed is to be executed loudly or forcibly.

FORTESCUE, SIR JOHN, an English lawyer, who lived in the reigns of Henry VI. and Edward IV. The dates of his birth and death are uncertain. In 1426 he was appointed one of the governors of Lincoln's Inn, and in 1442 chief justice of the king's bench. He was a zealous Lancastrian, and when in 1461 the fortune of war made Henry VI. a fugitive, Fortescue accompanied him to Scotland, where Henry is supposed to have appointed him chancellor of England, by which title he has been mentioned by several writers. Soon after, the Yorkists, who at that period controlled the parliament, included him in the act of attainder which was passed by them against the king, queen, and other prominent Lancastrians. In 1463 he fled to the continent with Queen Margaret and her son Edward, and remained abroad several years attending on the royal exiles. He returned with them to England, but after the fatal fight at Tewkesbury in 1471, he became a prisoner to the victor, Edward IV. Having obtained his pardon and liberty, Fortescue withdrew to Gloucestershire, and there passed the residue of his days in retirement. The most celebrated of his works is his treatise *De Laudibus Legum Angliæ*, which is written in the form of a dialogue, the interlocutors being Prince Edward and the author. The earliest edition is that of Whitechurch, published in the beginning of the reign of Henry VIII., and the latest that of A. Amos (Cambridge, 1825). The oldest translation is that by Mulcaster (London, 1516).

FORTH, a large river of Scotland, the 3d of that country in size, and one of the most noted

for romantic scenery. It rises from the confluence of two small streams, the Duchray and the Dhu, which unite on the N. E. slope of Ben Lomond. Thence, under the name of the Aven-dow or Black river, it flows E. through the fertile valley of the Laggan, shut in on either side by hills, and after receiving one or two tributaries assumes the name of Forth. From this point it begins to present the remarkable irregularities which form its chief characteristic, now winding gracefully through a rich level country, now doubling and flowing W., again sweeping to the E., describing at times almost complete circles, and forming all along its course many beautiful peninsulas. The most singular of these windings, called the "links of Forth," occur between Alloa and Stirling, the distance between which places, in a straight line, is about 6 m., while by water it is 12 m. The general course of the river is E. or S. E. Its depth is from 3 to more than 87 fathoms, and its bottom is generally muddy. The tide sets up from the sea as far as Stirling bridge, a distance of 70 m. It is navigable thus far for vessels of 100 tons, and to Alloa for vessels of 300 tons. Its length, including all its sinuosities, cannot be much less than 170 m., though in a direct line it would probably not exceed 90 m. The Teith, Allan, and Devon are its largest tributaries. A canal 38 m. in length connects it with the Clyde. At Kincardine it begins to widen into an estuary, called the frith of Forth, between the counties of Clackmannan and Fife on the N., and of Linlithgow, Edinburgh, and Haddington on the S. The frith contains several islands, and a great abundance of herrings and other fish. Length, 50 m.; greatest breadth, 15 m.

FORTIFICATION. This subject is sometimes divided into defensive fortification, which provides the means of rendering a given locality, permanently or for a short time only, capable of defence; and offensive fortification, which contains the rules for conducting a siege. We shall, however, treat of it here under the three heads of PERMANENT FORTIFICATION, or the mode of putting a locality, in time of peace, in such a state of defence as to compel the enemy to attack it by a regular siege; the art of SIEGES; and FIELD FORTIFICATION, or the construction of temporary works to strengthen a given point in consequence of the momentary importance which it may acquire under the peculiar circumstances of a campaign. I. PERMANENT FORTIFICATION. The oldest form of fortification appears to be the stockade, which up to the end of the 18th century was still the national system with the Turks (*palanka*), and is even now in full use in the Indo-Chinese peninsula among the Burmese. It consists of a double or triple row of stout trees, planted upright and near each other in the ground, forming a wall all around the town or camp to be defended. Darius in his expedition among the Scythians, Cortes at Tabasco in Mexico, and Capt. Cook in New Zealand, all came in contact with such stockades. Sometimes the space between the

rows of trees was filled up with earth; in other instances the trees were connected and held together by wicker work. The next step was the erection of masonry walls instead of stockades. This plan secured greater durability, at the same time that it rendered the assault far more difficult; and from the days of Nineveh and Babylon down to the close of the middle ages, masonry walls formed the exclusive means of fortification among all the more civilized nations. The walls were made so high that escalade was rendered difficult; they were made thick enough to offer a lengthened resistance to the battering ram, and to allow the defenders to move about freely on the top, sheltered by a thinner masonry parapet with battlements, through the embrasures of which arrows and other missiles might be shot or thrown against the assailants. To increase the defence, the parapet was soon built overhanging, with holes between the projecting stones on which it rested, so as to allow the besieged to see the foot of the wall and reach an enemy who might have got so far by direct missiles from above. The ditch, no doubt, was also introduced at an early period, surrounding the whole wall, and serving as the chief obstacle against access to it. Finally, the defensive capabilities of masonry walls were developed to the highest point by adding at intervals towers which projected from the wall, thus giving it a flanking defence by missiles thrown from them at such troops as assailed the space between two towers. Being in most cases higher than the wall, and separated from its top by cross parapets, they commanded it and formed each a small fortress, which had to be taken singly after the defenders had been driven from the main wall itself. If we add to this, that in some cities, especially in Greece, there was a kind of citadel, on some commanding height inside the walls (acropolis), forming a reduit and second line of defence, we shall have indicated the most essential points of the fortification of the masonry epoch.—But from the 14th to the end of the 16th century the introduction of artillery fundamentally changed the modes of attacking fortified places. From this period dates that immense literature on fortification which has produced systems and methods innumerable, part of which have found a more or less extensive practical application, while others, and not always the least ingenious, have been passed over as merely theoretical curiosities, until at later periods the fruitful ideas contained in them have been again drawn into daylight by more fortunate successors. This has been the fate, as we shall see, of the very author who forms, if we may say so, the bridge between the old masonry system and the new system of earthworks merely revetted with masonry in those places which the enemy cannot see from a distance. The first effect of the introduction of artillery was an increase in the thickness of the walls and in the diameter of the towers at the expense of their height.

These towers were now called roundels (*ron-delli*), and were made large enough to hold several pieces of cannon. To enable the besieged to work cannon on the wall too, a rampart of earth was thrown up behind it so as to give it the necessary width. We shall soon see how this earthwork gradually encroached on the wall, so as in some cases to supersede it altogether. Albert Dürer, the celebrated German painter developed this system of roundels to its highest perfection. He made them perfectly independent forts, intersecting the continuity of the wall at certain intervals, and with casemated batteries enfilading the ditch; of his masonry parapets, not more than 3 feet high is uncovered (visible to the besieger and subject to his direct fire); and in order to complete the defence of the ditch, he proposed *caponnières*, casemated works on the sole of the ditch, hidden from the eyes of the besiegers, with embrasures on either side so as to enfilade the ditch as far as the next angle of the polygon. Almost all these proposals were new inventions; and if none except the casemates found favor with his age, we shall see that in the latest and most important systems of fortification they have all been adopted and developed according to the altered circumstances of modern times.—About the same time, a change was adopted in the shape of the enlarged towers, from which modern systems of fortification may be considered to date. The round shape had the disadvantage that neither the curtain (the piece of wall between two towers) nor the next adjoining towers could reach with their fire every point in front of an intermediate tower; there were small angles close to the wall, where the enemy, if he once reached them, could not be touched by the fire of the fortress. To avoid this, the tower was changed into an irregular pentagon, with one side turned toward the interior of the fortress, and 4 toward the open country. This pentagon was called a bastion. To prevent repetitions and obscurity, we shall now at once proceed to give the description and nomenclature of bastionary defence, based on one of those systems which show all its essential particulars. Fig. 1 (see next page) represents 3 fronts of a hexagon fortified according to Vauban's first system. The left side represents the mere outline as used in the geometrical delineation of the work; the right gives the ramparts, glacis, &c., in detail. The entire side of the polygon $f' f''$ is not formed by a continuous rampart; at each end, the portions $d' f'$ and $e'' f''$ are left open, and the space thus arising is closed by the projecting pentagonal bastion $d' b' a' c' e'$. The lines $a' b'$ and $a' c'$ form the faces, the lines $b' d'$ and $c' e'$ the flanks of the bastion. The points where faces and flanks meet are called the shoulder points. The line $a' f'$, which goes from the centre of the circle to the point of the bastion, is called the capital. The line $e'' d'$, forming part of the original circumference of the hexagon, is the curtain. Thus every polygon will

have as many bastions as sides. The bastion may be either full, if the whole pentagon is filled up with earth as high as the *terreplein* of the rampart (the place where the guns stand), or hollow (empty) if the rampart slopes down, immediately behind the guns, into the interior. In fig. 1, *abace* is a full bastion; the next

one to the right, of which one half only is seen, is a hollow one. Bastions and curtains together constitute the *enceinte*, or body of the place. In them we notice, on the *terreplein*, first the parapet, constructed in front so as to shelter the defenders, and then the rampa, on the interior slope (*es*), by which the communi-

FIG. 1.

cations with the interior are kept up. The rampart is high enough to cover the houses of the town from direct fire, and the parapet thick enough to offer lengthened resistance to heavy artillery. All round the rampart is the ditch *t t t t*, and in it are several classes of outworks. First, the ravelin or demilune *k l m*, in front of the curtain, a triangular work with two faces, *k l* and *l m*, each with a rampart and parapet to receive artillery. The open rear of any work is called the gorge; thus in the ravelin, *k m*, in the bastion *de*, is the gorge. The parapet of the ravelin is about 3 or 4 feet longer than the parapet of the body of the place, so that it is commanded by it, and the guns of the latter may in case of need fire away over it. Between the curtain and ravelin there is a long and narrow detached work in the ditch, the *tenaille*, *g h i*, destined principally to cover the curtains from breaching fire; it is low and too narrow for artillery, and its parapet merely serves for infantry to flank the ditch fire into the lunette in case of a successful assault. Beyond the ditch is the covered way, *n o p*, bounded on the inner side by the ditch and on the outer side by the interior slope of the glacis, *r r r*, which from its highest inner boundary line or crest (*crête*) slopes very gradually down into the field. The crest of the glacis is again 3 feet or more lower than the ravelin, so as to allow all the guns of the fortress to fire over it. Of the slopes in these earthworks the exterior one of the body of the place and of the outworks in the ditch (scarp), and the exterior one of the ditch (from the covered way downward) or counterscarp, are generally revetted with masonry. The salient and reëntering angles of the

covered way form large, roomy, sheltered spots, called places of arms; they are called either salient (*o*) or reëntering (*n p*), according to the angles at which they are situated. To prevent the covered way from being enfiladed, traverses or cross parapets are constructed across it at intervals, leaving only small passages at the end nearest the glacis. Sometimes there is a small work constructed to cover the communication across the ditch from the tenaille to the ravelin; it is called a *caponnière*, and consists of a narrow pathway covered on either side by a parapet, the exterior surfaces of which slope down gradually like a glacis. There is such a *caponnière* between the tenaille *g h i* and the ravelin *k l m*, fig. 1.—The section given in fig. 2 will assist in rendering this description clearer. A is the terreplein of the body of the place, B is the parapet, C the masonry revetment of the scarp, D the ditch, E the *cunette*, a smaller and deeper ditch drawn across the middle of the larger one, F the masonry revetment of the counterscarp, G the covered way, H the glacis. The steps shown behind the parapet and glacis are called *banquettes*, and serve as stands for infantry to step on and fire over the protecting parapet. It will be readily observed from the diagram that the guns placed on the flanks of the bastions sweep the whole ditch in front of the adjoining bastions. Thus the face *a' b'* is covered by the fire of the flank *e' e''*, and the face *a' d'* by the flank *b' d'*. On the other hand, the inner faces of two adjoining bastions cover the faces of the ravelin between them, by keeping the ditch in front of the ravelin under their fire. Thus there is no portion of the ditch unprotected by a flanking fire; in this consists the original and great step

in advance by which the bastionary system inaugurates a new epoch in the history of fortification.—The inventor of bastions is not known, nor is the precise date at which they were introduced; the only thing certain is that they were invented in Italy, and that San Michele in 1527 constructed two bastions in the rampart of Verona. All statements respecting earlier bastions are doubtful. The systems of bastionary fortification are classed under several national schools; the first to be mentioned is of

course that which invented bastions, the Italian. The first Italian bastions bore the stamp of their origin; they were nothing but polygonal towers or roundels; they scarcely altered the former character of the fortification, except as regarded the flanking fire. The enceinte remained a masonry wall, exposed to the direct fire of the enemy; the rampart of earth thrown up behind served chiefly to give room to place and handle artillery, and its inner slope was also revetted with masonry, as in the old town walls.

FIG. 2.

It was not till a later day that the parapet was constructed of earthworks, but even then the whole of its outer slope up to the top was revetted with masonry exposed to the direct fire of the enemy. The curtains were very long, from 800 to 550 yards. The bastions were very small, the size of large roundels, the flanks always perpendicular to the curtains. Now as it is a rule in fortification that the best flanking fire always comes from a line perpendicular to the line to be flanked, it is evident that the chief object of the old Italian flank was to cover, not the short and distant face of the adjoining bastion, but the long straight line of the curtain. Where the curtain became too long, a flat, oblique-angled bastion was constructed on the middle of it, and called a platform (*piata forma*). The flanks were not constructed on the shoulder point, but a little retired behind the rampart of the faces, so that the shoulder points projected and were supposed to shelter them; and each flank had two batteries, a lower one, and a higher one a little to the rear; sometimes even a casemate in the scarp wall of the flank on the bottom of the ditch. Add to this a ditch, and you have the whole of the original Italian system; there were no ravelins, no tenailles, no covered way, no glacis. But this system was soon improved. The curtains were shortened, the bastions were enlarged. The length of the inner side of the polygon ($f'f'$, fig. 1) was fixed at from 250 to 300 yards. The flanks were made longer, $\frac{1}{2}$ of the side of the polygon, $\frac{1}{2}$ of the length of the curtain. Thus, though they remained perpendicular to the curtain and had other defects, as we shall see, they now began to give more protection to the face of the next bastion. The bastions were made full, and in their centre a cavalier was often erected, that is, a work with faces and flanks parallel to those of the bastion, but with a rampart and parapet so much higher as to give it of its firing over the parapet of the bastion. The ditch was very

wide and deep, the counterscarp running generally parallel to the face of the bastion; but as this direction of the counterscarp prevented the part of the flank nearest the shoulder from seeing and flanking the whole of the ditch, it was subsequently done away with, and the counterscarp was traced so that its prolongation passed through the shoulder point of the next bastion. The covered way was then introduced (first in the citadel of Milan, in the 2d quarter of the 16th century, first described by Tartaglia in 1554). It served as a place of concentration as well as of retreat for sallying parties, and from its introduction the scientific and energetic use of offensive movements in the defence of fortresses may be said to date; to increase its utility the places of arms were introduced, which give more room, and of which the reëntering angles also give a capital flanking fire to the covered way. To render the access to the covered way still more difficult, rows of palisades were erected on the glacis, one or two yards from its crest, but in this position they were soon destroyed by the enemy's fire; after the middle of the 17th century, therefore, they were placed, at the suggestion of the Frenchman Mandin, on the covered way, covered by the glacis. The gates were in the middle of the curtain; to cover them, a crescent-shaped work was placed in the middle of the ditch in front of them; but for the same reason that the towers were transformed into bastions, the half-moon (*demi-lune*) was soon changed into a triangular work—the present ravelin. This was still very small, but became larger when it was found that not only did it serve as a bridge-head across the ditch, but also covered flanks and curtains against the enemy's fire, gave a cross fire in front of the capitals of the bastions, and effectually flanked the covered way. Still they were made very small, so that the prolongation of their faces reached the body of the place in the curtain point (the extremity of the curtain). The principal faults of the Italian

mode of fortification were the following: 1. The bad direction of the flank. After the introduction of ravelins and covered ways, the curtain became less and less the point of attack; the faces of the bastions now were chiefly assailed. To cover these well, the prolongation of the faces should have met the curtain at the very point where the flank of the next bastion was erected, and this flank should have been perpendicular or nearly so to this prolonged line (called the line of defence). In that case there would have been an effective flanking fire all along the ditch and front of the bastion. As it was, the line of defence was neither perpendicular to the flanks nor did it join the curtain at the curtain point; it intersected the curtain at $\frac{1}{2}$, $\frac{1}{3}$, or $\frac{1}{4}$ of its length. Thus, the direct fire of the flank was more likely to injure the garrison of the opposite flank than the assailants of the next bastion. 2. There was an evident want of provision for a prolonged defence after the enceinte had been breached and successfully assaulted at one single point. 3. The small ravelins but imperfectly covered the curtains and flanks, and received but a poor flanking fire from them. 4. The great elevation of the rampart, which was all faced or revetted with masonry, exposed, in most cases, a height of 15 to 20 feet of masonry to the direct fire of the enemy, and of course this masonry was soon destroyed. We shall find that it took almost two centuries to eradicate this prejudice in favor of uncovered masonry, even after the Netherlands had proved its uselessness. The best engineers and authors belonging to the Italian school were: San Michele (died 1559), fortified Napoli di Romania in Greece, and Candia, and built Fort Lido near Venice; Tartaglia (about 1550); Alghisi da Carpi, Girolamo Maggi, and Giacomo Castriotto, who about the end of the 16th century all wrote on fortification. Paciotto of Urbino built the citadels of Turin and Antwerp (1560-'70). The later Italian authors on fortification, Marchi, Busca, Floriani, Rosetti, introduced many improvements, but none of these were original. They were mere plagiarists of more or less skill; they copied most of their devices from the German Daniel Speckle, and the remainder from the Netherlands. They all belong to the 17th century, and were completely eclipsed by the rapid development of fortificatory science which at that time took place in Germany, the Netherlands, and France.—The defects of the Italian system of fortification were soon discovered in Germany. The first man to point out the chief defect of the elder Italian school, the small bastions and long curtains, was a German engineer, Franz, who fortified for Charles V. the town of Antwerp. In the council held to try the plan, he insisted upon larger bastions and shorter curtains, but was outvoted by the duke of Alva and the other Spanish generals, who believed in nothing but the routine of the old Italian system. Other German fortresses were distinguished by the adoption of casemated galleries upon the principle of Dürer, as Küstrin,

fortified in 1587-'58, and Jülich, fortified a few years later by an engineer known under the name of Master John (*Meister Johann*). But the man who first broke completely through the fetters of the Italian school and laid down the principles on which the whole of the subsequent systems of bastionary fortification are founded, was Daniel Speckle, engineer to the town of Strasbourg (died 1589). His chief principles were: 1. That a fortress becomes stronger the more sides there are to the polygon which forms the enceinte, the different fronts being thereby enabled to give a better support to each other; consequently, the nearer the outline to be defended comes to a straight line, the better. This principle, demonstrated as an original discovery with a great show of mathematical learning by Cormontaigne, was thus very well known to Speckle 150 years earlier. 2. Acute-angled bastions are bad; so are obtuse-angled; the salient angle should be a right one. Though correct in his opposition to acute salients (the smallest admissible salient angle is now generally fixed at 60°), the partiality of his time for right-angled salients made him hostile to the obtuse salient, which is indeed very advantageous and unavoidable in polygons with many sides. In fact, this appears to have been merely a concession to the prejudices of his time, for the diagrams of what he considers his strongest method of fortification all have obtuse-angled bastions. 3. The Italian bastions are far too small; a bastion must be large. Consequently, Speckle's bastions are larger than those of Cormontaigne. 4. Cavaliers are necessary in every bastion and on every curtain. This was a consequence of the system of siege of his time, in which high cavaliers in the trenches played a great part. But in Speckle's intention, the cavaliers were to do more than resist these; they are real *coupures* provided beforehand in the bastion, forming a second line of defence after the enceinte has been breached and stormed. The whole of the credit generally given to Vauban and Cormontaigne for cavaliers forming permanent *coupures*, is therefore in reality due to Speckle. 5. A portion, at least, of the flank, and better still the whole of the flank of a bastion, must be perpendicular to the line of defence, and the flank be erected in the point where the line of defence crosses the curtain. This important principle, the alleged discovery of which forms the greater part of the glory of the French engineer Pagan, was thus publicly proclaimed 70 years before Pagan. 6. Casemated galleries are necessary for the defence of the ditch; consequently Speckle has them both on the faces and flanks of the bastion, but only for infantry; if he had made them large enough for artillery, he would in this respect have been fully up to the latest improvements. 7. To be useful, the ravelin must be as large as possible; accordingly, Speckle's ravelin is the largest ever proposed. Now, Vauban's improvements upon Pagan consist partly, and Cormontaigne's improvements upon

Vauban consist almost entirely, in the successive enlargement of the ravelin; but Speckle's ravelin is a good deal larger than even Cormontaigne's. 8. The covered way is to be strengthened as much as possible. Speckle was the first to see the immense importance of the covered way, and he strengthened it accordingly. The crests of the glacis and of the countescarp were formed *en crémaillière* (like the edge of a saw), so as to render enfilading fire ineffective. Cormontaigne, again, took up this idea of Speckle's; but he retained the traverses (short ramparts across the covered way against enfilading fire), which Speckle rejected. Modern engineers have generally come to the conclusion that Speckle's plan is better than Cormontaigne's. Speckle, beside, was the first to place artillery on the places of arms of the covered way. 9. No piece of masonry is to be exposed to the eye and direct fire of the enemy, so that his breaching batteries cannot be established before he has arrived on the crest of the glacis. This most important principle, though established by Speckle in the 16th century, was not generally adopted until Cormontaigne; even Vauban exposes a good deal of his masonry. (See O, fig. 3.) In this short abstract of Speckle's ideas the fundamental principles of all modern bastioned fortification are not only

and his system, and very good defense, considering the There is not a celebrated history of modern war proved to have been from this great defense. Speckle's was shown in the case of Ingolstadt, m, Colmar, Basel, which were fortified the same epoch, the case of the Netherlands school of fortification those old masonry to resist a regular assault the Spaniards; at time nor money in masonry bastions system. But the other resources in water horizon, and report in canal and the exact counter-barricade shallow wet ditch-works; low ramparts present, but covered part (*fausse-braye*) the ditch; numerous

outworks in the ditch, such as ravelins, half bastions (ravelins in front of the salient of the bastions), horn and crown works;* and finally,

* A horn work is a bastioned front, two half bastions, a ravelin, and a ravelin advanced in front of the main ditch and closed on each side by a straight line of rampart and

a better use of the accidents of the ground than with the Italians. The first town fortified entirely by earthworks and wet ditches was Broda (1583). Subsequently the Dutch method received several improvements: a narrow zone of the scarp was revetted with masonry, as the wet ditches, when frozen over in winter, were easily passed by the enemy; locks and sluices were constructed in the ditch, so as to let the water in at the moment when the enemy had begun to sap the hitherto dry bottom; and finally, sluices and dikes were constructed for a systematic inundation of the country around the foot of the glacis. The writers on this elder Dutch method of fortification are Marolois (1627), Freitag (1680), Volker (1666), Meider (1670). An application of Speckle's maxims to the Dutch method was attempted by Scheither, Neubauer, Heidemann, and Heer (all from 1670 to 1690, and all of them Germans).—Of all the different schools of fortification, the French has enjoyed the greatest popularity; its maxims have found practical application in a greater number of still existing fortresses than those of all the other schools put together. Still, there is no school so poor in original ideas. There is neither a new work nor a new principle in the whole of the French school which is not borrowed from the Italians, the Dutch, or the Germans. But the great merit of the French is the reduction of the art to precise mathematical rules, the symmetrical arrangement of the proportions of the different lines, and the adaptation of the scientific theory to the varied conditions given by the locality to be fortified. Errard of Bar-le-Duc (1594), commonly called the father of French fortification, has no claim to the appellation; his flanks form an acute angle with the curtain, so as to be still more ineffective than those of the Italians. A more important name is Pagan (1645). He was the first to introduce in France, and to popularize, Speckle's principle that the flanks should be perpendicular to the lines of defence. His bastions are roomy; the proportions between the lengths of faces, flanks, and curtains are very good; the lines of defence are never longer than 240 yards, so that the whole of the ditch, but not the covered way, is within musket range from the flanks. His ravelin is larger than that of the Italians, and has a *reduit* or keep in its gorge, so as to admit of resistance when its rampart has already been taken. He covers the faces of the bastions with a narrow detached work in the ditch, called a counter-guard, a work which had already been used by the Dutch (the German Dillich appears to have first introduced it). His bastions have a double rampart on the faces, the second to

ditch, which is aligned upon the faces of the bastions of the enceinte so as to be completely flanked by their fire. A crown work consists of two such advanced fronts (one bastion flanked by two half bastions); a double crown work has three fronts. In all these works it is necessary that their rampart should be at least as much lower than that of the enceinte as the rampart of the ravelin to maintain the command of the enceinte over them. The adoption of such outworks, which of course were exceptions, was regulated by the nature of the ground.

serve as a coupure; but the ditch between the two ramparts is entirely without flanking fire. The man who made the French school the first in Europe was Vauban (1633–1707), marshal of France. Although his real military glory rests upon his two great inventions in the attack of fortresses (ricochet fire and parallels), still he is popularly better known as a constructor of them. What we have said of the French school is true of Vauban's method in the highest degree. We see in his constructions as great a variety of forms as is compatible with the bastionary system; but there is nothing original among them, much less any attempt to adopt other forms than the bastionary. But the arrangement of the details, the proportions of the lines, the profiles, and the adaptation of the theory to the ever-varying requirements of the locality, are so ingenious, that they appear perfection in comparison to the works of his predecessors, so that scientific and systematic fortification may be said to date from him. Vauban, however, did not write a line on his method of fortification, but from the great number of fortresses constructed by him the French engineers have tried to deduce the theoretical rules he followed, and thus have been established 8 methods, called Vauban's first, second, and third system. Fig. 1 gives the first system in its greatest simplicity. The chief dimensions were: the outer side of the polygon, from the point of one bastion to that of the next, 300 yards (on an average); on the middle of this line, a perpendicular $a\beta$, $\frac{1}{6}$ of the first; through β , the lines of defence from a'' and a' , $a''d'$, and $a'e''$. From the points a'' and a' , $\frac{2}{3}$ of $a''a'$ measured on the lines of defence gives the faces $a''c''$ and $a'b'$. From the shoulder points c'' and b' arcs with the radius $c''d'$ or $b'e''$ were drawn between the lines of defence, giving the flanks $b'd'$ and $c''e''$. Draw $e''d'$, the curtain. The ditch: with radius 30 yards, an arc in front of the point of the bastion, prolonged by tangents drawn to this arc from the shoulder points of the adjoining bastions, gives the counterscarp. The ravelin: from the curtain point e'' , with radius $e''\gamma$ (γ , a point on the opposite face 11 yards beyond the shoulder-point), draw the arc $\gamma\delta$, until it crosses the prolongation of the perpendicular $a\beta$; this gives the point of the ravelin; the chord to the arc just described gives the face, which is continued from the point until it reaches the prolongation of the tangent forming the counterscarp of the main ditch; the gorge of the ravelin is fixed by this line equally, so that the whole of the ditch remains free for the fire of the flanks. In front of the curtain, and there alone, Vauban retained the Dutch *fausse-braie*; this had already been done by the Italian Floriani before him, and the new work had been called *tenaille* (*tenaglia*). Its faces were in the direction of the lines of defence. The ditch in front of the ravelin was 24 yards wide, the counterscarp parallel to the faces of the ravelin, and the point rounded off. In this manner Vauban obtained roomy bas-

tions, and kept his flanked salient angles well within musket range; but the simplicity of these bastions renders the defence of the place impossible as soon as the face of one bastion is breached. His flanks are not so good as Speckle's or Pagan's, forming an acute angle with the lines of defence; but he does away with the 2 and 3 tiers of uncovered guns which figure in most of the Italian and early French flanks, and which were never very useful. The *tenaille* is intended to strengthen the defence of the ditch by infantry fire, and to cover the curtain from direct breaching fire from the crest of the glacis; but this is very imperfectly done, as the breaching batteries in the reëntering place of arms (n , fig. 1) have a full view of the piece of the curtain next to the flank at e . This is a great weakness, as a breach there would turn all the coupures prepared in the bastion as a second line of defence. It arises from the ravelin being still too small. The covered way, constructed without *crémaillères*, but with traverses, is much inferior to Speckle's; the traverses prevent not only the enemy, but also the defence, from enfilading the covered way. The communications between the different works are on the whole good, but still not sufficient for energetic sallies. The profiles are of a degree of strength which is still generally adopted. But Vauban still clung to the system of revetting the whole of the outside of the rampart with masonry, so that at least 15 feet high of masonry was uncovered. This mistake is made in many of Vauban's fortresses, and once made can only be remedied at an enormous expense by widening the ditch in front of the faces of the bastions, and constructing earthwork counterscarps to cover the masonry. During the greater part of his life Vauban followed his first method; but after 1680 he introduced two other methods, having for their object to admit of a prolonged defence after the bastion was breached. For this purpose he took up an idea of Castriotto's, who had proposed to modernize the old tower and wall fortification by placing detached bastions, isolated, in the ditch, in front of the towers. Both Vauban's second and third methods agree in this. The ravelin is also made larger, the masonry is a little better covered; the towers are casemated, but badly; the fault that the curtain may be breached between bastion and *tenaille* is maintained, and renders the detached bastion partly illusory. Still, Vauban considered his second and third methods as very strong. When he handed over to Louis XIV. the plan for the fortification of Landau (second system), he said: "Sire, here is a place that all my art would not suffice to take." This did not prevent Landau from being taken 3 times during Vauban's life (1702, 1703, 1704), and again shortly after his death (1713).—The errors of Vauban were rectified by Cormontaigne, whose method may be considered as the perfection of the bastionary system. Cormontaigne (1696–1752) was a general of engineers. His larger bastions

permit the construction of permanent coupures and second lines of defence; his ravelins were nearly as large as those of Speckle, and fully covered that portion of the curtain which Vauban had left exposed. In polygons of 8 and more sides his ravelins were so far advanced that their fire took in the rear the besiegers' works against the next bastion as soon as he reached the crest of the glacis. In order to avoid this, two ravelins have to be conquered before one bastion can be breached. This mutual support of the large ravelins becomes more and more effective the more the line to be defended approaches a straight one. The reëntering place of arms was strengthened by a *reduit*. The crest of the glacis is drawn *en crémaillère*, as with Speckle, but traverses are maintained. The profiles are very good, and the masonry is always covered by the earth-works in front. With Cormontaigne the French school closes, as far as the construction of bastionary defences, with outworks within the ditch, is concerned. A comparison of the gradual development of bastionary fortification from 1600 to 1750, and of its final results as laid down by Cormontaigne, with the principles of Speckle, as stated above, will tend to elucidate the wonderful genius of the German engineer; for although outworks in the ditch have been multiplied to an enormous degree, yet not a single important principle has been discovered during all these 150 years which had not been already clearly and distinctly enunciated by Speckle. —After Cormontaigne, the school of engineers of Mézières (about 1760) made some slight alterations in his system, the principal of which is the return to Speckle's old rule that the flanks must be perpendicular to the lines of defence. But the principal point for which the school of Mézières is remarkable is that they for the first time construct outworks beyond the covered way. On fronts particularly open to attack they place at the foot of the glacis, on the capital of the bastion, a detached ravelin called a *lunette*, and thereby approach for the first time to the modern system of permanent intrenched camps. In the beginning of the 19th century Bousmard, a French emigrant who served in Prussia and was killed at Dantzic in 1806, tried still to improve upon Cormontaigne; his ideas are rather complicated, and the most remarkable is that his ravelin, which is very large, is advanced to the foot of the glacis almost so as to take the place and functions, to a certain degree, of the *lunette* just described.—A Dutch engineer of Vauban's time, who more than once opposed him in siege warfare with equal honor, Baron Coehorn, gave a further development to the old Dutch method of fortification. His system gives a stronger defence even than Cormontaigne's, by the clever combination of wet and dry ditches, the great facilities offered to sorties, the excellent communications between the works, and the ingenious *reduits* and coupures in his ravelins and bastions. Coehorn, a great ad-

miration of Speckle, is the only engineer of note who was honest enough to acknowledge how much he owed to him.—We have seen that even before the introduction of bastions, Albert Dürer used caponnières to afford a stronger flanking fire. In his fortified square he even entirely trusts to these caponnières for the defence of the ditch; there are no towers on the corner of the fort; it is a plain square with none but salient angles. To make the enceinte of a polygon entirely coincident with its outline, so as to have all salient and no reëntering angles, and to flank the ditch by caponnières, constitutes what is called polygonal fortification, and Dürer must be considered as its father. On the other hand, a star-shaped enceinte, in which salient and reëntering angles follow upon each other regularly, and in which each line is both flank and face at once, flanking the ditch of the next line with the portion next to the reëntering angle, and commanding the field with the portion next the salient—such an outline constitutes *tenaille* fortification. The older Italians and several of the older Germans had proposed this form, but it was not developed till afterward. The system of George Rimpler (engineer to the emperor of Germany, killed in defending Vienna against the Turks in 1683) forms a kind of intermediate stage between the bastionary and *tenaille* system. What he calls intermediate bastions constitute in reality a perfect line of *tenailles*. He declared himself energetically against open batteries with a mere earth parapet in front, and insisted on casemated batteries wherever they could be erected; especially on the flanks, where 2 or 3 tiers of well covered guns would thus have a far greater effect than the 2 or 3 tiers of guns in open flank batteries, which could never act together. He also insisted on batteries, that is, *reduits*, in the places of arms of the covered way, which Coehorn and Cormontaigne adopted, and especially a double and triple line of defence behind the salient angles of the enceinte. In this manner his system is remarkably in advance of his time; the whole of his enceinte consists of independent forts, each of which has to be taken separately, and large defensive casemates are used in a manner which reminds us, almost in the details even of their application, of the more recent constructions in Germany. There is no doubt that Montalembert owed as much to Rimpler as the bastionary system of the 17th and 18th century to Speckle. The author who first fully developed the advantages of the *tenaille* over the bastionary system was Landsberg (1712); but it would lead us too far if we were to enter into his arguments or describe his fortificatory outline. Of the long series of skilful German engineers who followed Rimpler and Landsberg, we may name the Mecklenburg colonel Buggenhagen (1720), the inventor of blockhouse traverses, or traverses hollowed out and adapted for casemated musketry fire; and the Würtemberg major Herbolt (1784), inventor of defensive barracks,

large barracks in the gorge of salient works, proof against vertical fire, with embrasured casemates on the side facing the enceinte, and barracks and store rooms on the side facing the town. Both these constructions are now very largely used.—Thus we see that the German school, with almost the only exception of Speckle, was from its origin adverse to bastions, which it sought to replace chiefly by tenailles, and that it attempted at the same time to introduce a better system of inner defence, chiefly by the use of casemated galleries, which again were considered as the height of absurdity by French engineering authorities. One of the greatest engineers, however, that France ever produced, the marquis de Montalembert (1713–'99), major-general of cavalry, passed over with drums beating and colors flying into the camp of the German school, to the great horror of the whole French engineering corps, who, up to the present date, decry every word he has written. Montalembert severely criticized the defects of the bastionary system; the ineffectuality of its flanking fire; the almost certainty it offered to the enemy that his shots if they missed one line must do harm in another; the want of protection against vertical fire; the perfect uselessness of the curtain as to fire; the impossibility of having good and large coupures in the gorges of the bastions, proved by the fact that no fortress of his time had any of the multifarious permanent coupures proposed by the theorists of the school; and the weakness, bad connection, and want of mutual support of the outworks. Montalembert therefore preferred either the tenaille or the polygonal system. In either case the body of the place consisted of a row of casemates, with one or two tiers of guns, the masonry of which was covered from direct fire by a counterscarp or *couvre-face* of earthwork extending all around and having a second ditch in its front; this ditch was flanked by casemates in the reëntering angles of the *couvre-face* covered by the parapet of the reduit or lunette in the reëntering place of arms. The whole system was based upon the principle of opposing, by means of casemated guns, such an overwhelming fire to the enemy the moment he reached the crest of the glacis, or of the *couvre-face*, that he could not possibly succeed in erecting his breaching batteries. That casemates could do this he maintained against the unanimous condemnation of French engineers, and he afterward even compiled systems of circular and tenaille fortifications in which all earthworks were rejected and the whole defence intrusted to high casemated batteries with from 4 to 5 tiers of guns, the masonry of which was to be protected by the fire of its batteries only. Thus, in his circular system, he contrives to concentrate 848 guns on any point 500 yards from the fortress, and expects that such an immense superiority of fire would put the possibility of erecting siege batteries entirely out of the question. In this, however, he has found no adherents, except in

the construction of the sea fronts of coast forts; here the impossibility of breaching strong casemated walls by the guns of ships was pretty well demonstrated by the bombardment of Sebastopol. The splendid forts of Sebastopol, Cronstadt, Cherbourg, and the new batteries on the entrance of Portsmouth harbor (England), and almost all modern forts for harbor defence against fleets, are constructed according to Montalembert's principle. The partly uncovered masonry of the Maximilian towers at Lintz (Austria) and of the reduits of the detached forts of Cologne are imitated from Montalembert's less happy projects. In the fortification of steep heights (Ehrenbreitstein in Prussia, for instance) the uncovered masonry forts have also been sometimes adopted, but what resistance they will be able to make must be decided by actual experience.—The tenaille system has never, to our knowledge at least, found practical application, but the polygonal system is in great favor in Germany, and has been applied to most modern constructions there; while the French tenaciously cling to Cormontaigne's bastions. The enceinte, in the polygonal system, is generally a plain earthwork rampart with revetted scarp and counterscarp, with large caponnières in the middle of the fronts, and with large defensive barracks behind the rampart and covered by it to serve as coupures. Similar defensive barracks have also been erected as coupures in many bastionary works, to close the gorges of the bastions; the rampart serving as a counterscarp to protect the masonry from distant fire. Of all Montalembert's proposals, however, that of detached forts has had the greatest success, and initiated a new era, not only in fortification, but in the attack and defence of fortresses, and even in general strategy. Montalembert proposed to surround large fortresses in important situations by a single or double chain of small forts, on commanding elevations, which, though isolated in appearance, would still support each other by their fire, and, by the facility they gave for large sorties, would render a bombardment of the place impossible, and when required form an intrenched camp for an army. Vauban had already introduced permanent intrenched camps under the guns of fortresses, but their intrenchments consisted of long continuous lines, which, if broken through at one point only, were completely at the mercy of the enemy. But these intrenched camps of Montalembert's were capable of a far greater resistance, for each fort had to be taken singly, and before 8 or 4 at least were conquered, no enemy could open his trenches against the place. Moreover, the siege of each of the forts could be interrupted at every moment by the garrison, or rather the army encamping behind the forts, and thus a combination of active campaigning and regular fortress warfare was secured, which must greatly strengthen the defence. When Napoleon led his armies hundreds of miles through the enemy's country, never heeding the fortresses which had all been constructed

The art of sieges had been brought to a certain perfection by the Greeks and Romans. They tried to breach the walls of fortresses by the battering ram, I approached them under cover of strongly roofed galleries, or in case of need by a lofty construction which was to com-

mand walls and towers by its greater height, and offer a safe approach to the storming columns. The introduction of gunpowder did away with these contrivances; the fortresses having now ramparts of less elevation, but a fire effective at long distances, the approaches were made by trenches, leading in zigzags or curved lines toward the glacis; batteries being erected at various spots so as to silence if possible the fire of the besieged and to batter down his masonry. Once arrived on the crest of the glacis, a high trench cavalier was erected, with the intention of commanding the bastions and their cavaliers, and then by a crushing fire to complete the breach and prepare for the assault. The curtain was the point generally attacked. There was, however, no system in this mode of attack until Vauban introduced parallels of ricochet firing, and regulated the process of sieges in the manner which is in use even now, and still denominated Vauban's attack. The besieger, after investing the place with a sufficient force on all sides, and choosing the fronts to be attacked, opens the first parallel during the night (all siege works are chiefly carried on at night) at about 800 yards from the fortress. A trench parallel to the sides of the besieged polygon is drawn around at least 8 of these sides and fronts; the earth, being thrown up on the side toward the enemy and propped upon the sides of the ditch with gabions (willow-work baskets filled with earth), forms a kind of parapet against the fire of the fortress. In this first parallel the ricochet batteries for enfilading the long lines of the attacked fronts are constructed. Taking for the object of the siege a bastioned hexagon, there should be ricochet batteries to enfilade the faces of 3 bastions and 8 ravelins, in all the batteries, one for each face. These batteries throw their shot so as to pass just over the parapet of the works and along the faces in their whole length, taking them in flank and endangering guns and men. Similar batteries are constructed to enfilade the branches of the covered way, and mortars and howitzers are placed in battery to throw shells into the interior of the bastions and ravelins. All these batteries are covered by earthwork parapets. At the same time, at two or more places, zigzag trenches are pushed forward toward the place, taking care to avoid all enfilading fire from the town; and so soon as the fire of the place shows signs of slackening, the second parallel, about 850 yards from the works, is opened. In this parallel the dismantling batteries are constructed. They serve to completely destroy the artillery and embrasures on the faces of the fortress; there will be 8 faces to attack (3 bastions and their ravelins, and the inner faces of the adjoining ravelins), for each of which there is a battery, constructed parallel to the attacked faces, and each embrasure exactly opposite to an embrasure of the fortress. From the second parallel fresh zigzags are pushed toward the town; at 300 yards the half parallel is constructed, forming new en-

largements of the zigzags armed with mortar batteries; and at last, at the foot of the glacis, the third parallel. This is armed with heavy mortar batteries. By this time the fire of the place will have been nearly silenced, and the approaches, in varied forms of curved or angular lines, to avoid ricochet fire, are carried up to the crest of the glacis, which it reaches opposite the points of the two bastions and of the ravelin. A lodgment or trench and parapet is then formed in the salient place of arms to enfilade the ditch by infantry fire. If the enemy is active and daring in his sorties, a 4th parallel connecting the salient places of arms across the glacis becomes necessary. Otherwise a sap is pushed from the 3d parallel to the reëntering places of arms, and the crowning of the glacis, or the construction of a trench all along the covered way on the crest of the glacis, is completed. Then the counter batteries are constructed in this *couronnement* in order to silence the fire of the flank, which enfilades the ditch, and after them the breaching batteries against the point and faces of the bastions and ravelin. Opposite the points to be breached, a mining gallery is constructed loading down from the trenches through the glacis and counterscarp into the ditch; the counterscarp is blown in, and a fresh trench constructed across the ditch to the foot of the breach, covered on the side whence the enfilading fire of the flank comes by a parapet. As soon as both breach and passage of the ditch are complete, the assault takes place. This is in the case of a dry ditch; across a wet ditch, a dike has to be constructed with fascines, covered equally by a parapet on the side of the flank of the adjoining bastion. If on taking the bastion it is found that there is a further intrenchment or coupure in the rear, a lodgment has to be effected, fresh batteries to be constructed on the breach, and a fresh breach, descent, and passage of the ditch and assault to be made. The average resistance of a bastioned hexagon of Vauban's first method against such a siege is calculated to be from 19 to 22 days if there are no coupures, and 27 or 28 days if it is provided with coupures. Cormontaigne's method is expected to hold out 25 or respectively 35 to 37 days.

III. FIELD FORTIFICATION. The construction of field works is as old as the existence of armies. The ancients were even far more expert in this art than our modern armies; the Roman legions, before an enemy, intrenched their camp every night. During the 17th and 18th centuries we see also a very great use of field works, and in the wars of Frederic the Great pickets on outpost duty generally throw up slightly profiled redans. Yet even then, and it is still more the case now, the construction of field works was confined to the strengthening of a few positions selected beforehand with a view to certain eventualities during a campaign. Thus Frederic the Great's camp at Bunzelwitz, Wellington's lines at Torres Vedras, the French lines of Weissenburg, and the Austrian intrenchments in front of Verona

in 1848. Under such circumstances, field works may exercise an important influence upon the issue of a campaign by enabling an inferior army successfully to resist a superior one. Formerly the intrenched lines, as in Vauban's permanently intrenched camps, were continuous; but from the defect that if pierced and taken at one point the whole line was useless, they are now universally composed of one or more lines of detached redoubts, flanking each other by their fire, and allowing the army to fall upon the enemy through the intervals as soon as the fire of the redoubts has broken the energy of his assault. This is the principal use of field works; but they are also employed singly, as bridge heads to defend the access to a bridge, or to close an important pass to small parties of the enemy. Omitting all the more fanciful shapes of works which are now out of date, such fortifications should consist of works either open or closed at the gorge. The former will either be redans (two parapets with a ditch in front forming an angle facing the enemy) or lunettes (redans with short flanks). The latter may be closed at the gorge by palisades. The principal closed field work now in use is the square redoubt, either as a regular or an irregular quadrangle, closed by a ditch and parapet all round. The parapet is made as high as in permanent fortification (7 to 8 feet), but not so thick, having to resist field artillery only. As none of these works has a flanking fire in itself, they have to be disposed so that they flank each other within musket range. To do this effectually, and strengthen the whole line, the plan now most generally adopted is to form an intrenched camp by a line of square redoubts flanking each other, and also a line of simple redans, situated in front of the intervals of the redoubts. Such a camp was formed in front of Comorn, south of the Danube, in 1849, and was defended by the Hungarians for 2 days against a far superior army.—The following statement exhibits the fortifications of the United States now existing or in course of construction (Oct. 1859), and the amount expended for their construction, modification, and repair :

Name or locality of fort.		Amount expended for construction and repair.
ON THE NORTHERN FRONTIER.		
1 Fort Wayne, near Detroit, Mich.....		\$17,125
2 Fort Porter, near Buffalo, N. Y.....		114,300
3 Fort Niagara, Niagara river, N. Y.....		65,000
4 Fort Ontario, near Oswego, N. Y.....		55,000
5 Fort Montgomery, at outlet of L. Champlain		200,000
Total on the northern frontier		\$351,425
ON THE ATLANTIC AND GULF COAST.		
1 Fort Knox, at narrows of Pamlico river, N.C.		\$51,000
2 Fort at entrance to Kennebec river, Me....		1,000
3 Fort Preble, Portland harbor, Me.....		32,000
4 Fort Scammon, Portland harbor.....		50,000
5 Fort on Hog Island ledge, Portland harbor		50,000
6 Fort McClary, Portsmouth harbor, N. H. ...		20,000
7 Fort Constitution, Portsmouth harbor.....		12,000
8 Fort Independence, Boston harbor, Mass. .		270,000
9 Fort Winthrop, Boston harbor		130,000
10 Fort Warren, Boston harbor.....		1,200,000
Amount carried forward.....		\$2,036,425

ly represented as blind, with wings on her feet, which she was believed to lay aside when entering Rome, with a crescent on her head, a helmet, cornucopia, or globe in her hand, and resting on a wheel.

FORTUNATE ISLANDS. See CANARY ISLANDS.

FORTUNE, ROBERT, a Scottish botanist, born in Berwickshire in 1818. He was brought up as a horticulturist, and having procured employment in the botanical gardens of Edinburgh, availed himself of the privilege afforded to young gardeners occupied there of attending the lectures of the university professor. He also went through a course of private reading, and upon his promotion to a post in the botanical gardens at Chiswick so recommended himself by his acquirements and intelligence, that after a severe examination he was appointed by the London horticultural society as collector of plants in northern China, which the peace of 1842 had just thrown open to Europeans. His "Three Years' Wanderings in the Northern Provinces of China" (2 vols. 8vo., 1847; 3d ed. 1853), published soon after his return, beside affording full information of the horticulture and agriculture of the Chinese, is one of the most entertaining books of travel recently written. After superintending for several months the gardens of the apothecaries' company at Chelsea, he again departed in the latter part of 1848 for China, under the auspices of the East India company, to examine and report upon the nature and method of cultivating the tea plant and to collect its seeds and introduce its culture into northern India. After an absence of more than 8 years, he returned to England and published his valuable work, entitled "Two Visits to the Tea Countries of China" (2 vols. 8vo., 1852). Scarcely had this gone through the press when he departed on a third tour to the same country, the results of which were given in his "Residence among the Chinese: Inland, on the Coast, and at Sea; being the Third Visit from 1853 to 1856" (8vo., 1857). In 1857 Mr. Fortune was employed by the U. S. patent office to visit China to collect the seeds of the tea shrub and of other plants, with a view to the introduction of their cultivation into the United States. He proceeded from England by the overland route directly to the tea districts in the middle and northern provinces of China, where he remained until March, 1859, and collected a large quantity of seeds, which he shipped to the United States, where they arrived in April, May, and June, generally in good condition. Mr. Fortune left Hong Kong March 15, and arrived in England in May, at which time his engagement with the patent office terminated.

FORUM, in ancient Roman cities, an open place, surrounded with public buildings, which was originally used for the administration of justice or the sale of goods, and subsequently for the transaction of all kinds of public business. In this respect it corresponded with the *agora* of

name of Tyche, as the daughter of Oceanus, according to Hesiod, and as the sister of the Muses and Parcs, according to Pindar, and had her temples at Smyrna and other cities. She was worshipped in Italy in the earliest times by the Etruscans at Volsinii, by the Latins at Praeneste, and by the Volsci at Antium, where she had a temple, two statues, and an oracle, whose responses were highly valued. She was diverse-

the Greeks; but unlike the agora, it was oblong in form, and never square. The Romans had two kinds of *fora*, the *civilia*, sometimes called *judicialia*, in which popular assemblies and courts of justice were held, and where the bankers and usurers usually kept their shops; and the *venalia*, which were used exclusively for mercantile purposes. The city of Rome contained 19 of both kinds; but the *forum Romanum*, whose origin is coeval with that of the city, and which is known by the general name of the Forum, was by far the most important, notwithstanding some very magnificent ones were built under the emperors. It occupied a hollow space between the Capitoline and Palatine hills, extending probably from the arch of Septimius Severus to the temple of Antoninus and Faustina (although its limits have been the subject of much controversy), and comprised an area of 7 jugera. Around its 4 sides stood temples, *basilica*, triumphal arches, and other public edifices, while within it were the *rostra* or stages from which orators addressed public assemblies, statues of illustrious Romans, columns, and trophies of war. At the *comitium* or upper end were suspended the laws of the 12 tables, and the *fasti* or calendar of all the days on which it was lawful to work. It is now known as the Campo Vaccino, from having been used for several centuries as a cattle market, and preserves no traces of its ancient splendor beyond a few scattered columns of temples. A *forum judiciale* was built by Julius Cæsar, and one by Augustus, which, with the *forum Romanum*, seem to have constituted the only ones in Rome for the transaction of public business. The others were used as markets, or were simply embellishments of the city.

FORWARD, WALTER, an American jurist and statesman, born in Connecticut in 1786, died in Pittsburg, Penn., Nov. 24, 1852. At the age of 17 he emigrated from New England to what was then the West, and settled at Pittsburg, where he studied law. He engaged early in politics, and in 1806, when he was only 19 years of age, he edited a democratic newspaper called the "Tree of Liberty." He was admitted to the bar in 1806, and for 16 years practised with success, acquiring a high reputation as an eloquent advocate. In 1822 he was elected to congress, as a representative from the western district of Pennsylvania, and served till March 4, 1825. In the presidential elections of 1824 and 1828 he supported John Quincy Adams in opposition to Andrew Jackson, and thenceforward he was identified with the whig party. In 1837 he was elected a member of the convention to reform the constitution of Pennsylvania, and bore a distinguished part in its deliberations. In March, 1841, President Harrison appointed him first comptroller of the treasury of the United States. In September of the same year President Tyler, on the resignation of the cabinet appointed by President Harrison, called Mr. Forward into his cabinet as secretary of the treasury. In this office he exercised great influence on the tariff question, and contributed

much to the enactment of the act of 1842 by an able official report on the subject. On retiring from the cabinet on the expiration of Mr. Tyler's term in 1845, Mr. Forward resumed the practice of the law at Pittsburg. In 1849 President Taylor appointed him U. S. chargé d'affaires at the court of Denmark, where he remained 2 or 3 years, when he resigned and came home to take the office of president judge of the district court of Alleghany co., Penn., to which he had been elected in his absence. While in court, engaged in his judicial duties, he was suddenly taken ill and died in 48 hours.

FORWARDING MERCHANT, one whose business it is to send forward goods to a distant consignee. There are in the United States persons who engage in this business almost exclusively, especially in the western cities, in which produce accumulates on its way to the East, and to which eastern goods are carried for distribution through the West. There is nothing, however, in their business which is so far peculiar to them as to be governed by peculiar laws of its own, and therefore call for especial statement. But there are two classes of persons who come under this name, or discharge the duties which it describes, and of whom more should be said. One of these consists of those who are called expressmen, and the other of common carriers, who, beside carrying goods on their own route, undertake to forward them still further. The whole business of expressmen is of comparatively recent origin; but it has already reached an immense extent and importance. It has grown out of common carriage of goods, but differs from it mainly in the fact that expressmen have no means of carriage of their own, but hire cars or vehicles, or room in them, and usually go with their parcels. It may be said, too, that they usually carry parcels only, or if larger packages, still not cargoes or large quantities of goods, as hundreds of barrels or bales, the carriage of these things being still left to common or private carriers. The principal question in relation to expressmen is, are they still common carriers in law, and do they as such come under the strict responsibilities of common carriers? In other words, do they insure the safe carriage and delivery of all the goods against all risks "except the act of God and the public enemy?" We have no doubt whatever that they do thus insure the goods they receive throughout the whole route for which they profess to be carriers, and that they are therefore liable for any loss or injury to them, without any proof or intimation of their negligence or default. We hold, too, that no customer is bound to inquire by what means or by what arrangements the expressman proposes to carry his parcel. If he receives it in Portland, and undertakes, specially or by general advertisement, notice, or sign, to "express it through" (to use a common phrase) to New Orleans or San Francisco, he is responsible for its safe delivery there. —A railroad company which takes goods at one place to be carried to a distant one might be

thought to come necessarily under the same rule, but it is not quite so. There is this difference between the two cases: the expressman has not, or is not known to have, any regular means of conveyance of his own for any definite portion of the distance over which he assumes to carry the goods. The owner who gives him a parcel in Portland for New Orleans has no means of knowing, and indeed no reasons for supposing, that the expressman has not made similar arrangements for all the parts of his route that he has made for any part. It is indeed commonly understood that every expressman does not undertake to convey goods everywhere, but this man advertises from A to B, because he has so arranged and provided, and that man from A to C, and the other from A to D; and his advertising, or indeed his undertaking to carry to the specified place, may properly be understood as a declaration on his part that he has made sufficient preparation in that direction and to that distance. But if the man in Portland puts goods on board a railroad car to go to New York, he knows, or should know, that the railroad company will convey it a certain part of the way in their own carriage, and under the charge of their own servants, and will not and cannot do any thing beyond that point except to put it safely on board of the cars of another company, who will take it to or toward New York. That is, the man in Portland knows that the railroad company will there receive the parcel as a carrier, and take it a certain distance as carrier, and will then act as a forwarding merchant for the rest of the route, sending it on in the best way they can. Here then is a change of relation, and with it a change of obligation; for the essential difference is this: a common carrier insures his goods against all risks but those arising from the act of God or the public enemy; but the forwarding merchant is liable only for his own default or neglect. If a company takes a parcel in Portland, and it is lost between Boston and Worcester, no one knows how, the sender can look at once to the company that took it, if they are carriers all the way, but not if they were carriers only to Boston, where their road ends, and only forwarding merchants for the rest of the route, and can show that they delivered the parcel safely and properly for further carriage. If it is known where the parcel is lost, the sender may always call on the company who had it in their possession or under their care when it was lost. But if, as sometimes happens, it can be traced beyond the first carrier, and no negligence can be imputed to him, and no one knows what has become of it, the sender is wholly remediless unless the first carrier is carrier to the end. Whether he is so or not has been very much disputed. Cases turning on this point have been very frequent both in England and the United States, and perhaps the law may not be positively determined in either country. Perhaps it may be said that the English courts are more disposed to fix the liability of carrier to the end

upon the party that first takes charge of a parcel than our own courts; but upon the whole, and resting upon the most recent adjudications, the rules of law in this matter may be summed up thus. There may be a partnership in the business of common carriage as in all others, and a railroad company may connect itself with other companies or with other carriers, and form a *quasi* partnership, the effect of which will be that each member will be liable, *in solido*, for all the rest. In that case, all the companies on the whole route are liable for a loss occurring in any part; and in particular the first company taking the parcel, or the last into whose hands it may be traced, may be made liable severally for any loss which has happened on the route. The company comes under such a liability equally by forming such a partnership and entering into such a joint business, or by advertising or indicating such a joinder in business, in any way which entitles third parties to act on the belief of it. And if such companies have a joint agent at either terminus or at any station, and this agent, with the knowledge of all, and purporting to act for all, sells a through ticket, as it is called, none of the companies thus represented can deny their joint business and joint or several liability for the whole; and if the price of the ticket is credited by the seller to all the companies and is divided among them, this constitutes conclusive evidence that each of them undertakes to be a carrier, with a responsibility as such, through the route. But the mere fact that a parcel directed to a distant place is received at a station, and there paid for for the whole route, does not of itself make any carrier for a part of the distance liable as carrier beyond that part. The test of the liability in every case is, what did the party undertake to be and to do? If he said he would carry all the way, he is liable as carrier all the way. If he said he would carry a part of the way and then send it on, he is only liable accordingly. And taking all the facts into consideration, which of these bargains was it that the railroad company made with the sender?—With this principle to guide us, we may return to expressmen. A person living at Albany wishes to send by express a parcel to New Bedford. He gives it to an expressman of Albany, who takes it to New York, and there gives it to the expressman for Boston, who pays the Albany man his fee for bringing it to New York, and takes it to Boston. The expressman between Boston and New Bedford pays the New York man what he paid, and also the fare from New York to Boston, and takes it to New Bedford; and the consignee when he takes the parcel pays the man who gives it to him all he has paid, and in addition his fare from Boston to New Bedford. Now, if the parcel did not arrive safely, but was lost somewhere on the route, is each one of these expressmen liable for the whole? We should say this must depend upon what each one undertakes to do. If the Albany man advertises that he takes goods to New Bedford, he is liable

as far as New Bedford as carrier. If he advertises that he carries parcels to Boston, he is so liable to that place; if only to New York, he is liable as carrier only to New York, and as forwarding merchant at New York, and there his liability ends; and so of all the rest. (The cases on this subject of the obligation of carriers beyond their own route are very numerous; the following may be regarded as among the most important and instructive: *Muschamp vs. L. and P. Junction railroad co.*, 8 Meeson and Welsby, 421; *St. John vs. Van Santvoord*, 25 Wendell, 660; *Fairchild vs. Slocum*, 19 Wendell, 329, and 7 Hill, 292; *Wilcox vs. Parmelee*, 8 Sandford, 610; *Farmers' and Mechanics' bank vs. Champlain transportation co.*, 23 Vermont, 186.) Expressmen now not uncommonly insert in their bills of lading or receipts which they give their customers a clause to this effect: "This company is responsible only as forwarders, and only for the negligence or other default of persons employed by them; and this is a part of our contract with all whose goods we carry." We must wait, perhaps, for further adjudication before we know certainly the effect of this clause. But applying to it the rules of law as far as they are now settled, we should say that a common carrier may make a valid special bargain with his customer, but that a mere notice or declaration inscribed upon a ticket or bill of lading does not of itself constitute such a notice.

FOSCARI, FRANCESCO, 45th doge of Venice, born about 1372, died Oct. 31, 1457. Elected doge in 1423, the whole period in which he governed the republic was one of war and tumult. The sultan Amurath laying siege to Salonica, Foscari despatched troops thither, who repelled the Mussulmans. He then engaged in hostilities with the duke of Milan, Filippo Visconti, and subjected to the republic the territories of Brescia, Bergamo, and Cremona, making the Adda the boundary of Venetian dominion. The war was soon renewed with various success, nearly all the Italian cities taking part in it; but the doge, supported by Cosmo de' Medici and by Francesco Sforza, marquis of Ancona, still further extended his power by a treaty concluded in 1441. In 1443 he formed a league with Sforza, the duke of Milan, and the republics of Genoa, Florence, and Bologna, against Alfonso of Aragon, king of Naples. The pope took part with the latter, but two victories of Sforza put an end to the war. In his old age he had made peace with all the enemies of Venice, including Mohammed II., when Jacopo, the last survivor of his 4 sons, was brought a second time before the terrible council of ten, falsely charged with the assassination of its chief. The tribunal, jealous of the power and popularity of the doge, condemned his son first to torture and then to exile in Crete. The young Foscari, whose mind was disordered by suffering, wishing after long banishment to see his country again at whatever peril, effected his return thither, but being condemned again, had scarcely reached

the place of exile when he died. This event is the subject of one of Lord Byron's tragedies. For the old doge one other humiliation remained. He had twice asked leave to resign his office, but the council had obliged him to retain it. He was now deposed, through the machinations of his enemies, and died 8 days after in a spasm as he heard the bells of St. Mark announce to Venice the election of a new ruler.

FOSCOLO, NICOLÒ UGO, an Italian poet and miscellaneous writer, born in the island of Zante, of a Venetian family, in 1777, died at Turnham Green, near London, Oct. 10, 1827. He was educated in Venice, and in the university of Padua. His first tragedy, *Tieste*, was produced at Venice in 1797, and was so unsatisfactory to the author that he himself published the severest criticism of it that appeared. Expecting the establishment of a republic when the ancient aristocracy of Venice fell by the hands of Napoleon, his hopes were disappointed by the treaty of Campo Formio, which gave up Venice to Austria. He retired with other patriots to Milan, and wrote a political romance called *Lettere di due amanti*, afterward republished under the title of *Le ultime lettere di Jacopo Ortis*. In 1799 he volunteered in the Italian contingent of the French army, took part in the defence of Genoa under Massena, and returned to Milan, where his time was divided between books and pleasure. When in 1802 Napoleon assembled the *consulta* of Italian deputies at Lyons to provide a new constitution for the Cisalpine republic, Foscolo was appointed to report upon the state of the country; and in an elaborate discourse, so bold that it was deemed unsafe to submit it to the first consul, but which was afterward published under the title of *Orazione a Buonaparte*, he contrasted the abuses of the military government which had been established with the free government which had been promised. In 1808 he was appointed professor of Italian eloquence in the university of Pavia, but the political independence evinced in his lectures caused his chair to be soon suppressed. At this period he published his beautiful lyric poem *I sepolcri*, his tragedy of *Ajace*, and an Italian translation of Sterne's "Sentimental Journey." On the fall of Napoleon he retired to Switzerland, and in 1816 to England. He wrote for the "Edinburgh" and "Quarterly" reviews articles on Dante, Petrarch, Boccaccio, and other Italian authors, delivered a course of lectures on Italian literature, published a volume of "Essays on Petrarch" (1823), and edited an edition of the *Divina Commedia* of Dante (1825).

FOSSANO (anc. *Fons Sanus*), a city of Piedmont, in the province of Coni, situated on the left bank of the Stura, 18 m. N. E. of Coni, and 87 m. S. E. by railway from Turin; pop. in 1853, 16,041. It is an antique, dismal, but regularly planned town, surrounded by walls, and defended by a strong fortress, which commands the valley of the Stura and the road into France by the Col d'Argentière. The houses

and hills upon which the footpaths, and the passages in many places are so low that a tall person can hardly walk upright in them.

FOSSIL (Lat. *fossile*, dug out of the ground), a term formerly applied to all mineral substances, but now used to designate only the remains of organic bodies found in geological formations. The general subject will be treated under the title **PALÆONTOLOGY**, and the more important fossil animals are considered under their respective names.

FOSSIL FOOTPRINTS, or **ICHNOLITHS** (Gr. *ichnos*, impression, *lithos*, stone), impressions of the made in clay, sand, or shale or sandstone region of these materials. In the new red sandstone overlying strata of which they have been found in Europe. The remains of animals, and fossils that there is some doubt as to their appropriateness to the animal kingdom; as to some of them are invertebrate crustaceans of the higher division, others are undoubtedly the tracks of tracheata, others probably of birds; while others are positively determined to be of the invertebrate classes. The fossil impressions are 30 to 15 in breadth, supposed to be made by small insects of the saw-bug group. The lines over the surface of the tracks are split open the extend through many in tough foliated clay sinking in disarranges its folia.—Publiced to these fossils by Scotland, in his paper, presented to the Royal Society in 1828. In this he described in great abundance of sandstone in Dumfriesshire successive layers of thickness of at least 45 feet the repetition of their deposition of the sandstone composed the imbedded in, and buried up; were similarly impressed in their turn. He regarded them as the tracks of birds extending from 20 feet to 40 feet. In the "Geological Survey of Scotland," 1831, is a description of footprints remains of footprints remains upon the surface of a loweroolite in Wiltshire the same formation

(the forest marble) were found fossil remains of crabs. The next discovery of fossil tracks was near Hildburghausen, Saxe-Meiningen, in 1834, in the member of the new red sandstone called *Bunter Sandstein*. They were made apparently by a reptile, and were seen as impressions upon the upper surface, and in relief on the under side of the slabs; one measured 12 inches in length; others were 8 inches long and 5 broad. A little in front of each large track was a smaller one, and the footsteps were seen following each other in pairs, the intervals between two pairs being about 14 inches. Five toes were imprinted in each track, the great toes appearing alternately on one and the other side. The animal was named *Chelonoides* by Prof. Kaup, from the resemblance in the form of the track to that of the hand. Similar impressions were afterward found in a rock of corresponding age near Liverpool, England. In studying the fossil remains of reptiles that had been found in this division of the new red sandstone in Germany and in England, Prof. Owen was convinced that instead of saurians, to which they had been referred, they belonged to the batrachian order, and were the remains of frogs of gigantic size. Further investigations resulted in the opinion that these were the animals that made the tracks. Some features in the fossil bones induced other distinguished anatomists to regard them as belonging to crocodiles, and by others again they are referred to the marsupialia.—Fossil tracks had been found in the sandstone of the valley of the Connecticut at South Hadley, Mass., as far back as the year 1803, which resembled so closely those of birds, that they were familiarly spoken of as the tracks of "poultry" and of "Noah's raven." They attracted, however, no attention beyond the immediate vicinity where they were found. In 1835 others of similar character were observed in the flagstones at Greenfield, Mass., which were brought from the neighboring town of Montague. These tracks were so clear and well defined, that they commanded the attention of those employed about them, and one of the laborers at least was induced by the singularity of the phenomenon, like Hugh Miller while observing the fossils in the red sandstone he quarried, to become a faithful student and zealous collector in this department of geology. (See the letter of Dexter Marsh to the editor of the "American Journal of Science," vol. vi. new series, p. 272.) Among others, Dr. James Deane of Greenfield became interested in these tracks, and in March, 1835, addressed a communication to Prof. Hitchcock, state geologist, in which he represented them as the tracks of birds, as he supposed, "of the turkey species;" and in a second letter, against Prof. Hitchcock's declaration in reply, "that they could not be the result of organization," he maintained his conclusion that they were the tracks of birds. He then caused casts to be made of some of the specimens, which he sent in April with a third communication to Prof. Hitchcock, and another also to Prof. Hil-

liman, editor of the "American Journal of Science," the latter intended for publication. By advice of Prof. Hitchcock, this disposition was not made of the communication for the "Journal," on the ground that he himself would be able to give in a few months a more full and satisfactory paper. During the ensuing summer Prof. Hitchcock occupied himself assiduously in investigating this subject, and near the close of the year he prepared the paper which appeared in the number of the "Journal" for Jan. 1836. In this he compared the tracks with those of living birds, giving illustrations of the recent as well as fossil, and advocated the opinion that the tracks were made by extinct species of birds, and that these were for the most part of the order of *grallæ* or long-legged waders. He found them in 3 varieties of the sandstone which occur irregularly interstratified—a reddish shale, or a fine micaceous sandstone passing into shale; a gray micaceous sandstone; and a very hard sandstone, not fissile, but very brittle, composed of clay and sand. The beds attain in some places a thickness of more than 1,000 feet, the tracks occurring at intervals throughout the series. He ascertained their occurrence near the Connecticut river in 5 places within a distance of 30 miles, and anticipated that many other localities would be discovered along the range of the sandstone of the Connecticut valley within and beyond the limits named. The dip of the strata containing the tracks varied from 5° to 30°; but the impressions were evidently made while their surface was level. Their occurrence through so great a thickness of strata could only be accounted for on the supposition that the surface was subsiding during the time of the deposition of the rock. Single tracks were frequently traced in regular succession, turning alternately to one and the other side, as birds sometimes walk; and the surface of some of the layers was found to be trodden thickly over, as is seen in muddy spots resorted to by ducks and geese. Prof. Hitchcock described 7 species of tracks, which he called ornithichnites, one which he figured measuring full 16 inches in length and 10 in width, and recurring at intervals of 4 to 6 feet along the surface of the rock, which distances were thus the measure of the strides of the animal. His views, however, as he afterward remarked, were not adopted by scientific men, with a few eminent exceptions. The novelty of the subject, and the discovery of new localities and new forms of the tracks, kept alive a strong interest in the investigations which continued to be prosecuted by Prof. Hitchcock, Dr. Deane, Mr. Marsh, Mr. William C. Redfield, and others, whose observations were recorded chiefly in the "American Journal of Science." In 1840 the American association of geologists and naturalists appointed a committee to investigate the nature of the tracks, and this committee at the next annual meeting reported "that the evidence entirely favors the views of Prof. Hitchcock." The subject, already introduced to the notice of European geolo-

gists by the publications of Prof. Hitchcock, was brought prominently before the geological society of London in 1842 by Dr. Mantell, who presented a communication accompanied with specimens which he had received from Dr. Deane. These served to remove the scepticism entertained by the eminent geologists and palæontologists of Great Britain upon the nature of the tracks, admitting which to be of birds established an earlier date for the introduction of these bipeds "than was authorized by any vestiges heretofore discovered, and the thanks of the society were warmly and unanimously expressed for so valuable a communication." Other communications from Dr. Deane appeared with illustrations in the "Transactions of the American Academy of Arts and Sciences" (vol. iv., 1849), and in the "Journal of the Academy of Natural Sciences" (March, 1856); and at the time of his death in 1858 a memoir illustrated with 70 beautifully executed figures was presented to the Smithsonian institution. In 1858 the legislature of Massachusetts published an elaborate report by Prof. Hitchcock "On the Sandstone of the Connecticut Valley, especially its Fossil Footmarks," constituting a quarto volume of 232 pages with 60 plates, illustrating 119 species of animals known only by their fossil footprints found in this sandstone. The following table, found on p. 174 of the report, presents a general view of the results arrived at by Prof. Hitchcock as respects the area over which the tracks are found, their number, and their distribution in the animal kingdom according to the arrangement of the author:

Number of localities of tracks in the valley thus far discovered.....	28
Length of the sandstone belt containing tracks (miles).....	90
Width of the sandstone belt containing tracks ".....	2 or 3
Whole number of species in the valley described above.....	119
Number of bipeds.....	81
Number of quadrupeds.....	38
With more than 4 feet.....	18
Without proper feet.....	12
With an uncertain number.....	3
Marsupialoid animals.....	5
Thick-toed birds.....	14
Narrow-toed birds.....	17
Ornithoid lizards or batrachians.....	10
Lizards.....	17
Batrachians, the frog and salamander family.....	11
Chelonians, the tortoise family.....	3
Fishes.....	4
Crustaceans, myriapoda, and insects.....	18
Annelids, the naked worms.....	8
Of uncertain place.....	6

Among the most remarkable of these are some of the huge tracks supposed to belong to batrachians, the dimensions of one of which have been already given. This animal (*Otoseum Moodii*), though allied to the frogs and to the salamanders, must have been like an elephant in size and weight. The bottom of the hind foot appears to have been furnished with a web, which extended beyond its margin and connected together the 4 toes, and, though compared by Prof. Hitchcock to a snow shoe, did not prevent the animal's sinking to the depth of 2 inches at least into the mud. For a long time no trace of more than the 2 hind feet was found; but finally unmistakable tracks of the fore feet were

discovered, provided with 5 toes each, and not more than $\frac{1}{2}$ as large as the hind feet. The tracks are very abundant in South Hadley, and one immense slab, too large to be removed, lies by the side of the public road, presenting on its upper surface 10 or more great impressions of the hind feet of the animal. A view of this locality and slab is given in the frontispiece of the work. The track of the *brontozoum giganteum*, one of the thick-toed birds, is very common in South Hadley, also above Turner's falls, near Greenfield, and at other localities. It was originally described by the name of *ornithichnita giganteus*, and was figured in Buckland's "Bridgewater Treatise." The animal was probably several times larger than any ostrich. One of its tracks will hold a gallon of water. The *dinornis* of New Zealand is among birds the only one whose bones indicate an approach to such a size. Many tracks formerly supposed to have been made by birds are now referred to the group designated as ornithoid lizards or batrachians. This also includes some enormous specimens, as those comprised in the new genus *gigantitherium*. No trace being found of more than 2 feet, and these having 3 toes like those of birds, the animal was naturally supposed to belong to the ornithic tribe; but the discovery of a trace of a long tail in the line of the tracks, similar to that made by living reptiles, gives a batrachian character to the vestiges, which has induced Prof. Hitchcock to form this new mixed group. In the species *G. caudatum* the whole length of the foot, from the extremity of the middle toe to the end of the heel, is 17.5 inches, and the whole area covered is about a square foot. From the remarkable rectilinear arrangement of the tracks there is some ground for supposing that the animal may have had 2 other feet, with the power of walking on the 2 hind feet alone or on all four. The reference of some of these tracks to the movement of fishes, either upon the surface of the land, as some kinds are known to have the power of progressing, or by swimming close to the soft bottom, is made with hesitation by Prof. Hitchcock. One set of marks, however, cutting the summits only of the little ridges left by the ripples, so strongly suggests this origin, that a genus has been introduced under the name of *ptilichnus*, from *πτελον*, fin or feather, and *χρος*, track. The tracks referred to insects are necessarily of very obscure character; some of them are so minute as not to exceed $\frac{1}{8}$ of an inch in length. It is only by reason of their continuity in long parallel rows that they attract notice. Those supposed to be made by worms much resemble the tracks of similar creatures seen upon the mud on the shores of ponds after rains. It is remarkable that very few bones or coprolites have been found among the tracks. As to the bones, their absence may be owing to their being devoured or washed away with other vestiges by the ebb tides to other localities, or they may have been dissolved by water. Those discovered were not in the immediate vicinity of the localities that abound in tracks, though not many miles off;

and although occurring in the same geological group with the tracks, the strata were evidently somewhat more recent by reason of their higher position in the series. One locality of them was at East Windsor, Conn., and another in the grounds of the Springfield armory in Massachusetts. Professor Jeffries Wyman regards them as unquestionably the bones of a reptile, but having the remarkable feature of hollowness of structure. Coprolites have been discovered at Chicopee Falls and at Turner's falls. Dr. Samuel L. Dana, on analyzing those from the former locality, detected uric acid in about the same proportion that is found in some varieties of guano. This, considered in connection with the other ingredients, led him to the conclusion that the coprolite was that of a "bird belonging to the class which has deposited the beds of guano." ("American Journal of Science," vol. xlviii. p. 60.) Impressions of raindrops, exactly like those made in soft mud during heavy showers, are very abundant over the surface of many of the slabs containing the footprints; and furrows are also frequently noticed like those left by the waves upon the sand, which are now universally recognized, even upon the strata of much older formations, and described as ripple marks.—The numerous specimens of tracks collected in the valley of the Connecticut are for the most part to be found in the cabinets of Amherst and Yale colleges, the Wesleyan university, the Boston society of natural history, and in the private collection made by Dr. John C. Warren of Boston. The trustees of the will of the Hon. Samuel Appleton of Boston appropriated \$10,000 to be expended for Amherst college in the erection of a suitable building for a scientific collection. This, called the Appleton cabinet, was furnished, through the liberality of others, with sufficient funds to secure a large collection of these specimens, President Hitchcock himself contributing a series of them, valued at \$2,000. The lower story of the building, 100 feet long and 30 wide, is exclusively appropriated to their arrangement, and is nearly filled with them. Some of the largest slabs are 80 feet long, and others are from 8 to 10 feet square, weighing nearly a ton each. They are generally arranged on their edges upon strong tables, and so placed that both surfaces are exposed to view, one side presenting the footprint depressed and the other in relief. The whole number of individual tracks exceeds 8,000.—Other discoveries of fossil footprints followed those made in the Connecticut valley. Mr. William O. Redfield in 1842 found one in the New Jersey red sandstone at Boonton, presenting 3 thick toes furnished with claws or nails; the track measured 6 inches in length by $8\frac{1}{2}$ in breadth. Mr. Logan about the same time discovered what appeared to Prof. Owen to be reptilian tracks in the strata of the coal formation in Nova Scotia, the first indication of an air-breathing animal so low in the series of formations. This was followed in 1844 by a descrip-

tion of numerous tracks met with at several places in Westmoreland co., Penn., by Dr. Alfred T. King. The strata which contained them were sandstones of the coal formation. The impressions were remarkably distinct, some being apparently of a biped with 3 toes, and others of quadrupeds having 5 toes, some upon all their feet, and others upon the hind feet alone, with 4 toes upon the fore feet. These vestiges were evidently reptilian, and produced by creatures of kindred structure to the *cheirotherium* of Europe. The paper of Dr. King appeared in the "Proceedings of the Academy of Natural Sciences of Philadelphia" for Nov. and Dec. 1844, and in the "American Journal of Science," vol. xlviii. p. 343. In 1849 Mr. Isaac Lea of Philadelphia announced the occurrence of footprints of a large reptile at Pottsville, Penn., in the red shale formation which underlies the coal measures; and in 1851 Prof. H. D. Rogers discovered in the same formation other tracks of 4-footed animals, with 5 toes on all their feet. In 1850 tracks of a reptile, supposed to be a chelonian, were observed in the old red sandstone at Cummingstone, England. Mr. Logan in 1852 found tracks of an animal in the Potsdam sandstone of Canada, which are supposed by Prof. Owen to have been made by more than one species of articulate animals, probably allied to the king crab or *limulus*. Prof. James Hall, in the "Report on the Palæontology of New York," vol. ii., describes tracks of gasteropoda, crustacea, &c., which are met with in the strata of the Clinton group.

FOSTER, JAMES, an English dissenting minister, born in Exeter, Sept. 16, 1697, died Nov. 5, 1753. He was educated in his native city, began to preach in 1718, and after removing from Devonshire to Melbourne, and thence to Ashwick, succeeded Dr. Gale as pastor in Barbican, London, in 1724. He subsequently became lecturer at the Old Jewry, and in 1744 minister at Pinner's hall. His reputation for eloquence was such that persons of every rank, wits, free thinkers, and clergymen of different persuasions, flocked to hear him. Pope sang his praise:

Let modest Foster, if he will, excel
Ten metropolitans in preaching well;

and Savage ascribed to him alone the art "at once to charm the ear and mend the heart." Bolingbroke erroneously attributed to him the saying: "Where mystery begins, religion ends." Beside many sermons, he published an "Essay on Fundamentals, especially the Trinity" (1720); "Defence of the Usefulness, Truth, and Excellency of the Christian Religion" (1731); and "Discourses on the Principal Branches of Natural Religion and Social Virtue" (London, 1749-'52).

FOSTER, JOHN, an English essayist, born in Halifax, Yorkshire, Sept. 17, 1770, died at Stapleton, near Bristol, Oct. 15, 1848. In early life he was engaged in the business of a weaver, to which, however, as to all manual labor, he had an invincible dislike; and at the age of 17, hav-

ing united with the Baptist church, he resolved to devote himself to the ministry, and finished his studies at the Baptist college in Bristol. He commenced his career as a preacher at Newcastle-on-Tyne in 1792, and afterward went to Dublin, and endeavored unsuccessfully to establish himself either as a preacher or schoolmaster. In 1797 he went to a Baptist chapel in Chichester, and thence successively to Downend in 1800, and to Frome in 1804; but though his preaching was powerful, it made little or no impression on the popular mind. While at Frome he first published his celebrated "Essays," and also became the principal contributor to the "Eclectic Review," the articles for which (185 in number) formed his almost exclusive literary labor for 18 years. In 1817 he returned to Downend, where he wrote his "Essay on the Evils of Popular Ignorance," in which he gives an appalling description of the barbarism prevailing in the lower classes of the English population,—a spectacle which he calls "a gloomy monotony; death without his dance." His health failing, he then employed himself chiefly in preparing works for the press, though preaching at intervals until his death. He was a profound thinker and a powerful writer. The "Life and Correspondence" of Foster (2 vols. 8vo.), edited by J. E. Ryland, was published in 1846. His "Historical and Biographical Essays" appeared in London in 1859 in 2 vols.

FOSTER, RANDOLPH S., D.D., an American Methodist clergyman, born in Williamsburg, Ohio, Feb. 22, 1820. He received his education at Augusta college, Ky., entered the ministry at the age of 17, and was received into the Ohio conference, and appointed to travel a circuit in the mountain region of western Virginia. While stationed in Cincinnati in 1848 he wrote a series of letters entitled "Objections to Calvinism." In 1853 he received the honorary degree of D.D. from the Ohio Wesleyan university. In 1854 he published a work entitled "Christian Purity;" in 1855 another entitled the "Ministry for the Times." In 1856 he was elected president of the North-Western university at Evanston, Ill., a post he still holds.

FOTHERINGAY, a parish and village of Northamptonshire, England, on the river Nene, 27 m. N. E. of Northampton. Its famous castle, the birthplace of Richard III., and the scene of the imprisonment, trial, and execution of Mary, queen of Scots, was founded in the reign of the Conqueror, and pulled down by James I. soon after his accession to the English throne. The village contains a handsome church, in which were buried Edward and Richard, dukes of York, the former slain at Agincourt and the latter at Wakefield.

FOUCAULT, LÉON, a French natural philosopher, born in Paris, Sept. 18, 1819. While studying medicine he was deeply impressed by the discoveries of Daguerre, and turned his attention exclusively to optics. He rapidly acquired proficiency in this branch of natural philosophy, and in 1844 he invented an illumi-

nating electric apparatus, which was at once adopted by natural philosophers for all their physical experiments, while it was also used as a means of lighting large factories or yards. With Hippolyte Fizeau he made a series of delicate and valuable experiments upon the phenomena of light. He solved a problem which had attracted the attention of Wheatstone, Arago, and many others; demonstrating, by a very ingenious contrivance, that the velocity of light differs materially while passing through a vacuum or through transparent bodies. He was no less successful in mechanics than he had been in optics; by means of the pendulum he gave a new and striking demonstration of the rotatory motion of the earth; and by this curious experiment, which has been repeated all over the world by scientific men and learned societies, Foucault is perhaps better known than by almost any of his other discoveries. The gyroscope, another instrument with which he experimented, not only affords new indications of the earth's rotation, and serves to measure it, but furnishes a means of determining astronomical positions without observation of the heavens. Foucault was rewarded for his labors by an appointment to an important post in the imperial observatory at Paris, and since 1845 he has been engaged in furnishing weekly scientific papers to the *Journal des débats*.

FOUCHÉ, JOSEPH, Napoleon's minister of police, born at La Martinière, near Nantes, May 29, 1763, died in Trieste, Dec. 25, 1820. A delicate constitution unfitted him for the profession of his father, who was a ship owner and sea captain. He was sent to Paris to study at the *Oratoire*, but did not take holy orders. He officiated as professor of philosophy in Arras and other towns, and in 1788 was placed at the head of the college of Nantes. He married about that time, became an advocate, founded a republican association in Nantes, was chosen in 1792 member of the national convention, voted for the immediate execution of Louis XVI., and in 1793 proceeded to Lyons with Collot d'Herbois, charged with the execution of the decree issued by the convention against that city. During the course of 5 months several thousand persons were put to death at Lyons, and more than double the number were driven into exile. By means of a telescope Fouché was an eye-witness of some of those butcheries from a distance. One of them took place under the window of a hotel, where with 30 Jacobins and 20 courtesans he was engaged at dinner, and the party rose from the table to enjoy the bloody spectacle. After his return to Paris he was elected president of the Jacobin club (June 4, 1794). His influence and opposition gave umbrage to Robespierre, who caused him to be expelled from the club; but he rejoined it after the execution of Robespierre (July 28, 1794), upon whom he now endeavored to throw all the odium of his violent proceedings at Lyons. But he was denounced as a terrorist, driven from the convention (Aug. 9, 1795), and placed under arrest, but restored to liberty

by the amnesty of Oct. 26, 1796. He afterward succeeded in ingratiating himself with Barras, the president of the directory, by betraying to him the movements of Babeuf. The latter was guillotined in 1797, and Fouché was rewarded with a large interest in the outfit of the army, and in Sept. 1798, by being made ambassador to the Cisalpine republic. In the beginning of 1799 he was sent in the same capacity to Holland, but was soon called to Paris to enter upon the duties of minister of police (July 31). He adopted rigorous measures against political agitators, without distinction of party, coöperated in the *coup d'état* of the 18th Brumaire (Nov. 5, 1799), and strengthened Bonaparte's position by his vigilance in detecting royalist and Jacobin conspiracies; but the first consul, who distrusted the mercenary and intriguing disposition of his minister, discarded him as soon as the apparent return of tranquillity rendered it practicable to dispense with his services. The suppression of the ministry of police, and the union of the office with the ministry of justice under the charge of a superior judge, was the pretext for his dismissal (Sept. 1802). He was made a senator, a post which yielded him about \$13,000 annually, and Napoleon rewarded him beside with half of the reserve fund in the treasury of the police, which amounted to nearly \$500,000. In 1804, when Napoleon's position became more complicated, Fouché was again employed. He opposed the execution of the duke d'Enghien, and told Napoleon "that it was worse than a crime, that it was a blunder;" a saying which has since become proverbial. After the establishment of the empire, he was formally reinstalled as minister of police (July 10, 1804), and under his administration tranquillity and order were secured at home, while Napoleon was engaged in fighting his battles abroad. In 1809 he received the title of duke of Otranto, with a large pension from the revenues of the kingdom of Naples. In the same year, at the time of the landing of the English on the island of Walcheren, while Crétet the minister of the interior was sick, Fouché managed his department along with his own, and caused the whole national guard of France to be put in motion. In his letters to the prefects he referred to the absence of the emperor, and called upon France to show to Europe that although the genius of Napoleon imparted glory to France, his presence was not required to protect the country. The last expression gave offence to Napoleon, although he approved of his measures in themselves. In the following year, Napoleon having opened secret negotiations with the court of St. James, Fouché, in ignorance of this fact, and without consulting the emperor, despatched the speculator Ouvrard to London with the same object; upon which the English government put an end to all negotiations, and Fouché was dismissed (June 5, 1810). Savary became his successor, and the governorship of Rome was assigned to Fouché, as a sort of honorable exile. But though he did not go to Rome, he was compelled to leave France, on

his refusing to surrender certain autograph letters of Napoleon and other important documents, and was only permitted to come back on condition of giving them up. In 1813, Napoleon was again obliged to endure his indispensable services, and employed him as governor of Illyria and in other capacities. But he was among the first to foresee the approaching end of Napoleon's power, and having been sent to Rome he governed his conduct in anticipation of the fall of his master, and concluded a treaty with Murat respecting the evacuation of the fortresses under the condition that the garrisons should not serve against the allies for a year. In Jan. 1814, he wrote to the emperor from Rome, recommending the adoption of a more conciliatory policy. Returning to France in the spring, he announced at Lyons and at Avignon the approaching fall of Napoleon, and entered Paris 2 days before the count d'Artois. On April 23 he wrote again to Napoleon, urging him to leave Elba for the United States. At the same time he put himself in communication with the Bourbons. They suspected him, however, and on Napoleon's return from Elba issued an order for his arrest; but he contrived to make his escape, and became for the 3d time Napoleon's minister of police, while he was at the same time Talleyrand's correspondent, the tool of the court of *émigrés* at Ghent, and the bosom friend of the liberal deputies in the chamber. After the battle of Waterloo he sent for Dupont de l'Eure, Lafayette, and others, and made use of their republican feelings to precipitate the overthrow of the emperor; and after his master's final abdication he became the leader of the provisional government (June 23, 1815). He was appointed for the 4th time minister of police by Louis XVIII. (July 6), but, placed between the opposition of the extreme republicans and the extreme royalists, his position became intolerable. He presented to the king 2 reports on the disturbed state of France, which created a great sensation, and which are the best of his political writings. He resigned the ministry Sept. 19, 1815, and was appointed ambassador at Dresden, but was deprived of that office by the law of Jan. 16, 1816, which affected all who had voted for the death of Louis XVI. From Dresden he removed to Prague, where he spent about 2 years; and having become in 1818 a naturalized subject of Austria, he resided for some time in Lintz, and for the rest of his life in Trieste. In 1815, 2 years after the death of his first wife, he married Mlle. de Castellane, whose family was one of the most influential in Aix; so great was the charm of his intellect and conversation, that he gained her affections notwithstanding his advanced age. She died in 1850. His fortune was immense, and he left to his children nearly \$3,000,000. His domain of Ferrières et Pontcarré, which now belongs to the Rothschilds, was one of the finest in France. Napoleon is reported to have said in St. Helena: "Fouché is a miscreant of all colors, a priest, a terrorist, and one who took an active part in many bloody scenes

of the revolution. He is a man who can worm all your secrets out of you with an air of calmness and unconcern. He is very rich, but his riches have been badly acquired. He never was my confidant. Never did he approach me without bending to the ground; but I never had esteem for him. I employed him merely as an instrument." Bourrienne says: "Fouché never regarded a benefit in any other light than as a means of injuring his benefactor." The *Mémoires de Fouché*, published by Alphonse de Beauchamp in 1824, have been declared apocryphal by the courts in Paris, at the suit of the heirs of Fouché. But it is known that Fouché left memoirs in manuscript, and it is supposed that some of them were used by M. de Beauchamp.

FOULD, ACHILLE, a French statesman, born of Jewish parents in Paris, Oct. 31, 1800. At an early age he entered the counting house of his father, who died in 1855, and who was the head of the still existing banking firm of B. L. Fould and Fould Oppenheim. In 1842 he was elected to the chamber of deputies, and in 1848 to the constituent assembly. Having repeatedly given evidence of his financial ability and political dexterity, and above all of his loyalty to Louis Napoleon, he became his confidant and private banker, and in 1849 his minister of finance. He retired from the ministry, Jan. 25, 1852, on occasion of the confiscation of the property of the Orleans family, to which he was opposed. He was made a senator, and afterward minister of state (July 30), and minister of the imperial household (Dec. 14, 1852).

FOULIS, ROBERT, a Scotch printer, born in Glasgow, April 20, 1707, died in Edinburgh in 1776. He was a barber's apprentice, but falling under the notice of Dr. Hutcheson, professor of moral philosophy at Glasgow university, was encouraged to perfect his education and become a printer and bookseller. In company with his brother Andrew (born Nov. 23, 1712, died Sept. 18, 1775) he made journeys to England and the continent during the summers in connection with his new business, and employed his winters in teaching. In 1739 he was enabled to open a shop in Glasgow, and in the following year to commence publishing. In 1743 he was appointed printer to the university, and afterward took Andrew into partnership. Their editions were remarkable for correctness and elegance, those of the Greek and Latin classics ranking with the best of the famous Aldine series. The Foulis edition of Demetrius Phalereus *De Elocutione* (1743) is thought to be the first Greek work published in Glasgow. Among the most valuable productions of this press were: Horace (12mo., 1744), the sheets of which were hung up in the university with the offer of a reward for the discovery of any error in them; Homer (4 vols. fol., 1756-'8); Thucydides, in Greek and Latin (8 vols. 12mo., 1759); Herodotus, in Greek and Latin (9 vols. 12mo., 1761); Xenophon, in Greek and Latin (12 vols. 12mo., 1762-'7); Gray's poems,

James Watson, &c. The two brothers acquired in time an ample fortune, which they lost by an unsuccessful attempt to establish at Glasgow an academy of painting and sculpture for the instruction of young men.

FOUNDATION, a term applied to that portion of a building which serves as a basis on which to erect the superstructure. Foundations may be divided into two classes, natural and artificial. The first class may be again divided into foundations on dry ground and foundations under water. Under the first of these subdivisions several cases may be considered, depending upon the character and position of the bearing stratum; if this be of solid rock or indurated gravel, no further precaution will be required than to level the foundation pit, that the masonry may start from a horizontal bed; any irregularities which may occur should be filled with concrete rather than with masonry, as the compression of the mortar joints will inevitably cause irregular settlement, unless cement is em-

bedded in the joints kept as close as possible to the best of soils is nearly incompressible, affected by exposure to the weather, too, is almost incompressible as it can be kept from being decayed by advantage. In practice, owing to the difficulty of levelling it, and the increased in large works of the use of this material, and of the use of irregular settlement. of the latter difficulty is the pier of a large aqueduct. Hughes in his "Papers on Bridges," 10 of these piers of gravel, and the masonry

appeared without a flaw when carried up to the height of 80 feet; the 11th, however, was founded partly on gravel and partly on very hard rock, and after being carried up to about 80 feet was fissured throughout its entire height, owing to the gravel yielding slightly, while the rock was incompressible. As inasmuch as the expense of preparing a level bed in hard rock, we may mention the Eddystone, Bell Rock, Skerryvore, and Minot's Ledge Lighthouses. For foundations under water, it is often sufficient, and generally feasible except in the case of a rock bottom, to bring up a number of isolated supports or piles. In other instances, however, a solid foundation is required, and this can be laid on the ground unless there is liability to scour, or the firm ground underlies a soft stratum which must be removed; in either of the latter instances, the water must be temporarily excluded from the site of the foundation.—Artificial foundations may also be divided into ordinary foundations and foundations under water. Of the first kind we have two general cases: 1, when the ground is soft but not fluid; and 2, when it is of a semi-fluid nature. Soft ground may either be consolidated by driving piles into it until it becomes

so compressed as to prevent the piles from sinking by the lateral friction produced; or a platform of fascines, timber, or concrete may be interposed between the surface of the ground and the superstructure, thus distributing the weight of the latter over a large extent of bearing surface. Artificial foundations under water form the most difficult class with which the engineer has to contend. If the ground be of tolerable firmness, it may be enclosed with a dam; but there is always danger of the bottom being lifted by the pressure of the water, and weighting the ground with planking and stones is generally resorted to as a preventive measure. If the ground is semi-fluid, the construction of a coffer dam is impossible, and the best mode of proceeding is to sink the work in large caissons, the bottom having been first covered with a bed of fascine work, weighted and sunk with stones or brickwork. This method is much used by the Dutch in their hydraulic works, and the fascine beds are often of large dimensions and several feet in thickness. The bundles of fascines cross each other at right angles, and are securely bound with tarred rope and strengthened with poles and wicker bands; after being weighted with gravel and broken stone, they are sunk when required by means of guide ropes, and afterward secured by long stakes and piles driven through them. (See BREAKWATER, COFFER DAM (COFFER), and PILE).

FOUNDERY, a furnace with the requisite conveniences for melting and moulding cast iron or other metal upon a large scale. The special apparatus and operations belonging to them are described in the article CASTING; to which a few further details of interest may here be added. Foundries are often conveniently placed near the blast furnaces in which iron ores are smelted; and from the products of pig iron furnished by these the particular qualities are selected for the second fusion, which is the special object of the foundry. But the business is commonly practised to better advantage in the vicinity of large iron markets, and in towns and cities where there is a constant demand for castings of every variety of form. To these places pig iron is brought from different sources and of all varieties, affording to the founder convenience of obtaining suitable mixtures for the kind of casting required. His supplies of fuel are also delivered with the greatest convenience and certainty, and his business is thus simplified and concentrated to the operations of the foundry itself. Some of the most extensive foundries in the United States are those employed in the manufacture of stoves, hollow ware, and other castings, in Albany and Troy, N. Y. In the former city nearly 200,000 stoves are annually produced. The manufacture of wheels for railroad cars is an especial branch of foundry operations, demanding the highest skill and judgment of the founder. This also is largely conducted at the cities named, as well as at many other places in the United States. Upon European roads wrought iron wheels alone are con-

sidered safe, and are in general use; and it is only by the skill and ingenuity directed to this branch in the foundries of the United States, that cast iron wheels are brought to a degree of strength to admit of their being used with safety. These wheels essentially require the opposite qualities of lightness and strength; and to give the highest possible degree of each with the greatest hardness of periphery to resist wear has proved one of the nicest problems for the founder to solve. Distributing the metal unequally in order to secure lightness with sufficient strength involved danger of fracture by unequal shrinkage in cooling. This required especial provision, which was chiefly met by a suitable mixture of different qualities of pig iron. So nice an operation is it to obtain the different degrees of strength required in different parts, that at some of the works as many as 8 to 12 varieties of the best American charcoal-made iron are used in each wheel, and the selections are made with the utmost care. With each heating, tests of the strength are made, and remedies applied to correct any defects. The periphery of the wheel requires a quality of iron susceptible of acquiring the highest degree of hardness by the process of chilling, and yet retaining great strength. Between the periphery and the hub the best method of securing the greatest strength in proportion to the weight of metal is found to consist in making the web double and of an undulating or corrugated form. The wheel is thus hollow, and is provided with holes for the escape of the air within, which would otherwise expand by the warmth derived from friction and burst the wheel. The capacity of some of the foundries engaged in this work is very large, a single establishment averaging the melting of over 40 tons of iron daily, and producing over 140 car wheels. Other foundry operations are referred to in the articles *BELL* and *CANNON*.

FOUNDLING HOSPITAL, a public institution for the reception and support of deserted children. The unwillingness or inability of some parents, especially of those of illegitimate children, to take care of their offspring, has led to the establishment of such institutions in many parts of the world. The nations of antiquity were notorious for their disregard of all promptings of humanity in the treatment of foundlings. Infanticide was punished by the ancient Egyptians, and the guilty parent was obliged to pass 3 whole days and nights in the embrace of the corpse of the deceased child, which was fastened to his neck. But in Athens and Rome infanticide was largely practised unchecked by law, and there is even reason to believe that in Rome the law commanded that deformed children should be put to death. Of the two crimes of infanticide and desertion, the latter was in most instances preferred as the less atrocious. It prevailed extensively in all the states of Greece except Thebes, where both child murder and the exposure of children were forbidden. At Athens

children were commonly exposed in the gymnasium, called *cynosarges*, and in Rome at the *columna lactaria*, a pillar which stood in one of the public market places. The reception and education of foundlings was encouraged by the state by assigning them as property to those who took them under their protection, while those unprotected by private individuals were to be educated at the public expense. It appears that Athens and Rome had at an early period public institutions for that purpose, and the appellation of *βρεφοτροφειον* is believed to have had reference to that in the *cynosarges* of the former city, while Rome is supposed to have possessed an establishment of the same kind at the *columna lactaria*. But most foundlings were left at the mercy of those who found them. Suetonius, in his treatise *De Illustribus Grammaticis*, refers to Gniphio the rhetorician and Melissus the grammarian and comic poet as foundlings who were taken up by benevolent persons, and who achieved distinction. But generally foundlings were educated and treated as slaves, given in pawn, sold, and frequently mutilated for the purpose of enlisting the sympathies of the benevolent. This practice was even excused by Seneca, upon the ground that the children were slaves. The exposure of children became so common, that the classic historians speak with admiration of the nations who abstained from its practice. Strabo praises the Egyptians for their humane laws, and Ælian the Thebans for their restrictive regulations on the subject; while Tacitus mentions as a circumstance deviating from the practice of the Romans, that the old Germans and the Jews considered infanticide as a crime. Endeavors to restrain the cruel practice of exposing children are said to have been made in the early days of Rome; Romulus is said to have prohibited the murder of sons and of first born daughters. But as the population increased and the public morals declined, those who had more children than they wished for exposed some of them. Ornaments and trinkets, more or less costly according to the circumstances of the parents, were deposited in many instances with the children, partly with a view of enticing people to take care of them, and partly for the purpose of facilitating the identification if at any future period the parents should be inclined to recover the children. Gibbon says: "The exposition of children was the prevailing and stubborn vice of antiquity; it was sometimes prescribed, often permitted, almost always practised with impunity by the nations who never entertained the Roman ideas of paternal power; and the dramatic poets, who appeal to the human heart, represent with indifference a popular custom which was palliated by the motives of economy and compassion. If the father could subdue his own feelings, he might escape, though not the censure, at least the chastisement of the laws; and the Roman empire was stained with the blood of infants, till such murders were included by Valentinian and his col-

spirit of the Cornelian jurisprudence had been his inhuman practice, was fortified by the emperor." The first Christian emperor to punish the Constantine inflicted on fathers guilty of children, and called ex-heretici. He issued orders by depriving them of recovering the children expenses incurred by them. He also decreed poor to educate their pecuniary assistance, there was nevertheless after. Lactantius, a friend of Constantine, children as a still premium; and Julius Maximus who lived under the particular instructions foundlings. The extent completely prohibitive, Valens, and the end of the 4th century. issued a law in 329 to be free, and for-ward were received and and detain them as children which existed foundlings in Rome in the Justinian *brephotro-*phic institutions, but in regulation and order for foundlings are in the 6th, 7th, or 8th century, and in the 7th century. The capitularies founding hospitals as Milan an institution an arch-priest named sent infanticide. Of time he gives a very better of foundation, by Muratori. The illegitimate) carried red salt between the note that the infant The foundlings (sacred nurses, supplied, taught some handicrafts were discharged regulation was probably guard against the end among the Franks, according to which property of those received and educated, and back by their parents 1070 Oliver de la Torre a charitable order, led themselves Accep- . devoted themselves

to the assistance of the poor, and of foundlings and orphans. A separate foundling hospital, under the name of hospital of the Holy Ghost, was founded in the city in 1180 by a zealous member of that order, the count Guy of Montpellier, which was sanctioned by Pope Innocent III. in 1198. During the 13th century foundling hospitals were established at Rome, and at Kimbeck (now belonging to Hanover). The magnificent foundling hospital at Florence, called at present *spedale degli innocenti*, was founded in 1316; kindred institutions were established in Nuremberg in 1331, in Paris in 1363, and in Venice in 1380.—The great hospital of Santo Spirito in Rome, on the right bank of the Tiber, near St. Peter's, contains a foundling hospital capable of accommodating upward of 3,000 children. The number annually received is about 800; the mortality is about 57 per cent. in the hospital, but many of the children are sent out to the country to be nursed, among whom it is said to be still greater. There are several other foundling hospitals in Rome; the total number of foundlings is estimated at upward of 3,000 annually, the facilities for admission being so great that children are brought from all parts of the Papal States and from the neighboring Neapolitan provinces. Its revenue is about \$50,000 per annum. At Naples, foundlings are chiefly accommodated at the hospital *della Annunziata*. There are in Naples annually about 2,000 foundlings, out of 15,000 births, and out of a population of about 400,000. Naples has the reputation of devoting more care to the education and welfare of foundlings than any other city of Italy. The number of foundlings in Tuscany is about 12,000 out of a population of about 1,800,000. A considerable number of the foundlings in Italy are supposed to be legitimate children, abandoned by their parents on account of poverty. About one in 16 of the children is claimed by the parents; the majority are cared for during infancy and childhood, either in the hospitals or among the neighboring peasantry, who supply them with board at a small remuneration. When of sufficient age they are dismissed to support themselves, but in many of the hospitals they have some claim in after life on occasions of distress or sickness. Many children carried to the foundling hospitals are accompanied by tokens. In the hospital *degli innocenti* at Florence a piece of lead imprinted with a number is hung round the neck of each babe, in such a manner that it cannot be easily removed. By these means, and by other tokens, it is easy to obtain information, even at a late period, in regard to each child.—There are foundling hospitals in Cadix, Barcelona, and other Spanish cities, and several in Madrid. The girls brought up in the foundling hospital at Barcelona were formerly led in procession when of marriageable age, and any one who took a fancy to one of them might indicate his choice by throwing a handkerchief on his favorite girl and marry her. The number of

foundlings annually received in the principal hospital at Madrid is about 4,000. The hospital is chiefly served by sisters of charity. The infants are intrusted to nurses, and at the age of 7 they are transferred to the college of the *desamparados* (forsaken), where they receive instruction. Some are sent to an asylum, where they are drafted to learn practical handicrafts, and this asylum is in a great measure a self-supporting institution. A curious law exists in Spain by which every foundling is to be considered as belonging to the nobility, it being deemed less wrong to raise 100 plebeians to the rank of noblemen, than to degrade one single nobleman to the level of a plebeian. The total number of foundling hospitals in Spain is estimated at about 70, and the foundlings at about 13,000. In Portugal, where illegitimate births are much more numerous than in Spain, the number of foundlings is said to be very great. In the neighborhood of Oporto country women may be met conveying babies to the foundling hospital of that city, 4 or 5 together in a basket. They are the illegitimate children of peasant girls, who are forwarded by the authorities to the care of the hospital. The *santa casa de misericordia*, an immense charitable establishment of Lisbon, contains a foundling hospital; and there is another hospital at Belem, near Lisbon (the *real casapia*). These two hospitals receive together over 3,000 children annually, who are brought up for some trade or calling. Almost every town and village of Portugal has an establishment called *casa de misericordia* which takes care of foundlings. —Among the first hospitals which received and educated foundlings in France was the *Hôtel Dieu* of Lyons (1523). Francis I. founded a kindred institution in 1586. A few years afterward it became customary for sisters of charity to place foundlings at the entrance of the cathedral of Notre Dame of Paris, and to enlist the sympathies of the public by exclaiming: *Faites bien à ces pauvres enfants trouvés* ("Extend your charity to these poor foundlings"). They were accommodated in an asylum called *la couche* (the bed), at the expense of the dignitaries of the law and of the church. The metropolitan see, the monasteries, and chiefly the hospital of the Holy Ghost, were all called upon to contribute toward their support. The dispensation of this charity led however to grave abuses. The women hired to take care of the children traded with them. Some were sold for 20 sous each to sorcerers, who purchased them for use in their art; others to beggars, who paraded the children with a view of securing the alms of the benevolent. The asylum was transferred to another place, but the donations were not sufficient to support the institution. The children increased in numbers at a fearful rate. Lots were cast to decide which of the children should have the benefit of education, and those who drew blanks were entirely neglected. Many children lost their health or died from the deteriorated milk of sickly nurses. The chil-

dren admitted into those asylums were almost all illegitimate or of unknown parents. A foundling hospital was established in 1563 in the hospital of the Holy Ghost, under the direction of the bishop of Paris, and managed by an association of priests. The children were well educated there, many of the boys for the priesthood, and many of the girls were married and provided with dowries. But this hospital (which was suppressed in 1670) refused to receive illegitimate children; yet they were the principal victims of misery, and their condition was such as we have above described when St. Vincent de Paul appeared. He pleaded with great fervor and eloquence the cause of the poor children, collected funds, and enlisting the sympathies of women, he established in 1640 a new institution for foundlings, with the assistance of the niece of the keeper of the seal, De Marillac, of Mlle. Legras, and other philanthropic ladies, and with the coöperation of the king and the court. During the life of Vincent de Paul it remained a private institution, under the zealous care of a committee of ladies. In 1670 the hospital was converted into a public institution by Louis XIV., and was transferred to the rue de Notre Dame. Revenues were assigned to it and taxes raised for its support, and the first president and procureur-general of the parliament placed at the head of its administration. Subsequently it was enlarged, and although similar institutions were founded in other great cities of France, at the charge of the feudal lords, about 2,000 foundlings came annually from the provinces to the capital. They were sent in such a reckless manner in crowded and ill-conditioned wagons that 9 or 10 children frequently died in one journey. The same inconvenience arose in Lyons, when the exportation of foundlings from the rural districts swelled the number from 500 to 600 at the beginning to 1,500 to 1,600 at the end of the 18th century. After the revolution of 1789 the republic assumed the guardianship of foundlings. The terrorists decreed (July 4, 1793) that they should be called *enfants de la patrie*, in compliment to their illegitimate mothers. In 1798, 11,000,000 francs were assigned toward their support. An imperial decree of Jan. 19, 1811, ordered the establishment of a foundling hospital in each arrondissement of France, to be governed by the following regulations. The children are suckled and weaned in the hospitals, and kept there until the age of 6, when they are placed under the charge of peasants and artisans, who receive a stipend for their board and training. This stipend is reduced from year to year until the children reach the age of 12, when the able-bodied boys are placed at the disposal of the minister of marine, while for those who are invalids some labor appropriate to their condition is provided in the hospital. They are the property of the state, and those who at the age of 12 have not been taken into the public service are immediately placed under apprenticeship by the administration of the hospital.

The annual expenses for nursing and for the outdoor board of the children below the age of 12 amount to 7,000,000 francs, which are paid by the departments to which the children belong. The expenditure for clothing is from 1,500,000 to 1,800,000 francs, which is paid by the respective hospitals. The number of foundlings in France was, in 1784, 40,000; 1811, 69,000; 1819, 99,346; 1825, 117,305; 1830, 118,073; 1838, 129,699; 1845, 96,788; 1856, 120,000. These numbers include only children below the age of 12. After 12 the administration ceases to keep them under its control, but the foundlings between the ages of 12 and 21 are estimated at from 60,000 to 70,000. The proportion of foundlings to the population is 1 to 353, and to births 1 to 39. The annual number of foundlings and deserted children is from 25,000 to 30,000; $\frac{2}{3}$ are illegitimate and $\frac{1}{3}$ legitimate children. The annual number claimed by and restored to their parents is about 3,000, or about 1 in 9. The average life of the foundlings does not exceed 4 years. The extent of the mortality is appalling; it is 52 per cent. during the first year, and 78 per cent. from the first day to the 12th year of their existence, so that only 22 out of 100 foundlings who are born on the same day live to the age of 12, while in the community at large 50 out of 100 reach the age of 21. The convicts and prisoners of France comprise 13 per cent. of male foundlings, and $\frac{1}{2}$ of the inmates of houses of prostitution are female foundlings. Previous to 1811 the admission of children was public, and they were deposited in the hands of an officer of the institution; but the decree passed in that year imposed upon each arrondissement the obligation to establish a hospital of deposit for the reception of children who are deserted after their birth, and to provide it with a turning box in which the mother or any other person could deposit the child secretly. In accordance with that decree 256 hospitals were established provided with such boxes, and 17 without them. But many arrondissements removed the boxes and the hospitals of deposit, and the total number of such hospitals in the whole of France was in 1856 not above 141, of which only 65 were provided with turning boxes. There is still a hospital of deposit for each department, but in 38 departments they are unprovided with turning boxes. The suppression of the turning boxes proceeded from the conviction that the great increase of foundlings since 1811 was due to their use, but a series of letters by M. Ulysse Ladet appeared in the *Gazette des tribunaux* in 1852 in favor of their restoration; and there are still many who think that, by insuring secrecy in depositing children, they are powerful preventives of infanticide, while their opponents look upon them as an encouragement for unnatural parents to discard their children, and prefer the restraint imposed by the publicity connected with the deposition of the child into the hands of an officer. The statistics of infanticide, however, are rather favorable to the influ-

ence of the turning boxes; but the question of their preservation or suppression depends upon many other considerations beside that of infanticide, and continues to be a subject of anxious investigation in France. This much is certain, that the extraordinary facility afforded by the law of 1811 for disposing of children produced a singular increase in the number of foundlings. So great was the effect of the law upon the people that it was not uncommon to hear parents exclaim at the least inconvenience which may have been produced by one of their children: *Je te mettrai aux enfants trouvés*. It was also discovered that parents put themselves in collusion with those appointed by the hospital to nurse the children or to supply them with board, and it was ascertained that there existed mothers who, after having discarded their own offspring by secretly depositing them in the turning boxes of the hospitals, afterward managed to officiate as nurses of the institution. In addition to the money saved by throwing the support of the child upon the hospital, the mother thus made gain from her own shame. Another source of evil was the placing of foundlings in the houses of peasants and artisans in the vicinity of their parents, and the children have been taken away from such dangerous neighborhood; but this has given rise to serious remonstrances on account of the cruelty of separating the poor creatures from those who, by their ministrations, have enlisted their affections. Since 1838, however, the policy of the suppression of hospitals and turning boxes in the provinces, and the displacement of children, has been favored by the government, but the discussions on the subject are far from being exhausted. The number of children admitted into the foundling hospital of Paris in 1852 was 2,303; 1853, 2,380; 1854, 3,441; 1855, 3,700; 1856, 3,943. The small numbers of 1852 and 1853 were exceptional, and owing to the measures adopted in the former year by the administration to check the abuses in abandoning children. Of those admitted in 1856 only 674 were supposed to have been legitimate; only 551 were born in the department of the Seine, and 282 were foreigners. There is also a provisional depot in the hospital for the reception of children whose parents are sick or in prison. Of 1,890 children admitted to the depot in 1856, 249 died in the same year, and 377 were transferred to the hospital in consequence of the death of their parents or guardians, or their inability or unwillingness to support them.—Previous to the separation of Belgium from Holland there were in both countries 19 hospitals (2 in Holland, and 17 in Belgium), and in 1826 they contained 13,220 foundlings, against 10,739 in 1815. The cost of maintaining these hospitals was \$350,000, or about \$27 for each foundling. The total number of children annually abandoned in Belgium is estimated in 1859 to exceed 8,000 out of 148,000 births, or about 1 in 18. The average expense attendant upon each infant is about \$14. Foundling hospitals are very numerous in

Belgium. The turning boxes in which, as in France, children were secretly deposited, have been declared illegal since 1884. The most important foundling hospital of Holland is that of Amsterdam, where about 8,000 children are received annually.—In Germany foundling hospitals are considered to exert an unfavorable influence upon morality, and many of them have been abolished. The foundling hospital of Vienna, founded by Joseph II. in 1784, is an admirable institution, and contains a lying-in hospital. There are similar institutions in the other principal cities of the Austrian empire, but in the German states the system of foundling hospitals has been gradually abandoned. There are children's aid societies, orphan asylums, and other charitable institutions, where children whom their parents are unable to support are educated at the expense of the government or of private charitable foundations. But foundling hospitals were considered in Germany to have saddled the people with taxes which ought to have been borne exclusively by the parents, and at the same time to have increased the temptation to licentiousness. On the other hand, however, it is maintained that the abolition of foundling hospitals tends to increase infanticide and abortion.—Toward the end of the 17th century proposals for a foundling hospital were made in London. Addison was among those who wrote in favor of its establishment (in the "Guardian" in 1713). It was founded in 1739, chiefly through the exertions and at the expense of Capt. Thomas Coram. Coram's full-length portrait, painted by Hogarth, is in the chapel of the hospital; and the great painter said: "The portrait I painted with the most pleasure, and in which I particularly wished to excel, was that of Capt. Coram for the foundling hospital." Coram's statue was also placed there in 1856. Handel the composer was one of the principal benefactors of the hospital. He presented it with an organ and gave several performances for its benefit, and performed his great oratorio of the "Messiah" for the first time in the chapel (May 1, 1753), and frequently repeated it there afterward. The hospital was opened June 2, 1756, and adapted to maintain and educate 500 children. But the great influx of children, the large mortality among them (in the foundling hospital of Dublin the mortality was still greater), and the abuses consequent upon the facility of admission, led to a modification of the institution; since 1760 it has ceased to be a receptacle for foundlings, and was then changed to what it now is (1859), a hospital for poor illegitimate children whose mothers are known.—In Stockholm, where public prostitution is prohibited, there are nearly 50 illegitimate children out of every hundred children born, and in the interior of Sweden one out of nearly 11. Hence there is a great number of children to be provided for in the numerous foundling hospitals of Sweden. The *Stora Barnhorst* hospital of Stockholm, originally established by Gustavus Adol-

phus for the children of military men, is now used as an asylum for infants, who are received without any questions being asked about their parents. It is not different from the ordinary foundling hospitals of Stockholm, except that an entrance fee of about \$35 has to be paid for every child. This institution is in a flourishing condition, and has an income of over \$150,000 per annum. Many parents who are fully able to maintain their children, send them to this hospital in order to be relieved from the care attending their training and education. There are foundling hospitals in Christiania and other Norwegian cities, but the number of foundlings is not as great in Norway as in Sweden. It is true that in the 4 years preceding 1855 every 10th child born in the whole country was illegitimate; but this large proportion is in a great measure due to the long time which elapses between the betrothal and the marriage of the parents, many of whom eventually secure the legitimacy and take care of their children.—The foundling hospital of Moscow (*Vospitatelni Dom*) was founded by Catharine II. in 1762. It is an immense establishment, which has been enlarged by a member of the Demidoff family, who contributed largely to its support. A lying-in hospital and schools are connected with the institution, and the entire number of its inmates is upward of 25,000. The upper part of the building is appropriated to the infants, of whom there are always about 600, with the same number of wet nurses, who are dressed in a uniform of dark cotton gowns and white aprons, and the peculiar cap worn by nurses in Russia. The girls are separated from the boys. About 5,000 children are sometimes in the villages in the environs, the peasant women receiving 5 rubles a week for suckling and taking care of a child. The inhabitants of a large village near Moscow are entirely devoted to the bringing up of the foundlings. All children are received, whether foundlings or not, on condition that they are given up to the state. In 1857, 14,000 children were received, and from 1762 to 1858, 890,000, including 60,000 born in the lying-in hospital. In June, 1858, there were 1,200 orphan children of officers in the institution. The payment of \$25 by the parent entitles the child to be brought up exclusively within the walls of the institution; one of \$200 procures for a boy the rank of an officer. Beside becoming soldiers and mechanics, the government has of late years established many of them as farmers and colonists on the crown lands. Many of the best Russian engineers have been educated in the institution. Those who display great abilities are sent to the university, and some of them become physicians. The majority of the girls are employed in manual labor, the proceeds of which go partly to the treasury of the institution, and are partly saved for them to form their marriage portion; but those of superior ability find opportunities for cultivating it, and may become musicians, actresses, governesses, teachers, &c. All, without refer-

ever to age or sex, can return to the hospital should they fall into distress in after life. The mortality among the children is about 60 per cent.; the expenses amount to nearly \$5,000,000 annually, which are defrayed by the government. The *Vospitatelni Dom* in St. Petersburg was founded by Catharine II. in 1772, as a branch of that of Moscow, but it now eclipses the parent institution. The small original endowment of Catharine has been increased by private donations and by large gifts of the successive czars, and the hospital is now one of the wealthiest landed proprietors in Russia. Alexander I. conferred upon it the monopoly of cards and the revenues of the Lombard bank. The annual revenues of the hospital are now estimated at \$4,500,000, and the expenditures at about \$3,800,000. It has been so much enlarged that it forms now a little district of its own, near the Fontanka canal, in the best part of St. Petersburg, covering 28 acres of ground. In immediate connection with it is a lying-in hospital. The staff of nurses is generally from 600 to 700; upward of 500 teachers are employed, beside a staff of physicians, cooks, housekeepers, &c.; the total number of nurses, servants, and other employees being rarely less than 6,000. The education of the children costs \$1,000,000 annually. In 1790 it contained only 200 children, and in 1837 about 25,000; the annual receipt of children is now about 7,000. The only question asked on their arrival is if the child has been baptized, and by what name. If not baptized, the ceremony is performed by a priest, and the mother receives a ticket, the duplicate of which is placed around the child's neck. The mortality is greater than in Moscow, which is accounted for by the inferior vigor of the nurses who come from the vicinity of the capital. A great many children die on the way to St. Petersburg, some being brought 1,000 miles, from Siberia and Bessarabia. Some die immediately after their arrival, and others during the tedious ceremony of baptism, which lasts several hours. Four or five deaths occur daily in the hospital, or about 8,000 annually among those in the asylum and those out at nurse. About 50,000 children have been already deposited in the cemetery of Okhta, a section of which is set apart for the foundlings. It is said that not only St. Petersburg and the immediate vicinity, but one-half of Russia sends its surplus of infantile population to this institution, and the other half to that of Moscow. Upward of 25,000 foundlings are constantly enrolled in the books of the St. Petersburg hospital. The children are given in care of wet nurses for about 6 weeks, when they are sent into the country until they are 6 years old. They are then brought back to the institution and educated, the schools of the St. Petersburg hospital being superior to those of Moscow. Many of the girls qualify themselves as governesses in Russian families, and the boys as artisans in imperial manufactories; or, as in Moscow, they receive, in cases of special capacity, a scientific, literary,

or musical education. In the lying-in-hospital connected with the institution pregnant women may enter a few weeks before their confinement, and the strictest secrecy is maintained. Among the foundlings are many of legitimate birth. The number of illegitimate children is rather small in St. Petersburg compared to some other large cities. In the hospital itself the strictest morality prevails; and on one occasion, when one of the inmates gave birth to an illegitimate child, the late emperor Nicholas is said to have threatened to disgrace the whole body. The empress of Russia is called the mother of the foundlings. Stringent laws have been passed since 1837, by which the foundlings become the property of the government, and the hospitals in St. Petersburg and Moscow furnish a constant supply of recruits for the army or navy. These establishments are admirably managed; but those in the interior of Russia are very bad, and the government does not seem inclined to favor the establishment of new foundling hospitals in the provinces. The property devoted to the support, maintenance, and education of foundlings in Russia is said to amount to \$500,000,000. Infanticide and abortion are almost unknown in that country.—In China, infanticide is practised throughout the empire, and in some provinces there are from 500 to 600 children killed per month. The number of illegitimate children is immense, although the laws punish illicit intercourse with from 70 to 100 strokes of the bamboo. A foundling hospital has been established at Canton in the hope of preventing infanticide, but only about 500 children, a very small proportion of the births, are deposited there annually.—One of the most important charitable institutions of the city of Mexico is the *cuna* or foundling hospital, in which there are usually from 500 to 600 children. It is supported by private individuals, the most influential citizens contributing the funds, and the Mexican ladies their time and attention. When a child has been about a month in the hospital, it is sent with an Indian nurse to one of the neighboring villages. These nurses are subject to a responsible person who is a resident of the village and guarantees their good conduct. The mothers of the children often officiate as nurses, and are paid for their services. When weaned the child is brought back to the hospital, but generally the children are adopted by respectable persons, who bring them up either as servants or as their own children.—In the foundling hospital of Rio de Janeiro, the boys, who are brought up in the neighboring establishment at Botofoga, are in due time apprenticed to trades, and the girls are educated in the city establishment. At each anniversary persons in want of wives attend, and any one who wishes to marry one of the girls, and whose proposals are accepted, applies to the managers of the hospital, who inquire into the character of the applicant. If it proves satisfactory, the marriage is permitted, and a small dowry is given from the funds of the hospital.—In the United States the

establishment of foundling hospitals has been frequently proposed and discussed in different places; but the public sentiment seems as yet to be decidedly averse to it, and foundlings are generally provided for in common with other objects of public and private charity.

FOUNTAIN, a W. co. of Ind., bounded W. by the Wabash river, and drained by Coal and other creeks; area, about 400 sq. m.; pop. in 1850, 13,253. It has a level surface, about $\frac{1}{4}$ of which is occupied by fine prairie land, while much of the remainder is covered with thick forests. The soil consists chiefly of a rich black loam, well adapted to wheat and other grain. The productions in 1850 amounted to 927,278 bushels of Indian corn, 60,031 of wheat, 58,480 of oats, and 7,554 tons of hay. There were 26 churches, 1 newspaper office, and 3,662 pupils attending public schools. Coal and iron are obtained in large quantities. Capital, Covington.

FOUQUÉ. I. HEINRICH AUGUST DE LA MOTTE, baron, a Prussian general, born at the Hague in 1698, died in Prussia, May 2, 1774. He was descended from an ancient Norman family which had fled on account of religious persecution to the Netherlands. While stationed at Küstrin he became acquainted with the crown prince, the future Frederic the Great, who was in prison there, and he possessed the confidence of that monarch until his death. Carlyle describes him as "a ready-witted, hot-tempered, highly estimable man." His memoirs (2 vols., Berlin, 1788, in French and German) contain his correspondence with Frederic, and his biography was prepared by his grandson (Berlin, 1824). II. FRIEDRICH HEINRICH KARL DE LA MOTTE, baron, grandson of the preceding, a German novelist and poet, born in the town of Brandenburg, Feb. 12, 1777, died in Berlin, Jan. 23, 1843. He was in arms in defence of his country in early youth, and again in 1813 in the war against Napoleon, was wounded at Kulm, and present at Leipsic. His delicate constitution unfitting him for permanent military service, he tendered his resignation soon afterward. Devoting himself henceforward to literature, he became one of the most original and fertile writers of the romantic school. An enthusiastic love for the ideal Christian chivalry of the middle ages, and for the ancient national poetry of Scandinavia and Germany, pervades most of his works; and his worship of the past was carried to such an excess in some of his later writings, that he was supposed to favor the perpetuation of feudal institutions, especially as during a few years previous to his death he edited in concert with Alvensleben the *Zeitung für den deutschen Adel* ("Journal for the German Nobility"). One of his most charming northern tales, "Sintram and his Companions," was suggested to him by Albert Dürer's engraving of the "Knight, Death, and Satan." One of his other tales, *Vial-Genie*, or *Mandrake*, is in Menzel's opinion one of the best elaborations of the old national legends. The work, however, by which he most endeared himself to

American and English readers is *Undine*. Coleridge's admiration for this romance was unbounded. He said there was something in *Undine* even beyond Scott; that it was one and single in projection, and had presented to his imagination what Scott had never done, an absolutely new idea. Menzel says that *Undine* will always continue one of the most delightful creations of German fiction. A French translation of *Undine* appeared in Paris in 1817. An English translation by the Rev. Thomas Tracy of Newburyport, from the 4th German edition (Berlin, 1834), was published in Boston. Most of the other romances and tales of Fouqué have been translated and published in England. The following are the titles of the English translations: "Aslauga's Knight," the "Magic Ring," "Ministrel Love," "Thiodolf the Iclander," "The Two Captains," and "Wild Love." The shorter tales are collected under the title of "Romantic Fiction." Several of these translations have been republished in America. A corrected edition of his select works was prepared by Fouqué before his death (12 vols., Halle, 1841).

FOUQUET, or FOUQUET, NICOLAS, marquis of Belle-Isle, a French minister of finance, born in Paris in 1615, died March 28, 1680. He entered the public service at an early age, became procurator general of the parliament of Paris in 1650, and was devoted to the interests of Anne of Austria and of Mazarin, by whose influence he was made superintendent of finances. After the death of Mazarin (1661) he was supplanted by Colbert, who had revealed to the king the alarming condition of affairs. Fouquet had already awakened the distrust of Mazarin by his boundless ambition and by his reckless prodigality. His chateau of Vaux cost 18,000,000 francs, equivalent to double that amount at the present day. Fouquet was a man of brilliant parts. Pélisson was his secretary, and his chateau, which eclipsed in splendor the abodes of royalty, was a resort of the most distinguished men and women of the age. Molière and La Fontaine were the poets of this enchanted circle, and on the occasion of a fête which he injudiciously gave in honor of the king (Aug. 17, 1661), Molière's comedy of *Les fâcheux* was performed for the first time. This fête cost about 1,000,000 francs, and surpassed in display any public entertainment ever before given in France. The king was anything but flattered at seeing his own palaces and entertainments eclipsed by those of his minister, and his ill feeling against Fouquet was increased by the latter's supposed ambition to rival his master in the affections of Mlle. de la Vallière. On Sept. 5, 1661, he was arrested, and prosecuted for malversation. His trial lasted 8 years. Among his papers were found instructions to his family, apparently given with a view of overthrowing Mazarin, but which were alleged against him as incitements to rebellion. He was also charged with enlarging the fortifications of his establishment of Belle-Isle, with the same treasonable

notes and additions. In 1780 he delivered a course of popular lectures on chemistry and natural history, which attracted a large auditory, and were published in 1781. In 1784 he was appointed professor of chemistry at the king's garden, now *jardin des plantes*, for which post he had been, in preference to Berthollet, designated by Buffon. He had been previously admitted to the scientific meetings held at Lavoisier's, took part in the discussions on systematizing chemistry, and was one of the editors of the *Méthode de nomenclature chimique*, which appeared in 1787, and marked a new era in the progress of that science. He meanwhile published many papers upon chemistry, and enlarged and improved his lectures. In 1792 he was elected assistant deputy to the convention, and for 18 months devoted his whole time and energy to extracting and purifying saltpetre, which was then much needed in France for the manufacture of gunpowder. During the reign of terror, Desault, Chaptal, and Darcet were indebted to him for their safety; but all his exertions were powerless to save Lavoisier. After the 9th Thermidor, being appointed a member of the committee of public safety, he endeavored to improve the system of public education; he organized the polytechnic school, caused the establishment of three schools of medicine, and suggested the idea of the normal school. On the adjournment of the convention he was elected to the council of ancients, resumed his public discourses on science, remodelled his lectures, which, under the title of *Système des connaissances chimiques, et de leur application aux phénomènes de la nature et de l'art* (6 vols. 4to, or 11 vols. 8vo., Paris, 1801), became "the greatest monument erected to chemical science in the 18th century." Bonaparte appointed him director-general of public instruction; under his care the public schools flourished, and no fewer than 800 colleges or lyceums were established. The organization of the new university of France was devised by him, and he expected to be appointed grand master; but Napoleon gave the place to Fontanes. This preyed seriously upon his mind, and hastened his death. Beside the works mentioned above, he left: *La médecine éclairée par les sciences physiques* (4 vols. 8vo., 1791), *La philosophie chimique* (8vo., 1792, reprinted in 1795 and 1806), *Tableaux synoptiques de chimie* (atlas folio, 1805), and many scientific papers in the *Mémoires de l'académie des sciences* and other learned collections.

FOURIER, FRANÇOIS MARIE CHARLES, a French writer on social science, born in Besançon, April 7, 1772, died in Paris, Oct. 10, 1837. His father was a woollen draper, and he was the youngest of 4 children, the others all being daughters. From his earliest infancy he manifested a singular originality and force of character. When only 5 years of age he was flogged for telling the truth about some article in his father's shop, and from that time, as he says, his mind was alive to the conventional falsehoods of

trade. He began to speculate almost as soon as he could think on the subject of reforming the processes of commerce. At school he was diligent and quick to learn. The prizes for French themes and Latin verse are assigned to him in the records of the town school for the year 1785. But his favorite early studies were geography, botany, and music. His pocket money he used to spend in buying globes and charts, and much of his leisure time he devoted to the cultivation of flowers. He was sufficiently master of music to be enabled to construct a new musical notation, which, however, has never come into general use. On leaving school he was sent to Lyons, where he entered as clerk in a commercial house. He was then about 18 years of age, and, having a vehement desire to travel and see the world, he engaged soon after as travelling agent with a highly respectable house, whose business connections extended over France, Germany, Switzerland, Holland, and Belgium. This gave him the opportunities for observation which he desired. In 1793, having received about \$20,000 as his share of his father's property, he began business for himself in Lyons, embarking his whole fortune in colonial produce, which he purchased at Marseilles, and expected to sell at the former city. But just then the troops of the convention occupied Lyons, and pillaged the inhabitants, taking the greater part of Fourier's small fortune. The Lyonnese rose against the revolutionists, and Fourier joined them, but the insurrection was promptly suppressed, though not without a fearful slaughter. Fourier was cast into prison for 5 days, hourly expecting to be led out to the guillotine, and only escaped by some accident, of which we know nothing. Flying to Besançon, his native place, he was again incarcerated as a suspicious person. By joining a troop of the revolutionary army, however, he was enabled to exchange the cell for the saddle, and as a *chasseur à cheval*, a light dragoon, he served nearly two years in the army of the Rhine. He obtained his discharge on account of ill health, Jan. 24, 1795. During his connection with the army he made important military suggestions to the government, for which he received its thanks through Carnot. Subsequently also he attracted the attention of Napoleon by a striking political essay put forth in a local journal. On acquiring his liberty again, he resumed his commercial pursuits, but his mind was then mainly absorbed by his speculations on the possibility of correcting the methods of industry. In 1799, while employed as a clerk in a wholesale warehouse at Marseilles, he discovered what he called the universal laws of attraction, and of the essential destiny of humanity upon earth. He spent many years in elaborating these discoveries; his first work, called *Théorie des quatre mouvements et des destinées générales*, was not published till 1808; but France being then agitated by the projects of Napoleon, no attention was given to it, although it was one of the most daring flights of the scientific imagination that

had ever appeared. It was not till 1814, when a copy of this book fell into the hands of Just-Muiron, an enthusiastic and benevolent gentleman of Besançon, that it had made a single convert. As it bore the imprint of Leipsic, without the name or address of the author, it was a long time before he was able to find out Fourier, who then resided at Belley. Just-Muiron afterward assisted him in the preparation and publication of other works. In 1822 was issued a *Traité de l'association domestique agricole* (2 vols. 8vo.), which in its latest form appeared under the more imposing title of *Traité de l'unité universelle*, and was the great work of his life. As originally conceived by the audacious mind of the author, it was meant to embrace 9 volumes, in the following order: 1, the abstract principles of passionnal attraction, and their partial application to industrial associations; 2, familiar synthesis of the principles of attraction, and their equilibrium in practice; 3, the analysis of man's physical, moral, and mental nature, individually and collectively, with regard to individual society and universal unity; 4, methodical synthesis and transcendental theory; 5, commercial duplicity and ruinous competition; 6, the false development of human nature, and a regular analysis and synthesis of a false development of universal nature, as an exception to universal harmony; 7, universal analogy and illustrations to cosmogony; 8, the scientific theory of the immortality of the soul; and 9, dictionary of contents and references to the whole work. Two volumes only were printed, however, at Paris, and these not a solitary critic or review noticed. Fourier drew up a brief summary of their contents, in the hope of getting them into notice in that way. But no one spoke. The truth was, that the subject was so novel and was treated in so original a manner, that no ordinary critic felt able to speak. Fourier's system had been the labor of his life, and it required the most patient and careful study in order to be comprehended. He sent his work to many of the leading statesmen of the times, with the same results. No one was ready or willing to lend him a helping hand. Disappointed and disgusted, Fourier returned to Lyons in 1825, where he accepted a cashiership in a commercial house, at a salary of 1,200 francs, or about \$250, a year. In 1826 he went to Paris again to prepare a compendium of his great work, which however was not published till 1829, under the name of the *Nouveau monde industriel et sociétaire* (1 vol. 8vo.). This was a far more attractive, clear, and judicious statement of his views than any that he had yet given, but it was received with the same indifference by the press. In 1831, when the St. Simonians began to make a stir in France, Fourier sent forth a bitter pamphlet against them and the followers of Robert Owen, accusing them of utter ignorance of social science, and of gross charlatanry in their pretensions; and from that time his extraordinary writings began to receive the attention of minds inclined

to such studies. Madame Clarisse Vigoreaux was one of his first disciples, and by her earnest and poetic work, entitled *Paroles de Providence*, written in imitation of Lamennais' *Paroles d'un croyant*, excited a vivid interest in the subject. Many of the ardent disciples of St. Simon, seeing the more precise and scientific nature of Fourier's socialism, abandoned their old master for this new teacher. On June 1, 1832, a journal of the socialistic doctrines of Fourier was begun under the name of *Le phalanstère*. It was continued for only two years, although it laid the foundation of the Fourieristic propaganda. About the same time a practical attempt to realize the doctrines was made at Condé-sur-Vesgre, near Rambouillet, but somewhat against the will of Fourier, who saw that the capital was insufficient for the enterprise. In 1835 Fourier published another work, called *La fausse industrie, morcelée, répugnante, et mensongère, et l'antidote, l'industrie naturelle, combinée, attrayante, véridique, donnant quadruple produit* (1 vol. 8vo.); but it added nothing to his original discoveries. The next year his friends commenced a monthly, under the name of *La phalange*, which was vigorously conducted; and when the subject had created an audience for itself, a daily paper, *La démocratie pacifique*, was established, under the editorship of M. Victor Considérant. This maintained the propagation till it was discontinued during the reactionary movements which followed the revolution of 1848.—Fourier died in 1837, but his doctrines had then obtained some vogue in France, where a school was regularly organized for their diffusion. At the head of it were Considérant, Cantagrel, Victor Hennequin, Laverdant, Victor Meunier, and others, ardent young men, who devoted their lives in the spirit of missionaries to what they supposed to be the reformation of the world. In England, Hugh Doherty placed himself at the head of the movement; a large weekly paper called the "Phalanx" was set on foot by him, and ably sustained; while in the United States Mr. Albert Brisbane, by his vehement expositions of the subject, gave to it an immense éclat and temporary success. Not a few of the earnest and intellectual young men of the country accepted the new doctrine as the veritable gospel of social reform; but of late years it has died out of the public mind. Nevertheless, the scheme of Fourier, as the most comprehensive, consistent, bold, and remarkable of the kind that was ever broached, and as having influenced so largely the current of thought in Europe and America, deserves more than a passing notice from the philosopher and the philanthropist. He was a man of the noblest humane impulses, of rare acuteness and sagacity of vision, and of profound as well as most original imagination. His negative criticisms of the disorders, the falsehoods, and the miseries of society, are a fearful laying bare of the ulcers of our imperfect civilization; and even they who may be inclined to reject his more positive no-

tions as whimsical and dreamy, will find abundant material for thought in these exposures. The fundamental and leading principles of Fourier are summed up in the following short formulas: "1. The series distributes the harmonies of the world. 2. Attractions are proportional to destinies. 3. Analogy is universal." In other words: 1, all the harmonies of the universe grow out of a regular and uniform order, which Fourier denominated the law of the series; 2, all beings are led to and kept in their true sphere, not by a principle of external force, but of internal attraction; and finally, 3, the universe being everywhere the same, constructed upon the same infinite model, and according to the same eternal laws, must in every sphere repeat itself, or be analogous. These general principles or deductions Fourier carried out into all branches of science, but his chief application of them was to social science. Society being composed of men, he began with an analysis of human nature, of human impulses and attractions. The permanent principles of nature were three: the active principle, or spirit; the passive principle, or matter; and the neutral principle, or the mathematical laws of justice and harmony. The nature of man was coördinate with this division, and contained: 1, his physical nature, adapted to the passive principle, or matter; 2, his moral nature, adapted to the active principle, or spirit; and 3, his intellectual nature, adapted to the neutral principles of law and justice. The common object of all his physical desires is sensuous enjoyment; the common object of his moral, mutual affection; the common object of his intellectual, order and association; while over all presides a superior tendency to unity, or universal harmony. The essential faculties of the soul, then, or impulses to action or life, Fourier analyzed into 5 sensuous "passions," 4 moral passions, and 3 intellectual passions. Thus:

Sensuous faculties, or modes of enjoyment.	{	1. Sight, or desire for enjoyments of color, &c.
		2. Hearing, or desire for the pleasures of sound.
		3. Taste, or desire for delights of the palate.
		4. Smell, or desire for agreeable odors.
		5. Touch, or desire for external ease, &c.
Moral affections.	{	6. Friendship, or the affection of equals.
		7. Love, or the affection of the sexes.
		8. Paternity, or the family affection.
Intellectual impulses.	{	9. Ambition, or the affection of society.
		10. Caballistic or emulative impulse.
		11. Alternating or varying impulse.
		12. Composite or combining impulse.
		13. Unity, or harmonizing aspiration.

These simple and essential desires of the soul, according to Fourier, may all be directed into a contrary and subversive development, by the unnatural action of circumstances. In the false conditions of society they become so many uncontrollable and warring appetites. What they want for their rectification and true development is a social sphere adapted to their harmonic action. Society must be constituted according to the same law of groups and series which harmonizes universal nature. The association of the 3 principal agents of production, that is, of capital, science,

and labor, for the mutual advantage of each member of such association, in the several branches of agriculture, manufacture, commerce, domestic industry, art, science, and education, would prepare the way for this true society. The economies effected in expenditure and consumption would be prodigious; the distribution of labor and of its result would become gradually very exact and equitable; the pleasures of combined and varied exertion would take from toil its monotony and its repulsive aspects; while the skill, the wisdom, the grace of every member of the association would be always available to the benefit of every other member. The unity of the association would be expressed in the common domain and combined dwelling house; the variety, in the separate apartments, the different labors, the individual tastes. A township of about 1,800 persons, male and female, Fourier regarded as the original germ of larger combinations, which would interweave and unite themselves together, step by step, until a network of connected associations, bound by the same principles, and governed by a syndic or council of representatives, would be spread over a state, a nation, Europe, the globe. But this grand and world-embracing harmony would be the result of no instantaneous or speedy change, but of a regular development of the combined order, according to the law of the series. Society, he said, passed through a process of regular growth, from its most infantile condition to its highest maturity, when it would again begin to decline, and finally fall into decrepitude and decay. In this it resembled the growth of the individual man, who had his ascending vibration, or advance from infancy to youth, from youth to manhood, from manhood to old age, and then by a descending vibration from old age to death. This universal career of humanity Fourier distributed in the following order: two phases of incoherence, containing each 7 social periods; two phases of combination, containing each 9 social periods; grand total of 32 social periods or societies. The first 7 of these periods, embracing the history and progress of the world up to the present time, he named: 1, Edenism; 2, savagery; 3, patriarchalism; 4, barbarism; 5, civilization; 6, guaranteeism; and 7, simple association. Five of them, as the records of all the earth prove, have been periods of constraint, poverty, oppression, fraud, carnage, and false science; the other two are the feeble dawns of a better day, ushered in by associations of joint interest and reciprocal guarantee. But as soon as society shall have reached them, a higher and composite order begins, when 7 other periods, distinguished by successive creations of harmonic beings, will give happiness to all the world. Then comes the plenitude and apogee of harmony, the pivotal or amphiharmonic age of the race, which nature will recognize by the conversion of the aurora borealis into a boreal crown, encircling the earth as the splendid ring of Saturn encircles that planet,

the stationary position of the ecliptic, and the disinfection and perfumery of all the waters of the seas, by means of the boreal fluid. This supreme condition of nature and man will continue for about 8,000 years, when the beam of happiness will again descend, and society pass through a series of declines, similar to the series of its advances. The earth itself will be smitten with a palsy of weakness, and after many convulsions, sink into final death. The human race, however, will not perish, but by a series of bicomposite transmigrations, attain to immortality in other spheres. Fourier was rigidly true to his method in all departments of inquiry, and applied it with the most intrepid and unhesitating fidelity, whatever the conclusions to which it might lead. His cosmogonical and ultramundane speculations therefore assume often the most bizarre and grotesque forms, and seem like the conjectures of a lunatic; and yet his thoughtful disciples find so much beauty in his social scheme, that they endure his aberrations for the sake of the comprehensive ideas which he suggests.—His collected works (8d ed., 6 vols., Paris, 1841 '45) do not include all his writings. Some transcendental speculations have since been published separately; others still remain in MSS.

FOURIER, JEAN BAPTISTE JOSEPH, baron, a French mathematician, born in Auxerre, March 21, 1768, died in Paris, May 16, 1830. In 1789 he was appointed professor of mathematics at Auxerre. He took an active but moderate part in the first movements of the revolution at Auxerre, was twice imprisoned there and once at Paris, and was only saved from the scaffold by great effort on the part of his friends. In 1794 he became sub-professor of the polytechnic school, and 4 years later formed one of the scientific expedition which accompanied the French army to Egypt. In 1802 he was appointed prefect of the department of Isère, and in 1808 made a baron. By the draining of the marshes of Bourgoing, he freed more than 40 communes from the pestilential malaria to which they had always been subject. On the return of Napoleon from Elba, he issued a proclamation in favor of Louis XVIII., and was removed by the emperor, who however appointed him prefect of the Rhone. In 1817 he was appointed, jointly with Cuvier, one of the perpetual secretaries of the academy of sciences, and upon the death of Laplace in 1827 became president of the *conseil de perfectionnement* in the polytechnic school. His principal works are the *Théorie analytique de la chaleur* (Paris, 1822), and the *Analyse des équations déterminées* (Paris, 1831), a posthumous publication.

FOURNEYRON, BENOÎT, a French inventor, born in St. Étienne, department of the Loire, Nov. 1, 1802. He was educated at the school of mines in his native city, and upon leaving it in 1819 was employed in the mines of Creuzot, and soon distinguished himself by a variety of useful suggestions and inventions, among which the turbine is best known. His first turbine

was exhibited with complete success at Inval, near Gisors, in 1834, and the prize of 6,000 francs, which had for 9 years remained unawarded, was bestowed upon him by the academy of sciences. His proposal to establish several of these machines in the Seine at Paris, for the purpose of supplying every part of the city with water, as well as of filling the ditches which surround the fortifications, was commended by Arago. He has published on this subject *Mémoires sur les turbines hydrauliques, et leur application en grand dans les usines et manufactures* (Liège, 1841).

FOWLER, ORSON SQUIRE, an American phrenologist, born in Cohocton, Steuben co., N. Y., Oct. 11, 1809. His parents were among the early settlers of Steuben co., and he is recorded to have been the first child born in the township of Cohocton. He was educated at Amherst college, where he was graduated in 1834, supporting himself during his collegiate course by sawing wood for his fellow students, and by teaching during vacations. Immediately after graduating he began to lecture on phrenology, a subject to which he had previously given much attention, and on which he had read Spurzheim, Combe, and the other current authors. In 1838, in conjunction with his brother Lorenzo, he established in Philadelphia the "American Phrenological Journal," and from that time forward, as editor, lecturer, and author, he has pursued a career of unusual activity. Among the many volumes on phrenology and kindred subjects which he has published, may be mentioned: "Memory and Intellectual Improvement applied to Self-Education" (1841); "Physiology, Animal and Mental, applied to Health of Body and Power of Mind" (1842); "Matrimony, or Phrenology applied to the Selection of Companions" (1842); "Self-Culture and Perfection of Character" (1843); "Hereditary Descent, its Laws and Facts applied to Human Improvement" (1843); "Love and Parentage applied to the Improvement of Offspring" (1844); "A Home for All, or the Gravel Wall and Octagon Mode of Building" (1849). In connection with his brother Lorenzo, he has written "Phrenology Proved, Illustrated, and Applied" (1836), and the "Self-Instructor in Phrenology and Physiology" (1849). He has lectured in almost every part of the United States and in Canada.—LORENZO NILES, brother of the preceding, born in Cohocton, June 23, 1811. His early history is almost identical with that of his brother, whom he accompanied on his lecturing tours. He has also lectured alone in all the considerable towns of the United States and the British American provinces. In addition to the works written in connection with his brother, he is the author of the "Synopsis of Phrenology and Physiology" (1844), and "Marriage, its History and Philosophy, with directions for Happy Marriages" (1846). As a member of the firm of Fowler and Wells he has been engaged in publishing "Life Illustrated," a weekly journal, the "American Phrenological Journal" and the

"Water Cure Journal," monthly periodicals, issued in New York.—LYDIA FOLGER, wife of the preceding, born in Nantucket, Mass., is a graduate of the Syracuse medical college, and practises medicine. She also lectures frequently on physiology and the diseases of women and children, and is the author of "Familiar Lessons on Phrenology and Physiology" (1847), and "Familiar Lessons on Astronomy" (1848).

FOX (*vulpes*, Cuv.), a well known carnivorous animal belonging to the vulpine division of the family *canidæ*. Foxes may be distinguished from the dogs, wolves, and other diurnal *canidæ*, by their lower stature, pointed muzzle, shorter neck, slender limbs, and long, bushy, and cylindrical tail; the fur is finer, thicker, and more glossy; they diffuse a strong scent from a gland at the base of the tail, so that hounds can easily track them; they dig burrows, and hunt at night, the pupil of the eye forming a vertical fissure; the dentition is the same as that of the wolf and dog. Foxes are shy, cunning, suspicious, cleanly, unsociable, and incapable of true domesticity; their senses of sight, smell, and hearing are very acute, and their speed is great; their tricks to escape their enemies and to seize their prey are so remarkable, that the epithet foxy is proverbially applied to the cunning, deceitful, and unscrupulous knave. Stealing from his hiding place at night, the fox follows the steps of small animals, and pounces upon the hare in her form, and grouse, partridges, and pheasants on their nests; he is fond of fruit, especially grapes, and will eat squirrels, rats, moles, field mice, cheese, fish, and also small reptiles, insects, and even carrion; in cultivated districts he is fond of visiting the farm yard in search of poultry and eggs. Foxes are so cunning that they are very rarely taken in any kind of trap; the favorite and surest way of destroying them is by meat poisoned by strychnine, which is now familiarly employed for this purpose even by our remote Indian tribes. They bring forth once a year, from 4 to 8 at a birth, the young being born with the eyes closed; the breeding season in the northern states begins toward the end of February, and gestation continues 60 to 65 days. There is considerable variety in the tones of the voice; they lie down in a curved form, sleep profoundly, and, when watching birds, stretch the hind legs behind them, a habit noticed in some dogs; they hunt singly, each one plundering for the satisfaction of his own appetite. Of the 14 or more well ascertained species, 6 are found in the United States; they are distributed over the surface of both hemispheres, most abundantly in the north, and never, according to Hamilton Smith, south of the equator; the resemblance between the species is greater than in other genera of the family. Prof. Baird restricts the genus *vulpes* to those species having a long muzzle, the tail with soft fur and long hair uniformly mixed, and the temporal crests of the skull coming nearly in contact, the red fox being the type of

this section; he proposes the genus *urocyon* for those species which, like the gray fox, have a short muzzle, the tail with a concealed mane of stiff hairs without any intermixture of soft fur, the temporal crests always widely separated, and the under jaw with an angular emargination below.—The common American red fox (*V. fulvus*, Desm.) has long, silky fur, with a full bushy tail tipped with white; the color is reddish yellow, grizzled with gray on the lower back; throat and narrow line on the belly white; back of ears and tips of the hair on the tail (except the terminal brush) black. The cross fox, the variety *decussatus* (Geoff.), has the muzzle, lower parts, and legs black, the tail blacker, and a dark band between the shoulders crossed by another over them; this is found from northern New York to Canada and northern Michigan and Wisconsin, while the red variety occurs from Pennsylvania to Canada, and from the Atlantic to the Missouri. The silver or black fox, variety *argentatus* (Shaw), is black, except on the posterior back, where the hairs are ringed with gray, and the tip of the tail is white; this is found in Washington territory. The European red fox is a different species, the fur being less soft and long, and the tail less bushy and more tapering; the muzzle is longer, the eyes further apart, and the feet more slender; the red color is darker and the tint more uniform, with little of the golden hue of the American species; the space where the whiskers are inserted is white instead of dusky, and there is more white on the throat and belly; this is the *V. vulgaris* (Briss.); it is found from Spain to Norway, and from Great Britain to eastern Russia. These species and varieties vary in length from nose to root of tail from 24 to 30 inches, and the tail to end of hair from 16 to 20 inches. From the fact that in the bone caves of the United States no skulls of the red fox have been found, while those of the gray fox are common, it is believed by many naturalists that the American red fox is a descendant of the European *V. vulgaris*. The skin of the red fox is worth from \$1 to \$1 25, that of the cross fox about 2 or 3 times as much, and that of the black fox much more. The American red fox, being a northern species, is rarely hunted by horses and hounds, as the nature of the country would generally render this sport impossible, and the people are too independent to permit their standing grain to be trodden down by man and beast for the sake of a poor useless fox. In Great Britain and Ireland, on the contrary, the sport of fox hunting is one of the most popular amusements of the higher classes.—The prairie fox (*V. macrourus*, Baird), the largest species known, inhabits the central portions of North America, and is noted for the beauty of its fur; its general color is like that of the red fox, and it seems to run into the variety of a cross fox; the tint is yellower, and there is more white below; the tail is uncommonly full and hairy; the skull is characterized by a muzzle as much longer than

that of the red fox, as is the muzzle of the latter than that of the European species. The kit or swift fox (*V. velox*, Say) is smaller than the red species; the head is short and broad, the ears small, and the legs short; the tail is very dense and bushy; the general color above, including the ears and tail, is yellowish gray, grizzled on the back, sides pale reddish yellow, below whitish, and tail black tipped. The arctic fox (*V. lagopus*, Linn.) is chiefly confined to the arctic regions of both hemispheres, and has never been seen within the limits of the United States, though it has occasionally been found in Newfoundland; it is smaller than the red fox, with a very full and bushy tail, the soles of the feet thickly furred, and the pelage fine and dense; in the adult the color is white, in the young grayish leaden. We are familiar with the appearance and habits of this rather unsuspicious species through the narratives of Dr. Kane and other arctic explorers.—The gray fox (*V. Virginianus*, Schreb.; *urocyon*, Baird) has the head and body about 28 inches long, and the tail 14 or 15 inches; the tail has a concealed mane of stiff hairs. The color is gray varied with black; sides of neck and flanks fulvous; band encircling the muzzle black; throat white; tail hoary on the sides, rusty below, black at the tip. The head is shorter and the body stouter than in the preceding section, and the fur is much coarser. It is decidedly a southern species, being rare north of Pennsylvania, and common from that state southward, and from the Atlantic to the Pacific; it is less daring and cunning than the red fox, and rarely visits the farm yard; it invades the nests of the wild turkey, pounces upon coveys of quails, and gives chase to the rabbit like a dog. When pursued by hounds in open woods, where it cannot skulk through thick underbrush, it will very often climb a tree. In general this species does not dig a burrow, preferring a hollow log or a hole in the rocks for its den; it is often caught in steel traps, and as a pet is less playful and less odorous than the red fox. Its windings when chased afford good sport for the hunter, and its chase with horses and hounds in the southern states, where the ground is favorable, is much relished as a healthful exercise and exhilarating pastime. In Carolina this species produces from 3 to 5 young at a time in March or April. The short-tailed fox (*V.* or *U. littoralis*, Baird) is about $\frac{1}{2}$ the size of the gray fox, with the tail only $\frac{1}{2}$ the length of the body; it resembles a miniature gray fox, of about the size of a house cat, though of stouter body; it was found on the island of San Miguel, on the coast of California.—Other species of fox exist in Nepal, in the Himalaya mountains, in Syria, and in Egypt, named respectively *V. Hodgsonii* (Hardw.), *V. Himalaicus* (Ogilby), *V. thaleb* (H. Smith), and *V. Niloticus* (Geoff.).

FOX, a N. W. co. of Iowa, newly formed, and named from the Fox Indians. It is drained by a small affluent of the Des Moines called Lizard river, and comprises an area of about

himself placed among the most eminent men of the day, and he resolved at once, notwithstanding his youth, to win the respect and rival the achievements of his associates. He made his first speech in the house, April 15, 1769, in favor of Luttrell against Wilkes. He spoke with insolence, according to Horace Walpole, "but with infinite superiority of parts." Through a desire to gratify his father he sustained the ministry, and was received by Lord North as a valuable accession. In Feb. 1770, he was made a junior lord of the admiralty, and in Jan. 1778, was made one of the lords of the treasury. He was possessed, however, of a strong spirit of independence, fearlessness, and self-reliance, which soon brought him into open collision with Lord North. As if hoping to intimidate his ungovernable adherent, the premier in 1774 caused Fox to be dismissed from the treasury board with every mark of contempt. But this treatment did not produce submission. Fox waited dutifully until his father's death, and then joined the opposition. The American war was now imminent. Fox assailed the leading measures of the ministry with unexampled power. Mild and gentle in his daily life and manners, yet in the house of commons, when aroused by his subject and inspired by revenge, disgust, and contempt, he assailed the feeble supporters of the crown with a vehemence that recalled the fires of Demosthenes; and as he imitated the perfect simplicity of the Greeks in his language and style, nothing intercepted the sharpness of his strokes or the clearness of his rejoinders. "He is the most brilliant and successful debater the world ever saw," said Burke of him; and this opinion was allowed to be just even by his enemies. His appearance, when aroused into eloquence, must have been singularly fine. His black hair hung carelessly over his forehead, his eyes were dark and piercing; his brown complexion reminded the spectator of his ancestor Charles II. In youth he had been fond of private theatricals, and he had then learned the art of declamation and animated gesticulation. He was always careless of his dress in later life, as if absorbed in greater objects; but his form, air, and vehemence of manner, when excited by debate, lent something terrible to his appearance. Nor was this the mere artificial rage of the actor, but rather the ardent impulses of a generous nature, excited to madness by the repeated triumphs of an infatuated ministry. Fox foretold the defeat of the British armies in America, and saw his prophecies one by one fulfilled. Edmund Burke, now his chosen friend, stood by his side in that long struggle against Lord North which ended in the freedom of America. In 1779 he fought a duel with a Mr. Adam, a member of parliament. While thus conspicuous as a political leader, Fox had wasted his great fortune in extravagance. He gamed to a height that astonished the frequenters of White's; his confiding nature made him the prey of designing men and women, and he was the most noted spendthrift of

his time. By 1780 he had squandered more than £100,000, and was often in want of small sums. He was beset by bailiffs and creditors, and Horace Walpole, on paying him a visit, found all his furniture and kitchen utensils being sold out and removed under execution. In this extremity, with his usual good humor, Fox consoled himself by writing an "Invocation to Poverty." When the ministry of Lord North fell in 1782, Fox was made secretary of foreign affairs, and at once projected a peace with the hostile powers. But his negotiations were interrupted by the death of the marquis of Rockingham, the prime minister; and when Lord Shelburne took the head of the ministry, Burke, Fox, and several of their associates thought proper to resign. In April, 1783, however, Fox again came into power, in that famous coalition which he then formed with his former enemy, Lord North. Much odium was heaped upon Burke and himself for their share in this transaction; but whatever may have been the means by which they obtained office, the object for which they employed their power was certainly a noble one. Fox now introduced his India bill, designed to relieve the sufferings of India. He pressed this measure with his usual warmth, aided by Burke; but the crown, the peers, and the India company united against him. The coalition fell, and for many years Fox was destined to remain in opposition, and out of office. When parliament was dissolved, Fox stood for Westminster, while the whole influence of the court and the ministry was arrayed against him. The old whig families and the people supported him, and he was elected by a majority of several hundred; but the court party demanded a scrutiny of the vote, and he was forced to enter parliament for a Scotch borough. The chief bailiff who had ordered the scrutiny was afterward fined £2,000 by a jury of the court of common pleas, and Fox finally triumphed. The nation was now divided into two parties, that of Fox and that of the king. "Fox," said Dr. Johnson, "is an extraordinary man; here is a man who has divided a kingdom with Cæsar, so that it was a doubt which the nation should be ruled by, the sceptre of George III. or the tongue of Mr. Fox." In the impeachment of Warren Hastings, Fox aided Burke and Windham with great zeal; he shared in their violent hostility against Hastings. When in 1788 the king became insane, Fox sought to make the prince of Wales, afterward George IV., regent; he contended that on the incapacity of the king the heir became regent of right. Pitt ridiculed his doctrine of indefeasible right, and when Fox first propounded it said with exultation: "Now I'll unwhig the gentleman." The king recovered, and the nation escaped the rule of the unpopular son. Fox next directed his attention to France, just rising in revolution. He had always been friendly to popular progress; he now believed that a new era was opening upon Europe. His letters to his nephew Lord Hol-

land, edited by Lord John Russell, commence with May 26, 1791, and bring into clear light his liberal principles. From the first he rejoiced in the effort of the French to govern themselves, excused their faults, lamented their failures, and still looked forward with hope, even when the massacres of the Temple and the execution of the king had shocked his humanity and touched his heart. When the allied armies cross the French frontiers to crush the germs of freedom, he trembles; and when they fly before the energy of the republicans, he exults over the misfortunes of the royalists. He wishes that the French were more like "our old friends the Americans;" he defends the Jacobins while he denounces their needless cruelty; he declares the policy of Pitt to be "detestable." Fox and Burke were now to separate for ever. Fox not only called Burke's splendid attacks upon the French revolution "mere madness," but praises a pamphlet which had been written against his old friend by "one Mackintosh." This was the *Vindicia Gallica* with which Sir James first made his way to renown. But when Burke proclaimed in parliament their final separation, Fox burst into tears. About this time, 1791, he actively aided Wilberforce in his efforts to abolish the slave trade, and on that subject delivered one of his finest speeches. In 1793 he supported Mr. (afterward Lord) Grey's motion for parliamentary reform. He soon became the leader of a party pledged to political reform. Pitt, sustained by great majorities, defeated every liberal measure, and Fox and his adherents were looked upon as dangerous factionists. He was member of several leagues formed to amend the British constitution, but finding his opposition in the house of commons useless, in 1797 ceased to attend its meetings. The latter portion of his life from 1797 was chiefly passed at St. Ann's Hill in literary retirement. He hoped to produce some work which might procure him a lasting fame. He projected an edition of Dryden, a defence of Racine and the French stage, and a disquisition to refute the false theories of Hume's history. Finally he resolved to compose a history of the revolution of 1688, the period of their national history which he thought least understood by his countrymen. His researches were wide and laborious. In 1802 he went to Paris to make collections for his historical design, and there saw Napoleon, who treated him with marked distinction. Fond of every form of genius, he was charmed and impressed by that remarkable man; there grew up a kind of friendship between them, founded upon mutual respect, which Fox transmitted to his nephew, and the good feeling of Holland house was afterward felt by Napoleon in St. Helena. The history was never completed; it extends only to the death of Monmouth. He was accustomed to dictate his narrative to Mrs. Armistead, a lady with whom he lived, or to some other amanuensis, as he would have done a debate. He married Mrs. Armistead in 1802. Pitt

having died in 1806, after the battle of Austerlitz, pacific measures were resolved upon, and Fox became secretary of foreign affairs in the new ministry. He now had an occasion of obliging Napoleon. A person proposed to him to assassinate the French emperor. Fox at once directed him to be imprisoned, and wrote a letter to Talleyrand informing him of the danger to Napoleon, and offering him the opportunity of prosecuting the assassin in the English courts. Napoleon directed Talleyrand to thank the English minister for this friendly act, to which Fox replied in a cordial note frankly offering peace. But death, which had already borne away Pitt from the midst of his disappointments, now struck down his ancient rival in the moment of his triumph. Fox died of dropsy at Chiswick house, after having been tapped 8 times in 5 weeks. He had always been a favorite with all orders of his countrymen, and his funeral was attended by a great multitude of the noble, the middle classes, and the poor. He was buried in Westminster abbey. Although Fox lived wholly without restraint and gratified every desire, yet happily he had many noble and generous impulses which preserved him from the worst features of sensuality and vice. Such was the sweetness of his temper, the generosity of his disposition, and the magnanimity of all his conduct, that he was loved and honored by the purest men of the time. Burke loved him as his chosen friend; with Wilberforce he labored side by side in the cause of humanity; and even the austere Johnson boasted of his friendship. In his political principles he was firm and unbending; no emotion of ambition took him from the path of honor; no opposition terrified or discouraged him. He gave to the whig party of England its distinguishing principles; he originated those measures of reform in the constitution which have finally been adopted; and probably no other statesman has had so large an influence upon the politics of England. Sir James Mackintosh says of him: "He certainly possessed, above all moderns, that union of reason, simplicity, and vehemence which formed the prince of orators. He was the most Demosthenean speaker since Demosthenes."—See "Characters of the late Charles James Fox," by Dr. Samuel Parr (2 vols. 8vo., London, 1809); "Speeches in the House of Commons," by C. J. Fox, with a biographical and critical introduction by Lord Erskine (6 vols. 8vo., London, 1815); "Memoir of C. J. Fox," by John Allen (London, 1820); "Memorials and Correspondence of Charles James Fox," by Lord John Russell (3 vols. 8vo., London, 1854). Some interesting particulars of the private life of Fox are given in the posthumous "Recollections of Samuel Rogers" (London, 1859).

FOX, GEORGE, founder of the society of Friends, born in Drayton, Leicestershire, England, in July, 1624; died in London, Jan. 18, 1691. His father, a zealous advocate of Presbyterian doctrines, early imbued his son's mind

with sentiments of truth and piety, but was unable to afford him any education beyond reading and writing. As a boy he showed a gravity and a love of solitude and contemplation unusual to childhood, and which the occupation of tending sheep, to which his earlier years were devoted, served to confirm. He was in due time apprenticed to a shoemaker; but keeping aloof from his fellow workmen, he meditated upon the Scriptures, gradually shaping the doctrines which he afterward promulgated. About the age of 18, under the influence of the religious enthusiasm which this course of life engendered, he abandoned his occupation in order to prepare himself for the mission to which he believed he had been called. For some years he led a wandering life, living in the woods and in solitary places, and practising a rigid self-denial. His friends at one time induced him to return to his home, but in a short time he resumed his solitary and nomadic life, and finally, in 1648, made his appearance as a preacher at Manchester, where the exposition of his peculiar views caused a prodigious excitement, and subjected him to imprisonment as a disturber of the peace. Thenceforth, undeterred by the assaults of the populace or the persecutions of the magistrates, he travelled over England, preaching his doctrines with an earnestness and perseverance which no harsh treatment could abate, and with a persuasiveness also which won him many converts. He advocated virtue, charity, the love of God, and a reliance upon the inward motions of the Spirit, by which, as he asserted, and not the Scriptures, "opinions and religions are to be tried." Simplicity, not merely in religious worship, but in all the relations of life, was also urged upon his converts; and to his refusal to recognize the ordinary tokens of outward respect, which, to use his own words, "made the sects and professions to rage," as well as to take any oath, are to be ascribed most of the persecutions and imprisonments to which he was subjected. The term Quakers was first applied to Fox's followers at Derby, in 1650, in consequence of his telling Justice Bennet, before whom he had been brought, to "tremble at the word of the Lord," or from the tremulous tones in which they were accustomed to speak. In 1655 Fox was carried a prisoner to London and examined in the presence of Cromwell, who not only released him, declaring that his doctrines and conduct were equally harmless, but on several subsequent occasions protected him from persecution. In 1669 he was married to the widow of a Welsh judge, and 2 years afterward, having preached in England, Ireland, and Scotland, and made thousands of converts, including men of position and learning, like Penn and Barclay, he visited the North American colonies, in nearly all of which he preached. On his return to England, in 1678, he was imprisoned for refusing to take the oath of supremacy, and for exciting disturbances among the king's subjects; but having been released within a year, he went

to Holland, where his preaching seems to have been attended with considerable success. He returned to England, was again imprisoned for refusing to pay tithes, revisited Holland in 1684, extending his travels to Hamburg, Holstein, and even to Dantzic, and a few years before his death established himself in London, where he rested from his arduous labors, although he continued to preach occasionally. Fox was a man of genuine piety, and his meekness, humility, and moderation are mentioned in terms of high praise by his friend William Penn, who says that "he had an extraordinary gift of opening the Scriptures, but above all excelled in prayer." Although he was a man of limited education, his published works, containing his journal, correspondence, and all his writings upon his doctrine, are numerous and curious. They were partially collected in 3 vols. fol., 1694-1706. An edition in 8 vols. 8vo. has been published in Philadelphia.—See the "Life of George Fox, with Dissertations on his Views," &c., by S. Janney (1 vol. 8vo., Philadelphia, 1852).

FOX, JOHN, the English martyrologist, born in Boston, Lincolnshire, in 1517, died in London in 1587. He was educated at Oxford, and elected a fellow of Magdalen college in 1543, but becoming a convert to Protestantism was deprived of his fellowship in 1545, and reduced to great distress by the withholding of his patrimony on the same pretext. After some time he obtained a situation as tutor in the family of Sir Thomas Lucy, immortalized by the story of Shakespeare's robbing his deer park. He was next employed in the house of the duchess of Richmond as tutor to the children of her brother the earl of Surrey, then imprisoned in the tower, and afterward executed. Here he remained many years, and on the accession of Edward VI. was restored to his fellowship. In the reign of Mary he was obliged to flee to the continent, where he was employed by Oporinus of Basel as a corrector of the press. On the death of Mary he returned to England, and was appointed by Cecil to a prebend in the cathedral of Salisbury. This office he retained while he lived, his refusal to subscribe to the new articles of religion preventing any further preferment. He was the author of numerous works, and even of some Latin poetry and sacred dramas. All are, however, now nearly forgotten, save his "History of the Acts and Monuments of the Church," commonly called "Fox's Book of Martyrs," which first appeared in London in 1553, and which, in despite of its many defects and inaccuracies, still maintains its place as a popular work. It details the sufferings of the early Protestant reformers from "the great persecutions, and horrible troubles, that have been wrought and practised by the Romishe prelates, especiallye in this realme of England and Scotlande, from the yeare of our Lorde a thousande, vnto the tyme now present," and met with great success, though its trustworthiness has always been disputed by Catholics.

FOX, WILLIAM JOHNSON, an English Unitarian

clergyman and politician, born in Wrentham, Suffolk, in 1786. He was educated at Homerton Independent college, and embracing Unitarian doctrines, became a preacher, in which capacity he officiated many years at the chapel in Finsbury square, London. He has always taken an active part in politics, and is an able and frequent speaker and writer on the extreme liberal side. For most of the time during the last 12 years he has represented the borough of Oldham in parliament. He wrote the first article in the first number of the "Westminster Review," and has since been among its regular contributors. He has also been one of the chief writers for the "Weekly Despatch" newspaper, and has been similarly connected with other prominent magazines and newspapers. Among his published works are a volume of "Lectures on Religious Ideas," "Lectures to the Working Classes" (4 vols. 12mo.), &c.

FOXGLOVE. See DIGITALIS.

FOX INDIANS, or OTTIGAMIES, a tribe of the Algonquin nations, belonging to the western group with the Sacs, Miamis, Menomonees, and others; they formerly lived at the S. end of Green bay, Wisconsin, but are now removed beyond the Mississippi. They have long been united with the Sacs, and indeed form with them one tribe in language, features, customs, and social and political interests. They are a fine, athletic, brave, and warlike people, more averse to the restraints of civilization than most of the tribes within our borders; the internal capacity of the cranium, according to Dr. Morton's measurements, is very large, and in the few specimens examined by him equal to the Caucasian standard. The number of the tribe has been variously estimated at from 1,600 to 2,400; before the revolution their warriors were estimated at from 100 to 250; in 1806 there were 400 warriors and 1,750 souls, trading in deer and bear skins and a few furs, living opposite Prairie du Chien, at the confluence of the Mississippi and Wisconsin rivers, and at that time at war with the Chippewas; in 1825 they lived in Illinois and the Missouri territory, numbering with the Sacs 6,400 souls, and claiming between 4,000,000 and 5,000,000 acres of land on both sides of the Mississippi; in 1829 the Foxes were estimated at 1,600, and the Sacs at 5,000, united into one tribe by a treaty made at St. Louis in 1804; in 1846 their agency was at Osage river, and the whole number was about 2,500, owning 8,000 horses, supporting themselves by agriculture and hunting, and enjoying an annuity of \$81,000; from the delegation which visited Washington in 1852, it appears that the Foxes then numbered only 700, with a fund of \$30,000; disliking schools, missionaries, and even dwellings of civilized man, and adhering to their old religion. By the treaty of 1804, the Sacs and Foxes (for they cannot be separated) ceded to the United States all their land east of the Mississippi, nearly 10,000,000 acres, for an equivalent of money and goods worth about \$22,000; in 1824 they with the Iowas ceded 10,000,000

1,000; and in 1881 with the 1,000 acres for about \$318,000; ceded 5,760,000 acres for in 1837, 236,000 acres for and in 1886, 1,250,000 acres 829 they owned the country from the northern boundary upper Iowa river, and their claim extended to the Calumet branch of the Missouri; the Iowas were jointly interested in this tract; at this time about 200 Sacs and Foxes lived on the Little Platte river. By treaty of Oct. 1837, the Missouri Sacs and Foxes had \$175,400 at interest at 5 per cent; and by the treaties of Oct. 1837, and 1842, the Mississippi tribes of this name had \$1,000,000 invested for their benefit.—The name of Fox Indians is sometimes given to the inhabitants of the Fox islands, between the N. W. coast of America and Kamtschatka; they belong to the Asiatic fishing tribes, living on seals, stranded whales, and other marine products; they are a quiet, timid race, short in stature, with projecting cheek bones, flat faces, and small eyes; they resemble in appearance, habits, and language the Esquimaux of America, and are probably derived from the same stock.

FOX ISLANDS. See **ALEUTIAN ISLANDS.**

FOX RIVER, a river of Wisconsin, called by the Indians *Necnaa*. It rises in Marquette co., near the centre of the state, and after a course of about 200 m., during which it makes numerous bends and passes through Lake Winnebago, it enters the head of Green bay. The lower part of its course furnishes valuable and extensive water power, but it is chiefly important as the basis of a series of improvements undertaken some years since with a view of opening water communication between Lake Michigan and the Mississippi. A canal has been cut from Fox river to the Wisconsin, which is a navigable affluent of the Mississippi, and the channel of the river below Lake Winnebago has been cleared to admit steamboats from Lake Michigan and Green bay. A grant of land was made by congress to assist the work.

FOY, MAXIMILIEN STRAS-RIEN, a French general and orator, born in Ham, Feb. 3, 1775, died in Paris, Nov. 28, 1825. He entered the army in 1791 as a 2d lieutenant of artillery, served under Dumouriez, and fought for the first time at the battle of Jemmapes. He was imprisoned at Cambrai in 1793 by Joseph Buonaparte, but was saved from death by the events of the 9th Thermidor. He served with distinction in the army of the Rhine and Moselle until 1797. Beginning to serve as an aide-de-camp to Bonaparte on his expedition to Egypt, he was employed in the so-called "army of England," and served under Massena in Switzerland, where he signalled himself at Zurich and Schaffhausen. In 1800 he was attached for a while to the army under Moreau, before joining that of the first consul in Italy, where he was wounded for the 2d time. In 1801 he became a colonel, but his freedom of speech and his vote against making

Napoleon emperor impeded his further advancement. He was active during the campaign in Austria in 1805, and at Constantinople where he had been sent in 1807 to aid the sultan Selim against the English. Being ordered to Portugal in 1808, he took a distinguished part in the battle of Vimiero, and the emperor made him a brigadier-general, and two years later a general of division. At Salamanca he protected the retreat of the French army, and during the following campaigns gained great applause by his skillful manoeuvres. At the battle of Orthes in 1814, he was so seriously wounded that his life was despaired of. On the first restoration he was appointed inspector-general of infantry; during the Hundred Days he was placed in command of a division, fought heroically at the battle of Quatrebras, and was wounded at Waterloo. On the second restoration he returned to private life, and devoted himself to a history of the peninsular war. In 1819 he was elected to the chamber of deputies by the department of Aisne, and delivered his maiden speech in December. This speech, in which he supported the just claims of an old soldier, made a sensation, not only among the representatives, but among the people. For 6 years he held his seat in the legislature where he was, indeed, the national orator. His health, impaired by his former wounds, broke down under his parliamentary labors, and after a few weeks of suffering he died of a disease of the heart. No fewer than 100,000 citizens attended his funeral; and it having been reported that the only inheritance left his children was his fame, subscription lists were opened, and within a few days the amount had reached 1,000,000 francs. The speeches of Gen. Foy were collected and published in 2 vols. 8vo. (Paris, 1826). His unfinished *Histoire de la guerre de la péninsule* appeared in 1827, in 4 vols. 8vo.

FRACTION (Lat. *frango*, to break), in arithmetic and algebra, an expression for an unexecuted division, originally invented to represent a quantity less than a unit. Thus $\frac{3}{4}$ originally signified three quarters of one, and afterward was used for the fourth part of three, these two quantities being identical. The dividend number is called the numerator, because in arithmetic it numbers how many parts are taken; and the divisor is called the denominator, because it names the parts. These terms are retained in algebra, where it is evident that their literal meaning is inapplicable. Fractions are also used to express the ratio of the numerator to the denominator.

Thus the expression $\frac{a+b}{a-b}$ may signify the ratio of the sum of the quantities a and b to their difference, or the quotient arising from the division of that sum by that difference. The propriety of indicating the quotient and the ratio by the same sign is evident from the consideration that the quotient bears the same ratio to unity that the dividend bears to the divisor. A decimal fraction is one whose denominator consists of 1 with zeros annexed, in which case

the denominator is not written, but is understood from a point being prefixed, with zeros if necessary; thus, .0371 for $\frac{371}{10000}$. A continued fraction is a fraction whose numerator is 1, and whose denominator is a whole number plus a fraction whose numerator is 1 and denominator a whole number plus a fraction, &c.

FRACTURE, in surgery, a solution of continuity of one or several bones, produced by external violence or the sudden and forcible contraction of muscles. When there is no external wound, the fracture is said to be simple; when complicated with lesion of the surrounding soft parts, compound; and comminuted, when the bone is broken into many fragments. Fractures may occur at any time from the end of intra-uterine life to extreme old age; in youth, fractures are comparatively rare on account of the elasticity of the bones, and in advanced life common from their brittleness. Ruptures of vessels and nerves are the most dangerous complications of fractures of the extremities; gangrene is often the consequence of the former, and paralysis, convulsions, or intense pain and inflammation, of the latter; comminuted fracture is very apt to be followed by tedious suppuration, necrosis, false joint, or much shortened limb; dislocation also is not unfrequently added to fracture. Fractures may be transverse or oblique; the former are most common in children, and are accompanied by little displacement; the latter are the most frequent, and often require all the surgeon's skill and sufferer's patience to effect permanent reduction and prevent deformity of the limb. The causes of displacement in the ends are muscular contractions and the weight of the fractured part; the lower fragment rides over the upper, sometimes to the extent of several inches. The bones most liable to fracture are the superficial ones, like the clavicle, tibia, and skull; or such as, like the radius in the forearm, are likely to receive the weight of the body during a fall; old age, caries, and cancerous, scorbutic, and venereal diseases, predispose to fracture. Violence applied to a part does not always produce a direct fracture; for instance, a fall upon the shoulder may indirectly break the clavicle; the knee-pan and the olecranon are the bones most commonly broken by muscular action. The physiological symptoms of fracture are pain and inability to move the limb; the physical characters are unnatural mobility, change in the length, direction, or form of the limb, and crepitation when the broken fragments are moved upon each other. When there is great swelling, it is often difficult to ascertain the nature or even the existence of a fracture. The course of a simple fracture is a painful and inflamed swelling a few days after the accident, with more or less febrile reaction; these gradually subside, and with proper treatment the bone unites in from one to two months, with or without deformity according to circumstances not always under the control of the surgeon; when the constitution is diseased, or

the reparative process injudiciously interfered with, union may not take place and a false joint be formed. Complicated fractures often terminate in death of portions of bone and of the soft parts, in unhealthy abscesses and tetanus, leading perhaps to fatal consequences unless the limb be removed. The prognosis of fracture of course depends on its situation, extent, complication with wounds, and a variety of circumstances which will occur to every physician. The process of reparation has been described in the article *Bone* (vol. iii. p. 480), and it will only be necessary to say here that lymph is effused between the broken surfaces, which is gradually converted into cartilage, and in a few weeks into a spongy ossific mass called the provisional callus; this holds the ends together for a few months until the permanent callus is deposited between them; the former is gradually absorbed, and the latter has all the characters of true bone. In the interior of the skull, however, and in the cavities of the synovial membranes of the joints, no provisional callus is formed; if the parts be kept in close apposition, bony union will slowly take place; if not, the union will be ligamentary. The indications of treatment are to reduce or set the fragments, and keep them at rest and in close contact, so as to prevent deformity; all disturbing muscles must be relaxed, the ends of the bones extended, and the parts properly supported and kept in place; the limb is bandaged, to prevent swelling and muscular contractions; and some kind of splint or apparatus is applied to keep the limb immovable and of its natural length. Splints are made of wood, pasteboard, tin, and more recently and best of sheet gutta percha, all properly padded and secured against displacement; the starched bandage, consisting of layers of cloth imbued with starch or dextrina, is light, firm, and capable of very exact application; a plaster of Paris apparatus has been much used in Germany, especially for intractable persons and on the field of battle. When swelling and inflammation run high, antiphlogistic and refrigerant applications should precede the use of bandages and splints; and the latter when applied should be loosened when swelling comes on, and afterward readjusted so as to keep the parts uniformly in place. The variety of bandages, splints, and apparatus for the different kinds of fractures is very great; and in nothing does American surgery stand more preëminent than in its ingenious and effectual instruments for the treatment of broken bones. The accompanying symptoms of depression, inflammation, delirium, painful twitchings of muscles, and other complications, must be treated on principles familiar to every surgeon. When a false joint is produced, attempts at union are made by exciting inflammation in the separated pieces by rubbing, the seton, sawing off the ends, and other operations now in vogue; care being taken at the same time to strengthen the patient, and to correct any evident constitutional vice. In compound frac-

tures, especially the severe ones now so common from railroad accidents, the question of amputation is frequently a most difficult one to resolve; much depends on the strength, habits, and age of the patient, the degree of laceration, the proximity to joints, and the injury to vessels and nerves; if the operation be decided on, it is generally performed at once, before the accession of inflammatory fever. If it be determined to retain the limb, the bone should be reduced, loose pieces removed, and the necessary applications be made to induce the wounds to heal; in proper time bandages and splints should be applied; cooling lotions, opium to quiet pain and restlessness, prevention of lodgment of matter, tonics and stimulants to support the strength under profuse discharges, are the additional general indications of treatment. Particular fractures require special apparatus, of which neither the limits nor the character of this work will permit any description.

FRAMINGHAM, a township of Middlesex co., Mass., on the Boston and Worcester railroad, at its junction with a branch road to Milford; pop. in 1855, 4,676. It borders on Cochituate lake, and contains several ponds abounding in fish and wild fowl. In 1855 it contained 3 woollen mills, with \$300,000 capital, employing 374 hands, and manufacturing yearly \$764,650 worth of goods, 5 car and carriage factories, and 2 hat and bonnet factories. In 1858 it had a bank, a savings bank, a high school, and 7 churches, 2 Baptist, 2 Congregational, 1 Methodist, 1 Roman Catholic, and 1 Unitarian.

FRANCO, the monetary unit in France since 1795, in Belgium since 1833, and in Switzerland since 1849. The first coins having this name were manufactured under John the Good in 1360; they were of fine gold, and were called *francs à cheval* from the impression upon them. These coins in 1695 were intrinsically worth 7 livres. Under Charles V. the impression was changed, and they were styled *francs à pied*, but retained the same value. The first silver coin called a franc was struck by order of Henry III. in 1575, and presented on one side the head of the king and on the other a decorated cross. The franc became the monetary unit on the establishment of the decimal system, and is equal in value to about 19½ cents. The franc and livre were originally synonymous as moneys of account, but the old livre tournois is now reckoned at 1½ per cent. less, or as 81 to 80. The Swiss franc was formerly one-half greater than now. Of silver coins, there are ½, 1, 2, and 5 franc pieces; and of gold coins, formerly only pieces of 20 and 40 francs, but since 1830 also of 10 and 100 francs, and in Belgium of 2½ francs.

FRANCE (Lat. *Gallia* or *Francia*), one of the principal states of Europe, occupying the western end of the central part of that continent, between lat. 42° 20' and 51° 5' N. and long. 4° 50' W. and 8° 20' E. It is bounded N. by the North sea and the strait of Dover (*Pas-de-Calais*), and N.W. by the English channel (*La Manche*), which sepa-

rate it from Great Britain; W. by the Atlantic and the bay of Biscay; S. by the Pyrénées, forming its frontier toward Spain, and by the Mediterranean; E. by the Var, the Alps, and the Rhone, the Jura mountains and the Rhine, which respectively divide it from the Sardinian states, Switzerland, and the grand duchy of Baden; N. E., on which side it has no natural boundary, by a conventional line which runs from the left bank of the Rhine at its junction with the Lauter, to the shores of the North sea, some 20 m. E. of the straits of Dover, along the frontiers of Rhenish Bavaria, Rhenish Prussia, the grand duchy of Luxemburg, and Belgium. Under the meridian of Paris, that is, toward its centre, it measures N. to S. about 598 m., and E. to W., between lat. 48° and 49°, about 572 m.; while its greatest length N. W. to S. E., from the extremity of Finistère to the mouth of the Var, is 664 m., and its greatest breadth, N. E. to S. W., from the mouth of the Lauter in the Rhine to that of the Bidassoa in the bay of Biscay, a line crossing the former nearly at right angles, is about 620 m. Its entire line of frontier is estimated at about 2,930 m., of which 1,530 are coast and 1,400 on the land side. Its total area, Corsica included, is officially computed at 52,768,618 hectares, or 203,736 sq. m. It holds the 5th rank in point of extent among European countries, being surpassed by Russia, Sweden, the Austrian empire, and Germany. Previous to the revolution of 1789 France was divided into 36 provinces, which differed from each other in extent, population, rights, immunities, and administration. Now it contains 86 departments, the extent of which is nearly equal. They are subdivided into 363 arrondissements, 2,850 cantons, and 36,826 communes or villages. Sixty-five of the departments are named from the rivers by which they are drained, 11 from mountains, 3 from their situation, 8 from the country in which they are situated, 2 from the sea or straits which border on them, 1 from a forest, and 1 from a spring. The following table shows the departments, the provinces from which they have been chiefly formed, their population in 1856, and their capitals:

Provinces.	Departments.	Pop. in 1856.	Capitals.
N. DIVISION:			
Flanders	Nord	1,212,853	Lille.
Artois	Pas-de-Calais.	712,848	Arras.
Picardy	Somme	566,619	Amiens.
Normandy ...	Seine-Inférieure }	769,450	Rouen.
	Eure	404,665	Evreux.
	Orne	430,127	Alençon.
	Calvados	478,897	Caen.
	Manche	595,202	Saint Ló.
CENTRAL DIVISION:			
Isle of France }	Seine	1,727,419	Paris.
	Seine-et-Oise.	494,179	Versailles.
	Oise	396,085	Beauvais.
	Seine-et-Marne }	341,383	Melun.
	Marne	555,589	Laon.
Champagne ..	Ardennes	322,183	Mézières.
	Marne	372,050	Châlons-sur-Marne.
	Aube	261,673	Troyes.
	Haute-Marne .	256,512	Chaumont.

(Table continued.)

—In population, France ranks 4th among the great European states, being inferior only to Russia, Germany, and Austria. It has increased but slowly during the last century, in comparison with the progress of Great Britain and the United States. We gather the following figures from authentic documents:

Years.	Population.	Years.	Population.
1700.....	19,600,320	1821.....	33,540,354
1762.....	21,769,163	1834.....	35,540,910
1790.....	24,800,000	1841.....	34,339,178
1790.....	26,500,000	1848.....	35,401,761
1801.....	27,349,008	1851.....	35,751,626
1806.....	29,107,425	1856.....	36,000,264
1830.....	30,491,187		

According to this table, within a period of a century and a half the population has not even doubled, while within the last 50 years its increase has not been quite 40 per cent.; but it must be borne in mind that during the first part of this period the population was heavily taxed by the bloody wars of the empire, by which France lost no fewer than 1,700,000 men on the battle field. During this period of 50 years the population of Great Britain has nearly doubled, and that of the United States increased nearly fivefold. A comparison between the census of 1790 and that of 1856 shows that the increase has been very unequally divided among the departments. Nine of them, Seine, Nord, Rhône-et-Loire (now divided into 2, the Rhône and the Loire), Seine-Inférieure, Isère, Manche, Maine-et-Loire, Haute-Garonne, and Bas-Rhin, have nearly doubled their population; in 1790 it was in the aggregate 8,960,996, while it amounts now to 7,581,801. It may be added that the first two on the list have more than doubled; that of the Seine, for instance, from 723,333 in 1790 reached 1,727,419 in 1856, the increase being 1,004,086. Of this, 300,000 have been gained within the last 5 years, and the ratio of increase is still augmenting. Paris, more than any other great city, seems to be an absorbing centre. On the other hand, 9 departments show a decrease for the same semi-centennial period; these are Yonne, Basses-Alpes, Lozère, Hautes-Alpes, Côte-d'Or, Indre-et-Loire, Cantal, Morbihan, Seine-et-Marne, whose aggregate population in 1790 was 2,925,894, while in 1856 it was but 2,555,498, a decrease of 370,396. Although trifling, this is not easily accounted for, if we except Seine-et-Marne. This is one of the most prosperous departments in the empire, owing to its vicinity to the capital, but this vicinity and the increasing number of elegant country seats have contributed to lessen the population. The case is nearly the same with Eure, Orne, and Oise, whose population has remained nearly stationary. The total increase for the last 50 years amounts to 7,000,000. The N. W. region, where Paris is situated, has gained the most; then comes the S. E., in which are Lyons and Marseilles. If we divide the departments into 4 classes according to their ratio of increase, we find that the first class (21 departments) has increased 80 per cent., the 2d class 35 per cent., the 3d 25 per cent., while the 4th has been stationary or decreasing. If we draw an imagi-

was 1 to 41 of the whole population. The births were to the deaths as 118 to 100, and to the population as 1 to 84. For the last 10 or 12 years the annual average of marriages was 279,500, except in years when bread was dear, as in 1847 and 1854, when there were only 270,688 and 270,906 marriages. In 1855, notwithstanding the high price of provisions and the increase in the army, the number of marriages was 283,488, or 1 marriage to 127 inhabitants. The large and populous cities of France are comparatively few. Paris, the capital, has (1856) 1,178,262 inhabitants; Lyons, which comes next, has but 255,960; Marseilles, 215,196; Bordeaux, 140,601; Nantes, 101,019; Rouen, 94,645; Toulouse, 92,223; St. Etienne, 91,938; Lille, 71,286; Strasbourg, 65,120; Havre, 62,468; and Amiens, 52,149.—The bulk of the French nation consists of the descendants of Gallo-Romans mixed with German and Scandinavian barbarians (Burgundians, Goths, Franks, and Northmen), who invaded Gaul between the 5th and 10th centuries. But the latter elements are far from being important, and the French may be called a neo-Latin race; their language partakes of the same character, being Latin with a slight admixture of Germanic and Celtic. Although the various races have melted into a single people, some of the original types may be still traced, especially in the remote parts of the country or along the frontiers. The inhabitants of Brittany, 2,800,000 in number, mostly retain the characteristic features of their ancestors, and the Breton language is still spoken in the western part of that province. The Basques preserve their primitive language. Alsace and Lorraine are inhabited by about 1,300,000 Germans, who speak both German and French; while the Corsicans speak Italian. There are beside about 100,000 Jews and 6,000 gypsies, scattered or wandering over the country.—The shape of France is an irregular hexagon, the sides of which might be drawn respectively along the English channel, the Atlantic, the Pyrénées, the Mediterranean, the Alps, and the Rhine, the last side running from this river to the North sea. The first of these sides, or the N. W. coast, presents from Dunkirk to the mouth of the Somme a succession of sandy downs from which project Capes Gris Nez and Blanc Nez, opposite Dover. At the mouth of the Somme is the small bay of St. Valéry. From this point, sweeping S. W. toward the mouth of the Seine, the coast is characterized chiefly by cliffs of chalk and marl, with here and there harbors, the most important of which is Dieppe. The Seine now widens into a small bay, bearing the name of Seine, Havre, or Calvados, from which the coast line runs almost due W., fringed by a chain of reefs, to the mouth of the Vire, whence it takes a N. direction and forms the square-shaped peninsula of Cotentin. On the N. face of this peninsula, between Capes Barfleur and La Hague, lies the magnificent port of Cherbourg. From Cape La Hague, a low shelving shore, interrupted by

granitic cliffs, runs southward to the bay of Cancale, the sandy bottom of which is dry at ebb tide. The coast then resumes its westerly direction to form the triangular peninsula of Brittany, the rocky cliffs of which present a wild, grand, and desolate aspect. Beside the bay of Cancale, Brittany is washed by the St. Malo roads and the bay of St. Brieuc. Its extremity, Cape St. Mathieu or Finistère, runs into the Atlantic, and is the westernmost point of France. The coast is here deeply indented by a magnificent bay, capable of containing at least 500 ships of war, which receives its name from the important military seaport of Brest, and by the less sheltered bay of Douarnenez, which is separated from the former by the peninsula of Crozon. From the point which projects S. of the bay of Douarnenez, the coast, gradually declining and becoming sandy again, recedes E. S. E. toward the mouth of the Loire, presenting in succession Cape Penmark, the small peninsulas of Quiberon and Sarzeau, the roads of Lorient, and the bay of Croisic. From the Loire to the Gironde, the shore, continuing low and sandy, is indented by several bays, generally protected by islands, and presents the two seaports of La Rochelle and Rochefort. From the mouth of the Gironde to the foot of the Pyrénées, the coast is but an unbroken line of sandy downs interspersed with marshes, the only opening to vessels being the basin of Arcachon. Drifting sands have here covered large tracts of good soil, and within the last two centuries a number of scattered cabins, private residences, convents, and even whole villages, have been thus completely buried. Of late years such ravages have been partially stopped by the planting of beach grass, broom, and pine trees. Along the Atlantic division, which is 585 m. in length, there are many islands, including Ushant (Ouessant) on the extreme point of Brittany, Belleisle, nearly opposite the mouth of the Loire, Noirmoutiers, Dieu, Ré, and Oleron, between that river and the outlet of the Gironde. At the entrance of the English channel, near the Cotentin peninsula, 3 important islands, Jersey, Guernsey, and Alderney (Aurigny), although physically belonging to France, are held by Great Britain. The coast of the Mediterranean, 870 m. long, recedes first toward the N. E. in a semicircular curve to the mouth of the Rhone, and forms what is improperly called the gulf of Lyons (Fr. *golfe du Lion*); bold and rocky near the Pyrénées, it soon lowers into a sandy beach, intersected by a number of lagoons, such as those of Thau and Valcarès, but without a single good harbor. It is everywhere bordered by shoals, and the accumulation of land is such as to require constant attention to prevent the filling up of the few indifferent ports which are to be found here. Aigues-Mortes, which was formerly an accessible port, is now nearly 5 miles from the sea. Agde, notwithstanding works of improvement, affords protection only to a few barks, and Cette admits only vessels of the smallest size. Beyond the mouth of the

Rhone, the shore, rising up in bold cliffs, abounds in good ports, the principal of which are Marseilles and Toulon, both of the highest importance, the former on account of its large and always increasing trade with Algiers and the East, the latter as a naval and military station. The land frontiers, as we have said, are but partly formed by physical boundaries. On the S. the dividing line follows the ridge of the Pyrénées, with one or two deviations too trifling to be noticed, and ends with the lower Bidassoa. On the E. the Rhine from Basel to the mouth of the Lauter divides France from the grand duchy of Baden. Toward Switzerland, the frontier, running S. S. W., starts from the great bend of the Rhine, follows the Doubs to its falls, then a ridge of the central Jura to Mount Rixon, and finally the Laudon to its mouth in the Rhone. This river in part separates France from Savoy; then the dividing line winds its way to the Alps, follows the Cottian Alps and the northern ridge of the Maritime Alps to the Var, and ends with this river on the Mediterranean. The conventional line on the N. E. starts in a S. E. direction from the North sea, 4 miles E. of Dunkirk, reaches the Lys, which it follows down for a few miles, crosses this river at Menin, runs S. E., passing a few miles N. of Lille, Valenciennes, and Maubeuge, crossing the Scheldt and the Sambre, recedes S. of Philippeville and Marienbourg, then runs N. toward the Meuse, which it crosses below Charlemont; then resuming its winding course to E. S. E. it runs a few miles N. of Mézières, Sedan, Montmédy, and Thionville; then after crossing the Moselle N. of this last city, the Sarre near Sarreguemines, the Vosges N. of Bitche, it follows the Lauter to its fall into the Rhine. This open line is protected by a series of strongholds and fortified towns, the principal of which have been here mentioned.—Beside the two great mountain chains which form the boundaries of France toward Spain and Italy, several others of minor importance, belonging to the Alpine and Pyrenean systems, intersect the country. The principal of these chains, which is but a part of the great European watershed, starts from the Pyrénées, taking first a winding course E. N. E. nearly parallel to the Mediterranean shore, then setting up northward, under the names of Black mountains, Cévennes, and Côte d'Or; near lat. 48°, where it is called the plateau of Langres and Monts Faucilles, it makes a curve eastward, and then branches, projecting northward the Vosges, and southward various ridges which, through the Jura, connect with the Alps. This chain thus divides France into two very unequal parts, the greater sloping toward the Atlantic and the English channel, the smaller toward the Mediterranean. Four ranges, the general direction of which is N. W., branch off from this watershed and separate the basins of the various rivers flowing into the above seas: 1, the hills known as the eastern Ardennes; 2, the western Ardennes, connecting with those of Picardy and Artois; 3, the branch consisting of the Morvan

mountains, the hills of the Orleans forest, of lower Normandy, and *Monts d'Arrée*, running along the N. shore of Brittany; 4, the mountains of Auvergne, which may be more properly called a cluster, of which the hills of Limousin and Poitou are but the continuation. The *Pyrénées* also send some secondary ramifications through the S. W. The highest summits of this great chain within the limits of France are the *Pic du Midi de Bagnères*, the *Pic Long*, the *Tours de Marboré*, *Mts. Taillon* and *Vignemale*, the *Pic du Midi de Pau*, and *Mt. Canigou*, whose summits are from 9,000 to 10,000 feet above the sea; but the most elevated, such as *Mts. Perdu*, *Pòsets*, and *Maladetta*, are to be found in Spain. In the *Cévennes* ridge, *Mts. Mézin* and *Lozère* are about 6,000 feet high. The *Bocuet* and the *Dole* tower over the ranges of the *Jura* to about 5,000 feet. Among the rounded summits of the *Vosges*, which are known under the name of "balloons," the only one deserving notice is the *Ballon d'Alsace*, in the southern part of this chain. The group of *Auvergne* presents the *Puy de Dôme*, *Mt. Dore*, and the *Plomb du Cantal*, rising to a height of nearly 5,000 feet. The loftiest summit is to be found in the *Alps*: *Mt. Pelvoux* reaches an elevation of nearly 13,000 feet; next to it come *Mts. Genève* and *Viso*. On an average, the mountains of France are comparatively low.—The great W. slope of France is divided into 3 parts, one inclined toward the North sea, another toward the English channel, and the third toward the Atlantic. The first is drained by 3 rivers: the *Rhine*, which scarcely belongs to France, since it merely runs for about 100 m. along a portion of its E. frontier, and receives the *Moselle*; the *Meuse*, which flows in a northern direction, between the E. and W. *Ardennes*; and the *Scheldt*; the last two are properly Belgian. The *Somme*, the *Seine*, the *Orne*, the *Vire*, and the *Rance* flow into the English channel. The *Seine* rises at *St. Seine*, at the foot of the *Côte d'Or*, runs in a N. W. direction, flows in its sinuous course past *Troyes*, *Paris*, *Rouen*, and other cities, receives on its left the *Yonne*, and on its right the *Aube*, the *Marne*, and the *Oise*, and falls into the sea at *Havre*. The Atlantic receives the *Blavet*, the *Vilaine*, the *Loire*, the *Sèvre-Niortaise*, the *Charente*, the *Gironde*, and the *Adour*. The *Loire*, which is the largest river and waters the most central part of the country, rises in the *Cévennes*, at *Mt. Mézin*, runs generally N. W. as far as *Orleans*, and thence mostly W. S. W. with a somewhat tortuous course to its mouth. It receives on the right the *Nièvre*, and further down the *Mayenne*, which, after being joined by the *Sarthe*, assumes in its lower part the name of *Maine*; on the left, the *Allier*, the *Cher*, the *Indre*, the *Vienne* swollen by the confluence of the *Creuse*, and the *Sèvre-Nantaise*. The *Loire* and its tributary streams, particularly those from the south, roll down immense quantities of gravel and sand, which, continually shifting, render

the navigation difficult and dangerous. A great dike, called the "*Levéé of the Loire*," the origin of which is lost in antiquity, bounds the course of the river on the right bank from *Blois* to *Angers*; this vast work is generally about 25 feet high and 40 broad. The *Garonne*, which has its source in the valley of *Adan*, in *Catalonia*, follows one of the passes of the *Pyrénées*, flows N. E. until it reaches *Toulouse*, then turns toward the N. W. and becomes navigable; it receives the *Tarn* and the *Lot*, which run E., passes *Bordeaux*, where it is half a mile wide, and meeting the *Dordogne* a few miles below this city, takes the name of *Gironde*, forms several islands, and falls into the sea by two channels. The navigation between *Bordeaux* and the sea is impeded by many shoals; the tide flows up about 80 m., and is sometimes preceded by a huge billow that sweeps destructively along the shore. This phenomenon is called the *mascaret*. The *Adour*, rising in the *Pyrénées*, has a semi-circular course toward the bay of *Biscay*, into which it enters after receiving numerous mountain streams. The E. slope, which is inclined S. toward the *Mediterranean*, is enclosed between the *Jura* and the *Alps* on one side, the *Côte d'Or* and the *Cévennes* on the other. It is drained almost entirely by the *Rhone* and its branches. The *Rhone* is not very wide, and runs generally with the impetuosity of a torrent. It reaches France after issuing from the lake of *Geneva*, runs S. and forms part of the French frontier line, then makes a bend westward, joins the *Saône* at *Lyons*, and flows S. to the *Mediterranean*, into which it discharges itself by several branches, forming a delta. It is joined on the left by the *Isère*, which comes from *Savoy*, the *Drome*, and the rapid *Durance*, which rises in the *Alps*. The few lakes which France contains scarcely deserve the name; the largest is that of *Grand Lieu*, near the mouth of the *Loire*; the most picturesque are those of *Gerardmer* in the *Vosges*, and *Nantua* in the southern part of the *Jura*.—The general aspect of the interior of France is agreeably diversified. The banks of the *Seine* present pleasant landscapes, with fertile and well cultivated fields. Those of the *Loire* have few attractions in the upper part of its course, but are beautiful below *Orleans*; the neighborhood of *Tours* has been characterized as the "garden of France." The valley of the *Garonne* is covered with those rich vineyards which send their produce to all parts of the world. The lower *Rhone* is remarkable for picturesque grandeur. The *Auvergne* mountains, the *Pyrénées*, the *Vosges*, the *Jura*, and the *Alps*, abound in fine scenery. *Brittany* is partly covered by wide heaths and naked rocks.—The geological outline of France is easily marked. A belt of the granitic rocks running through the *Vosges*, the *Alps*, the *Pyrénées*, and the peninsula of *Brittany*, forms a kind of basin, in the centre of which a pile of the same formation rises. This consists of the *Auvergne* mountains, which, being mostly composed of granite, gneiss, and mica-

ceous schists, bear abundant traces of recent volcanic activity; extinct craters, lava streams, &c., present an interesting field for the observations of the geologist. The primary rocks at the circumference are of the greatest diversity, the granite however predominating at the extremity of the peninsula of Brittany. The intervals between the external belt and the central nucleus are mostly filled up by secondary formations, interspersed with tertiary deposits. Both are interesting. The former, which are calcareous or marly and generally compact, contain a vast number of shells, madrepores, and other organic remains; stretching in long hill ranges, of little elevation, they run through Lorraine, Burgundy, Franche Comté, Dauphiné, and Languedoc. Many are steep and bare, or covered only by a thin vegetable soil; but some, the hills of the Côte d'Or especially, are admirably suited for the vine. The most remarkable tract of tertiary formations is known as the "Paris basin;" a larger one covers nearly the whole of the valleys of the Garonne and the Adour, while several others of smaller extent are found in the valleys of the Rhine, the Loire, and the Allier. These are mostly calcareous, enclosing great quantities of shells and the remains of fossil mammalia of large size. The district around the mouth of the Rhone is entirely alluvial.—The soil of France, taken as a whole, is of superior quality; and the productive part of it bears a larger proportion to the entire extent of the country than in most other European states, amounting to 41,850,000 hectares out of 52,768,600. The whole may be distributed in the following manner: arable lands, 25,500,000; meadows, 4,830,000; vineyards, 2,130,000; orchards and gardens, 640,000; miscellaneous crops, 950,000; copse wood, 7,800,000; heath land, 7,789,000; ponds, 209,000; roads, rivers, canals, houses, &c., 2,920,000.—The climate, being on the whole temperate, is one of the finest in Europe; it is however greatly diversified by the differences of latitude, elevation, soil, exposure, &c. In this respect, France has been divided into 4 regions, each being characterized by a special production: the 1st, the region of the cereals, extends from the northern frontier to a line drawn from Mézières to Nantes; the 2d, the region of the vine, is comprised between this line and another passing from Strasbourg to the mouth of the Charente; the 3d, through which the cultivation of maize prevails, is bounded S. by a line extending from Grenoble to Perpignan; and the 4th, the region of the olive, includes the most southern part of the country. The air is generally pure and healthy. The mean annual temperature of different parts of France has been estimated as follows by Humboldt: at Toulon, 62°; at Marseilles, 59.5°; at Bordeaux, 56°; at Nantes, 55.2°; at Paris, 51.2°; and at Dunkirk, 50.5°. More rain falls annually in the valley of the Rhone than on the Atlantic slope; the average fall in the former being about 80 inches,

while it does not exceed 20 inches in the latter. The centre of the country enjoys a happy medium of temperature and climate; in the S. the summers are long, dry, and hot. The mountainous region of Auvergne is visited by long and severe winters. The departments around the gulf of Lyons are subject to disagreeable winds, which sometimes prove injurious to the crops; the most dreaded is the *mistral*. Of the vegetable products the most generally cultivated are wheat, rye, maize, buckwheat, oats, barley, potatoes, colewort, black poppy, the olive, &c. The average yield of wheat amounts to 225,000,000 bushels; rye, 83,000,000; oats, 140,000; barley, 50,000,000; potatoes, 250,000,000. The chief grain-growing districts are the departments of Eure-et-Loir (formerly Beauce), Aisne, Nord, Meurthe, Moselle, Seine-et-Marne, Seine-et-Oise, Seine-Inférieure, Somme, and Pas-de-Calais. Barley, oats, oleaginous seeds, hops, and beet root are mostly cultivated in the department of Nord; buckwheat in Brittany. Meadows and pastures are principally found in Normandy. The vineyards, which extend through no fewer than 76 departments, yield annually about 900,000,000 gallons of wine, worth about \$160,000,000 at the places of production; nearly the 4th part of this amount is exported. Apple trees are abundant in the N. W., and the Normandy cider enjoys a wide reputation in France; hemp and flax are raised in large quantities in the same region; attention is given to the mulberry tree in the S. and S. E.; madder is successfully cultivated in the E. on the banks of the Rhine and the Durance; tobacco is raised in the departments of Nord, Pas-de-Calais, Gironde, Bas-Rhin, Ile-et-Vilaine, Lot, and Lot-et-Garonne. The principal forest trees are the chestnut on the central mountains, the oak in the Pyrénées, the fir in the Landes. The most richly wooded districts are the Ardennes table land, the Vosges, the plateau of Langres, the Côte d'Or, the Cévennes and their ramifications, the Jura, and the Alps. The destruction of wood has been considerable within the last two centuries, and the forests do not cover more than $\frac{1}{10}$ of the whole area of the country. The principal forests still in existence are those of Compiègne, Fontainebleau, L'Esterel, Haguenau, Rambouillet, Villers-Cotterets, Orleans, &c. The French flora comprises upward of 830 genera and 6,000 species.—France is far from being so well stocked with domestic animals as she ought to be, considering her extent and the nature of her soil. The numbers of live stock in 1854 were as follows: horned cattle, 9,939,828; sheep, 82,151,480; horses, 2,818,493; mules and donkeys, 787,860; total, 45,697,111, to which about 5,000,000 swine must be added. This insufficiency of stock is yearly supplied by importation. Within the last 40 years great attention has been given not only to the improvement of native breeds, but to the introduction of foreign ones, which has been generally successful. The best breeds of cattle are those of Auvergne and Gascony;

the sheep of Berry are considered the finest; the fattest swine are raised in Alsace, Lorraine, and the Pyrénées; the horses of Limousin, Brittany, Perche, and Normandy are renowned, those of the last two provinces for their strength and size; the mules of Poitou deserve the same praise. Poultry, which contributes one of the principal articles in the husbandry of France, is raised with peculiar success in Maine, Angoumois, and Burgundy. Eggs are important articles of export, especially to England. Bees are principally raised in the departments bordering on the Mediterranean; the most celebrated honey is that of Narbonne. The wild animals are fast diminishing all over the country, owing to the progress of population; the black bear is confined to the higher ranges of the Alps and the Pyrénées, where the ibex, chamois, and wild goat are also found. The lynx appears rarely in these mountains and the Cévennes. Wolves, notwithstanding the active war of extermination carried on against them, are still numerous in some central departments, especially the mountainous districts. The wild boar, roebuck, and fox abound in all well wooded parts. The red and fallow deer are becoming rare, while hares and rabbits are abundant. Several kinds of squirrels, the polecat, weasel, marten, hedgehog, and other small animals, are common. Otters and a few beavers are found in some of the southern streams. Reptiles are few; a venomous kind of viper and a harmless adder are to be found in some regions. Among the birds, which are very numerous, are eagles, vultures, falcons, &c. The rivers and coasts generally abound with fish; fisheries are consequently an important item, and a great source of wealth. Cancale and Marennes furnish excellent oysters. The pilchard fishery, which is conducted mostly on the shores of Brittany, is the most important of all; about 8,000 barrels of salted pilchards are sent into the market annually, and the inhabitants on the coast live in great part on fresh pilchards during the season. The herring fishery, the headquarters of which are at Dieppe, has also some importance, as well as the sole, ray, and mackerel fisheries. The tunny fishery, much less productive, is pursued on the shores of the Mediterranean. The coasting fisheries, which employ 28,000 hands and 7,000 boats, bring about \$3,000,000 a year to the country. Dunkirk, Boulogne, St. Valéry-sur-Somme, Dieppe, Fécamp, and St. Malo send yearly a number of ships which engage in the herring, mackerel, cod, and whale fisheries.—The mineral wealth of France is at once large and diversified, although gold and silver are to be found in but very small quantities. The former appears in some small streams flowing from the Pyrénées; a few mines of the latter are wrought, but with little profit; while the precious metal is extracted in larger quantities from lead and copper ores. Large beds of iron ore are found in nearly all parts of France; they are mostly wrought in the departments of Ardennes, Haut-Rhin, Moselle,

Haute-Marne, Haute-Saône, Isère, Eastern and Lower Pyrénées, Ardèche, Aveyron, &c. They yield annually about 680,000 tons, and give employment to about 15,000 hands. Marble, porphyry, granite, alabaster, and crystals are found in nearly all the mountains; slate in the Ardennes, Maine-et-Loire, and Finistère; building stone of various kinds everywhere. The number of quarries in working order is estimated at 22,000, giving employment to over 80,000 hands. Coal beds of various kinds are also numerous, and within the last 25 years considerable progress has been made in the working of mines. The most productive are to be found in the departments of Nord, Loire, Saône-et-Loire, Aveyron, &c., and their annual yield is about 2,000,000 tons. Salt mines are worked in the departments of Meurthe, Moselle, Haute-Saône, Doubs, Jura, Ariège, and Basses-Pyrénées, while salt marshes exist along nearly the whole of the sea coast. The produce of both amounts to nearly 1,200,000,000 lbs. annually. Lead is extensively scattered through the mountainous districts, especially in Brittany. Copper is abundant in the Pyrénées, Alps, and Vosges. Together with these metals, zinc, cobalt, and manganese are found. Alum is gathered in Haut-Rhin, Aisne, Oise, and Aveyron. The mineral springs, which are about 860 in number, are divided into cold and hot, ferruginous, gaseous, sulphureous, and salt waters; the most renowned are those of Aix, St. Amand, Bagnères, Balaruc, Barèges, Bourbon-Lancy, Bourbonne-les-Bains, Canterets, Eaux-Bonnes, Forges, Mont Doré, Plombières, Vichy, &c.—France is essentially an agricultural country, whether we take into consideration the extent of lands under cultivation or the number of hands employed in it. Out of her whole area, 54 per cent. is given to agriculture. The whole agricultural population, amounting to 20,351,628, as before mentioned, is distributed as follows: proprietary farmers, 7,159,284; tenant farmers, 4,000,348; day laborers, 6,122,747; servants, 2,748,263; woodmen, 320,986. This population works upon a capital which has been assessed at \$8,935,390,000, thus divided: lands and buildings, \$7,877,430,000; implements and furniture of farms and houses, \$631,750,000; cattle, horses, &c., \$426,220,000. The annual gross income of the above capital is estimated at about \$1,700,000,000. This has been increasing at a rapid rate; during the 18th century it scarcely reached \$300,000,000; under Napoleon I. it swelled to about \$600,000,000, and has thus nearly trebled in less than 50 years. This result may be said to have been obtained more through the abundant resources of the country than by improvements in husbandry. It is indeed only within late years that the new methods of culture which have proved so successful in England and elsewhere have been tried in France upon a large scale. The small farmers show unreasonable repugnance to any departure from their traditional system; and many of them still stubbornly adhere to old erroneous

notions, which can only be dispelled in the course of time by the example and success of their more enlightened neighbors. The minute subdivision of landed property, and the small capital which each one has at his disposal, are also hindrances in the way of rapid improvement. —The weights and measures now used in France were introduced soon after the first revolution, and the use of the old is forbidden by law, although the old names are retained, the values which they express being calculated by the new standard. The unit of length is $\frac{1}{10,000,000}$ of a quadrant of the meridian, or distance from the equator to the north pole, and this quadrant, as ascertained by MM. Delambre and Méchain by measuring an arc of the meridian between the parallels of Dunkirk and Barcelona, is equal to 32,808,992 English feet. The unit of length, or *mètre*, is therefore about 39.37070 English inches. From the metre all other measures are derived by a system of decimal multiplication and division, and their names are formed on the simple principle of adding a Greek prefix when the measure is a multiple of the metre, and a Latin prefix when it is a fraction. Thus, a decametre = 10 metres, a hectometre = 100 metres, a kilometre = 1,000 metres, a myriametre = 10,000 metres; and a decimetre = $\frac{1}{10}$ of a metre, a centimetre = $\frac{1}{100}$, a millimetre = $\frac{1}{1,000}$. The unit of square measure is the *are* or square decametre (100 square metres) = 119.6033 square yards, or about $\frac{1}{8}$ of an acre. The unit of solid measure is the *stère*, or cubic metre = 35.3166 cubic feet; that of liquid measure is the *litre* or cubic decimetre = 61.02705 cubic inches, or nearly $\frac{1}{16}$ of an imperial gallon. The unit of weight is the *gramme*, which is the weight of a cubic centimetre of distilled water at its temperature of greatest condensation. It is equal to 15.4325 grains troy, or about $\frac{1}{16}$ of a dram avoirdupois. The compounds of these weights and measures are formed and named on the same principle as those of the metre. The monetary unit is the *franc* (silver), which weighs 76.5 grains, and is worth about 19.2 cts. U. S. currency. Its fractions are the centime = $\frac{1}{100}$ of a franc, and the decime = $\frac{1}{10}$ of a franc.—Manufactures, although like agriculture laboring, as a general rule, under the want of large capital, have been progressing steadfastly; and as respects the extent and value of her products, France ranks as a manufacturing country next to Great Britain. While she can scarcely enter into competition with the latter in the manufacture of cotton goods and several other valuable articles, she excels her and other countries in nearly all those requiring particular taste and elegance. French industry is the ruler and great purveyor of fashion. Her silk goods hold the most prominent place in this respect. The number of silk looms amounts to over 80,000, employing 170,000 workmen, and producing goods worth over \$50,000,000, to which must be added about \$16,000,000 worth of ribbons manufactured at St. Étienne. This place, Lyons, Avignon, Nîmes,

Tours, &c., are the principal seats of this important and truly national manufacture, the excellence of which is sufficiently proved by the fact that $\frac{2}{3}$ of its products are exported. The manufactures of jewelry and bronze goods amount annually to over \$18,000,000; their principal seat is Paris. The capital is also the great centre of the fabrication of surgical and philosophical instruments, books, and what is especially called *l'article-modes*. The publishing business is also carried on with some activity in Lyons, Tours, and several other large cities. Lace, tulle, and embroideries are mostly manufactured in and around Nancy, St. Quentin, and Metz. Iron works, over 800 in number, employing 40,000 workmen, are to be found in various parts of France, and particularly in Nièvre; the product of pig iron has been on the increase, and is now estimated at 600,000 tons, worth about \$20,000,000; that of wrought iron is about 400,000 tons, valued at \$36,000,000. The making of cutlery, which employs 60,000 workmen, is principally carried on at Paris, Langres, Châtellerault, Moulins, and Thiers; hardware is produced at the same places, as well as St. Étienne, Strasbourg, Charleville, &c. There are manufactories of fine porcelain and earthenware at Sèvres, Limoges, Nevers, Monteban, and Sarreguemines, the products of which amount to \$6,000,000 a year; the porcelain of Sèvres is much and justly esteemed. About 10,000 hands are employed at watchmaking in and around Besançon, Montbéliard, Pontarlier, and Versailles. Leather is manufactured to the value of \$36,000,000, of which \$1,400,000 worth is for gloves. The woollen manufacture is of paramount importance; its chief seats are Sedan, Louviers, and Elbeuf, for cloths; Vervins, Rheims, Amiens, Arras, St. Omer, Roubaix, and Tourcoing, for flannels and other coarse stuffs; Paris, Beauvais, and Aubusson, for carpets; the total value of woollen fabrics is estimated at nearly \$90,000,000. The cotton manufacture, employing no fewer than 170,000 workmen, amounts, including all kinds of fabrics, to nearly \$120,000,000 a year. It is mostly carried on in the departments of Haut and Bas Rhin, Nord, Aisne, and Seine-Inférieure. Linens are manufactured principally in the N. provinces. St. Quentin, Valenciennes, and Cambrai produce the best cambrics; Lyons and Alençon, the best muslins. Mirrors of superior quality are manufactured at St. Gobain, St. Quirin, and Cirey; other glass wares of various kinds give employment to 10,000 hands, distributed in 280 establishments, the annual product amounting to nearly \$5,500,000. There are about 800 sugar houses for the manufacture of beet root sugar, giving an annual product of 150,000,000 lbs. Shipbuilding is principally carried on at Cherbourg, Brest, Rochefort, Marseilles, Toulon, and Bordeaux.—The great articles of export consist of silk, woollen, and other manufactured goods, wines and brandies, joiners' and cabinetmakers' wares, leather, bronze, steel, and iron wares, paper, refined sugar, china, earthen and glass wares;

while the imports comprise all sorts of colonial produce, cotton, wool, sugar, coffee, spices, dyestuffs, raw silk, woollen, hemp, flax, coal, copper, cattle, hides, &c. These are mostly brought to Marseilles, Havre, Bordeaux, Nantes, La Rochelle, Dunkirk, Boulogne, St. Malo, Lorient, Bayonne, Cette, &c., which are also the outlets of exportation. The following tables, compiled from recent official publications, show the official and actual values of the commerce of France, distinguished as "general" and "special"—the former term comprehending all the imports and exports, and the latter only the imports for domestic consumption and the exports of French produce and manufactures. The official value is that fixed by law in 1826. The sums are given in millions of francs.

GENERAL COMMERCE.

SPECIAL COMMERCE.

These figures do not include the imports and exports of gold and silver, which were as follows in 1858—the values being expressed in francs:

Precious metals.	Imports.	Exports.
Gold	588,000,000	166,500,000
Silver	160,000,000	175,000,000
Total	688,000,000	242,100,000

The average yearly movement of specie for the 10 years ending with 1858 was as follows:

Precious metals.	Imports.	Exports.
Gold	498,350,000	94,010,000
Silver	178,879,500	214,790,000
Total	617,517,500	308,789,000

ports over exports being 308,787,500 francs. The following tables show the principal articles of special commerce:

IMPORTS.

EXPORTS.

partmental roads are tolerably good, but the communal are indifferent, and too often out of repair, as they are not like the others under the charge of civil engineers appointed by the government. The canals, 79 in number, have an aggregate length of 3,600 miles; among the principal are: the southern canal (*canal du midi*), which runs from Cette to Toulouse, where it joins the Garonne, and thus connects the Mediterranean with the Atlantic; the canal of Burgundy, between the Yonne and the Saône, and the canal of the Rhine and Rhone, connecting these two rivers; the canal of the centre, between the Loire and the Saône; the Loing, Briare, and Orleans canals, opening a communication between the Seine and the Loire; the St. Quentin canal, which is remarkable for its tunnel, and connects the Oise with the Scheldt; the canal of Brittany, the longest of all, running from Nantes to Brest, a distance of 230 miles. The aggregate length of land and water communications in the interior of France is reckoned at 547,500 miles. The railways, highways, and canals are placed under the superintendence of a special department known as the board of engineers of bridges and public ways (*ingénieurs des ponts et chaussées*.) Each department has its chief engineer; and the departments are divided into 16 circuits under the control of division inspectors.—The present government of France, as established by the constitution of Jan. 14, 1852, is virtually an absolute monarchy, the head of which is styled emperor; the crown has been declared hereditary in the male line of the Bonaparte family. The whole of the executive power centres in the hands of the emperor, who employs 10 ministers, placed at the head of the following departments: 1, the state and imperial household; 2, justice; 3, finance; 4, home or the interior; 5, foreign affairs; 6, war; 7, navy; 8, public instruction and worship; 9, agriculture, commerce, and public works; 10, Algeria and the colonies. The last was created June 24, 1858, its duties having been previously performed by the minister of the navy. To these were added from 1851 to 1853 a ministry of police, which has been merged in the home department. The legislative power, which is in fact under the immediate control of the executive, is nominally divided between 3 great bodies politic: 1, the senate, consisting of not over 150 members, appointed for life by the emperor, and of the archbishops, marshals of the empire, and admirals, who are *de facto* entitled to seats; 2, the legislative body, comprising 267 deputies, who are elected for a term of 5 years; 3, the council of state, consisting of 40 councillors, 40 masters of requests, and 40 auditors, all of them appointed and removable at will by the emperor. This council is intrusted with the preparation of the various bills and administrative regulations; the legislative body examines and votes upon such bills as are introduced by the ministers; the senate, the province of which is the preservation of the laws and the consti-

ution, gives its sanction to the measures which have been adopted by the deputies. There are 83 ambassadors or ministers plenipotentiary of France to foreign countries, with an equal number of secretaries of embassy or legation, and 113 consuls, 24 of whom are styled consuls-general. The internal administration of each department is in the hands of a prefect, who is assisted by a council of prefecture, and has under his direction the sub-prefects of the arrondissements; a mayor, aided by a municipal council, is at the head of each commune. Councils of arrondissement and councils of department hold sessions of a few days every year to regulate the assessment of taxes and give expression to the wishes and wants of their respective communities. Such are the administrative arrangements all over the country, with the exception of the department of the Seine and the city of Lyons, which have an organization of their own.—For the administration of justice France has 27 imperial courts established in so many of the principal cities, and holding jurisdiction over from one to 7 departments. They are composed of a president, several vice-presidents, and from 20 to 60 councillors, to whom must be added an attorney or *procureur* general, assisted by advocates general and substitutes. The principal of these courts is that of Paris. Under them, each arrondissement has its court of original or primary jurisdiction (*tribunal civil ou de première instance*); each canton, its tribunal of justice of the peace and its simple police court. At the head of the judiciary establishment stands the court of cassation, which is a superior court of appeal in both civil and criminal cases; its decisions are invested with the highest authority. The crime of high treason falls under the jurisdiction of an exceptional high court of justice. The courts of assize are organized with juries, but take cognizance of criminal cases only. The court of accounts (*cour des comptes*), although not a regular tribunal, may be also mentioned here; it is established to audit and examine all the accounts connected with the public revenue and expenditure. Beside the regular judiciary courts, tribunals of commerce and councils of *prud'hommes*, chiefly composed of commercial men, are established in the principal manufacturing and commercial towns, to decide upon cases connected with trade and manufactures. The penitentiary institutions of France have somewhat improved during the last 20 years, but are still far from being as complete and perfect as they ought to be in a highly civilized community. Beside the *bagnes* of Brest, Rochefort, and Toulon, most of the inmates of which have been lately transported to the penal colonies of Guiana, there are 20 central prisons for convicts of various grades, the principal being at Clairvaux, Gaillon, Melun, Poissy, Mont St. Michel, Clermont, &c. They contain an average of about 17,000 persons. It is estimated that there are annually from 35,000 to 40,000 individuals under confinement or the surveillance of the police.—Reli-

gious toleration is exercised to its full extent, and the law secures equal freedom and protection to every kind of worship. A vast majority of the population belong to the Roman Catholic church. The French government supports not only the pastors of this church, but also those of the Protestant and Jewish communions. France, including its colonies, is divided into 85 Catholic dioceses, 70 of which are bishoprics, and 15 archbishoprics, viz.: Aix, Albi, Auch, Avignon, Besançon, Bordeaux, Bourges, Cambrai, Lyons, Paris, Rheims, Rouen, Sens, Toulouse, and Tours. Only 5 of the bishoprics are out of France proper, viz.: Algiers, La Réunion, Ajaccio, Martinique, and Guadeloupe. Every bishop and archbishop is assisted by vicars-general and a chapter. The dioceses are divided into parishes, which, according to their importance, are intrusted to priests, holding for life, with assistants, or to mere officiating ministers removable at will by the bishops. There are 175 vicars-general, 661 canons, 3,388 curates with 7,190 vicars, and 29,537 officiating ministers. Each diocese has a seminary for the instruction of clergymen; theological colleges or faculties exist at Paris, Aix, Bordeaux, Lyons, Rouen, and Toulouse. The French Protestants mostly belong to the Lutheran and Reformed or Calvinist churches; they number about 4,000,000. The Lutherans, who live principally in the departments of Haut-Rhin, Bas-Rhin, Doubs, and Seine, have 249 pastors, with presbyterial councils and consistories under the superintendence of a directory at Strasbourg, where their chief theological seminary and a faculty are situated. The Calvinists, who mostly inhabit the departments of Seine, Gard, Charente-Inférieure, Ardèche, Drome, Tarn, Tarn-et-Garonne, Lot-et-Garonne, Lozère, and Deux Sèvres, have 507 church pastors, presbyterial councils, 91 consistories, a central council sitting at Paris, and a theological college at Montauban. The Jews, numbering about 100,000, who are found principally in the large towns of the east and south, have synagogues at Paris, Strasbourg, Colmar, Metz, Nancy, Bordeaux, and Marseilles, with a central council in the capital. Their pastors consist of a great rabbi of the central council, 7 great synagogue rabbis, 53 rabbis, and 61 officiating ministers. The clergy of the Catholic church, which, previous to the French revolution, was the holder of fully one third of the landed property, and had a yearly income amounting to very near \$40,000,000, now receive a salary, the aggregate amount of which is scarcely over \$5,000,000. —The government has a direct and supreme control over public instruction, through the instrumentality of that powerful institution known as the university of France, and the combined action of its civil officers in the administration thereof. The minister of public instruction, placed at the head of the whole organization, is assisted by an imperial council and a body of 18 inspectors-general. The country is divided into 16 districts, each with its academy; the seats of these institutions are at Aix, Besançon,

Bordeaux, Caen, Clermont, Dijon, Douay, Grenoble, Lyons, Montpellier, Nancy, Paris, Poitiers, Rennes, Strasbourg, and Toulouse. Each academy is governed by a rector, with an academy inspector for every department. The rector is assisted by an academical council, of which he is the presiding officer; the academy inspector, by a departmental council presided over by the prefect. Three grades of instruction are recognized, superior, secondary, and primary. Superior instruction, embracing the highest branches of human knowledge only, is given by a number of faculties, the professorships of which are intrusted to men of tried capacity and talent. There are 8 faculties of theology (6 Catholic, 2 Protestant), 9 of law, 3 of medicine, 16 of science, and 16 of letters. Secondary instruction, nearly equivalent to the curriculum of American universities, is supplied by secondary schools of medicine and pharmacy, imperial lyceums and communal colleges, under-seminaries, chiefly for theological students, private institutions, and schools. On March 1, 1854, there were 61 lyceums, with 21,076 pupils; 253 communal colleges, with 27,905 pupils; and 1,081 private schools and institutions (825 of them under the direction of laymen, 256 conducted by clergymen), with an aggregate number of 63,657 pupils; the under-seminaries not included. The above two branches of public instruction are under the special control of the rectors and academy inspectors. The third, primary instruction, is especially intrusted to the care of the prefects, aided by special inspectors. For primary instruction there are 460 high schools, and 63,000 primary schools established all over the country. These are supported by the communes; part of their pupils are admitted free of expense; the others pay a trifling annual charge. Asylums for children complete the establishments of primary instruction. Normal schools for the education of primary teachers exist in nearly all the departments, and have worked satisfactorily. A superior normal school, established at Paris, is the seminary from which come the majority of the professors appointed in the imperial lyceums: this institution has been of great service, and many of its alumni have gained a scientific or literary reputation. In connection with this, we must mention the French school at Athens, to which a number of young men from the normal school are sent by the government to perfect their knowledge of the Greek language. Candidates for the Catholic priesthood are educated in high ecclesiastical schools or great seminaries under the exclusive control of the Catholic bishops; ministers are prepared in the Protestant seminaries at Strasbourg and Montauban; rabbis in the central rabbinic school at Metz. These schools are of course out of the pale of the university. So are also the celebrated polytechnic school, where naval, military, and civil engineers, artillery officers, &c., are educated; the military schools of St. Cyr, La Flèche, and Saumur; the practical schools

for artillery and engineering, &c.; all of which are under the supervision of the minister of war. Some other practical schools connected with the navy; civil engineering, the mines, manufactures, forests, &c., are respectively controlled by the ministers to which they more properly belong. The central school of art and manufactures at Paris, a dependency of the ministry of public works, deserves particular notice on account of its general usefulness. Important in a higher sphere are the college of France, where lectures are delivered on the highest topics of science and literature; the museum of natural history, an admirable collection of animal, vegetable, and mineral wealth, connected with the *jardin des plantes*; and the lectures on oriental languages delivered at the imperial library. Above all these learned institutions stand the French academy, the academies of inscriptions, of science, of the fine arts, and of moral and political sciences, which compose the 5 classes of the illustrious institute of France. In 1854, the number of public libraries in the departments amounted to 888, containing 44,070 MSS. and 3,689,369 printed works. This does not include the public libraries of Paris, which are over 87 in number, with 104,000 MSS. and more than 2,500,000 printed volumes. There are in France 1,037 printing offices, publishing 1,115 periodicals. Paris has 91 printing offices and 470 periodicals.—The charitable institutions of France are very numerous. Hospitals and asylums exist in nearly every town of importance. These establishments, some of which hold considerable property, are supported by the state, the department, or the commune. They are 1,388 in number, with an income amounting to over \$10,500,000, and yearly accommodate about 50,000 patients. The largest and wealthiest are at Paris, Lyons, Bordeaux, Rouen, Marseilles, Lille, Nantes, and Strasbourg. There are military and marine hospitals under the control of the secretaries of war and the navy. The former, established in the principal fortified places of the empire, are 42 in number, with 18,000 beds for officers, non-commissioned officers, or privates, under the care of officers and men belonging to the medical staff of the army. The 4 marine hospitals at the great seaports of Cherbourg, Brest, Rochefort, and Toulon, can accommodate about 5,000 patients, and are taken care of by sisters of charity and male overseers. Of several asylums for disabled soldiers and sailors who have served their country for a period of years, the most celebrated is the *hôtel des invalides*, at Paris, having a marshal of France for its governor, and a large staff of officers. It contains nearly 3,000 old soldiers, generously provided for by the government. Among the other institutions are the blind asylum, known as the *Aspice des quinze-vingt*, and the imperial institution for the education of the blind at Paris; the imperial institutions for deaf and dumb there and at Bordeaux; over 40 lunatic asylums, the most important of which

are at Charenton, near Paris; foundling hospitals, &c. Poor-relief boards (*bureaux de bienfaisance*), at least 7,000 in number, give either indoor or outdoor relief to over 700,000 individuals. Various societies for the assistance of prisoners or the sick, and a vast number of philanthropic associations of all kinds, are dispersed throughout the country. There are 46 *monts-de-piété* (pawnbroking establishments), with a capital of nearly \$10,000,000, making yearly loans to the amount of about \$12,000,000. Such loans are gratuitous in 5 of the above establishments; interest in the others varies from 2 to 15 per cent. The first savings bank (*caisse d'épargne*) was established in 1818 at Paris; and on Jan. 1, 1858, there were 411 in all parts of the country. The interest on deposits is 4 per cent.—A double system of taxation exists in France. The direct taxes are those laid on land (*contribution foncière*), on houses (*contribution des portes et fenêtres*), on persons (*contribution personnelle et mobilière*), and on licenses (*impôt des patentes*). The indirect taxes, beside the import and export duties, comprise excise charges upon wines, brandies, salt, gunpowder, tobacco, postage, public stages and coaches, stamped paper, registry of deeds and sales, &c. This complicated system requires an army of public officers and collectors of every rank, private and general receivers, payers, &c. These are under the control of the minister of finance, who is assisted by 54 finance inspectors and the court of accounts. Beside the government taxes, there are numerous local ones, mostly established in the towns of importance to defray local expenditures; they are generally known under the name of *octrois*. The yearly estimate of receipts and expenditures is called the *budget*, which is proposed by the minister of finance and voted upon by the legislative assemblies. We give below a table of the budgets at several periods:

Years.	Receipts, fr.	Expenditures, fr.
1815.....	743,830,200	793,590,859
1818.....	1,118,610,875	1,154,649,320
1824.....	994,971,963	992,563,233
1830.....	1,031,796,054	1,095,142,115
1831.....	1,305,550,970	1,314,610,965
1848.....	1,767,955,690	1,770,990,740
1852.....	1,448,834,652	1,503,898,315
1857.....	1,709,874,512	1,698,904,664
1858.....	1,737,115,171	1,716,969,396
1859.....	1,778,919,114	1,766,060,877

The receipts and expenditures in detail in 1858 were as follows:

	Receipts.	France.
Direct taxes.....	445,534,063	
Registration, stamps, and public lands.....	850,023,396	
Forests and fisheries.....	36,950,500	
Customs and salt duty.....	217,874,000	
Indirect taxes.....	424,016,000	
Post office.....	54,559,000	
Miscellaneous.....	205,017,926	
Extraordinary sources.....	1,129,236	
Total.....	1,737,115,171	
	EXPENDITURES.	
Public debt.....	522,831,126	
Dotations (including the civil list of the emperor, 25,000,000 fr.).....	39,490,316	
Ministry of state.....	2,127,000	
“ of justice.....	27,361,370	
Carried over.....	596,809,812	

The French war department is admirably complete in all its appointments. The principal military schools have been previously alluded to.—The French navy is perhaps the branch of public service that has increased and improved the most since the establishment of the empire. The vessels afloat in 1848 were as follows: 21 ships of the line, 32 frigates, 37 war corvettes, 47 brigs, 90 sailing vessels of smaller size, and 76 steam vessels; in all, 291 vessels afloat, beside 23 steam and 48 sailing vessels; total, 362 vessels. In March, 1855, the total had been increased to 420, distributed as follows: 56 ships of the line, 80 frigates, 58 corvettes, 37 brigs, 6 sailing gun brigs, 33 light sailing vessels, 26 transport ships, 78 steam advice boats, 20 steam gun boats, 5 sailing bomb vessels, 5 floating batteries, 8 sailing gun boats, 18 sail and steam transports. Of these, 212 were sailing vessels, of which 181 were afloat and 31 building; and 208 steam vessels, 157 afloat and 51 building. In 1858 there were afloat or building 252 sailing vessels with 8,106 guns, and 209 steam vessels with 4,414 guns, making a total of 461 vessels, carrying 12,520 guns and 56,616 seamen and marines. The total number of seamen exceeds 62,000; there are beside 4 regiments of marines, 14,761 strong, and 8 regiments of artillery, 8,514 strong. The naval staff, previous to the war, consisted of 2 admirals, 18 vice-admirals, 23 rear-admirals, 114 ship captains, 341 frigate captains, 678 lieutenants, 552 sub-lieutenants or midshipmen (*enseignes*), and 230 cadets (*aspirants*). There are boards of marine engineers, of hydrographical engineers, of inspectors, &c. Naval schools, and several schools of application, for the education or scientific improvement of the officers and even the seamen, are connected with the navy department. A board of admiralty, another superintending the naval works, and a third attending to the improvement of instruction among the sailors, act as advisors to the secretary of the navy. The maritime territory of France is divided into 5 districts or prefectures, subdivided into arrondissements and quarters. The naval prefects reside at Cherbourg, Brest, Lorient, Rochefort, and Toulon, and under them officers, called heads of service, commissaries, and under commissaries, are placed in the several subdivisions. —France could once boast of the extent of her colonial possessions in America, and also for a while in Asia. She has lost the greater part of them, and possesses now only the following: 1, in Africa, Algeria on the N. coast, several islands, seaports, and military posts on the banks of the river Senegal, the island of Goree on the coast of Senegambia, S. of Cape Verd, and some trading posts along the coast of Guinea, and La Réunion, formerly Bourbon island, S. E. of that continent, in the Indian ocean; 2, in Asia, the districts of Pondicherry, Karical, Ohandernagore, Yanaon, and Mahé in Hindostan; 3, near the coast of North America, the islands of St. Pierre and Miquelon; 4, in the Caribbean sea, Martinique, Guadeloupe,

Marie-Galante, Les Saintes, Desirade, and one half of St. Martin island; 5, in South America, Guiana; and 6, in the Pacific ocean, the Marquesas islands, or Mendana archipelago, and New Caledonia. Tahiti and Gambier islands are under the protectorate of France. The population of Algeria is estimated (1856) at about 2,600,000, natives and Europeans; the latter do not exceed 160,000, of whom, according to the last census, 107,407 are French. The population of the other colonies scarcely reaches 600,000, a little over $\frac{1}{10}$ of whom are Europeans.—France, which comprises the largest part of the country formerly known as Gallia Transalpina, owes its name to the Franks, one of those associations of German tribes that invaded and dismembered the Roman empire during the 5th century. These warriors were above all noted for their fiery spirit and rashness. Crossing the lower Rhine, they settled in the northern part of Belgium under various chiefs, and successful conquest brought them gradually to the banks of the Somme. Meanwhile other hordes of barbarians had taken possession of several other provinces of Gaul; the Burgundians had peacefully shared the eastern part of this country with the Gallo-Romans, while the Visigoths, already masters of nearly the whole of the Spanish peninsula, extended their military rule over the population of Aquitania. The cities of Armorica had formed themselves into a confederation, and the central part of Gaul from the Somme to the Loire was alone held by the Romans. Such was the condition of the country in 481, when a young man of 15 was proclaimed king by the Frankish tribe living in and around the city of Tournay. This was Khlodwig or Clovis, the founder of the Frankish dominion in Gaul, and of the Merovingian dynasty, as it was called from his grandfather Meroveus. In 486 he invaded the Roman province, conquered the governor, Syagrius, at Soissons, and thus secured to himself the possession of the whole country to the Loire. Ten years later, after forcing back to Germany some rival tribes which had crossed the Rhine in the hope of dividing the spoils with the Franks, Clovis, yielding to his wife's entreaties, consented to be baptized, and henceforth all the Catholic bishops of Gaul were enlisted in his cause. Their powerful influence helped him greatly in consolidating his authority among the Gallic population, and carrying his conquests southward. A single victory won (507) at Vouillé over the Visigoths, who were Arians, gave him the possession of nearly all Aquitania. On his death in 511, his kingdom extended from the banks of the Rhine to the Pyrénées, thus including the whole of Gaul, with the exception of the province occupied by the Burgundians, the Mediterranean shore, which had been retained by the Visigoths through the aid of Theodoric, king of the Ostrogoths, and the peninsula of Brittany. This kingdom, although partitioned among the 4 sons of Clovis, was soon increased by the conquest of Burgun-

Repayments.....	109,582,063
Extraordinary expenses.....	19,562,000
Total.....	1,716,939,396

The principal items of expenditure in the budget for 1859 are: ministry of state and imperial household, 12,729,400 fr. ; justice, 28,398,270 ; foreign affairs, 10,470,600 ; interior, 150,623,818 ; finances, 903,694,229 (including 530,478,698 interest on the public debt) ; war, 854,042,020 ; navy, 123,985,536 ; Algeria, 16,563,002 ; public instruction and worship, 68,040,936 ; agriculture, commerce, and public works, 98,159,466. The public debt, Jan. 1, 1856 and 1857, stood as follows :

Description.	1854.	1857.
Floating debt:		
Bearing interest.....	651,764,100 fr.	773,521,900 fr.
Not bearing interest.....	76,835,200	79,415,200
Consolidated debt.....	7,558,040,822	8,081,992,466
Total	8,236,143,122 fr.	8,884,929,566 fr.

During the 15 years of the restoration (1815-'30) the national debt was more than trebled; under Louis Philippe (1830-'48) it increased but one fourth; while within the last 10 years it has nearly doubled. From 1851 to 1858 the increase was at the rate of 439,949,200 francs a year, and from 1814 to 1859, a period of 45 years, of which only 3 have been years of war, the public debt of France has been in the aggregate increased from \$240,000,000 to \$1,700,000,000, and the annual charges thereon to be provided for by taxes from \$12,000,000 to \$100,000,000.—The military establishment of France is not only formidable in extent, but placed upon such a systematic basis of administration as to secure its full efficiency. The control of the whole belongs to the minister of war, who is assisted by several boards or consultative committees of general officers, severally attending to business connected with the general staff, infantry, cavalry, artillery, fortifications, &c. The army, previous to the war in Italy (1859), consisted of the following troops: infantry—100 regiments of the line, 20 battalions of chasseurs de Vincennes, and 9 companies of veterans; cavalry—2 regiments of carabineers and 10 regiments of cuirassiers, forming the reserve; 12 regiments of dragoons and 8 of lancers, being the cavalry of the line; 12 of chasseurs and 8 of hussars or light cavalry, and 10 supplementary companies; artillery—17 regiments, heavy and light, with 4 companies of veterans and 14 companies of workmen; engineers—3 regiments, 2 companies of workmen, and 1 company of veterans. The above does not include the imperial guard nor the troops especially belonging to the African service. The former, a select body of tried soldiers, comprises: infantry—3 regiments

of grenadiers, 4 of voltigeurs, 1 of Zouaves, 1 of chasseurs, 1 of gendarmerie; cavalry—2 regiments of cuirassiers, 1 of dragoons, 1 of chasseurs, 1 of guides, 1 squadron of mounted gendarmerie; artillery—1 mounted regiment, 1 on foot (with 1 squadron of workmen), and 1 division of the corps of engineers. The African troops consist of 3 regiments of Zouaves, 3 battalions of light African infantry, 1 foreign legion of 2 regiments, 3 regiments of Algerian sharpshooters, 12 discipline companies, 3 regiments of mounted African chasseurs, and 3 of mounted Spahis. A body of troops, called the imperial gendarmerie, forms an armed police force, whose functions are to preserve order at home. The aggregate of the above troops in 1858 amounted to 409,062 men, distributed as follows: infantry, 247,641; cavalry, 65,407; artillery, 34,262; others, 61,752. The general staff comprised 10 marshals of France, 78 generals of divisions, 154 brigadier-generals, beside 79 generals of division and 170 brigadier-generals belonging to the reserve. The above figures have been of course altered by the state of war. During the Crimean war, there were in active service 581,000 men and 113,000 horses. The army is recruited by an annual contingent of about 80,000 men, either volunteers or conscripts, above 20 years of age. The conscripts are chosen by ballot for a term of 7 years. There are several causes of exemption, either natural or legal, and any conscript has it in his power, by paying a fixed sum, to put a substitute in his place. France is divided into 21 military divisions, governed by generals of division, and the most important by marshals, and 87 subdivisions under brigadier-generals. The headquarters of the divisions are in the following towns and cities: Paris, Rouen, Lille, Châlons-sur-Marne, Metz, Strasbourg, Besançon, Lyons, Marseilles, Montpellier, Perpignan, Toulouse, Bayonne, Bordeaux, Nantes, Rennes, Bastia, Tours, Bourges, Clermont, and Limoges. The country is protected by 185 fortresses or strongholds, the most important being the following: 1, along the N. frontier, Lille, Douay, Condé, Valenciennes, Mauberge, Givet, Mézières, Sedan, Longwy, Thionville, Metz, and Hagenau; 2, along the E. frontier, Strasbourg, Belfort, Besançon, Fort de Joux, Lyons, Grenoble, Briançon; 3, along the Mediterranean coast, Antibes, Toulon, Marseilles, Cette, Fort St. Elme, Port Vendres; 4, along the Pyrénées, Bellegarde, Mont Louis, Perpignan, Bayonne; 5, along the western and northern coast, the islands of Oléron, Ré, Noirmoutiers, Belle-Ile and Groix, Rochefort, La Rochelle, Lorient, Brest, St. Malo, Mont St. Michel, Cherbourg, Havre, Boulogne, Calais, and Dunkirk. The government has 3 cannon foundries, at Douay, Strasbourg, and Toulouse; and factories of gunpowder, muskets, cannon balls, &c. Its military arsenals and warehouses can place at any moment at the disposal of the army about 12,000 guns and howitzers of various sizes, with immense stores of munitions of war of every kind.

(577) not only sanctioned their pretensions, but extended the principle of inheritance to all the ~~feud~~. Such was the foundation of the feudal system, the origin of which may be said to coincide with the beginning of France proper. The name France indeed appears in history about the 9th century, and applies to the country W. of the Scheldt, the Meuse, the Saône, and the Cévennes; and henceforth we distinctly see a French nation forming by the fusion of the Frankish with the Gallo-Roman element, and a new language, a mixture of the German and the Latin, springs up at the same time. The Carolingian family, being essentially Germanic, could scarcely preserve the affections of this new people; the imbecility of most of its later members moreover brought them into contempt. They were soon opposed by national princes who had courage and talent; and after a struggle which went on during the latter part of the 9th and nearly the whole of the 10th century, they were finally deprived of their hereditary throne, and another dynasty was inaugurated (987). Previous to this a new race, the Normans, had established themselves in the N. W. of France. They had carried on a system of piracy along the coast as early as the reign of Charlemagne, and since then they had pushed their incursions into the very heart of the country; most of the principal cities were laid waste; and the terror-stricken people, unable to resist such formidable assailants, bribed them to depart. But such a measure only insured their return; and at last the imbecile Charles the Simple thought the best way to stop the invasions was to give the invaders possession of part of the country; the beautiful lands situated W. of the lower Seine were ceded in 912 to Rollo, the chief of a large horde of these Northmen, and Normandy soon became one of the most flourishing and best regulated provinces in France. Its dukes held the first rank among the feudal princes, when Hugues or Hugh Capet, the duke of France, on the death of Louis V., assumed the title of king (987). The beginning of the new dynasty to which this prince gave his name was humble. Hugh was indeed in point of territory the most powerful of the feudal lords; but he had the prestige of neither past glory nor genius. His immediate successors were even less distinguished than himself; they took no part in the great events by which the 11th century was marked. While southern Italy was conquered by Norman adventurers, while William of Normandy was giving a new rule to England, while all the Christian princes eagerly engaged in the crusades, the Capetians quietly stayed at home; and by this very inactivity, without any particular display of policy, they upheld their royal supremacy, which during the 12th and 13th centuries was established on a solid foundation by kings of uncommon ability. Louis VI. (1108-1137), a king of unsurpassed activity and bravery, forced a great many of the nobles into submission, and to this end more than once availed himself of the support he

found among either the clergy or the people of cities. The latter, whose material and moral condition had greatly improved during the previous century, were then vindicating their municipal liberties, and willingly entered into an alliance with the king against their feudal masters. Philip Augustus (1180-1228), the most sagacious prince of his time, nearly doubled the royal domains. Beside Normandy, Touraine, Anjou, Maine, and a large part of Poitou, which he seized upon by force, after confiscation had been adjudged by parliament against King John of England, he acquired by various means the counties of Artois, Vermandois, Valois, Auvergne, &c., making his royal power felt at the same time from the Pyrénées to the Rhine, and from the Mediterranean to the English channel. Vainly did the count of Flanders ally himself with the English king and Otho IV. of Germany. Philip gained over his combined enemies a brilliant victory at Bovines in 1214; and thenceforth the royal power was paramount over the country. France was thus enabled to play a conspicuous part in European affairs; and the rank to which Philip's able policy raised her was fully maintained by the wisdom of his grandson, Louis IX. (1226-1270), who proved himself at once a saint and a hero. The traditional policy was followed under his reign; well devised treaties and fortunate marriages were concluded, which secured the ultimate possession of Languedoc and Provence, while the commons, or the third estate, as it was then called, was placed under the more immediate control of the king. The introduction of the Roman law and the regular constitution of the parliament, forming a high court of justice which was to supersede gradually all feudal jurisdictions, were mighty additions to the efficiency of the royal power; while the king's personal kindness and virtue, the wisdom of his administration, the removal of many grievances under which the people complained, and the severity with which oppressions by the nobles were punished, conciliated the respect and affection of the nation. The popularity thus secured for the royal title was so strong as to be scarcely impaired by the unworthiness of Louis's successors, who completed the monarchical system that was to prevail for several centuries. More than ever they leaned upon the third estate in order to counterbalance the ascendancy of the two privileged orders. Men of low birth had already been introduced into the parliament; under Philip IV. their influence increased, and representatives of the third estate were admitted to the general assemblies of the nation, which before had consisted only of deputies from the clergy and the nobility. Through these new members the king was nearly certain to gain his end in all important circumstances. It was by their agency that he succeeded in 1302 in triumphing over the pretensions of Pope Boniface VIII. Neither were they inactive when this same king induced Pope Clement V. to suppress the knights templars, seized upon their immense wealth,

and brought their grand master to the scaffold. The Capetian kings, whatever may have been their faults and personal shortcomings, succeeded in giving so powerful an organization to the kingdom as to enable it to stand the brunt of the foreign and civil wars which were to threaten its existence under the younger branch of Valois (1328-1589). The rivalry between France and England, consequent upon the accession of Duke William of Normandy to the throne of the latter, had already been the cause of occasional hostilities between the two nations; it came to a decisive crisis during the first half of the 14th century. On the direct branch of the Capetians becoming extinct, Edward III., by virtue of hereditary right derived from his mother's side, claimed not only such provinces on the continent as had been taken from his ancestors, but the whole kingdom of France; thus beginning that protracted conflict which French historians call the "hundred years' war" (1337-1453). Twice France was on the eve of becoming a dependency of the English crown. In 1340 an English fleet destroyed the naval force of France at Sluis, on the coast of Flanders; in 1346, at Crécy, the English archers won an unexpected victory over the flower of French chivalry; and 10 years later, at Poitiers, the Black Prince not only conquered King John, but made him prisoner. The states-general were also the scene of a deadly struggle between the regent and the third estate, so that royalty itself was put in jeopardy; companies of adventurers and mercenary troops ransacked the provinces; the peasantry of several districts, driven to despair by the oppression of their lords, broke out into a fearful insurrection, which was named the *Jacquerie*, and marked by all the horrors of a servile war. Charles V., by his vigorous policy, succeeded in quelling internal disorders; and with the help of his great constable, Du Guesclin, he regained in a few campaigns all the English acquisitions in France, with the exception of a few important seaports. When both died, in 1380, the kingdom was in a fair way to regain its former prosperity. But the minority of Charles VI., and his subsequent derangement, again plunged France into a series of calamities. The conflict between the various classes of society was renewed with increased fury; rival factions, headed by princes of the royal family, Orleans and Burgundy, waged against each other a war of treason and assassination; while the English, encouraged by the forlorn condition of their enemy, again invaded France. For the 3d time, the French chivalry was decimated on the memorable field of Agincourt (1415). John the Fearless being treacherously murdered by the Orleanists or Armagnacs, in an interview which was intended to bring about peace, Burgundy, that is, the N. E. part of France, threw itself into the arms of the English. An insane king, a queen of foreign origin impelled by her unnatural hatred to her son the dauphin, and a prince carried away by his thirst for vengeance, concluded the famous treaty of Troyes,

1420, by which the royal inheritance of France was delivered up to her deadly enemy. Henry V., on marrying the princess Catharine, was appointed heir to Charles VI., and meanwhile was to assume the power of regent. France seemed now to be irretrievably lost; all her organized powers, royalty, clergy, nobility, and burgesses, were prostrated, when a simple country girl appeared and overthrew the power of England. Carried away by patriotic or, as was supposed, by a supernatural inspiration, Joan of Arc was the very impersonation of the national feeling; the English were defeated, and the disinherited son of Charles VI. was triumphantly conducted to Rheims to receive there the royal unction (1429). Brought to a premature end by treason and cruelty, the Maid of Orleans could not complete the deliverance of her country, but she had given the signal; the nation, aroused by her example, fought its own battles, and after 20 years of repeated efforts, drove the foreign invaders away (1453). Calais, the only place now left in the hands of the English, was to be retaken 105 years later. After these long trials, France was at last enabled to exercise her recuperative powers; her population increased at a rapid rate, industry and art flourished, and the last vestiges of the past calamities disappeared. Meanwhile her kings had returned to their traditional policy of enlarging the royal domains and consolidating the royal power by the destruction of the feudal aristocracy. To this task none applied himself with greater zeal than the crafty and tyrannical Louis XI. (1461-1483). Numberless nobles of every rank were delivered to the executioner; the most powerful of all, Charles the Bold, duke of Burgundy, was led to his ruin and death in 1477 by the intrigues of Louis, who at once seized upon part of the large inheritance left by that formidable vassal, and the duchy of Burgundy was thus annexed to the crown. The fine provinces of Anjou, Maine, and Provence, beside claims upon the kingdom of Naples, were bequeathed to Louis by the last prince of the house of Anjou; the king of Aragon resigned to him the counties of Roussillon and Cerdagne; and France, reaching thus her natural frontiers toward the S. and the S.E., became one of the great powers on the Mediterranean. On the N. W., by the marriage of Charles VIII. with Anne of Brittany, she gained possession of that large province, which had hitherto been nearly independent. With a well organized army and a full treasury, she was now ready for foreign contests. Under Charles VIII., a weak-minded prince who dreamed of following in the footsteps of Alexander the Great and Charlemagne, a French force invaded Italy in 1494, and conquered the kingdom of Naples without opposition; but this conquest was lost still quicker than it had been gained. Such was the commencement of those Italian wars in which the impudence of the French shone no less conspicuously than their prowess, and in which the brightest victories were always followed by irretrievable disasters. Italy was justly termed the grave of

the French. Louis XII. tried all the arts of diplomacy to secure his conquests, but he was no match for the Italian politicians of the 16th century, and still less for the crafty Ferdinand of Aragon. By the latter he was expelled for ever from Naples, of which he had partly taken possession, while Pope Julius II., the republic of Venice, and the princes of Italy, availing themselves of Spanish, German, and even English alliances, forced him out of the duchy of Milan, which he claimed in right of his grandmother, Valentina Visconti, and which he had twice conquered. Francis I., in his turn, appeared in Italy as a conqueror, and his first victory at Marignano or Melegnano (1515) seemed to forebode permanent conquest; but the king of France was opposed by the emperor Charles V., and after his disastrous defeat at Pavia in 1525, he was carried a prisoner to Madrid. Not daunted by the captivity of the king, France kept up the contest against the immense forces which Germany, the Netherlands, Spain, and Italy placed at the disposal of their imperial master. Francis I., after his liberation, and his son Henry II., were conscious of the importance for their own country, as well as for Europe, of checking the ascendancy which the house of Austria aimed at; for more than 30 years France waged war not only for her own independence, but for that of Europe also; more than once her own borders were invaded; but she finally came out of the struggle with honor, and not without profit. She was indeed obliged to give up all her claims to possessions in Italy; but, by the treaty of Cateau Cambrésis (1559), she added to her provinces the bishoprics of Metz, Toul, and Verdun, which she had just conquered; while by her alliance with the Protestants of Germany on the one side, and with the Turks on the other, she succeeded in defeating the ambitious designs of the Austrian monarchs. During this period, her social organization had been improved; science and literature had been cultivated under the fostering care of the king, the princes, and the wealthy; poets and prose writers had appeared who had given comparative perfection to the French language; painting, sculpture, and architecture had been successfully cultivated; and with all its drawbacks, the first half of the 16th century may be accounted one of the brightest periods in her history. The latter part of this century unfortunately was darkened by the horrors of religious civil wars. The reformation had been hailed with joy by many minds in France, and its doctrines were rapidly propagated by Calvin and his followers. Mostly circulated at first among the nobility, they gained ground all over the country, although it may be remarked that the great mass of the nation remained faithful in their allegiance to the Roman Catholic church. Francis I. and Henry II. attempted to check the progress of the new principles; they even resorted to persecution, but this only gave a new impetus to the religious movement. Their

numbers increasing daily, the Protestants planned a powerful organization not only to preserve their liberty of conscience, but also to gain, if possible, political influence. They formed, as it were, a kind of commonwealth within the state. This could not but inspire the rulers of an absolute government with uneasiness and fear; and although prudent advisers tried at first to bring about a reconciliation, such a policy could not be permanently adopted, and the king was soon found entirely on the side of the Catholics. Both parties meanwhile had their chosen chiefs, and both were ready for the contest. This commenced in fact as early as 1560, during the short reign of Francis II., and lasted with more or less violence till 1598. No fewer than 8 civil wars were waged during the reigns of Charles IX. and Henry III., a period of scarcely 28 years. The Protestants held their ground with tenacity; the most illustrious among their chiefs, Admiral Gaspard de Coligni, accomplished wonders; but, thoroughly honest and too ready to confide in the honesty of others, he permitted himself to be deceived by the fair promises of Charles IX., and with thousands of his companions was treacherously murdered on St. Bartholomew's night, 1572. This fearful massacre did not however annihilate the Protestants, who continued the struggle against the holy league or Catholic union, which had been organized for the better protection of the Catholic church in France, and which was upheld by the pope as well as Philip II. of Spain. The head of the league, Duke Henry of Guise, secretly aimed at the crown, and his popularity seemed to warrant his success, when Henry III. during the session of the states-general at Blois, in 1588, had him despatched by his body guards, known as the "forty-five." A few months later, in 1589, the king himself fell by the dagger of the fanatic Jacques Clément, leaving his crown to Henry of Navarre, the head of the family of Bourbon, and the leader of the Protestants. The struggle henceforth took essentially a political turn; and Henry, joined by but a few of the Catholics who had served his predecessor, and much reduced in circumstances, had great difficulty in making good his claims to the crown. His personal bravery and ability, and the sympathetic gayety of his character, finally conciliated many of the Catholic royalists, but he could hope to be recognized as king by the majority of the nation only on his conversion to Catholicism. To this he assented, June 25, 1593; and now his whole attention was given to the pacification of his kingdom. This he effected by concluding with Spain the treaty of Vervins, May 2, 1598, upon the conditions of the old treaty of Cateau Cambrésis, and by publishing the celebrated edict of Nantes, which granted to the Protestants full religious liberty, admission to all offices, and several places of security, among others the strong city of La Rochelle. Henry now devoted himself entirely to the work of healing the wounds which had been inflicted on the country during nearly 40 years

and brought their grand master to the scaffold. The Capetian kings, whatever may have been their faults and personal shortcomings, succeeded in giving so powerful an organization to the kingdom as to enable it to stand the brunt of the foreign and civil wars which were to threaten its existence under the younger branch of Valois (1328-1589). The rivalry between France and England, consequent upon the accession of Duke William of Normandy to the throne of the latter, had already been the cause of occasional hostilities between the two nations; it came to a decisive crisis during the first half of the 14th century. On the direct branch of the Capetians becoming extinct, Edward III., by virtue of hereditary right derived from his mother's side, claimed not only such provinces on the continent as had been taken from his ancestors, but the whole kingdom of France; thus beginning that protracted conflict which French historians call the "hundred years' war" (1337-1453). Twice France was on the eve of becoming a dependency of the English crown. In 1340 an English fleet destroyed the naval force of France at Sluis, on the coast of Flanders; in 1346, at Crécy, the English archers won an unexpected victory over the flower of French chivalry; and 10 years later, at Poitiers, the Black Prince not only conquered King John, but made him prisoner. The states-general were also the scene of a deadly struggle between the regent and the third estate, so that royalty itself was put in jeopardy; companies of adventurers and mercenary troops ransacked the provinces; the peasantry of several districts, driven to despair by the oppression of their lords, broke out into a fearful insurrection, which was named the *Jacquerie*, and marked by all the horrors of a servile war. Charles V., by his vigorous policy, succeeded in quelling internal disorders; and with the help of his great constable, Du Guesclin, he regained in a few campaigns all the English acquisitions in France, with the exception of a few important seaports. When both died, in 1380, the kingdom was in a fair way to regain its former prosperity. But the minority of Charles VI., and his subsequent derangement, again plunged France into a series of calamities. The conflict between the various classes of society was renewed with increased fury; rival factions, headed by princes of the royal family, Orleans and Burgundy, waged against each other a war of treason and assassination; while the English, encouraged by the forlorn condition of their enemy, again invaded France. For the 3d time, the French chivalry was decimated on the memorable field of Agincourt (1415). John the Fearless being treacherously murdered by the Orleanists or Armagnacs, in an interview which was intended to bring about peace, Burgundy, that is, the N. E. part of France, threw itself into the arms of the English. An insane king, a queen of foreign origin impelled by her unnatural hatred to her son the dauphin, and a prince carried away by his thirst for vengeance, concluded the famous treaty of Troyes,

1420, by which the royal inheritance of France was delivered up to her deadly enemy. Henry V., on marrying the princess Catharine, was appointed heir to Charles VI., and meanwhile was to assume the power of regent. France seemed now to be irretrievably lost; all her organized powers, royalty, clergy, nobility, and burgesses, were prostrated, when a simple country girl appeared and overthrew the power of England. Carried away by patriotic, or, as was supposed, by a supernatural inspiration, Joan of Arc was the very impersonation of the national feeling; the English were defeated, and the disinherited son of Charles VI. was triumphantly conducted to Rheims to receive there the royal unction (1429). Brought to a premature end by treason and cruelty, the Maid of Orleans could not complete the deliverance of her country, but she had given the signal; the nation, aroused by her example, fought its own battles, and after 20 years of repeated efforts, drove the foreign invaders away (1453). Calais, the only place now left in the hands of the English, was to be retaken 105 years later. After these long trials, France was at last enabled to exercise her recuperative powers; her population increased at a rapid rate, industry and art flourished, and the last vestiges of the past calamities disappeared. Meanwhile her kings had returned to their traditional policy of enlarging the royal domains and consolidating the royal power by the destruction of the feudal aristocracy. To this task none applied himself with greater zeal than the crafty and tyrannical Louis XI. (1461-1483). Numberless nobles of every rank were delivered to the executioner; the most powerful of all, Charles the Bold, duke of Burgundy, was led to his ruin and death in 1477 by the intrigues of Louis, who at once seized upon part of the large inheritance left by that formidable vassal, and the duchy of Burgundy was thus annexed to the crown. The fine provinces of Anjou, Maine, and Provence, beside claims upon the kingdom of Naples, were bequeathed to Louis by the last prince of the house of Anjou; the king of Aragon resigned to him the counties of Roussillon and Cerdagne; and France, reaching thus her natural frontiers toward the S. and the S.E., became one of the great powers on the Mediterranean. On the N. W., by the marriage of Charles VIII. with Anne of Brittany, she gained possession of that large province, which had hitherto been nearly independent. With a well organized army and a full treasury, she was now ready for foreign contests. Under Charles VIII., a weak-minded prince who dreamed of following in the footsteps of Alexander the Great and Charlemagne, a French force invaded Italy in 1494, and conquered the kingdom of Naples without opposition; but this conquest was lost still quicker than it had been gained. Such was the commencement of those Italian wars in which the imprudence of the French shone no less conspicuously than their prowess, and in which the brightest victories were always followed by irretrievable disasters. Italy was justly termed the grave of

sion, was brought about by mere family ambition. A more formidable coalition opposed the ambitious schemes of the old king, who aimed at nothing less than placing his grandson upon the Spanish throne, vacant by the death of Charles II.; the two greatest generals of their time, Marlborough and Prince Eugene, were at the head of the allied armies; defeat after defeat befell the French forces, and the kingdom seemed reduced to extremities; but the constancy of the king did not fail him during a contest of 12 years' duration; he succeeded in his bold undertaking, and by the treaties of Utrecht and Rastadt (1713-'14) the house of Bourbon inherited the best part of the once magnificent Castilian monarchy. The burden which he bore to his last moments was far too heavy for his weak successors; he had moreover taxed the energies of France and stretched the royal power to such an extent that a reaction was unavoidable. The 18th century was an age of depression, decay, and ruin for all the institutions, doctrines, and classes that had hitherto commanded respect. Royalty lost its prestige, both through the unbounded licentiousness of the regent duke of Orleans, and the king himself, and through the irretrievable corruption or imbecility of its ministers; nobility became degraded; the great constituted bodies fell into general contempt; and an uncontrollable spirit of censure and raillery hastened the work of destruction. Even the remedies that were tried only added to the universal confusion. Politically the French government, controlled in turns by unscrupulous princes, by Cardinal Fleury, who, how good soever his internal administration, failed to support the national dignity abroad, and by the king's mistresses, gradually sank in the eyes of Europe; and toward the end of Louis XV.'s reign, it could scarcely be ranked among the great European powers. The 4 wars in which France then participated, against Spain (1717-'19), for the succession of Poland (1733-'35), for the succession of Austria (1740-'48), and finally the 7 years' war (1756-'63), were productive only of disgrace and disaster. This dark picture is somewhat relieved by occasional successes and individual deeds of gallantry; such was especially the case in the 8d war above mentioned, when Maurice of Saxony won glorious victories for the country of his adoption, and vindicated her claim to be still one of the great military powers of Europe; but the 7 years' war placed in a shameful light the incompetence of the French generals, the unparalleled want of discipline among their soldiers, and, notwithstanding a few happy exceptions, the lowering of the general military character of the nation. The navy was not only demoralized, but it was utterly ruined; the French colonies in Asia and America were lost, and the French flag almost disappeared from the seas. At home, however, literature and philosophy were cultivated with extraordinary ardor, and with the glory of these pur-

suits the nation seemed aiming to cover the disgrace which had befallen her arms. One consequence of the spread of philosophical teachings was an earnest and general desire for reform, which showed itself in different ways as soon as Louis XVI. had ascended the throne (1774). The king himself and some of his counsellors were willing to place themselves at the head of this reform movement; but the well-meaning monarch was too deficient in energy, and the opposition around him was too strong, to admit of the success of such an undertaking. The privileged orders carried their hostility so far, that the people took the reforms into their own hands; and a revolution was the result. This very revolution was partly prepared by the help which Louis XVI. extended to the English colonies in America; the sympathy which nearly all classes felt for their liberty, the principles which their example diffused among the thoughtful, the enthusiasm excited by their ultimate triumph, encouraged the French nation to attempt its own liberty. The states-general met on May 5, 1789; the third estate, by dint of prudence, energy, and perseverance, secured its ascendancy over the nobility and the clergy, and swore not to separate until they had given a constitution to their country, and thus originated a movement that soon became uncontrollable, but which, though it occasioned many grievances and sufferings, was finally productive of much good. The constituent assembly, the first of the great assemblies which guided the French revolution, labored for about 2½ years, from May 5, 1789, to Sept. 30, 1791, to establish the principles which still form the basis of the French law and constitution—civil and religious liberty, equality of rights, and popular sovereignty. It overthrew feudal and hierarchical privileges, provincial divisions and customs, gave to the country a regular administration, and tried to establish a kind of constitutional monarchy. The legislative assembly, which succeeded, had but a short existence, from Oct. 1, 1791, to Sept. 21, 1792; ill satisfied with the new form of government, it did not uphold it, and paved the way for the republican government. This was at once proclaimed by the third popular assembly, the national convention, on its first meeting, Sept. 21; and then the fearful trials, butcheries, and gigantic struggles of the French revolution commenced. Organizing at once a government of absolute powers, the convention sentenced Louis XVI. to death as a declaration of war against all the kings of Europe, and summoned all nations to independence, extending to them the helping hand of France. Thenceforth the country had to struggle against nearly all the European powers; the tremendous impulse it gave to the whole people carried her through all foreign dangers; and when the convention adjourned, Oct. 26, 1795, after a session of more than 87 months, the republic was everywhere triumphant. The internal struggles between the republican and the reactionary parties

that marked the existence of the directorial government, from Oct. 27, 1795, to Nov. 9, 1799, are merged in the military glory of Bonaparte, whose campaigns in Italy (1796-'7) and expedition to Egypt (1798-'9) pointed him out as the future master of the nation. When, on his return from the East, the young general drove the legislative council from their chamber and formed a new constitution, his course was unanimously approved, and the history of France became for 15 years the history of a single man. Chosen first consul for 10 years, Dec. 18, 1799, he broke up the coalition which had been formed against France, by his victory at Marengo, June 14, 1800; forced Austria to conclude the peace of Luneville in 1801, and England that of Amiens in 1802; and by a concordat with the pope reestablished Christian worship in France. Consul for life, Aug. 3, 1802, then hereditary emperor, May 18, 1804, he proved himself a great legislator at home by the formation of the civil code, the organization of public instruction, and the improvements he introduced in all the branches of public service; while he added to his military and political glory by his triumphs at Austerlitz, Jena, Auerstadt, Eylau, Friedland, Eckmühl, and Wagram, and by the treaties of peace which he signed at Presburg, 1805, Tilsit, 1807, and Vienna, 1809, with the great powers of Europe, successively brought by England into coalition against him. He had now reached the height of his power and glory; he had placed his brothers on the thrones of Holland, Westphalia, and Spain, and his brother-in-law on that of Naples; he thus extended his influence over nearly the whole of western Europe, and played a part equal, if not superior, to that of Charlemagne. But his insatiate ambition was an incessant cause of terror and hatred against him among the sovereigns and the nations of Europe; they were waiting for the moment when this wonderful fortune should begin to decline. It was shaken by the successful resistance which the conqueror met with in the Spanish peninsula (1808-'13); but his prestige was ruined by his disastrous expedition to Russia in 1812. The European nations, recovering their courage, united against him; and their combined exertions inflicted upon him at Leipsic, Oct. 18, 1813, a blow from which he never recovered. It was in vain that he accomplished wonders during the campaign of 1814; he could not expel his enemies from the French territory; he was dethroned, and a prince of the house of Bourbon received from the conquerors the sceptre of France, now restricted to her old limits. The sudden return of Napoleon from Elba overthrew this new power; and for 100 days, from March 20 to June 28, 1815, he was again the acknowledged sovereign of France; but the battle of Waterloo (June 18, 1815) destroyed his power forever, and the Bourbons, under the protection of foreign bayonets, once more ruled the kingdom. Louis XVIII., the first monarch under the restoration, granted a charter to his subjects, and keeping carefully within the

limits of that instrument, died in undisturbed possession of his throne, although, in compliance with orders from the holy alliance, he had in 1823 sent a French army to put down the liberal revolution in Spain. His brother, Charles X., a strange mixture of generous impulses and conceited bigotry, anxious to take back the little liberty France was enjoying, tried to divert public attention by supporting the Greek insurrection against Turkey (1827-'8) and conquering Algiers (1830). But these enterprises failed to conciliate public opinion; and when the king attempted to suspend some of the most important guarantees secured by the charter, a formidable insurrection broke out, July 27, 1830. Charles was obliged to abdicate; and after a few days' interval, his cousin, Louis Philippe, duke of Orleans, was appointed king (Aug. 9) by the chamber of deputies. The choice, however, being acceptable to the middle classes or *bourgeoisie*, was maintained; and notwithstanding some occasional outbursts of republicanism among the people, the July monarchy, as it was called, lasted for 18 years. At first Louis Philippe seemed willing to fulfil the expectations of the liberalists, supported Belgium against Holland, and seized upon Ancona to counterbalance the influence of the Austrians in Italy. But by degrees his policy was changed; the government proved reactionary at home and devoid of energy abroad; and the popular favor on which it had relied deserted it. A political manifestation in favor of parliamentary reform brought on another revolution, Feb. 24, 1848; and although the majority of the nation would have preferred the continuation of a constitutional liberal monarchy, the irresistible course of events precipitated them into a republic. The middle classes, being apparently resigned to their present fate, professed to be ready to give this new form of government a fair trial; but within a few months their representatives in the constituent assembly, frightened by socialistic movements, gave strong evidence of their deadly opposition to it. A so-called republican constitution was adopted, and on Dec. 10, 1848, Louis Napoleon Bonaparte, the nephew of Napoleon I., was elected president of the French republic for a term of 4 years, by 5,658,755 votes, against about 1,500,000 given to Gen. Cavaignac, who had done good service for the preservation of order during the most trying circumstances. Internal dissensions, some signs of which were apparent, soon estranged the majority of the legislative assembly from the president; and rumors of revolution became rife as the epoch of a new presidential election approached. The expected revolution took place, Dec. 2, 1851; by a bold stroke of policy the president dissolved the assembly, assumed dictatorial powers, and made an appeal to the people, asking them to sanction by their votes what had been done. The support of the army had been previously secured, and various unconcerted attempts at armed resistance were smothered by energetic and bloody measures. The

sion, was brought about by mere family action. A more formidable coalition opposed ambitious schemes of the old king, who aimed nothing less than placing his grandson upon Spanish throne, vacant by the death of Charles II.; the two greatest generals of their time, Marlborough and Prince Eugene, were at head of the allied armies; defeat after defeat befell the French forces, and the king seemed reduced to extremities; but the stancy of the king did not fail him during contest of 12 years' duration; he succeeded his bold undertaking, and by the treaties of Utrecht and Rastadt (1713-14) the house of Bourbon inherited the best part of the magnificent Castilian monarchy. The burden which he bore to his last moments was far too heavy for his weak successors; he had overtaxed the energies of France and stretched the royal power to such an extent that reaction was unavoidable. The 18th century was an age of depression, decay, and ruin for all institutions, doctrines, and classes that hitherto commanded respect. Royalty lost prestige, both through the unbounded licentiousness of the regent duke of Orleans, the king himself, and through the irretrievable corruption or imbecility of its ministers; nobility became degraded; the constituted bodies fell into general contempt and an uncontrollable spirit of censure and calumny hastened the work of destruction. Even the remedies that were tried only added to the universal confusion. Politics, the French government, controlled in turn by unscrupulous princes, by Cardinal Fleury, who, how good soever his internal administration, failed to support the national dignity abroad, and by the king's mistresses, gradually sank in the eyes of Europe; and toward the end of Louis XV's reign, it could scarcely be ranked among the great European powers. The 4 wars in which France then participated, against Spain (1717-19), for the succession of Poland (1733-35), for the succession of Austria (1740-48), and finally the 7 years' war (1756-63), were productive only of disgrace and disaster. This dark picture is somewhat relieved by occasional successes and individual deeds of gallantry; such was especially the case in the 3d war above mentioned, when Maurice of Saxony won glorious victories for the country of his adoption, and vindicated her claim to be still one of the great military powers of Europe; but the 7 years' war placed in a shameful light the incompetence of the French generals, the unparalleled want of discipline among their soldiers, and, notwithstanding a few happy exceptions, the lowering of the general military character of the nation. The navy was not only demoralized, but it was utterly ruined; the French colonies in Asia and America were lost, and the French flag almost disappeared from the seas. At home, however, literature and philosophy were cultivated with extraordinary ardor, and with the glory of these pur-

still form the basis of the French law and constitution—civil and religious liberty, equality of rights, and popular sovereignty. It overthrew feudal and hierarchical privileges, provincial divisions and customs, gave to the country a regular administration, and tried to establish a kind of constitutional monarchy. The legislative assembly, which succeeded, had but a short existence, from Oct. 1, 1791, to Sept. 21, 1792; ill satisfied with the new form of government, it did not uphold it, and paved the way for the republican government. This was at once proclaimed by the third popular assembly, the national convention, on its first meeting, Sept. 21; and then the fearful trials, butcheries, and gigantic struggles of the French revolution commenced. Organizing at once a government of absolute powers, the convention sentenced Louis XVI. to death as a declaration of war against all the kings of Europe, and summoned all nations to independence, extending to them the helping hand of France. Thenceforth the country had to struggle against nearly all the European powers, the tremendous impulse it gave to the whole people carried her through all foreign dangers; and when the convention adjourned, Oct. 26, 1795, after a session of more than 87 months, the republic was everywhere triumphant. The internal struggles between the republican and the reactionary parties

that marked the existence of the directorial government, from Oct. 27, 1795, to Nov. 9, 1799, are merged in the military glory of Bonaparte, whose campaigns in Italy (1796-'7) and expedition to Egypt (1798-'9) pointed him out as the future master of the nation. When, on his return from the East, the young general drove the legislative council from their chamber and formed a new constitution, his course was unanimously approved, and the history of France became for 15 years the history of a single man. Chosen first consul for 10 years, Dec. 18, 1799, he broke up the coalition which had been formed against France, by his victory at Marengo, June 14, 1800; forced Austria to conclude the peace of Luneville in 1801, and England that of Amiens in 1802; and by a concordat with the pope reestablished Christian worship in France. Consul for life, Aug. 8, 1802, then hereditary emperor, May 18, 1804, he proved himself a great legislator at home by the formation of the civil code, the organization of public instruction, and the improvements he introduced in all the branches of public service; while he added to his military and political glory by his triumphs at Austerlitz, Jena, Auerstadt, Eylau, Friedland, Eckmühl, and Wagram, and by the treaties of peace which he signed at Presburg, 1805, Tilsit, 1807, and Vienna, 1809, with the great powers of Europe, successively brought by England into coalition against him. He had now reached the height of his power and glory; he had placed his brothers on the thrones of Holland, Westphalia, and Spain, and his brother-in-law on that of Naples; he thus extended his influence over nearly the whole of western Europe, and played a part equal, if not superior, to that of Charlemagne. But his insatiate ambition was an incessant cause of terror and hatred against him among the sovereigns and the nations of Europe; they were waiting for the moment when this wonderful fortune should begin to decline. It was shaken by the successful resistance which the conqueror met with in the Spanish peninsula (1808-'18); but his prestige was ruined by his disastrous expedition to Russia in 1812. The European nations, recovering their courage, united against him; and their combined exertions inflicted upon him at Leipsic, Oct. 18, 1813, a blow from which he never recovered. It was in vain that he accomplished wonders during the campaign of 1814; he could not expel his enemies from the French territory; he was dethroned, and a prince of the house of Bourbon received from the conquerors the sceptre of France, now restricted to her old limits. The sudden return of Napoleon from Elba overthrew this new power; and for 100 days, from March 20 to June 28, 1815, he was again the acknowledged sovereign of France; but the battle of Waterloo (June 18, 1815) destroyed his power forever, and the Bourbons, under the protection of foreign bayonets, once more ruled the kingdom. Louis XVIII., the first monarch under the restoration, granted a charter to his subjects, and keeping carefully within the

limits of that instrument, died in undisturbed possession of his throne, although, in compliance with orders from the holy alliance, he had in 1823 sent a French army to put down the liberal revolution in Spain. His brother, Charles X., a strange mixture of generous impulses and conceited bigotry, anxious to take back the little liberty France was enjoying, tried to divert public attention by supporting the Greek insurrection against Turkey (1827-'8) and conquering Algiers (1830). But these enterprises failed to conciliate public opinion; and when the king attempted to suspend some of the most important guarantees secured by the charter, a formidable insurrection broke out, July 27, 1830. Charles was obliged to abdicate; and after a few days' interval, his cousin, Louis Philippe, duke of Orleans, was appointed king (Aug. 9) by the chamber of deputies. The choice, however, being acceptable to the middle classes or *bourgeoisie*, was maintained; and notwithstanding some occasional outbursts of republicanism among the people, the July monarchy, as it was called, lasted for 18 years. At first Louis Philippe seemed willing to fulfil the expectations of the liberalists, supported Belgium against Holland, and seized upon Ancona to counterbalance the influence of the Austrians in Italy. But by degrees his policy was changed; the government proved reactionary at home and devoid of energy abroad; and the popular favor on which it had relied deserted it. A political manifestation in favor of parliamentary reform brought on another revolution, Feb. 24, 1848; and although the majority of the nation would have preferred the continuation of a constitutional liberal monarchy, the irresistible course of events precipitated them into a republic. The middle classes, being apparently resigned to their present fate, professed to be ready to give this new form of government a fair trial; but within a few months their representatives in the constituent assembly, frightened by socialistic movements, gave strong evidence of their deadly opposition to it. A so-called republican constitution was adopted, and on Dec. 10, 1848, Louis Napoleon Bonaparte, the nephew of Napoleon I., was elected president of the French republic for a term of 4 years, by 5,658,755 votes, against about 1,500,000 given to Gen. Cavaignac, who had done good service for the preservation of order during the most trying circumstances. Internal dissensions, some signs of which were apparent, soon estranged the majority of the legislative assembly from the president; and rumors of revolution became rife as the epoch of a new presidential election approached. The expected revolution took place, Dec. 2, 1851; by a bold stroke of policy the president dissolved the assembly, assumed dictatorial powers, and made an appeal to the people, asking them to sanction by their votes what had been done. The support of the army had been previously secured, and various unconcerted attempts at armed resistance were smothered by energetic and bloody measures. The

revolutionary president, who alone controlled the elections, was chosen for a term of 10 years by 7,889,216 votes; a new constitution, very much like the consular one framed by Bonaparte in 1799, was promulgated; and finally, Nov. 7, 1852, the senate made a motion for the reëstablishment of the empire; this having been assented to by a vote of 7,824,129 citizens, the empire was proclaimed, Dec. 2, 1852. The emperor wields his power with such energy and ability that he is considered the leading spirit of Europe; and France has resumed the rank she held during the reigns of Louis XIV. and Napoleon I. The war against Russia for the protection of the Ottoman empire (1854-'5), and that in Italy against Austria (1859), show that she has lost nothing of her military superiority.—A more detailed account of the principal events in the history of France will be found in the articles on her various sovereigns, statesmen, and generals.—See *Statistique générale méthodique et complète de la France*, by J. H. Schnitzler (4 vols. 8vo., 1842-'6); *Patria, ou la France ancienne et moderne* (2 vols., Paris, 1847); *Rerum Gallicarum et Francicarum Scriptores, ou recueil des historiens de France*, by Dom Bouquet and other Benedictine monks, continued by members of the institute (21 vols. fol., 1788-1857); *Collections des mémoires relatifs à l'histoire de France*, respectively published by Guizot, Petitot, Buchon, and Michaud and Poujoulat; the general histories of France by Sismondi (81 vols. 8vo., 1821-'43), Henri Martin (4th ed., 17 vols. 8vo., 1855-'9), Michelet (not yet complete, 12 vols. 8vo., to Louis XIV.), Théophile Lavallée (12th ed., 4 vols. 12mo., 1858), and Duruy (2 vols. 12mo., last ed., 1859); "History of France," by E. E. Crowe (5 vols. 8vo., London, 1858 *et seq.*); "History of France," by J. White (1 vol. 8vo., Edinburgh and London, 1859).

FRANCE, ISLE OF. See MAURITIUS.

FRANCE, LANGUAGE AND LITERATURE OF. The French is the most important of the 6 Romanic languages produced from Latin by the influence of other tongues. The Italian, the Rumanic or Wallachian, the Provençal, Spanish, and Portuguese are its sisters. The Belgæ of Gaul probably spoke Celto-Teutonic, the Aquitani Celto-Iberic, while the Celtæ or Galli proper occupied the centre of the country, and at the same time Greek colonies held points on the Mediterranean sea. The language of Rome overwhelmed all these idioms. The Gallic, however, was yet spoken in the 3d century; Celticism was perceptible in the *lingua rustica*, or degenerate Latin, at the close of the 5th century; and the ancient vernaculars continued to exist afterward. The *rustica* extended from the Rhine to the Pyrenées in the 4th century. The corruption of the Latin was similar in all the countries from the Danube to the mouth of the Tagus, and the above-mentioned languages differ only in consequence of the various barbarous tongues that have acted upon them. Since the Suevi, Visigoths, Burgundians, Franks, &c., made no ef-

forts to destroy the languages of the inhabitants of Gaul, comparatively few words of theirs survived in the *lingua rustica*. Many Celtic elements had combined with the Latin even before Cæsar, and some were introduced afterward; but it is difficult to distinguish them from the Latin stock on account of their common origin from the storehouse of the Indo-European family of languages. The Latin jargon, tainted by Germanic ingredients, is called *lingua Romana*, and also *Gallica* or *Gallicana*. It coexisted for some time with the *Frenkiska* (*Francisca*, *Francica*), or *Theotisca* or *Tudesque*; and although it continued to exist with more vigor than the last named, it was eventually called *lingua Franco-Gallica*, or rather *Franco-Romana*, *langue Française*. While the Frankish prevailed in the N. and E. of the country, the *rustica* or *Romana* was spoken S. of the Loire, although also used in the Frankish regions. The council of Tours (813) recommended the use of both the rustic and Tudesque versions of the homilies. Probably the most ancient monument of the Roman is the oath of Louis the German to Charles the Bald, who on his part swore in German, in Strasbourg, Feb. 842. This oath ran as follows:

Pro	Deo	amur	et pro	Christian	poblo	et nostro
Pour	l'amour	de Dieu	et pour	le peuple	Chrétien	et notre
commun	salvament,	dist	di	en	avant,	in
salut	commun,	dorénavant	(de	isto	die	in
quant	Dens	savir	et	podir	me	dunat, &c.
tant	que	Dieu	savoir	et	pouvoir	me
					donnera, &c.	

The Latin grammatical suffixes were gradually dropped, and the accusative case was in general taken as the new word. Auxiliary verbs were successively introduced from the Teutonic idioms, the case endings were supplied by prepositions, the personal endings of verbs by pronouns, or both by the fragments of ancient endings and by pronouns before the verb. In the 10th century the Latin *ille*, *iste* were converted into the article *le* and the pronouns *il* and *cet* (*ce*), the latter being pronounced *st*. According to Raynouard's hypothesis, the *lingua Romana* was separated into two dialects. The Visigoths and Burgundians S. of the Loire said *oc* (Latin *ac*, German *auch*, also) for *yes*, for which the Franks and Normans (who established themselves in France in 912) along the Seine used *oil*; hence the southern or Provençal dialect was named *la langue d'oc*, and the northern (Roman-Walloon) *la langue d'oïl*. After 879 the focus of the former was at the court of the kings of Arles, and in 927 the chief point of the latter at the court of the duke of Normandy. Less troubled by wars and more thoroughly Romanized, the south produced distinguished *troubadours* during two centuries, while the north had, somewhat later, its *trouvères*, both named from *trovare*, to find—finders of songs, poets. From the beginning of the crusades to the death of St. Louis (1095-1270) both dialects approached toward a fusion. The vulgar language was employed in the crusades in rousing the populace, whose war-cry was: *Diez el volt* (God wills it). Under John the

diets were held both in *oe* and in *oil*. A few fragments of the Bible date before 1100; but popular heroic and religious songs appear to have been composed and recited by the *jongleurs* (*joculatores*). The development of chivalric poetry in Provence was checked by the persecution of the Albigenses; the language of the troubadours was proscribed, and, together with the political rule of the north, the idiom of Picardy (a branch of the *langue d'oïl*) extended toward the south. The real French language began to be developed about the time of the conquest of Constantinople by the French crusaders, at the beginning of the 13th century. Already before the conquest of England by William (1066) English youths were sent to be educated in France; but the conquest made the Norman-French the official and court language in England. Froissart's "Chronicles" (14th century) is the first work in genuine French. Francis I. substituted the language for Latin in public transactions. Rabelais greatly enriched it; Ronsard and Du Bellay, Amyot and Montaigne, and others developed it further. The religious reform, political troubles, the influence of the Italian wars and queens, modified it greatly. The introduction of Arabic words is chiefly due to the crusades, and that of Greek and Latin words and of scientific terms to the study of those languages and to the cultivation of the natural sciences. The *académie Française*, established by Richelieu for the regulation of the national language (1635), the influence of the court, the labors of the Port-Royalists, especially Pascal (1656), and a galaxy of great writers, purified, augmented, and diffused it more and more. It was first used as a diplomatic language at the conferences of Nimeguen (1678).—The French is certainly a very clear tongue, on account of the strictly logical order of its syntax, but very monotonous, and incapable of the composition of words already fixed, as well as of bold poetic turns. The French language, in short, is, like every other, the exponent of the nationality, vicissitudes, intelligence, culture, and taste of the people that speak it. The following are some examples of the changes from ancient to modern French forms: A—*aimer, père, chanté, mer, table, chien*, &c., from *amare, pater, cantatum, mare, tabula, canis*; E—*espoir, plein, venin, fiel*, &c., from *sperare, plenus, venenum, fel*; I—*foi, ordonner, cercle, vaincre, sangle, vierge*, &c., from *fides, ordinare, circulus, vincere, cingulum, virgo*; O—*heure, cœur, roue, puis*, &c., from *hora, cor, rota, post*; U—*puit, joug, nombre, fleuve, croix*, &c., from *puteus, jugum, numerus, fluvius, cruz*; Æ—*Égypte, Grec, siècle, proie, Juif*, &c., from *Ægyptus, Græcus, sæculum, præda, Judæus*; Œ—*ciel, fécond, foin, morne*, &c., from *cælum, fecundus, fœnum, mœrens*; Au—*or, louer, oiseau, aboyer, peu*, from *aurum, laudare, avicella, adbaubare* (barbarous), *paucus*. Tonic vowels were dropped or suffered various changes of elision or contraction, even destroying the organic affinity of the consonants; e. g.: *l'ami*,

s'en aller, for *le ami, se en aller*; *mûr, sûr, plonger, rage, Dijon, orge, roche, sèche, pigeon*, &c., from *maturus, securus*, barb. *plumbear, rabies, Divio, hordeum, rupe, sepia, pipio*. By transposition, the improper diphthongs, the *l* and *gn mouillés*, are often produced; thus: *muid, chaîne, Seine, empereur, merveille, paille, ognon*, &c., from *modius, catena, Sequana, imperator, miraculum, palea, unio*. Examples of change of consonants are: O—*gobelet, glas, groupe, figue, chant, Charles, musique, queue, voisin, fait, verrue*, &c., from *cupella, classicum, corpus, ficus, cantus, Karl, musica, cauda, vicinus, factum, verruca*; Q—*égal, chercher, Seine*, &c., from *æqualis*, barb. *quæricare, Sequana*; G—*jaune, Anjou, je, frère, loyal, lire, géant, Geoffroi*, &c., from barb. *galbinus, Andegavi, ego, fragilis, legalis, legere, gigantem, Gottfried*; H—*Louis*, from *Hludovic* (Chlodwig), &c.; the letter *I* became hissing, as *joug, jeu*, &c., from (the original) *iugum, iocus*; P—*chèvre, chanvre, ravir, double, chef, écrit*, &c., from *capra, cannabis, rapere, duplex, caput, scriptum*; B—*devoir, siffler, dette*, &c., from *debere, sibilare, debitum*; F—*habler, hêtre* (*haître*), *Arnoul, Raoul*, &c., from *fabulari*, barb. *sagaster, Arnolf, Radulf*; Ph—*faisan, fantaisie, fanal*, &c., from Greek words written with Φ; V—*brebis, courber, œuf, guêpe*, &c., from *vervex* (*vervecem*), *curvare, ovum, vespa*; T—*salade, cascade, père, saluer, veau, puis, perche*, &c., from Ital. *salata* and *cascata*, Lat. *pater, salutare, vitulus, post, pertica*; D—*jour, jusque, bai, coir, hui, avocat, bénir, pié, nu*, &c., from *diurnus*, barb. *de-usqua, badius, videre, hodie, advocatus, benedicere, pes* (*pedem*), *nudus*; S—*été, échelle, épée, émail, crête, naïtre, tête, mât, hâte*, &c., from both *astate* and Ital. participle *stato* (Span. *estado*), *scala*, Germ. *Spaten, Schmelz*, Lat. *crista, nasci, testa*, Germ. *Mast, Hast*; also *nez, rez, chez*, &c., from *nasus, rarus, casa*; and *s* instead of Latin *tis*: *tous louez, prenez, assez*, &c., from *laudatis, prehenditis*, barb. *ad-satis*; X—*tâcher, mâchoire, mèche, moustache, tisser*, from *tazare, maxilla, μυξα, μυσταξ, texere*; L—*rossignol, apôtre, épître, péruque, orme, remorque*, &c., from *lusciniola, apostolus, epistola*, barb. *piluca, ulmus, remulcum*; *niveau, amydon* (*amidon*), *aube, baume, bougre, autre, chaud, chaud, Guillaume, mou, beaux, cheveu*, &c., from *libella* (*level*), *αμυλον, alba, balsamum, Bulgarus, alter, calidus, cala, Gildhelm, mollis, bellus, capillus*; R—*autel, pèlerin, auberge*, &c., from *altare, peregrinus*, Germ. *Herberge*; M—*nous aimons, Garonna, conter, nappe, nêfle, airain, rien, on, mon, houblon* (whence Eng. *hop*), &c., from *amamus, Garumna, computare, mappa, mespilus, aramen, rem, hominem, meum, humulus*; N—*licorne, orphelin, Bologne, jour, four, Béarn, île, épouse, mois, couvent, coûter*, &c., from *unicornis, oppavos, Bononia, diurnus, furnus, Beneharnum, insula, sponsa, mensis, conventus, constare*; Gn—*mouillé* in *Champagne, vigne, Espagne, grognier*, &c., from *Cumpania, vinea, Hispania, grunire*.—Examples of adventitious letters are: *e*

before an initial impure *s*, as in *escabeau*, *escarmouche*, *estomac*, *esquif*, *esprit*, &c., from *scabellum*, Teuton. *skirmish*, *skiff*, *σρομαχος*, *spiritus*. Other prefixed letters are: *grenouille*, *huître*, *lendit*, *nombril*, *tante*, &c., from *ranicula*, *ostrea*, *indictum*, *umbilicus*, *amita*. In the following examples letters have been inserted for the sake of euphony: *chambre*, *dompter*, *Embrun*, *trompette* (*trombe*), *hante*, *rendre*, *Angoulême*, *jongleur*, *trésor*, *perdrix*, &c., from *camera*, barb. *domitare*, *Eburodunum*, *tuba*, *hasta*, *reddere*, *Iculisma*, *joculator*, *θεραπος*, *perdix*.—Changes of quantity and of accent, and all sorts of mistakes in writing and in pronunciation, have further increased the dissimilarity of words from their prototypes, which were chaste, strong, organic, and significant. Some further examples may show both the deviation from the prototypes and the conglomeration of altered words into ungainly compounds. Of the first kind are: *oindre*, *teindre*, *coucher*, *chômer*, *coutume*, *poltron*, *gêne*, &c., from *ungere*, *tingere*, *collocare*, Romanic *calmare*, *consuetudinem*, *pollice-truncato*, biblical *gehenna*. Specimens of altered words are: *alentour* (*à le en tour*), *auparavant* (*à le par ab ante*), *aujourd'hui* (*à le jour de ho-die*), *désormais* (*de is(ta) hora magis*), *dorénavant* (*de hora in ab ante*), *lorsque* (*la hora qua*), &c. Owing to the mixture of the languages of *oc* and *oil*, as well as to the introduction of many forms in later times, there are, as it were, two parallel idioms in the French language; as for instance: *eau*, *ciel*, *père*, *chef*, *temps*, *bois*, *poudre*, *terre*, *poumon*, *doigt*, *pierre*, *faux*, *mauvais*, &c., alongside of *aquatique*, *céleste*, *paternel*, *capital*, *temporel*, *ligneux*, *pulveriser*, *vitreux*, *pulmonaire*, *digitale*, *pétréfaction*, *falsifier*, *malveillant*. As the accent or stress falls upon the last effective syllable of a word, imparting thus a monotony to the spoken language, some pretend that the French has no accent. This is an incorrect assertion, for *possible*, *inconsolable*, *sentiment*, &c., differ from the English words in accent more than in sound. There is also no reason for the denomination of the 3 signs (``) as accents, since they are marks of omission, and the two first sometimes marks of sound; thus, for instance, in *été*, *être*, *père*, *sûre*, *maître*, &c., derived from *astate* and *estado* (see above), *estre* (Span. *estar*, *stare*), *patre*, *securus*, *magister*, they denote omissions; and in words like *pénétrer*, *célébrer*, *célèbre*, &c., the ' and ` are merely signs of sound, as no word can have more than one accent.—The French is written with the same letters as the English. K and W occur only in Norman and Flemish names incorporated into French, and in other foreign words. There are 12 distinct vowels as regards their quantity; they are represented by 6 letters called vowels, or by their combination, and by the help of *m*, *n*, viz.: *a*, *e*, *é*, *i*, *o*, *u*, *ou*, *eu*, and 4 nasals, *an*, *in*, *on*, *un*. Including all modifications (*â*, *ê*, *î*, *ô*, *û*, *ouï*, and the so-called *e muet*), they stand for 20 sounds, of which Malvin-Cazal and Michelet of the *conservatoire de musique* count 17. Of consonants

there are 20, represented by 18 letters, viz.: *b*, *k* (also written *c* and *ch* as in *chœur*, *q*, *qu*, and *g* as in *sang et eau*), *d*, *f* (and *ph*), *g* hard (also *gh*, *gu*), the sound of English *s* and *z* in *vision*, *crozier* (written *g* before *e*, *i*, and *y*, and *j* before all vowels except *i* and *y*), *h* (unless mute), *l*, *l mouillé* as in the English *million* (written *ill*, *il*, *gli*, *lh*), *m*, *n*, *n mouillé* as in the English *onion* (written *gn*, *nh*), *p*, *r*, *s* (also *c* before *e*, *i*, *y*; also *x* in *Bruxelles*, *t* in *nation*), *t* (also final *d* when pronounced with the next word, as *grand homme*), *v* (also final *f*, when pronounced with the next word, as *neuf aunes*), *y* as in the English *yes*, with the preceding power of *i* (for instance, *payer*, pronounced *pè-yé*), *z* (written also *s*, *x*, when pronounced with the next word, as *les eaux*, *aux esprits*), and the sound of the English *sh*, as in *shall* (written *ch*). Most consonants are not uttered when final, unless they are joined to a succeeding word which begins with a vowel or *h* mute. *S*, *x*, *z*, *t*, being the principal grammatic letters, are most frequently joined in this manner. On French pronunciation Malvin-Cazal and Mme. Sophie Dupuis may be advantageously consulted.—The dialects and *patois* of the French language are: I. The academic, consecrated by the best literature. II. Old French: 1, Walloon (*rouchi*), in Belgium and West Luxembourg; 2, Franco-Flemish; 3, Picard and dialect of Artois. All these are Franco-Romanic. III. New French: A, in the north—1, Norman; 2, *patois* of Paris and Champagne; 3, of Lorraine and the Vosges; 4, the Bourguignon; 5, *patois* of Orleans and Blois; 6, of Anjou and Maine; B, in the middle and west—1, Anvergnat; 2, Poitevin; 3, Vendéen; 4, Bas Breton; 5, Berrichon; 6, Bordelais and Gascon; C, in the east—1, Franc-Comtois and its varieties in Valais and Neuchâtel, and partly in the cantons of Freyburg and Bern; 2, Vaudois (Roman, Romain); 3, Savoisien and Genevois; 4, Lyonnais; 5, *patois* of the cities of Dauphiné; D, in the islands of Jersey and Guernsey, Anglo-Norman. French is also spoken with various local peculiarities or corruptions in Algeria, on the Senegal, in the Mascarene and Seychelles islands, French Guiana, the French West Indies, the greater part of Hayti, in Illinois, Michigan, Louisiana, and some other of the United States, by the *habitans* of Lower Canada and even some aboriginal tribes, and in some settlements in Asia and Oceanica. There are also small French colonies in the Banat of Temesvár and elsewhere. It is the most generally known of all languages among civilized nations, and many illustrious foreigners, as Leibnitz, Humboldt, Gibbon, and Sir William Jones, have written some of their works in it. The dialects of the *langue d'oc*, particularly the Limousin, Languedocien, and Provençal, are spoken S. of a line passing through the departments of Charente, Charente-Inférieure, Haute-Vienne, Creuze, Allier, Puy-de-Dôme, Haute-Loire, Ardèche, Drome, and Isère. Celtic (*Breyzad*) is spoken by nearly 1,000,000 people in Finistère, Côte-du-Nord, and Morbi-

han; Basque by about 130,000 in Basses-Pyrénées; German by about 1,000,000 in Haut-Rhin and Bas-Rhin, and to some extent in Moselle and Meurthe; Flemish in parts of Nord and Pas-de-Calais; Catalan in Pyrénées-Orientales; and Italian in Corsica.—Among the authors of grammars of the French tongue are: J. Sylvius (1537); Étienne Dolet, *De la ponctuation Française* (Lyons, 1541); Jacques Pelletier, *Dialogues sur l'orthographe et la prononciation Française* (Poitiers, 1550); Loys Meygret, *Treuvé de la grammaire, &c.* (1550); Robert and Henry Stephens (Paris, 1558 and '79); Ramus, *Grammaire Française* (1571); Philippe Garnier, *Præcepta Gallici Sermonis* (Strasbourg, 1607); Vangelas, *Remarques sur la langue Française* (1647); the Port-Royal writers, Lancelot and Arnould, *Grammaire générale et raisonnée* (1660, often republished); Dumarsais, *Véritables principes de la grammaire Française* (1729); Restaut, *Principes généraux et raisonnés de la grammaire Française* (1730); Wailly, *Grammaire Française* (1754); Condillac, in his *Cours d'études* (1755); Beauzée, *Grammaire générale* (Paris, 1767); D'Olivet, *Essais de grammaire* (1783); Domergue, *Grammaire Française simplifiée* (1778); Levizac, "Theoretical and Practical Grammar of the French Tongue" (1801); Fabre, *Syntaxe Française* (1803); Guéronlt, *Grammaire Française* (1806); Lhomond, *Éléments de la grammaire Française*; Girault-Duvivier, *Grammaire des grammaires* (1811, many times reprinted); Landais, *Grammaire générale et raisonnée*, a compilation from numerous sources (1836); Noël and Chapsal, *Nouvelle grammaire Française* (1828, 37th ed. in 1844).—Among the best dictionaries are those by Robert Stephens (French and Latin, 1532); Aymar de Rançonnet (1606); Richelet (Geneva, 1680); Furetière (1690); Menage (1694); the famous dictionary of Trévoux, so named from its place of publication (1704); that of Boiste and Bastien (1800); Roquefort (1829); Raymond; Landais; Charles Nodier, *Dictionnaire critique des dictionnaires* (1808), *Dictionnaire raisonné des difficultés de la langue Française* (1818), *Dictionnaire des onomatopées* (1828); Laveaux (1820); Bescherelle, *Dictionnaire national, ou grand dictionnaire critique de la langue Française* (2 vols., 1843-'6); Noël and Carpentier, *Philologie Française* (1831). The *Dictionnaire de l'académie Française* was published in 2 vols. fol. in 1694, and has been several times reprinted. A *Dictionnaire historique de la langue Française*, on a grand scale, is in preparation by the academy. Girard (1718), Beauzée (1769), Roubaud (1785), and Guizot (1809-'22) have written on French synonymes, and J. B. F. Gerusez (1801), Henry (1811), Villemain, in the dictionary of the academy, J. J. Ampère (1841), F. Wey (1845), and F. Génin (1845-'6), on the history of the French language.—The earliest literature of France is that of the *trouvères* and *troubadours*. The latter, who wrote in the soft southern *langue d'oc*, produced short lyrical effusions on love or matters of trifling import; they flourished most during

the 11th and 12th centuries. The *trouvères*, on the other hand, in their narrative poems, known as *chansons de geste*, and written in the energetic *langue d'oïl*, treated of great national subjects and celebrated the heroic deeds of illustrious kings and knights. Some of their compositions, the earliest especially, have a striking character of grandeur which may sometimes be not unfavorably compared with that of the ancient epic poems. These *chansons de geste*, which are also called *romances*, are very numerous, and have been classified into 3 cycles, bearing respectively the names of Charlemagne, King Arthur, and Alexander. The first cycle of course includes all such poems as celebrate the deeds of the great Frankish emperor, his descendants and vassals; one of the oldest and perhaps the most magnificent of this category is entitled *La chanson de Roland ou de Roncevaux*. The Armorican cycle or that of King Arthur is filled up with the traditional legends connected with old Britain and the achievements of the Norman warriors; the *Roman de Brut*, or that of King Arthur of Britain on one side, and the *Roman de Rou*, or that of the dukes of Normandy on the other, may be said to be the double foundation on which all the poems belonging to this series rest. The cycle of Alexander consists of poems in which recollections of Greece and Rome are strangely enough mixed up with chivalric notions and legends of fairy land. The "History of the Taking of Troy," composed about 1160 by Benoît de St. Maure, and the "Romance of Alexander," about 1180, by Lambert li Cors and Alexandre of Paris, are fair specimens of these compositions. They were succeeded by satirical and allegorical poems of equally vast proportions, some of which enjoyed unparalleled popularity, such as the *Roman du renard* and the *Roman de la rose*. The *fabliaux* and several lighter kinds of poetry cultivated by the troubadours were also treated by the *trouvères*, who found here an appropriate field for their ingenuity and ready wit. Among those who excelled in the *fabliaux* was Rutebeuf, who lived in the reign of St. Louis. Songs were not neglected, and those of the illustrious Abelard in the 12th century enjoyed a wide popularity. Audefroy le Bastard, Quesnes of Bethune, and the castellan of Coucy were among his most distinguished successors. Thibaud, count of Champagne and king of Navarre, deserves to be particularly mentioned; the songs in which he alludes to his love for Queen Blanche of Castile, the mother of King Louis IX. of France, have given him historical celebrity. The progress of prose was slower than that of poetry, but the 13th century presents two specimens showing that it had already acquired a certain degree of power and polish; these are the "Chronicle of the Conquest of Constantinople," by Villehardouin (1207), remarkable for its soldier-like simplicity and straight-forwardness, and the *Mémoires* in which Joinville, with winning artlessness, tells us of the heroic deeds and private virtues of the good king Louis IX. The

whole literature of the 14th century culminates in Froissart's "Chronicles," which remain the model of this kind of writing, and present the liveliest pictures of society and manners during that period of war and gallant emprise. Christine de Pisan and Alain Chartier deserve notice for their intelligent efforts toward the improvement of prose. This improvement is fully illustrated in the 15th century by the *Mémoires* of Comines, which presents a striking delineation of the characters of Louis XI. and his contemporaries. Already a popular poet, Villon, a strange compound of villainy and inspiration, had given evidence in his poems that French verse was able to reach a high sphere of excellence; and a princely songster, Duke Charles of Orleans, that it had lost nothing of its gracefulness. The revival of antique learning and the religious reformation exercised a powerful influence on French literature in the 16th century. Its principal characteristics being freedom of thought and variety of style, writers cannot be judged according to a single standard. In originality Rabelais and Montaigne are entitled to the first rank. The former, whom Lord Bacon styled "the great jester of France," was a profound scholar, physician, and philosopher, and contented himself with the renown of a profane humorist. His nondescript romance, the "History of Gargantua and Pantagruel," is filled with strange tales, wild notions, amusing quibbles, and gross buffooneries, interspersed with a seasoning of good sense, sound philosophy, and keen raillery. A more refined class of readers are attracted by Montaigne, whose "Essays," one of the standards of French literature, are a series of free and familiar disquisitions upon every subject, couched in the most easy and winning style, but sceptical throughout. His views were partly reduced to a system by his friend and disciple, Charron, in his treatises *De la sagesse* and *Des trois vérités*. Meanwhile the reformation had been vindicated by Calvin in his *Institution de la religion Chrétienne*, a masterly piece of writing, which afforded convincing evidence that French prose had now acquired strength and gravity enough to become a fit vehicle of religious eloquence; and, later in the century, an admirable pamphlet, the *Satire Ménippée*, and some speeches of Chancellor L'Hôpital, proved it to be flexible enough for political purposes. Its capacity for lighter subjects had been previously demonstrated by the tales of Margaret of Navarre. Amyot invested it with new graces by happily blending Grecian and French beauties in his translation of Plutarch's "Lives." In poetry this period was less successful. Clément Marot had indeed exhibited elegance, grace, and wit, in his epistles, epigrams, and elegies; but he had merely given perfection to inferior branches of poetry. Ronsard attempted a higher flight; he tried to invest French verse with that power, variety, and inspiration which he so much admired in Greek metres; but his violent introduction of foreign

forms and elements into the vernacular was far from attaining the fortunate results he anticipated; in spite of all his defects, however, he contributed to elevate the tone of French poetry. In the 17th century, Malherbe appeared as the reformer, or rather the regulator, of poetry; a man of fastidious taste and meagre imagination, he ridiculed the artistic luxuriance of Ronsard, and introduced in its stead a style of grammatical correctness and dry elegance which sometimes reached pomposity, but was destructive of feeling and enthusiasm. His polishing process was nevertheless of great service to poetical language; and his odes, stanzas, and other pieces present many beautiful lines, which are frequently quoted. Balzac devoted his attention to the improvement of prose; and his semi-philosophical works, his epistles especially, were valuable at the time as models of careful and harmonious rhetoric. Such were also, notwithstanding their mannerism, the frivolous but witty letters of his friend Voiture. Both were great favorites at the hotel Rambouillet, the headquarters of a society of wits and fashionable ladies, who acted as arbiters of good taste and elegance; many social reunions were now in reality literary clubs, which gave particular attention to philological propriety; one of these, receiving from Cardinal Richelieu the title of the French academy, was especially appointed "to establish certain rules for the French language, and make it not only elegant, but capable of treating all matters of art and science." Leaving mere disquisitions about words to such societies and to second-rate writers, three great men now enriched French literature with works in which style was only a medium for conveying original conceptions or powerful thoughts. Pierre Corneille brought tragedy to a degree of grandeur which has not been surpassed; *Le Cid*, *Horace*, *Cinna*, and *Polyeucte* are still the objects of admiration; while *Pompée*, *Rodogune*, *Heraclius*, *Don Sanche*, and *Nicomède*, though less perfect, abound with striking beauties. Descartes, in his *Discours sur la méthode*, showed that the French vernacular was now equal to the highest philosophical subjects; and Pascal, in his *Lettres provinciales*, in which comic pleasantry and vehement eloquence are happily blended, first formed a standard of French prose. Such was the opening of the splendid literary epoch which is generally styled the age of Louis XIV; and following it came a galaxy of superior minds, who, under the royal patronage, applied themselves to perfecting every branch of literature. Sacred eloquence was perhaps the most successfully cultivated, and the pulpit was adorned by the funeral orations of Bossuet, full of pathos and religious melancholy; those of Fléchier, so remarkable for artistic finish; the sermons of Bourdaloue, the powerful dialectician, and those of Massillon, the most exquisite and most attractive of preachers. Tragedy, in the hands of Racine, lost perhaps a little of the imposing character with which it had been invested by

Corneille, but teemed with the most touching of human feelings, clothed in a language unapproachable for correctness, elegance, and sweetness. *Andromaque*, *Iphigénie*, and *Phèdre* remind us of the productions of ancient Greece, while *Athalie* brings on the stage in a style of adequate splendor an episode of the Jewish annals. Comedy, which had been successfully attempted by Corneille in *Le menteur*, reached its highest pitch with Molière, a most original delineator of human character; his masterpieces, *Le misanthrope*, *Tartufe*, *L'avare*, and *Les femmes savantes*, are profound and humorous creations. *L'école des maris* and *L'école des femmes*, which are scarcely inferior, *Amphytrion*, a licentious but exceedingly attractive comedy, *Le festin de Pierre*, a strange mixture of the comic and dramatic elements, several farces, *Le bourgeois gentilhomme* and *Le malade imaginaire*, afford abundant evidence of Molière's flexibility of genius no less than of his power of observation. After him, but at a great distance in point of merit, Regnard, Dancourt, and Dufresny furnished the French stage with light comic sketches. Fable, through La Fontaine's genius, was but comedy on a smaller scale; this inimitable poet, whose popularity is unrivalled as it is unfailing, had presented in his collection of fables "a drama in a hundred acts," animated by truthfulness and keenness of observation, transparency of narrative, depth of emotion, and humorous fancy. Most of these qualities are also found in his miscellaneous poems, and especially in his "Tales," whose licentiousness, however, renders them unfit for general reading. Didactic, philosophical, and satirical poetry, that is, poetry under its less poetical forms, had as their representative Boileau, who finished the work previously undertaken by Malherbe, and was indeed the Aristarchus of his time; his *Art poétique*, his *Épîtres*, his *Satires*, as well as his heroico-comic poem *Le lutrin*, are remarkable for good sense and symmetry; they abound with wise maxims and common truths finely expressed, but are entirely deficient in poetical enthusiasm. Moral philosophy was not neglected; Malebranche, the disciple of Descartes, the sagacious and imaginative author of *La recherche de la vérité*, Bossuet in his *Connaissance de Dieu et de soi-même*, Fénelon in his treatise *De l'existence de Dieu*, and Pascal in fragments which have been collected under the title of *Pensées*, considered the highest problems of humanity from a Christian point of view; while La Rochefoucauld in his *Sentences et maximes* wrote a libel upon mankind, and La Bruyère in his *Caractères* drew vivid and amusing sketches of human characters, manners, and oddities.—History, which under the pens of St. Réal and Vertot was but a faint imitation of the style of ancient historians, was treated with some energy by Mézeray in his *Histoire de France*, and with ingenuity by Fleury in his *Histoire de l'église*, a treasure of good faith and learning; while Bossuet clothed it with an imposing character of eloquence in

his *Discours sur l'histoire universelle*, and with all the passionate vivacity of theological discussion in his *Histoire des variations des églises protestantes*. The personal *Mémoires* of Cardinal de Retz concerning the wars of the Fronde are among the masterpieces of familiar history. Hamilton's *Mémoires du comte de Grammont*, a gem of sprightly narrative, brings us to lighter kinds of literature. The novels of Mme. de Lafayette, *Zaïde* and *La princesse de Clèves*, present a faithful though somewhat ideal picture of elegant society, into which we penetrate through the familiar letters written by Mme. de Sévigné to her daughter and friends; in fact these letters, which never were intended for publication, furnish us with a complete and lively panorama of the age. Fénelon's *Télémaque*, which is written in an epic form, and can scarcely be ranked among novels, created a deep sensation toward the end of the 17th century, being considered an indirect censure of Louis XIV., gained great popularity on the same account during the following reign, and deservedly keeps a high rank among French standard works; it marks the crowning point of a period of pure literary glory.—We now reach the age that has been called philosophical *par excellence*. A number of free thinkers, among whom Bayle, the author of the great *Dictionnaire historique*, is the leading spirit, and some licentious poets, Chanlieu especially, had been paving the way for the coming philosophers. The 17th century had been on the whole a religious age; the 18th was eminently an age of scepticism and infidelity. Literature, which had been a pure art, seeking for ideal beauty and religious truths, now became a means of conveying bold opinions or assaulting time-honored creeds and institutions. The whole age was swayed by four men of genius, Montesquieu, Voltaire, J. J. Rousseau, and Buffon, who all exercised a powerful influence over their contemporaries, while each acted a different part in the general struggle. Montesquieu, a writer of unusual scope of mind, combining a masculine vigor with great brilliancy of style, commenced his career by publishing *Les lettres Persanes*, a satire on French manners, government, and even religion. He illustrated the philosophy of history in his *Considérations sur la grandeur et la décadence des Romains*, a masterpiece of historical style, and finally produced the *Esprit des lois*, a profound disquisition upon general legislation—"a book," says Vinet, "with which genius was inspired by justice and humanity." Voltaire, the true personification of his age, protean in disposition as well as in talents, was destined by his faults no less than his good qualities to become at once a leader; and the power he seized when still young, he preserved unimpaired to his last moment. He was for half a century the king of public opinion. His wonderful versatility enabled him to treat successfully almost all branches of literature; as a tragic poet he takes rank by the side of Corneille and Racine; his tragedies, *Mérope*, *Zaire*, *Mahomet*, *Alzire*,

des, combine pathos with dramatic interest and liveliness of style; his *Discours sur l'homme* and other philosophical poems are to be classed with those of Pope; while his miscellaneous effusions, as numerous as they are sprightly, raise him in this sphere above any other French poet. The perspicuity of his mind appears in his *Dictionnaire philosophique* and other philosophical works; and his wit in his novels, which, notwithstanding their licentiousness, are models of their kind. His various books on history, *Charles XII.*, *Le siècle de Louis XIV.*, *L'essai sur les mœurs des nations*, are still read with profit and pleasure, while his bulky correspondence is scarcely excelled by that of Mme. de Sévigné. If Voltaire may be said to have been the master of minds, J. J. Rousseau was the master of souls. His passionate eloquence conquered the coldest and even the most prejudiced; eloquence indeed is the mainspring of all his works. As a prose writer he has no superior, scarcely an equal among the most perfect of his rivals. His first essay, *Discours contre les sciences et les arts*, which he wrote when 88 years of age, was a declaration of war against civilization; the second, *Origine de l'inégalité parmi les hommes*, was an attack upon the existing social order. In his *Émile* he drew a visionary plan of education, and in his *Contrat social* proclaimed the principles of popular sovereignty and universal suffrage. His *Nouvelle Héloïse* is a novel in which love and paradox are blended together, while his *Confessions* excited a mixed feeling of sympathy and disgust. Buffon occupied a less agitated sphere, devoting his labors to the description of nature; and his great *Histoire naturelle* is a scientific and literary monument, which time can scarcely injure. Diderot, a passionate and incorrect writer, and D'Alembert, a great geometer, founded the *Encyclopédie*, a vast review of human knowledge, often threatening to social order, always hostile to religion. Helvetius in his treatise *De l'esprit*, D'Holbach in his *Système de la nature*, La-mettrie in his *Homme-machine*, and Raynal in his *Histoire philosophique des deux Indes*, far exceeded the destructive doctrines of the encyclopædists; while other writers, such as the virtuous Vauvenargues, Condillac, a most perspicuous analytic philosopher, Mably, a bold publicist, and Condorcet, who wrote afterward an *Esquisse des progrès de l'esprit humain*, mostly kept on the side of moderation. The various branches of literature connected with philosophy were the most productive; but the others were far from being neglected, as appears from the following names which we take almost at random. Crébillon and Ducis, both tragic poets appealing, the former to terror, the latter to sympathy; Gilbert, a thorough enemy of Voltaire and the encyclopædists, and a satirist of uncommon power; Le Sage, the author of *Gil Blas*, the most perfect novel of the age, and of *Turcaret*, perhaps the best comedy next to those of Molière; Beaumarchais, whose *Barbier de Séville* was as it were the signal of revolution; Bernardin de St. Pierre, the author

of *Paul et Virginie*; Duclos, Mlle. Delaunay, and St. Simon, whose *Mémoires* have gained a deserved celebrity; Barthélemy, who wrote the *Voyage du jeune Anacharsis en Grèce*; Rulhière, a historical essayist; Prévost, who produced the novel of *Manon Lescaut*; Marmontel, the author of *Bélisaire*; and Lebrun, the lyric poet. The age was not poetical; poetry had degenerated into verse-making, and the verse-makers, in imitation of Thomson's "Seasons," indulged in all sorts of descriptive pieces. Delille, the most skilful of them, gained a reputation by translating, not without a certain degree of accuracy, the "Georgics" of Virgil. Toward the end of the century imitation was the order of the day, and the only poet who was gifted with originality, André Chénier, died on the scaffold before his best effusions were published.—Neither the revolution nor the empire was favorable to literature. Some tragedies after the classical pattern, among which those of Joseph Chénier may be mentioned, a few light comedies, beside novels and short poems, were not sufficient to relieve the general dulness. Mme. de Staël and Châteaubriand were the forerunners of a revival, but the improvement was perhaps owing less to the *Corinne* and *L'Allemagne* of the former, *Le génie du Christianisme* and *Les martyrs* of the latter, than to the influence upon the public taste of the masterpieces of English and German literature, which found more and more admirers in France. The romantic school now inaugurated a new era. Through the exertions of many young and original writers new life was infused into nearly every branch of literature, poetry, history, philosophy, and the drama. An animated controversy was maintained in pamphlets and periodicals, between the supporters of reform and the adherents of the classical school; but the contest reached its utmost fury when Alexandre Dumas, Victor Hugo, Alfred de Vigny, Frédéric Soulié, and others produced on the stage dramas framed according to their own ideas of the Shakesperian style. The performances of these dramas were indeed regular battles between the opposing literary parties; and it was only at the end of several years that the younger body of combatants came out victorious. Among the plays which were thus received with both enthusiasm and censure, *Henri III. et sa cour*, *Antony*, *Tereza*, and *Angèle*, by Dumas, *Hernani*, *Marion Delorme*, *Lucrece Borgia*, and *Le roi s'amuse*, by Hugo, are still remembered; while numberless pieces, successful at the time, have since fallen into complete oblivion. In fact, the only gain resulting from this protracted dispute was the abrogation of the obsolete rules which had so long regulated the French stage. A reactionary movement was attempted when the illustrious actress Rachel appeared with such striking effect in the tragedies of Corneille and Racine. Ponsard and Latour St. Ybars returned to the old form of tragedy; but the *Lucrece* of the former and the *Virginie* of the latter enjoyed but ephemeral success, while the "School

of Good Sense," as the adherents of this movement were styled, reckons only a few light comedies by Émile Augier. This school had been preceded in the tragic line by Casimir Delavigne, who, gradually deviating from the classical model, attempted to reconcile the classic and the romantic systems, in his *Marino Faliero*, *Les enfants d'Édouard*, and *Louis XI*. Meanwhile Eugène Scribe, who never gave a thought to this literary quarrel, was day by day increasing his enormous stock of successful comedies, or rather vaudevilles, on a larger or smaller scale. Novels, which, with the exception of De Vigny's *Cinq-Mars*, had been scarcely noticed during the excitement of dramatic reform, became the rage as soon as this was on the point of being accomplished. George Sand (Mme. Dudevant) acquired reputation by her *Indiana* (1832), and subsequently established her claim to be considered the most admirable stylist of her time by her subsequent performances, *Valentine*, *Lélia*, *Jacques*, *André*, *Simon*, *Mauprat*, *Consuelo*, *Le champi*, *La mare au diable*, *La petite Fadette*, *La filleule*, and *L'homme de neige*. Alexandre Dumas, the inexhaustible story-teller, has won unequalled popularity by his *Trois mousquetaires*, *Vingt ans après*, *Le vicomte de Bragelonne*, *Le comte de Monte Christo*, *Joseph Balsamo*, *Le collier de la reine*, *Ange Pitou*, *La comtesse de Charny*, and other recitals, in all filling hundreds of volumes. Eugène Sue also had his days of glory, when *Les mystères de Paris*, *Le Juif errant*, and *Martin l'enfant trouvé* depicted with glaring colors the secret and most shameful miseries of society. Honoré de Balzac undertook to present, under the title of *La comédie humaine*, a daguerreotype of every aspect of French society during his time; this immense work was interrupted by death; but some parts of it, complete in themselves, are invaluable for depth of observation and acuteness of delineation: *Eugénie Grandet*, *Le Père Goriot*, *La recherche de l'absolu*, *Le contrat de mariage*, *Modeste Mignon*, *Les parents pauvres*, *Les scènes de la vie privée*, &c. Frédéric Soulié, who, although his popularity is not as great, is nearly the equal of those we have just named, evinced uncommon talents in his historical novels of southern France, among which *Le vicomte de Béziers* specially deserves to be mentioned. Still greater power characterized his pictures from the social world: *La lionne*, *La comtesse de Montrion*, *Diane et Louise*, *Le lion amoureux*, and *Les mémoires du diable*. Alphonse Karr in his *Sous les tilleuls*, *Midi à quatorze heures*, *Geneviève*, *Clotilde*, and numerous short tales, has given unrivalled specimens of good sense, fine feeling, and genuine humor. By the originality, delicacy of style, and charm of fancy which Alfred de Musset displayed in his *nouvelles*, such as *Frédéric et Bernerette*, *Emmeline*, *Les deux maîtresses*, *Le fils du Titien*, and *Mimi Pinson*, he is entitled to a high rank as a novelist. Such is also the case with Prosper Mérimée, whose *Chronique du temps du Charles IX.*, *Colomba*, *Le case Etrusque*, and *Arsène Guillot* are gems of their kind. Beside

these masters of novel-writing we can merely mention their contemporaries, Mme. Charles Reybaud, Mme. Émile de Girardin, Théophile Gautier, Jules Sandeau, Émile Souvestre, Paul Féval, and Méry. A new generation of story-tellers has been rising within the last few years, whose powers are scarcely to be compared with their predecessors, but who, nevertheless, are not devoid of talent. Some of them belong to what they themselves call the "realist school." They are Henri Murger, Alexandre Dumas *fils*, Champfleury, Ernest Feydeau, and Gustave Flaubert. Octave Feuillet, the successful author of *Le roman d'un jeune homme pauvre*, and Edmond About deserve to be mentioned. Poetry is far from being as popular in France as the novel, and poets have been and are still very slightly regarded by the public; but four of them have such claims to admiration as to be dear even to the least poetical minds; these are Béranger, Lamartine, Victor Hugo, and Alfred de Musset. The first named, who wrote nothing but songs, is at once the most national and the most popular of all, as well as the best known in foreign countries. Although song-makers are numerous in France, there is only one who deserves to be mentioned after Béranger; this is Pierre Dupont, who, however, stands far behind his master. Lamartine, whose effusions present a happy combination of harmony, human feeling, and religious sentiment, is the great favorite of all minds that incline to sentimentality and reverie. His *Méditations*, *Harmonies*, and *Recueils poétiques*, his *Jocelyn* and *Chute d'un ange*, have left many vestiges in the memory of his contemporaries, and are still read, admired, and learned by heart. His friend and rival, Victor Hugo, perhaps his superior in point of strength and variety, though not gifted with the same graceful charm, has written more voluminously. His *Odes et ballades*, *Orientales*, *Feuilles d'automne*, *Chants du crépuscule*, *Voix intérieures*, *Les rayons et les ombres*, and *Contemplations*, are poems of sentiment and fancy; while his *Châtiments* are bitter satires against Napoleon III. and his associates. Alfred de Musset, the most independent, and perhaps the most original, of the four, has published only two small volumes under the modest appellation of *Poésies*. His fame among the literary fraternity was great from his first appearance; his popularity is still gaining ground, but has scarcely extended beyond the limits of France. Among the many other poets Casimir Delavigne, whose *Messéniennes* rivalled for a while the success of Lamartine's *Méditations*, and Auguste Barbier, the nervous author of the *Jambes*, must not be forgotten. Of the more recent poets, the only one who can be classed in the same category is Victor de La Prade, whose elegant productions have been rewarded by his election to the French academy.—History is undoubtedly the most successful branch of modern French literature. A larger number of valuable historical works have been published within the last 35 years than during any

other equal period of time; and the taste for such performances is still on the increase. M. Guizot, the great philosophical expounder of social institutions and moral revolutions, and Augustin Thierry, the artistic historian of the middle ages, stand foremost among the promoters of this historical movement. The *Essais sur l'histoire de France*, by the former, the *Histoire de la civilisation en Europe et en France*, which he wrote before engaging actively in political life, and his *Histoire de la révolution d'Angleterre*, which he has completed since he left the ministry in 1848, are monuments of philosophical history; while the *Lettres sur l'histoire de France* of Thierry, his *Histoire de la conquête de l'Angleterre par les Normands*, his *Récits des temps Mérovingiens*, and his *Histoire de la formation du tiers-état en France*, present a happy combination of dramatic narrative and perspicuous discrimination. Three writers have devoted their efforts to a full recital of the general history of France: Sismondi, whose voluminous work is an inexhaustible mine of knowledge and thorough research; Michelet, who combines the profound learning of a Benedictine monk with the humorous fancy of a poet; and last but not least, Henri Martin, who, under the impulse of patriotic enthusiasm, has successfully embodied in his book the results of modern science, while infusing into its pages a lively and never slackening interest. De Baze, after giving (1824) in his *Histoire des ducs de Bourgogne* an attractive specimen of purely narrative history, has recently published histories of the French convention and of the directory, in which his monarchical predilections are strongly apparent. The revolutionary period has engaged the attention of many historians, among whom the most prominent are Thiers, Mignet, Michelet, and Louis Blanc. The first of the four, by his *Histoire de la révolution*, at once gained a well-deserved popularity, which gave him an introduction into political life; he is now completing his *Histoire du consulat et de l'empire*, which places him in a still higher rank as a writer and publicist. The histories of Michelet and Louis Blanc are marked with strong democratic opinions; while that of Mignet, a vivid yet substantial sketch, bears the impress of philosophical impartiality. This writer has also produced several miscellaneous historical works which are highly valued: *Histoire de Marie Stuart*, *Charles Quint, son abdication et sa mort*, *Philippe II. et Antonio Perez*, and a large compilation, *Histoire des négociations relatives à la succession d'Espagne*, containing beautiful narratives, preceded by an admirable introduction. Lamartine also figures among the historians: his *Histoire des Girondins*, which appeared in 1847, created a deep sensation by its magnificent style and enthusiastic spirit. He has since published the *Histoire des constituants*, *Histoire de la restauration*, *Histoire de Turquie*, &c., more remarkable for showy eloquence than soundness and accuracy, as he too often contents himself with clothing

in splendid language the researches of others. Such is not the case with A. de Vaulabelle, the author of an excellent *Histoire de la restauration* (1814-1880), deserving of more fame than it has gained. Great historical publications are in progress under the patronage of the government or of learned societies, the *Collection des historiens de France*, and the *Histoire littéraire de la France*, among the number. An association of professors and learned men, under the direction of Duruy, are publishing a *Histoire universelle*, adapted to the wants of the general reader; that is, a series of special histories compressed within the limits of one or two volumes, and bringing the annals of all nations to about the date of their publication. Villemain ought to be reckoned among the historians, not only for his *Histoire de Cromwell*, but above all for the admirable pictures of men and society in his excellent *Tableaux de la littérature* in the 18th century and the middle ages, and his *Souvenirs contemporains*. As a lecturer and a critic no man has contributed more to the diffusion of enlarged literary doctrines, healthy principles, and good taste.—Archæology has not been neglected, as is evidenced by the works of Letrone, Raoul-Rochette, and more recently by those of Beulé, *L'Acropole d'Athènes* and *Études sur le Péloponnèse*. Champollion threw new light upon ancient Egypt by his system of deciphering hieroglyphics. The study of oriental languages, promoted by Sylvestre de Sacy, is still successfully carried on, the most recent publications of interest being those of Ernest Renan upon the Semitic languages. The works of Abel de Rémusat have been valuable contributions to the occidental knowledge of the Chinese literature.—Moral philosophy was brought back to spiritualist principles by the natural reaction against the materialism of the preceding age. This revolution, prepared by Royer-Collard, Maine de Biran, and others, has been accomplished by Victor Cousin and his disciples, who, under the name of eclecticism, unfurled the banner of spiritualism. The eloquent lectures which Cousin delivered at the Sorbonne exercised a powerful influence over the rising generation; they have been printed, with corrections and considerable additions, under the title of *Cours de philosophie*, *Fragments de philosophie*, *Du vrai, du beau, et du bien*. Jouffroy and Damiron, who acknowledged him as their master, contributed to the progress of the same doctrines, which are still advocated by Cousin's younger disciples, Émile Saisset, Amédée Jacques, Vacherot, Paul Janet, Adolphe Frank, and Jules Simon. The books of the last named, *Du devoir*, *De la liberté de conscience*, and *De la liberté*, are among the most meritorious performances for healthfulness of tone, honesty of purpose, and generosity of mind. Beside the eclectic school, four philosophers of great originality and uncommon power have shone each in his own sphere, viz.: Joseph de Maistre, the blunt apologist of absolute power, in his treatise *Du pape*, and the eccentric author of the *Soirées de St. Péters-*

bourg; Bonald, who, in his *Législation primitive*, as well as his other philosophical writings, upheld the cause of monarchy and the church; Ballanche, the mystic dreamer, who, in his *Palinogénésie sociale*, attempted to represent through a series of symbolical narratives couched in a poetical style the various phases of the history of mankind; and Lamennais, who, at first a bold and independent defender of the papal power, was gradually led to become the advocate of pure democracy. His *Essai sur l'indifférence en matière de religion*, *Les paroles d'un croyant*, *Le livre du peuple*, *Une voix de prison*, and *Esquisse d'une philosophie*, show the various steps of this transformation, while they are placed among the masterpieces of French eloquence. On the publication of his first performance, he had been styled the "Christian Rousseau." The *Cours de philosophie positive* of Auguste Comte, parts of which have been reproduced in English by G. H. Lewes, Harriet Martineau, and Prof. Gillespie, offers a connected system of philosophy, embodying ideas derived from Hegel and various French socialist philosophers. Among these, St. Simon and Fourier are incontrovertibly the most conspicuous; and although their doctrines have been rejected as a whole, they have exercised a powerful influence over the present generation. Pierre Leroux is in some sort one of their disciples; and his principal work, *De l'humanité, de son principe, et de son avenir*, has commanded great attention. The historian Michelet takes rank among fanciful philosophers by his last book, *L'Amour*. The various branches of natural philosophy boast of many original and powerful writers, at the head of whom we must place Georges Cuvier, author of *Le règne animal distribué d'après son organisation*, and *Recherches sur les ossements fossiles*, with an admirable introduction entitled *Discours sur les révolutions du globe*. Cuvier's rival, Étienne Geoffroy St. Hilaire, must of course be mentioned after him. The son of the latter, Isidore, is worthy of his father, and many disciples of these great men, among whom are Duméril, Jussieu, and Alcide d'Orbigny, have been and are publishing works which expound with clearness and elegance the latest scientific discoveries. Mineralogy boasts of Élie de Beaumont, Beudant, and Dufrénoy; chemistry and physics of Thénard and Dumas, Gay-Lussac, and Despretz. French medical literature is particularly rich, from the contributions of Bichat, Broussais, Corvisart, Magendie, Trousseau, and many others. Mathematical sciences have distinguished representatives in Lagrange, Laplace, Ampère, Biot, and especially Arago, who has no equal for clearness of exposition and perspicuity of style. Among the travellers whose writings have been of most service to science or who have attracted particular attention are Freyssinet, Duperrey, Dumont d'Urville, René Caillé, Victor Jacquemont, Fontanier, and latterly Father Huc.—Many able pens have been devoted to political economy and philosophy: Michel Chevalier, whose *Lettres sur l'Amérique* have made him known in

the United States, Léon Faucher, Rossi, Adolphe Blanqui, Frédéric Bastiat, André Cochut, De Beaumont, and De Tocqueville. These last two are well known in America by their books *Du système pénitentiaire aux États Unis*, *Marie, ou l'esclavage aux États Unis*, and *De la démocratie en Amérique*. The admirable historical essays of Laferrière upon French jurisprudence must not be forgotten. The political writers who deserve to be named, even after the interest of the daily questions they treated is gone, are numerous. Among them are Armand Carrel; the model journalist, Courier, so familiarly known during his lifetime as *Paul Louis, vigneron, ex-canonnier à chétal*; Cormenin, his imitator, perhaps his equal in point of pungency and wit, though far from possessing the same classical perfection. The French essayists and literary critics are a legion. Silvestre de Sacy and St. Marc Girardin, who have both been admitted to the French academy, the former merely as a journalist, the latter on account of his versatile talents as a political writer, able critic, and elegant lecturer; Philarète Chasles, Cuvillier-Fleury, Ernest Renan, Hippolyte Rigand, Henri Taine, and finally Jules Janin, the dramatic feuilletonist. Gustave Planche and Ste. Beuve are entitled to a prominent place in this class of writers; the former is a sound and unsparing critic, in the fine arts as well as literature; the latter excels in the delineation of literary characters, and has also published a *Tableau de la poésie Française au 16^e siècle* and a history of the Port-Royalists. Charles de Rémusat and Albert de Broglie, regular contributors to the *Revue des deux mondes*, give their attention to historical matters from a philosophical or religious point of view. Théophile Gautier, Edmond About, Léon Delaborde, Vitet, Delécluse, have particularly devoted themselves to fine art criticism; Delécluse, Fétis, Hector Berlioz, Fiorentino, Scudo, to musical matters. The "chroniclers," who weekly talk of amusing events in society, and whose origin must be traced to the witty *Lettres Parisiennes*, which Mme. Girardin, under the assumed name of "Vicomte Delaunay," published in the journal *La presse*, have become a body by themselves, owing to Eugène Guinot, Jules Lecomte, Philippe Busoni, Henri de Pène, &c. Alphonse Karr, a moralist in the guise of a lively critic, in his monthly *Guêpes*, which are carefully preserved in book form, is always witty, sensible, and humorous. The literary movement which commenced with the restoration is now nearly exhausted; and although there has been no falling off in intellectual activity, the rising generation of writers do not seem on the whole to equal their predecessors.—See *Histoire littéraire de la France*, by Dom Rivet and other Benedictine monks, continued by members of the institute (22 vols. 4to., 1733–1858); *Histoire littéraire de la France avant le 12^e siècle*, by Ampère (3 vols., 1838–'40); *Tableau de la littérature au moyen âge*, by Villemain (2 vols. 12mo., last ed., 1857); *Essais sur l'histoire littéraire du 16^e siècle*, by St. Marc Gi-

rardin and Philarète Chasles (1827); *Tableau de la poésie Française au 16^e siècle*, by Ste. Beuve (1828); *Histoire de la littérature Française*, by Demogeot (new ed., 1 vol., 1857).

FRANCHI, ARSONIO, an Italian author, born in Pegli, Sardinia, in 1820. From a Roman Catholic priest he became a rationalistic philosopher, and adopted the above name, his real name being Cristoforo Bonavino. In his introduction to his principal work, *La Filosofia delle scuole Italiane* (1852), he states the ground of his conversion: "When I had examined the doctrines of the various Catholic schools, I turned to the principles of the Jansenists; next I consulted Protestant systems, interrogated the philosophy of the past century, pondered the works of modern critics touching religious symbols, and the final, indisputable, unimpeachable conclusion in which my mind found rest was this: In reason resides the supreme criterion of all truth." Mittermayer in Germany, and Michelet in France, have declared him to be the best logician and critic of modern times. The titles of his works are: *La religione del secolo XIX* (1853); *Appendice della filosofia* (1853); *Il sentimento* (1854); *Il razionalismo del popolo* (1855); *Le rationalisme* (in French, with an introduction by D. Bancet, Brussels, 1858).

FRANCHE COMTÉ (free county), or county of Burgundy, an ancient province on the E. frontier of France, bounded N. by the Faucilles, and E. by the Jura mountains, S. by Burgundy, and W. by Burgundy and Champagne. Capital, Besançon. It is drained by the Saône, Doubs, and Ain, is partly covered with forests, and contains iron and coal mines, marble quarries, and salt pits. The country was originally inhabited by the Sequani, and called Maxima Sequanorum by the Romans. In the 5th century it was occupied by the Burgundians, and then became a part of the Frankish dominions; after the disruption of the Carolingian empire it belonged to the kingdom of the two Burgundies, from which it fell to the German empire. It was then governed by its own counts, although the name of Franche Comté does not occur before the middle of the 11th century; the origin of this name is attributed to the freedom of the country from all taxes and imposts, save a certain sum granted annually to the sovereign under the title of a free gift. A little later it was also styled the palatine county of Burgundy. In 1384 it fell to the Valois house of Burgundy by the marriage of Marguerite of Flanders, who then owned it, with Philip the Bold. On the death of the last duke, Charles the Bold, it passed to the house of Austria by the marriage of his daughter Mary with the archduke Maximilian, through whose son Philip it became attached to the crown of Spain, which retained it until the latter part of the 17th century. Louis XIV. conquered it in 1674, during his war against Holland, and got definite possession of it by the treaty of Nimeguen in 1678. Franche Comté is now divided between the departments of Haute-Saône, Jura, and Doubs.

FRANCIA, FRANCESCO, whose real name was FRANCESCO RAIBOLINI, a painter of the Bolognese school, born in Bologna about 1450, died in 1517, or, according to Lanzi, in 1533. He was originally a goldsmith, and at an advanced period in life turned his attention to painting. The immediate impulse to his genius seems to have been the invitation extended by Giovanni Bentivoglio to the artists of neighboring cities to adorn his palace in Bologna. Francia, zealous to uphold the honor of Bolognese art, competed with the strangers so effectively that he was held by his countrymen, according to Vasari, "in the estimation of a god." He painted some noble works for the Bentivoglio chapel, one of which, an altarpiece with portraits of the Bentivogli, is probably as fine a specimen of his style as exists. The British national gallery a few years ago purchased for £3,500 an altarpiece from the duke of Lucca's collection. Later in life Francia attempted fresco painting, of his proficiency in which he has left a notable example in the series illustrating the life of St. Cecilia, which are now unfortunately hastening to decay. His style partakes of the characteristics of Perugino and G. Bellini.

FRANCIA, JOSÉ GASPAR RODRIGUEZ, commonly called Dr. Francia, dictator of Paraguay, born there about 1757, died in Assumption, Sept. 20, 1840. He boasted that he was of French extraction, but his father is supposed to have been born in Brazil, of Portuguese descent, and to have emigrated to Paraguay as an agriculturist along with other settlers. His mother was a creole woman. He was destined for the priesthood, studied at the university of Cordova de Tucuman, was graduated as a doctor of divinity or of canon law, officiated for a short time as professor of theology, afterward applied himself successfully to the practice of the law, and gaining a reputation for ability and rectitude, he was appointed to several public offices, including that of first alcalde or mayor of Assumption. After the declaration of independence of the Paraguayans in 1811, he became the secretary of the revolutionary junta, which, beside him, consisted of two assessors and a president, Don Fulgencio Yegros. The latter and Francia were in 1813 appointed joint consuls for one year, but Francia was the moving spirit of the government. At his instigation the consulship was abolished in 1814, and he was made dictator for 3 years, at the end of which he contrived to secure his election as dictator for life. He combined in his own person the executive and the administrative powers of the government. He monopolized the cultivation of Paraguay tea, and of other products of the country, but husbanded the national resources with great sagacity, gave a powerful impulse to the rearing of horses and cattle and to the cultivation of rice and grain, and established a standing army and guard houses along the frontiers, to protect the people against attacks from the Indians. He devised a code of laws, promoted education, checked the abuses of the clergy,

improved the appearance of the capital, and while neighboring states were in anarchy, he secured for Paraguay a comparative degree of tranquillity. He peremptorily declined all intercourse with other South American states, and almost all foreign nations, and detained all foreigners who set foot in the country. No export or import trade was allowed without the dictator's license, and death awaited those who were discovered in the act of leaving the country without his special permission. Those opposed to his rule were either shot or imprisoned. The principal victims of his administration were peculating officials, corrupt priests, and persons generally who endeavored to enrich themselves at the public expense. He was humane toward the poor, and cruel toward their oppressors, and professed to be impelled to rigorous measures by a sense of justice. He was most unrelenting toward those who were accused of a conspiracy against his life. Gen. Ramirez of Entre Rios was supposed to contemplate an invasion of Paraguay (1819). A letter from him to Yegros, Francia's former associate in the consulate, fell into the latter's hands. Yegros was charged with plotting against the country, and, with upward of 40 others, was put to death, and about 300 persons were imprisoned for 18 months, when they were only released upon the payment of a large ransom. Some of Francia's prisoners were subjected to the most cruel tortures, and the delight which he seemed to find in inflicting torment gave rise to the belief that, like some of his brothers, he was occasionally deranged. In his habits of life, too, he was peculiar. After having been fond of gambling and social and sensual enjoyments, he led a life of the utmost retirement, and Paraguay was not more isolated from the rest of the world than he from the rest of mankind. He resided in the palace of the former governors of Paraguay, attended by 4 slaves. His barber, a mulatto, was his principal channel of communication with the public, and a half breed named Patifios was his principal secretary. After the death of his master the latter was implicated in a charge of conspiracy against the government, and hung himself in prison. When riding out to inspect the public works and the barracks, Francia was accompanied by a strong escort, and armed with a sabre and a pair of double-barrelled pocket pistols. Especially toward the end of his reign he was in constant fear of assassination. He remained a bachelor until the 70th year of his age, when he was reported to have married a young French woman. He was a man of remarkable physiognomy, with dark, piercing eyes, and of great mental powers, which he cultivated by study and reading. He was especially fond of the French literature of the 18th century, and an admirer both of Robespierre and Napoleon. The anecdotes of his eccentricities were almost as numerous as the reports of his cruelties. Yet his death was deplored as a public calamity, and the people seemed to recognize in him a friend and

a benefactor. His reputation as the tyrant of Paraguay was particularly aggravated in Europe by his treatment of Bonpland, whom he detained for 10 years, and by the accounts given of him by other persons whom he had interfered with. Among these were two Swiss surgeons, Rengger and Longchamp, who were detained by him from 1819 to 1825. On their return they related their observations, and at the same time expressed their dislike of Francia, in an *Essai historique sur la révolution de Paraguay et le gouvernement dictatorial du docteur Francia* (Paris, 1827). Two young Scotchmen, I. P. and W. P. Robertson, who went to Paraguay on a commercial venture, were turned out of the country by the dictator, and they gave appalling accounts of his administration in 3 works: "Letters on Paraguay" (2 vols., 2d. ed., London, 1839), "Francia's Reign of Terror" (London, 1839), and "Letters on South America" (3 vols., London, 1843). A graphic sketch of his life and character was given by Thomas Carlyle in an article in the "Edinburgh Review" (1843), in which the dictator is greatly lauded for his eccentric and ruthless energy and justice.

FRANCIS I., king of France, son of Charles, count of Angoulême (cousin german of Louis XII.), and Louisa of Savoy, born at Cognac, Sept. 12, 1494, died at Rambouillet, March 31, 1547. He married Claude, daughter of Louis XII., in 1514, and succeeded him as nearest heir, Jan. 1, 1515. Louis was meditating the reconquest of the Milanese (which he claimed as heir of his grandmother, Valentina Visconti) at the moment of his death; and the youthful king, having renewed his predecessor's treaty with England, immediately turned his eyes in the same direction, and with an army of about 40,000 crossed the Alps by passes previously considered impracticable. The Swiss army employed by the duke of Milan to defend the foot of the Alps was driven back, but being joined by reinforcements gave him battle at Marignano (Melegnano), 10 m. S. E. from Milan, Sept. 18, 1515. It was a fierce contest, since called the battle of the giants; and though the Swiss had only infantry to oppose to the finest cavalry in Europe, the sturdy mountaineers retired only on the second day with a loss of 12,000. Francis had lost 8,000 of his best troops, but he had displayed extraordinary generalship and valor; and his name became at once the most distinguished in Europe. In the chivalric spirit of the age he accepted knighthood on the spot from the chevalier Bayard, whose final charge had completed the victory. Peace was concluded with the Swiss and a concordat with the pope; and Francis, master of Milan, returned in triumph to Paris. In 1517 he made a treaty of friendship and of alliance against the Turks with the emperor Maximilian and Charles I. of Spain. Maximilian died in Jan. 1519, and Francis became a competitor with Charles I., afterward so famous under the title of Charles V. of Germany, for the imperial sceptre. Charles

prevailed in the electoral council in consequence of a recommendation of Frederic the Wise, duke of Saxony, and Francis betrayed the passions natural to disappointed ambition. His chagrin forced from him expressions of disparagement of his successful rival, which were resented; and from this jealousy, as much as from conflicting interests, arose that hostility between these princes which kept Europe in turmoil during their reigns. It was easy to find causes of strife; Italy and Navarre afforded them abundantly. But before engaging in war, each strove to gain to his interests the English king Henry VIII., who obviously held the balance in his hand. Charles hastened to pay this monarch a personal visit at Dover as he passed from Spain to his dominions in the Netherlands, and forgot not at the same time to secure the influence of Cardinal Wolsey by a virtual promise of the papacy. Francis invited the English king to France, where, by a splendid hospitality, he hoped to gain both the cardinal and his master. The sumptuous interview took place in the plain between Guines and Ardres, which history commemorates as the field of the cloth of gold (1520). Unprecedented magnificence, feats of chivalry, and gallant exercises of every description, occupied the two courts. The kings themselves, according to Fleuranges, had a personal wrestling match, in private. Francis easily overthrew his antagonist, but by his frank and generous bearing failed not to win the friendship of his royal brother. Henry, however, flattered by the wily Charles, whose visit he returned after his conference with Francis, was easily secured to the interest of the emperor, and declared that he wished to remain impartial, but should pronounce against the aggressor. The French king began hostilities by seizing Navarre. His troops also invaded Spain, but were routed and chased beyond Navarre. Charles attempted to enter France from the north. He was repelled at Mézières by the chevalier Bayard, and Francis marched into the Low Countries. By some strange over cautiousness he lost an opportunity of cutting off the whole imperial army. Meanwhile Cardinal Wolsey effected a league between his sovereign, the emperor, and the pope, against Francis. A papal army, under Prosper Colonna, seized Milan, and dispossessed the French of all their Italian conquests, except the fortress of Cremona. Francis, in the midst of these disasters, received from Henry of England a declaration of war (May 29, 1522). Undaunted, however, although his treasury was utterly exhausted, he succeeded in putting the kingdom in a state of defence. The constable de Bourbon, at this crisis, rejecting the queen mother's invitation to marriage, and robbed by the incensed woman, through legal chicanery, of his family estate, not only offered his sword to the emperor, but proposed to incite a rebellion in France. The conspiracy was discovered, and Bourbon fled; but Francis, uncertain of its extent, was compelled to abandon his bold plan

of carrying the war into Italy. He nevertheless despatched an army of 80,000 men, under Bonnivet, against Milan, which failed through the incapacity of the commanding general. Bourbon principally conducted the imperial operations in this quarter, and in conjunction with Pescara (1524) drove the French, after a rout at Biagrossa, into their own country. The retreat was fatal to the chevalier Bayard, who, strange to say, after having saved France at Mézières, was nevertheless subordinate to Bonnivet. The imperialists entered Provence. Francis hastened in person to relieve Marseilles, carried all before him, pursued the enemy again into Piedmont, and laid siege to Pavia. He was here defeated in a great battle, Feb. 24, 1525. His Swiss allies fled; and Francis, unhorsed, after fighting foremost in his brave army, and killing with his own hand 7 of the enemy, at length yielded his sword to the Neapolitan viceroy Lannoy, who received it on his knees, and was hurried a prisoner to Madrid. *Tout est perdu, fors l'honneur*, he had written to his mother from the field; but it is a question with historians whether the honor there saved was not lost at the Spanish capital. Europe was filled with alarm. The emperor's unworthy behavior to his gallant captive, far less, however, than his growing power and ambition, roused the animosity of Henry of England, who now declared for France, and demanded the liberation of the king, as did also Rome, Venice, Florence, and Genoa. But the emperor insisted on large cessions of territory, the restoration of Bourbon to all his rights, the marriage of Francis with Charles's sister Eleanor, queen dowager of Portugal, and the delivery of his two eldest sons as hostages for his good faith. Francis at last signed a treaty on these conditions, but at the same time caused a secret protest against them to be drawn up, and was liberated March 17, 1526, his sons taking his place at Madrid. He at once demanded and obtained from the pope absolution from his oath to fulfil the treaty, and, gracefully thanking the English king for his sympathy and alliance, sent forth armies again to Italy. If, say French historians, he was guilty of perjury, then was every man in France his accomplice. Charles, overreached, and now opposed by all Italy as well as France and England, sent Bourbon with an army of mercenaries against the pope. Rome was sacked with unparalleled barbarity, and the pope was imprisoned. A French army, meanwhile, under Lautrec, hastened to avenge the insulted pontiff, but after a series of triumphs was destroyed by disease before Naples. Peace, an obvious necessity for all the belligerents, was concluded at Cambrai by the mother of Francis and the aunt of Charles (Margaret of Austria) in July, 1529. The king of France retained Burgundy, surrendered his Italian claims, and paid 2,000,000 crowns ransom for his sons. The French courtiers vied with each other in supplying the ransom money. Francis at the same time married Queen Eleanor; but

no pledges could secure peace. In 1538 the duke of Milan put to death an agent of the king of France, charged with murder. Seizing this as a pretext for war, Francis took up arms again, and in 1535 overran Savoy. Charles in the spring of 1536 marched upon Provence, and the French troops hurried again to the defence of that region. Charles lost half his army through famine and disease, the country having been laid waste purposely by the French commander, and with the remainder fled before the light troops of the province. At the same time the prince of Nassau, who had invaded the north of France, was compelled to retreat. Soon after these events, the eldest son of Francis died, poisoned. The crime was laid to the charge of the emperor, probably without any foundation; but the circumstance carried the exasperation of the two sovereigns to the extreme of decency. Francis attacked the Low Countries, and even formed an offensive alliance with the Turkish sultan Solymán; but the pope and the queen of Hungary interposing with offers of mediation, a truce of 10 years was concluded at Nice (1538). The rivals exchanged visits and embraced; and on the occasion of a second visit Charles promised to invest a son of the French king with the sovereignty of Milan, but the promise was never fulfilled, Charles giving the duchy instead to his son Philip. War again broke out in 1542, and Francis sent 5 armies against various quarters of the imperial dominions, and gained a great battle at Cerisolles (1544), but without important consequences. After a short and bootless invasion of France by Henry VIII. and Charles in alliance, peace was again concluded; and no further military events took place during the reign. The king's health had been hopelessly ruined some years before in consequence of one of his many amours, and death at length ensued. Francis was an unhesitating libertine, though during the latter years of his life his attention was given to wiser thoughts; and notwithstanding his vices and his cruelty to the Protestants, admiration cannot be withheld from many gallant and noble traits of character, which might have been blessings to his country had he been content with any other than military glory. He introduced into France striking improvements of art and learning. He was gifted with remarkable elegance and grace. In youth he was the *magnus Apollo* of his comrades, "the courtier's, scholar's, soldier's eye, tongue, sword." Of his munificence many monuments remain; as the imperial library of Paris, the imperial college, the original Louvre, Fontainebleau, and Chambord. By his first wife he had 7 children; by the second none. To his son Henry II. he bequeathed a treasury with a surplus of 400,000 crowns.

FRANCIS II., king of France, born in Fontainebleau, Jan. 19, 1548, died in Orleans, Dec. 5, 1560. He was the eldest son of Henry II. and Catharine de' Medici. His father, more brave than wise, more devoted to amours and chival-

ric amusements than to the management of affairs of state, had yet succeeded in obtaining some important advantages over the emperor Charles V. and the house of Spain, and in terminating favorably a long series of wars, chiefly in Italy and the Netherlands, against the growing might of that house. Henry died in 1559 of a wound accidentally received in a tournament. Francis, then a boy of 16 years, possessed of neither character, strength, nor talent, succeeded to the throne. He had already married the daughter of James V. of Scotland, the beautiful and afterward unhappy Mary Stuart. Her influence gave the reins of government to her uncles, Francis duke of Guise, and the cardinal of Lorraine. The arrogant sway of these two ambitious and unscrupulous princes alarmed and irritated the princes of the blood, Anthony king of Navarre, and his brother Louis of Condé, who became the leaders of a Protestant party in opposition to the court. Every thing concurred to produce civil commotion. Protestantism had penetrated, in the form of Calvinism, into France. Its spirit suited that of the feudal nobility, and the profligacy and corruption introduced by the Italian Medicis into the court and manners of France, and the influence of strangers, disposed the people to rebellion. It was by secret plots, however, rather than by open revolt, that the Protestant princes tried to wrest power from the hands of the Guises. Assisted by the duke of Montmorency, La Renaudie, and others, they framed the conspiracy of Amboise, in which they agreed to enter that place on a certain day in detached parties, to massacre the Guises, and seize the person of the king. But the plot was denounced almost at the moment of execution, by two Protestants; the duke of Guise secretly assembled a body of troops, and cut to pieces the forces of the conspirators as they were entering the city. His triumph was stained with barbarous cruelty, and the waters of the Loire were colored with the blood of those who fell in combat or perished on the scaffold. The court was depraved or bigoted enough to gaze at the executions, as scenes of public festivity, from platforms and the windows of the castle. Arrests and executions throughout the country followed. The duke of Guise was made lieutenant-general of the kingdom. The axe was brought into play to stifle the opposition of the princes, and the inquisition was set up to repress Calvinism. A royal edict made the bishops, instead of the parliaments, judges of heresy; the chancellor De l'Hôpital gave his consent, led by reasons of humanity and caution, and having sufficient proof of the persecuting spirit of the parliaments. But at the same time, and for the same reasons, he urged the calling of a general, or, if the pope refused, of a national council, to pacify the church and France. The princes of Lorraine, desirous of completing their victory by the death of Condé, convened the states-general at Orleans. Condé had tried to dissemble his mortification after the failure of Amboise, and was now impru-

death enough to appear. He was arrested, tried, and soon condemned to die as a traitor. The death of Francis, however, saved his life, and restored him to the leadership of the Huguenots. The young king had long suffered from an abscess in his ear, and died after a reign of 17 months, so suddenly that rumors of poison, now regarded as unfounded, spread, and were believed throughout the country; the more easily, as assassination was becoming fashionable in France, and the queen mother was renowned for her love of alchemy and the use of poisons. Francis bequeathed to his brother and successor, Charles IX., then a boy of 10 years of age, a treasury loaded with debt, and a state full of the elements of civil war. The regency was intrusted to Catharine de' Medici, whose intrigues fostered the flame of civil and religious dissensions.

FRANÇOIS I. (SWITZER), emperor of Germany, born in 1708, died Aug. 18, 1765. He was the son of Leopold, duke of Lorraine, and of a niece of Louis XIV., and the great-grandson of Ferdinand III., emperor of Germany. In 1739 he succeeded his father as duke of Lorraine and Bar, but in consequence of the war of the Polish succession, in which Louis XV. took a feeble part in support of his father-in-law, Stanislas Leszczyński, the dethroned king of Poland, his duchy was exchanged for Tuscany, where the house of Medici was on the point of becoming extinct, and given to Stanislas, to revert after his death to the crown of France. Francis soon after married Maria Theresa, daughter and heiress of the emperor Charles VI. Charles appointed him generalissimo, and he fought in a successful campaign against the Turks. After the death of the last of the Medici, he went with Maria to Florence, the capital of his new dominion, and returned with her after the death of Charles, to share with her the regency, the cares, but not the prerogatives of the inherited crown. He fought for her rights in the wars which now ensued in spite of the pragmatic sanction, and which would have deprived her of her inheritance had she not been stoutly supported by her Hungarians, who swore at Presburg to die for their "king Maria Theresa," and found an ally in George II. of England. Frederic the Great of Prussia was satisfied with the glory won in the wars of Silesia, and the conquest of that province, and Charles of Bavaria, who had been chosen emperor, died in 1745. Francis could now be elected, and was acknowledged in the peace of Aix la Chapelle as emperor of Germany (1748). Being of a mild and peaceful disposition, and influenced more by personal avarice than by ambition, he promoted commerce and agriculture, particularly in Tuscany, but left the heavier cares of government to his masculine consort, who was soon again involved in a 7 years' war with Frederic. Two years after the termination of this war Francis died at Innsbruck, leaving the crown to his son Joseph II., for whom he reigned till 1780, and Tuscany to his son Leopold II.

FRANÇOIS II., emperor of Germany (I. of Austria), born in Florence, Feb. 8, 1708, died in Vienna, March 2, 1835. He was the son of the emperor Leopold II. and of Maria Louisa, daughter of Charles III., king of Spain. He was educated first at the polished and popular court of Florence, then at that of Vienna, where he had an opportunity of studying the statesmanship and reign of his uncle, Joseph II. He accompanied him in his unsuccessful campaign against the Turks, and even took the title of commander-in-chief of the army, though still a youth of 21 years, while the old and experienced general Laudon served as an assistant. After the death of Joseph (1790), Francis held the reins of the empire for a few days, till the arrival of his father from Florence, whom he followed in the next year to the convention of Platts, where the emperor and the king of Prussia formed the first coalition against revolutionary France. The short and mild reign of Leopold ended in 1792, and Francis succeeded him in his hereditary dominions, and was successively crowned king of Hungary, emperor of Germany, and king of Bohemia, but was soon surrounded with difficulties and dangers. Hungary, stripped of its constitutional privileges by the centralizing and Germanizing efforts of Joseph, and not fully appeased by the concessions of Leopold, was in a state of national excitement, and the Belgian provinces were ripe for revolt. The legislative assembly of France obliged Louis XVI. to declare war against the young king of Hungary and Bohemia in April, 1792. The victories of Dumouriez and the revolt of Belgium, the victories of Custine on the Rhine, the execution of Louis XVI., and that of the queen Marie Antoinette, the aunt of Francis, followed in rapid train. It was in vain that Clairfait obtained some advantages over the French, that Francis took the command in person, and was for a time successful, that a new and mightier coalition was formed; the armies of the republic soon drove back the allies; Francis's confederates deserted him, and in 1795 Tuscany, Sweden, Spain, and even the king of Prussia, concluded at Basel a treaty of peace with the republic, whose Italian army, now commanded by Gen. Bonaparte, conquered in the two next years the whole north of Italy. Francis himself, notwithstanding some slight advantages gained by his brother the archduke Charles over Moreau, in southern Germany, was finally forced to conclude the treaty of Campo Formio (Oct. 17, 1797), in which he sacrificed Belgium, Milan, and a Rhinish province of the empire, in exchange for Venice. Changes in France and new French aggressions tempted Austria, Russia, and England to another war. The allied armies were successful for a while under the archduke Charles in Germany, under Hotze in Switzerland, and under Kray and Suwaroff in Italy. But reverses came; Suwaroff was recalled by his emperor, and Bonaparte, returning from Egypt, became master of France by a coup d'état, and of Italy by the passage of

the Alps and the battle of Marengo (June 14, 1800), while Moreau fought his way through southern Germany toward Vienna. These disasters compelled Francis to the peace of Luneville, by which he lost a portion of Germany and acquired a portion of Italy. England made peace with France at Amiens, but broke it again, and framed a new coalition, in which the emperors Francis and Alexander and the king of Sweden took part, while Prussia remained neutral, and Bavaria, Würtemberg, and Baden were ready to side with the French. Francis expected the first attack from Italy, and sent thither his brother Charles, who gained a battle over Masséna; but Napoleon broke through Germany, and his sudden marches, the surrender of Ulm with its 24,000 men under Mack, the retreat of the archduke Ferdinand, and the great battle of Austerlitz (Dec. 2, 1805), in which the two allied emperors were present, made him the dictator of the treaty concluded at Presburg, in which Francis lost the Tyrol, Venice, and 3,000,000 subjects, and received only Salzburg. The electors of Bavaria and Würtemberg now took the title of kings as a reward for their support of the victor; the confederation of the Rhine was founded under Napoleon's protectorate, and the French ambassadors declared that they no longer recognized a German empire or a German constitution. Francis, who had already assumed the title of hereditary emperor of Austria, solemnly laid down that of emperor of Germany in Aug. 1806. But Napoleon, having crushed Prussia, Portugal, and Italy, threatened Austria again. Francis armed the ancient German militia, and resorted to the general rising of the Hungarian nobles. Three brothers of the emperor were sent with armies across the German, Italian, and Polish frontiers; but Austria stood this time alone, while Napoleon was assisted by Poles, Russians, and Germans. With the exception of the battle of Aspern and Essling, May 21 and 22, 1809, in which Napoleon suffered his first defeat, the whole campaign in Germany was a series of French victories. The Austrians were forced to evacuate Vienna, driven from Poland, and signally defeated at Wagram; the Hungarian nobles were dispersed, and a rising of the Tyrolese in favor of Austria proved abortive. The peace of Schönbrunn cost Francis some rich provinces, and more than 3,500,000 subjects. The resources of his empire were exhausted, and his treasury had long been bankrupt. In this situation he consented to give his daughter Maria Louisa in marriage to Napoleon, and soon saw the title of king of Rome, once his own, bestowed upon her child. But the power as well as the presumption of Napoleon had now attained its highest pitch. In the disastrous Russian campaign of 1812 an auxiliary Austrian force occupied Poland in the French interest, but effected little. In 1813 Francis declared his neutrality, and on Napoleon's refusal to accept his mediation with Russia he joined the allies, and contributed largely to their victory at Leipsic. In the following year

he entered France with his army, and remained two months in Paris after its occupation by the allies, March 31. In June the European congress assembled at Vienna, but the brilliant festivals with which Francis entertained his guests were interrupted in March, 1815, by the news of Napoleon's return from Elba. An Austrian army now crossed the Simplon and occupied Lyons, while another marched into Italy, overthrew Murat, and restored to the old king Ferdinand the crown of Naples. On the restoration of peace after the battle of Waterloo, Francis, having ceded Belgium to the Netherlands, and acquired Lombardy and Venice, saw his empire greater than it had ever been before. His policy, developed by Metternich, became the policy of Europe. Based on a horror of revolution, and a reverence for hereditary right, it took the form of a thorough conservatism and centralization, supported by a large standing army, a secret police, strict subordination, a literary censorship, and all the measures of repression familiar to an arbitrary government. Austria was the centre of all the reactionary movements of the period following the French restoration. Monarchical congresses for the suppression of the revolutionary spirit of Germany, Spain, and Italy were held on its territory at Carlsbad in 1819, at Troppau in 1820, at Laybach in 1821, and at Verona in 1822; Austrian armies restored order in Piedmont and Naples, and Austrian influence prevailed in Spain, Portugal, and the German confederacy at Frankfurt. Francis sanctioned even the despotic rule of Turkey over Greece, and imprisoned the Greek refugee Ypselantes. He was the first to counteract in Italy the influence of the French revolution of July, 1830, and was of aid to Czar Nicholas in the Polish war of independence in 1831. It was nevertheless a constant though secret part of his policy to check the growing and threatening power of Russia. At home his chief embarrassments sprang from an exhausted treasury, enormous debts, and the uneasiness of the Italians, Hungarians, and Slavs. New loans and taxes relieved his finances; state prisons and rigorous punishments were used to crush the spirit of independence in Italy; while the diet of Presburg was appeased by reluctant concessions, and German officials kept order in Poland and Bohemia. In the promotion of industry, commerce, and the arts in the German provinces, and the advancement of German influence, he showed a wiser policy. The courts of law were reorganized, and the ancient codes were revised and modified. Francis was economical, industrious, and regular in his personal habits, popular with the Germans, but little known and less liked by his other subjects. The anticipations inspired by the reactionary measures of his government, and the attacks of the liberal press in foreign countries (for there was none in Austria), and of the Hungarian patriots in their diets and assembly assemblies, were directed less against the emperor than against his minister Metternich. His private treasury was in an incomparably better condi-

tion than that of the state, and his family was large and prosperous. The latter part of his reign was undisturbed. Of his 4 wives, princesses of Würtemberg, Sicily, Modena, and Bavaria, the second, Maria Theresa, was the mother of 13 children, among whom were Maria Louisa, wife of Napoleon I., Ferdinand, who succeeded to the throne, and Francis Charles, the father of the present emperor, Francis Joseph I.

FRANCIS JOSEPH, the reigning emperor of Austria, grandson of the preceding, eldest son of the archduke Francis Charles, and nephew of Ferdinand I., born Aug. 18, 1830. He was educated under the care of Count Bombelles, and was early inspired with ambition by his mother, the archduchess Sophia, daughter of the king of Bavaria and sister of the queens of Prussia and Saxony, a handsome, energetic, and unscrupulous woman, who possessed more influence and enterprising spirit than either the emperor himself or her husband, the heir presumptive to the throne. Like his uncle Ferdinand, he was taught to speak the various languages of his polyglot empire, and also became a skilful rider and fond of military displays, without however evincing any particular talent. Sent to Pesth in 1847 to install his cousin Stephen as palatine of Hungary, he spoke Hungarian to the assembled nobles, and even gained some popularity. This, however, was of short duration. The revolutions of 1848 having brought the Austrian empire to the brink of dissolution, his mother became the leading spirit in the counter-revolutionary plots which saved it. Francis Joseph was sent to the army of Italy, and was favorably mentioned in some reports of Gen. Radetzky. Lombardy having been reconquered by that general, Prague and Vienna subdued by Windischgrätz, and the Hungarians defeated before Vienna, it seemed to the archduchess Sophia that the moment had arrived for completing her work. Francis Joseph was declared of age, Dec. 1, 1848, at the temporary court of Olmütz, and on the following day his father resigned his right to the succession, and the emperor his crown, in favor of the youthful prince. Hungary had still to be conquered, and a constituent Austrian parliament was assembled at Kremsir. The young emperor in his inaugural proclamation promised a constitutional, progressive, and liberal reign. Its beginning was successful. The Hungarians under Görgey retreated before Windischgrätz, giving up Presburg, Raab, and finally (Jan. 5, 1849) Buda and Pesth; Guyon and Perczel were routed; Schlick was victorious in the north of Hungary. The battle of Kápolna (Feb. 26, 27), which was announced by Prince Windischgrätz as a decisive victory over the united main army of the rebels, was believed to have given the finishing blow to the revolution in Hungary. On receiving this news the emperor dissolved the Austrian parliament, ordered the arrest of its liberal members, and promulgated a new constitution of his own (*octroyirte Verfassung*), known as the

constitution of March 4. But on the very next morning the victory of Damjanics at Szolnok destroyed at once the delusions of Windischgrätz, and now the imperial army suffered defeat after defeat in Hungary and Transylvania. Radetzky, however, was again victorious over Charles Albert in Italy (March 23). To subdue Hungary foreign aid was necessary. Francis Joseph, therefore, went to Warsaw to invoke the assistance of the czar Nicholas. This was granted, and Hungary was soon invaded from every quarter. Francis Joseph himself went for some time to that country, and was present at the taking of Raab (June 28). After the fall of the revolution, its leaders who had surrendered were punished with unmitigated severity. One day (Oct. 6) witnessed the execution of Count Batthyanyi, the Hungarian Egmont, at Pesth, and of 13 generals at Arad, all of whom had voluntarily surrendered. The dungeons of the empire were filled with victims. Görgey alone was spared. Soon after the surrender of Venice (Aug. 23) and Comorn, which inaugurated the unlimited centralizing sway of the minister of the interior, Bach, Prince Felix Schwarzenberg resumed with new energy the management of foreign affairs. The revolutionary schemes of a German union apart from Austria had been defeated; now the schemes of Prussia for forming a separate union with a number of smaller German states were discomfited. In Oct. 1850, Francis Joseph mustered his south German allies at Bregenz, and in Nov. Prussia yielded to their threatening attitude. Austrian influence prevailed in restoring the ancient order in the electorate of Hesse and in Schleswig-Holstein, as well as the ancient federal diet at Frankfort. After the death of Schwarzenberg, who was succeeded by Count Buol-Schauenstein as minister of foreign affairs, Francis Joseph renewed his friendly relations with Frederic William IV. in an interview at Berlin (Dec. 1852), which was followed by a treaty of commerce (Feb. 1853). In the meanwhile absolutism was gradually reëstablished within the empire. The national guards were dissolved, the freedom of the press put down, and finally the constitution itself, which had never been in operation, abolished (Jan. 1, 1852). The unfavorable reception which the emperor met with in Hungary on a journey undertaken in the autumn of the same year proved that that country felt, as it was treated, as a conquered province. An outbreak at Milan (Feb. 6, 1853), which was suppressed by Radetzky, evinced the revolutionary spirit of Lombardy. On Feb. 18 of the same year, while walking on the public promenade of Vienna, the emperor was furiously attacked with a knife by a young Hungarian tailor, named Libényi, who had for months meditated and coolly prepared for this deed. The wound inflicted was regarded as threatening to the life, and afterward to the sight, of the monarch, who, however, slowly recovered. Libényi, who had been disarmed with difficulty, died on the gallows

protesting his fidelity to republicanism and Hungary. A few months afterward Czar Nicholas paid Francis Joseph a visit at Olmütz, but the attitude of the latter in the war in Turkey, which soon followed, and during which he concluded a treaty with the allies (Dec. 2, 1854), occupied the Danubian principalities, and concentrated a large army in Galicia, was far from satisfying either Russia or her enemies. The treaty of Paris (1856), which terminated the great struggle, was signed on the part of Austria by Buol and Hübner. The expenses of all these diplomatic and military undertakings were met by means of extravagant and often violent financial operations. In April, 1854, Francis Joseph married Elizabeth, daughter of the Bavarian duke Maximilian Joseph of Zweibrücken-Birkenfeld, who in 1855 bore him a daughter, Sophia, in 1856 another, Gisela, and in 1858 a son, Rudolph. All these family events were followed by partial and scanty political amnesties. The first born child died during a second imperial journey through Hungary, in 1857, at Buda. In October of the same year Francis Joseph received a visit at Vienna from Alexander II. of Russia, which quieted the apprehensions caused by a preceding interview of the same monarch with Napoleon III. at Stuttgart. While Austrian diplomacy was thus successful in its various operations, it was most effectually active in Italy. A concordat concluded with the see of Rome (1855), which conferred extraordinary rights upon the Roman Catholic bishops and the Jesuits, and private treaties with Tuscany, Parma, and Modena, made Austrian influence predominant in the peninsula. Beyond the Po, Austria held the important military positions of Ancona and Piacenza. To counterbalance this state of things, Sardinia strengthened herself by increasing her army, by enlisting the sympathies as well as the refugees of the other Italian states, and finally by an alliance with Napoleon III. On New Year's day, 1859, the emperor Napoleon declared to the diplomatic corps in Paris his dissatisfaction with the Italian policy of Francis Joseph, and his few words were understood by Austria as a threat, if not as a declaration of war. On both sides the most active preparations for a great struggle began. Napoleon demanded from Austria the surrender of her private treaties with the Italian states, and the evacuation of all non-Austrian territories in Italy; Austria demanded from Sardinia a disarmament and the expulsion of the refugees. None of these demands was agreed to. The alarmed English ministry in vain offered its mediation. The proposition to call a European congress, made by Russia, was agreed to by Napoleon, but rejected by Francis Joseph, who objected to the admission of Sardinia in the congress. Austrian reinforcements were pouring into Lombardy; French troops began to cross the Alps, and to sail from Marseilles for Genoa. At this juncture Francis Joseph surprised the world by sending an ultimatum to

Sardinia, April 19, granting but 8 days for a compliance with his conditions, and by the commencement of hostilities immediately following its rejection. The Austrians, under Count Gyulai, crossed the Ticino (April 26, 27), and occupied the N. E. provinces of Piedmont as far as the Dora Baltea, while their left wing was advanced as far as Bobbio on the Trebbia. They thus threatened both Turin and Genoa; but every thing soon took an unfavorable turn for them. On the very first day of the war a bloodless revolution broke out at Florence, in consequence of which the grand duke left Tuscany, and the country was placed under the military dictatorship of Victor Emanuel, the king of Sardinia. Similar movements soon after drove the duke of Modena and the duchess of Parma into exile. The overflowing tributaries of the Po, and probably want of decision, prevented a bold stroke against the Sardinians before the approach of the French and the arrival of their emperor. After the first vigorous repulse suffered from the French at Montebello (May 20), the Austrians gave up the offensive, retiring toward the Ticino and Piacenza. The allied armies closely followed, commanded by the respective monarchs in person. Victor Emanuel, on the left, crossed the Sesia, and won the battle of Palestro (May 31); Garibaldi at the head of a troop of volunteers was allowed to enter Lombardy, and to rouse the mountaineers of the lake region; while, masked by a false display on the right, Napoleon transferred the main bulk of his army behind the line of the Sardinians to the banks of the Ticino, which he crossed at Turbigo and Buffalora (June 3), before the Austrian commanders perceived their mistake. Recrossing the Ticino in haste, but too late, they threw themselves unsuccessfully upon Buffalora, and suffered the first great defeat at Magenta (June 4). Francis Joseph, arriving from Vienna, reached his army after the evacuation of Milan (June 5). A general retreat was now begun, interrupted only by the battle and defeat at Melegnano (June 8). Piacenza and Pizzighettone with their fortifications, the lines of the Oglio and Chiese, as well as Ancona and Bologna, were given up without a blow. Lombardy, Parma, and Modena proclaimed their annexation to Piedmont. Arrived on the banks of the Mincio, the retreating army once more turned against the closely following enemy, and Francis Joseph, having dismissed Gen. Gyulai, held the chief command in person in the great battle of Solferino (June 24), in which nearly half a million of combatants were engaged for a whole day, on a line extending from the lake of Garda to the vicinity of the Po. The victory of the allies was, as in every preceding battle, dearly purchased, but it conquered the line of the Mincio. Francis Joseph retired to Verona, followed by his army, and soon after by that of the allies. The armies were in sight of each other; the French fleet was threatening Zara, Fiume, and Venice, Kosuth preparing to revolutionize Hungary, Prus-

sia mobilizing her armies, apparently in favor of Austria, when a sudden armistice, and immediately preliminaries of peace, were concluded between the two emperors, the latter at a personal interview in Villafranca (July 11). This treaty gave Lombardy as far as the Mincio to Sardinia, leaving the 4 great fortresses of Mantua, Peschiera, Verona, and Legnano in the possession of Austria. It also provided that Italy should be reorganized as a confederacy of states under the honorary presidency of the pope. Before leaving Verona for his capital (July 14) Francis Joseph published an order of the day, in which he throws the blame of his defeat on the standing aloof of his natural allies, and expresses his confidence in the devotedness of the army if any new struggle should arise. A conference for the final settlement of the new treaty was held in Zürich immediately afterward.

FRANCIS, JOHN WAKEFIELD, an American physician and author, born in New York, Nov. 17, 1789. His father was a German who emigrated to this country soon after the peace of 1783, and his mother a Philadelphia lady of Swiss family. In his youth he was for some time in the printing establishment of George Long. Subsequently, however, having been carefully prepared by the Rev. George Strebeck, and the Rev. John Conroy, of Trinity college, Dublin, he entered an advanced class at Columbia college, and about the same time (1807) began to study medicine under Dr. Hosack. He was graduated A.B. in 1809, and M.D. by the college of physicians and surgeons in 1811, being the first person upon whom a degree was conferred by the latter institution. A few months afterward Dr. Hosack offered his young pupil a partnership, and the connection thus formed, extending not merely to professional, but also to literary and other pursuits, lasted until 1820. In 1810, while yet a student, he issued, in conjunction with Dr. Hosack, the prospectus of the "American Medical and Philosophical Register," which was published quarterly and continued for 4 years. In 1813 Dr. Francis was appointed lecturer on the institutes of medicine and materia medica at the college of physicians and surgeons, and soon afterward, the medical faculty of Columbia college having been consolidated with that institution, he received the chair of materia medica in the united body. He would accept no fees for his first course of lectures, fearing lest the increased expenses of the new establishment might exclude some who wished to attend the full course. With the design of both completing his own studies and transferring to the medical schools of New York some of the most valuable features of those abroad, he visited Europe, where he became acquainted with Cuvier, Gall, Denon, Dupuytren, Gregory, Playfair, Brewster, Bell, the Duncans, Jameson, Abernethy, the Aikins, Sir Walter Scott, and Dr. Rees, to whose cyclopædia he contributed several articles. On his return to New York, the chair of materia medica having been added to that of chemistry, he became professor of

the institutes of medicine, and in 1817 succeeded Dr. Stringham as professor of medical jurisprudence. In 1819 he was made professor of obstetrics in addition to his other duties, and retained this appointment until 1826, when the whole faculty resigned, and a majority of them founded the Rutgers medical school, which, after a successful career of only 4 terms, was closed by the legislature. In this institution Dr. Francis filled the chairs of obstetrics and forensic medicine. Since his retirement from this post he has devoted himself to the practice of his profession and the pursuit of literature, neither of which indeed he had allowed his academical duties to interrupt. In conjunction with Drs. Beck and Dyckman he edited, in 1822, '3, and '4, the "New York Medical and Physical Journal." He actively promoted the objects of the New York historical society, the woman's hospital, the state inebriate asylum, and the cause of natural history, the typographical guild, and the fine arts, in behalf of which he has frequently written and spoken. In addition to biographical sketches of many of the distinguished men of the last half century with whom he has been in intimate relationship (among others, of Robert R. Livingston, Philip Freneau, Daniel Webster, J. Fenimore Cooper, Cadwallader Colden, Samuel L. Mitchill, Edward Miller, John Pintard, and the actors Cooke and Kean), and articles in different medical periodicals on obstetrics, vitriolic emetics in croup, *sanguinaria Canadensis*, iodine, the goitre of W. New York and Canada, on medical jurisprudence, yellow fever, death by lightning, caries of the jaws of children, elaterium, ovarian disease, &c., he has published an essay on the "Use of Mercury" (8vo., New York, 1811); "Cases of Morbid Anatomy" (4to., 1814); "Febrile Contagion" (8vo., 1816); "Notice of Thomas Eddy the Philanthropist" (12mo., 1823); "Denman's Practice of Midwifery, with Notes" (8vo., 1825); "Address before the New York Horticultural Society" (1830); "Address before the Philolexian Society" (1831); "Letter on Cholera Asphyxia of 1832" (8vo., 1832); "Observations on the Mineral Waters of Avon" (1834); the "Anatomy of Drunkenness;" "Discourse before the N. Y. Lyceum of Natural History" (1841); discourses before the N. Y. academy of medicine (1847, 1848, and 1849); addresses before the typographical society of New York, "On Dr. Franklin" (1850 and 1859), and "On the Publishers, Printers, and Editors of New York;" "Old New York, or Reminiscences of the past Sixty Years" (8vo., 1857; 2d edition, enlarged, 12mo., 1858). A memoir of Christopher Colles, read by him before the historical society in 1854, was published in the "Knickerbocker Gallery" in 1855. His discourse at the Bellevue hospital, 1858, embraces a minute view of the progress of anatomical investigation in New York from its early state under the Dutch dynasty down to the present time. He was elected the first president of the New York academy of medi-

cine after its organization in 1847; he is a foreign associate of the royal medico-chirurgical society of London and other institutions abroad, and in fellowship with many scientific bodies in his native land. In 1850 he received the degree of LL.D. from Trinity college, Hartford, Conn. His style is animated, excursive, and often enlivened by humor, while his intimate acquaintance with the history and old inhabitants of New York, and his fondness for local antiquities, cause him to be looked upon as an oracle in matters relating to his native city.—**JOHN W.**, jr., son of the preceding, born in New York, July 5, 1832, died there, Jan. 20, 1855, was graduated at Columbia college in 1852. A "Memorial of his Life," by Henry T. Tuckerman, was published in New York (1 vol. 8vo., 1855).

FRANCIS, SIR PHILIP, a British politician and pamphleteer, born in Dublin, Oct. 22, 1740, died in London, Dec. 22, 1818. He was the son of the Rev. Philip Francis, author of an elegant and popular translation of Horace, and also of several tragedies of little merit, and some liberal political pamphlets. The son removed with his father to England in 1750, and was placed on the foundation of St. Paul's school, where he remained about 3 years. Here Woodfall, afterward the printer of the "Public Advertiser," and the publisher of the "Letters of Junius," was his fellow pupil, a circumstance much relied upon in the effort to prove Sir Philip the author of those letters. In 1756 he was appointed to a place in the office of his father's patron, Mr. Fox, then secretary of state, which he continued to retain under the secretaryship of Mr. Pitt. He was, in fact, a successful placeman. In 1758 he went as private secretary to Gen. Bligh when that officer commanded an expedition against the French coast, and was present in a battle near Cherbourg. When the earl of Kinnoul went in 1760 as ambassador to Portugal, on the recommendation of Mr. Pitt he took Francis with him as his secretary; and on his return to England in 1763, Francis received an appointment in the war office. Here he remained until March, 1772, when he resigned in consequence of a quarrel with Lord Barrington, the new minister at war. The remainder of that year he passed in travelling through Flanders, Germany, Italy, and France. In June, 1773, soon after his return, he was appointed one of the council of Bengal with a salary of £10,000. It has been supposed that he owed this lucrative place to the influence of Lord Barrington, now once more his friend; but the fact is not clearly established. Francis went to India in the summer of 1774, and remained there till Dec. 1780, when he resigned on account of his quarrel with Warren Hastings. This quarrel led to a duel, in which Francis was shot through the body. His active and somewhat austere disposition had brought him into constant opposition to Hastings, and for a time he controlled the majority in the council. Two of the members having

died, Hastings obtained the mastery; and after their duel Francis returned to England in disappointment and anger. To revenge himself upon Hastings seems to have been the ruling motive of his later life. In 1784 he became member of parliament for Yarmouth in the isle of Wight. He was a bold, severe, and frequent speaker, but he never became distinguished as an orator. His politics were always extremely liberal. When the prosecution of Hastings began in 1786, its leaders would have committed the management to Francis. The house of commons, however, refused twice, by large majorities, to permit this appointment. Burke, Fox, and Windham labored in vain to change this determination. At last the committee of managers united in writing a note to Francis inviting him to aid them in their labors; he consented, and passed many years in this occupation. When others tired, Francis never flagged. He embittered the existence of his enemy, and no doubt destroyed his own peace in the effort. Hastings, however, finally triumphed and died acquitted. When the French revolution broke out, Francis was its firm friend. He became an active member of the revolutionary association of "Friends of the People." He was defeated at the election of 1796, when he stood for Tewkesbury, but in 1802 was returned by Lord Thanet for the borough of Appleby, and continued to sit for that borough while he remained in parliament. He sustained Fox and Grey in their plans of reform, and advocated the abolition of the slave trade with unfailing ardor. His political consistency is worthy of honor. In Oct. 1806, on the formation of the Grenville ministry, Francis was made a knight of the bath. It is believed that it was also designed to send him to India as governor-general, but this appointment never took place. He retired from parliament in 1807, and afterward wrote pamphlets and political articles in the newspapers. From the obscurity of old age he was suddenly recalled to the attention of the public. In 1816, John Taylor published his "Junius identified with a Distinguished Living Character," viz., Sir Philip Francis. The argument is ingenious, the coincidences remarkable; but none of Francis's acknowledged writings equal the fierce eloquence of Junius. He himself, it is said, always denied that he wrote the famous letters. He was the author of about 26 political pamphlets. He was twice married, the second time to a Miss Watkins, a clergyman's daughter, when he was over 70. By his first wife he left a son and two daughters.

FRANCIS OF ASSISI, a saint of the Roman Catholic church, and founder of the order of Franciscans, born in Assisi, in the present papal delegation of Perugia, in 1182, died near that city, Oct. 4, 1226. His father, Pietro Bernardone, was a wealthy merchant. The son was taught to speak the French tongue, and the ease with which he mastered it caused the change of his baptismal name of Giovanni to that of Francesco.

He led a gay life until he was captured in a civil conflict of Assisi with Perugia, and kept for a year prisoner in the city of his enemies. During his detention he formed the design of renouncing the world; and fancying that he heard one day while praying in a church a voice from the crucifix, bidding him repair the falling walls of Christ's house, he gave the proceeds of some goods he had sold to the priest of the church, offering himself as an assistant. This act brought upon him the displeasure of his father, who threatened if he persisted to deprive him of his inheritance. But neither this threat, nor the popular ridicule which saluted his seeming insanity, could turn him from his purpose. He formally renounced his right of heirship, emptied his pockets, and even stripped himself of his clothing, putting on the cloak of a laborer. He was then (1206) 24 years old. From this time he gave himself exclusively to works of piety and charity. He begged in the streets for money to repair the church, and assisted the masons by carrying the stones with his own hands. He frequented the hospitals, washing the feet and kissing the ulcers of the lepers. Now he was stripped of his coarse raiment by robbers, and now he put it off from his own person to clothe the poor whom he met by the way. His excessive humility in dress and demeanor began after a time to win sympathy for him. Prominent men desired to imitate him, and to become his companions. The rich merchant, Bernard of Quintaval, in whose house Francis had been a guest, sold all his estate, distributed it to the poor, and came to pray with his friend. To him was soon joined a canon of the cathedral, Peter of Catana. These brethren received the dress of Francis, a coarse robe of serge girded with a cord, Aug. 16, 1209, from which day the foundation of the Franciscan order properly dates. At the beginning, Francis and his companions occupied a little cottage just outside the wall of the city; but as their number increased they removed to the premises of the Portiuncula, which had been offered them by the Benedictines, refusing, however, to accept this as a gift. His own habits were consistent with the strict poverty enjoined by his rule. He slept upon the ground, with a block of wood or stone for his pillow, ate his scanty food cold, with ashes strewed upon it, sewed his garments with packthread to make them coarser, bathed himself in snow to extinguish the fires of sensual desire, obeyed the orders of his novices, fasted long and rigidly, and shed tears so freely that he became nearly blind, and could only save his sight by a dangerous and painful searing of the face. He preached wherever he could find audience, yet he would never take priests' orders, and contented himself with the humble place of a deacon. He forbade, too, the spirit of controversy, and inculcated peace as the spirit which all Christians should labor to establish. In the civil strifes which raged so fiercely in Italy in the 13th century, he brought his order in as a peacemaker. Francis was a zealous missionary, and

made long journeys in behalf of the Catholic faith. He sought to visit Morocco, and was only prevented by a sickness which detained him in Spain. His cherished design was to lay down his life in the Holy Land in behalf of Christ's religion. His first attempt to reach Syria proved ineffectual; contrary winds hindered his vessel. But the plan was not relinquished, and after a brief sojourn in Acre, he joined the camp of the crusaders at Damietta in 1219. He arrived only to witness the failure of the Christian army, but he was gratified in his desire for an interview with the Saracen chief, and was permitted to testify in presence of the infidels concerning Christ and the Christian faith. On the occasion of the formal approbation of his order in 1228, he preached a sermon before the sacred college, which seems to have been the last of his important public performances. His failing health and growing blindness confined him more and more to that favorite seclusion of the hill of Alverno, on which a nobleman had built a church and convent for the Franciscan brethren. In this solitude he gave himself more ardently to prayer and religious exercises. His enthusiasm became rapture. His visions were multiplied. The Saviour and the saints seemed to appear, and the legend tells of the *stigmata*, the print of nails in the hands and feet, and of a wound in the side, corresponding to similar marks on the person of the Saviour, which Francis brought away with him from one of these interviews. It was even affirmed that blood continued to flow from his wounds; and portions of this blood were long after exhibited for the reverence of the faithful. He was canonized July 16, 1228.—The literary remains of St. Francis are neither numerous nor especially remarkable. They consist of letters, monastic conferences, parables, and poems in the Italian tongue. The best edition is that of 1641 (folio, Paris). The life of the saint has been many times written by brethren of the various branches into which his order has been subdivided; by Thomas de Celano, his disciple; by St. Bonaventura; by Helyot; by Chalippe (4to., 1728, and 2 vols. 12mo., 1736); by Chavin (8vo., Paris, 1841); by Böhlinger in his series of biographies; and by Frederic Morin (16mo., Paris, 1858).

FRANCIS OF PAULA, the founder of the order of Minims, a saint of the Roman Catholic church, born in Paula, Calabria, in 1416, died in Plessis-les-Tours, April 2, 1507. He was devoted by his parents to St. Francis of Assisi, to whose intercession they ascribed his birth, after their marriage had been for a long time childless. When 12 years old he was brought into an unreformed convent of Franciscans in Calabria, where he surpassed all the monks in the strict observance of the rule. Two years later, in 1428, he returned to Paula, resigned his right of inheritance, and retired to a grotto to lead the life of a hermit. He was hardly 20 years old when he found many followers, who built themselves cells near his grotto. He received from

the archbishop of Cosenza the permission to build a church and convent, which were completed in 1436. From this year dates the establishment of the order of the Minims, which adopted the name of hermits of St. Francis. To the usual 3 monastic vows (poverty, chastity, obedience) St. Francis added as a fourth, perpetual abstinence, not only from meat, but also from eggs and milk, except in cases of sickness. He himself was still more ascetic. He slept on the bare ground, took no food before sunset, often contented himself with bread and water, and sometimes ate only every other day. The fame of miracles reported of him induced Pope Paul II. in 1469 to send to him his chamberlain in order to investigate the facts. The report made to the pope was very favorable to the saint and his new order. Pope Sixtus IV. confirmed this order, appointed the founder superior-general, and permitted him to establish as many convents as he could. King Louis XI. of France called him to his court, in order to cure him of a dangerous sickness, but Francis waited until, in 1482, the pope ordered him to go. He met the sick king in Tours, and exhorted him to leave the issue of his sickness to the will of God, and to prepare himself for death. The successor of Louis, Charles VIII., retained the saint in France, and consulted him in cases of conscience as well as in state affairs, and built for him 3 convents, two in France and one in Rome. Francis was canonized by Leo X. in 1519.

FRANCIS DE SALES, a saint and bishop of the Roman Catholic church, born at the chateau de Sales, near Annecy, Savoy, Aug. 21, 1567, died in Lyons, Dec. 28, 1622. Both his parents were noble by birth. Francis, their eldest son, was sent successively to the college of Annecy, to the Jesuits' school in Paris, and to Padua, where he studied law. At the age of 20 he received the degree of doctor of laws. His inclination, nevertheless, was toward the ecclesiastical life. He refused repeatedly the offered dignity of senator, and finally obtained his father's permission to accept the place of provost in the cathedral at Geneva. His ordination as deacon soon followed, and in 1591, at the age of 24, he began his work as a preacher. His success was immediate and wonderful. His earnest manner, and the spiritual elevation and beauty of his thought, gave him a powerful hold on his audiences. He went on foot through the neighboring villages, visited the prisons, and became everywhere known as the friend of the sick and the poor. Accompanied by his cousin, Louis de Sales, he went on a mission among the Protestants of the province of Chablais. All sorts of difficulties were thrown in his way. There were conspiracies against his life, and slanders against his character. At first the converts were few. Some of the soldiers were moved, and a partial reform in their manners was accomplished; but nearly 4 years passed by without any considerable impression upon the heresy. At last, how-

ever, conversions multiplied; new missionaries came to his aid, and in 1598 the Catholic religion was publicly restored and the reformed faith was suppressed throughout the province. Repeated conferences were held with distinguished Protestant leaders, and the brilliant success of Francis in the argument with La Faye led the pope to select him to deal with Theodore Beza; but in this case he was not able to report a conversion. In 1599 he was chosen coadjutor to the bishop of Geneva, whose death in 1602 left to Francis the full charge of the diocese. His episcopal life was characterized by the same zeal, vigor, and devotion which had marked his missionary career. He went first to Paris, where he preached before Henry IV. in the chapel of the Louvre, and liberal offers of money and place were made to retain him in France. But he preferred to return, and after assisting the cardinal de Bérulle in the establishment of the Carmelite order and the congregation of the Oratory, he went back to Switzerland. He established new and stricter rules, not only for the clergy and laity of his diocese, but for his own personal conduct. He renounced all luxuries, multiplied fasts, discouraged lawsuits, and reformed the lax discipline of the monasteries. His fame as a preacher led various cities to solicit his aid in the services of the Lenten season. He was more than once chosen, from his moderate and peaceful temper, to reconcile disputes between different parties and orders in the church. A still wider renown was given to his name by the publication (in 1608) of the "Introduction to a Devout Life." The purpose of this book, originally composed of letters to a lady, was to show that the secular state is not incompatible with a truly religious life. Some ridiculed it, others denounced it, as allowing profane pleasures in the sacred state. On one occasion it was torn by a preacher, and burned before the eyes of the congregation. But generally the book and its doctrines were approved, and even the Protestant James of England, who had received a jewelled copy as a present from the queen of France, graciously commended it to the clergy of his realm. It was translated into many tongues, and in less than 50 years 40 editions of it were published. Francis was far from undervaluing monastic institutions. He not only established convents of existing orders, but he founded a new order of nuns (1610), called the order of the Visitation, and induced the wealthy and accomplished Madame de Chantal to come from France and preside over it. In 1616 he published his work on the "Love of God," a fit sequel to the former "Introduction." The appointment of a younger brother as assistant bishop enabled him to give himself more fully to the work of reclaiming heretics. The famous Calvinistic leader Leodigières became one of his converts. In 1619 he visited Paris as one of the embassy sent to secure the hand of the princess Christina for the young prince of Piedmont. His preaching in this visit

revived the impression which it had made in the previous reign. On his return to his own diocese he applied himself more resolutely than ever to the ministration of alms, the suppression of scandals, and exercises of personal discipline. In 1622 he accompanied Louis XIII. of France from Avignon to Lyons, where, on Christmas day, after preaching, he was attacked with apoplexy, and died on the third day after. The works of St. Francis have been often published. The best edition is that of 1835, 16 vols. 8vo., Paris. A complete edition, to comprise 15 vols., is in progress 6 vols. having been published up to 1858.

FRANCISCANS (*Minorites, Fratres Minorum*), a religious order in the Roman Catholic church, founded by St. Francis of Assisi in 1209 at the small church called Portiuncula near Assisi. When the number of his disciples had increased to 10, he gave them, in 1210, a rule, in which strict poverty and a union of the active and contemplative life are the principal points. The order was orally confirmed by Innocent III. in 1210, and again in 1215, and spread with such extraordinary rapidity that 5,000 brethren were assembled at the general chapter in 1219. In 1228 Honorius III. confirmed the order, by a bull, as the first among the mendicant orders, gave them the right of collecting alms, confirmed to the church of Portiuncula the celebrated indulgence which was afterward extended to all the churches of the Franciscans, and granted them several other privileges. The vow of poverty made the Franciscans the favorites of all classes of the people, and thus secured them more novices than any of the other orders. Forty-two years after the death of the founder the number of Franciscans was estimated at about 200,000, with 8,000 convents in 23 provinces. At the head of the convent a guardian was placed; the guardians of a province chose a provincial, who was assisted by *definitores*; the general assembly of all the provincials (general chapter) elected a general, and likewise definitores. The simplicity of the rule left room for the greatest variety of opinions. This showed itself during the lifetime of the founder, one party wishing to have the vow of poverty mitigated, the other strenuously opposing any such change. From 1219, when Elias of Cortona, the first leader of the milder party, was made by St. Francis himself vicar-general of the order, until 1517, when Leo X. divided them into two separate organizations, the strife never ceased. At the election of almost every new general we find the two parties in competition, and even the popes sometimes siding with the one, sometimes with the other. The milder party, when in a minority, generally submitted; but the rigorous party, when prevented from upholding the whole rule of St. Francis, preferred to form separate branches. In several cases they even dared to oppose the pope when he decided against them, and to appeal from him to a general council. As early as 1296, when Elias of Cortona, after having been

once expelled from the order, was reelected general, Cæsarius of Spire left the order, followed by 72 others, called after him the Cæsarines or Cæsarians, who, however, were reconciled with their brethren when in 1256 Bonaventura as general restored a stricter observance of the rule. The lax government of the general Matteo di Aquas Spartas caused in 1294 the foundation of the Minorite Celestines; who however, after the death of their protector Celestine V., were, in 1307, condemned by the inquisition as heretics and suppressed. Some of them who fled to France established in 1308 the Minorites of Narbonne and the Spirituals, who were likewise condemned in 1318 as infected with the heresy of Peter John Oliva. Another offshoot of Celestines, the Minorite Clarenines, founded in 1302 by Angelo di Cordona, was tolerated, and existed until 1506, when they united with the Observants. Much more successful than these secessions was the attempt of Paoletto di Foligno in 1368 to restore the strict observance of the rule. His followers were called Observants, and those who adhered to the milder rule Conventuals. Henceforth these two names distinguish the two great parties. By the 15th century the number of new congregations had thrown the order into great confusion. Leo X. made an attempt in 1517 to reunite them, but succeeded only with the various congregations of Observants, on whom he therefore conferred the right of electing the general (*minister generalis*), while the Conventuals could only elect a magister-general (*magister generalis*), whose election had to be confirmed by the general. From that time the quarrels between the Observants and Conventuals were less violent. The Conventuals made several attempts to regain the ascendancy, but in 1631 Urban VIII. commanded them to abandon their claims for ever. Notwithstanding the desire of the pope that no further separations should occur, several congregations arose, mostly for the purpose of still surpassing the strict observance of the Observants. These communities were styled Minorites of the stricter observance, and though forming separate provinces from the main body of the regular Observants, were always under the same general. They were called Alcantarines in Spain from St. Peter of Alcantara, Riformati in Italy and Germany, and Recollects in France, England, Ireland, Belgium, and Holland. The Capuchins, originally a congregation of reformed Franciscans, became afterward an independent order. (See CAPUCHINS.) The number of the Franciscans has been greatly reduced by political revolutions since 1789. In the 18th century the Franciscans, including the Capuchins, still counted nearly 200,000 members with about 26,000 convents; in 1848, the number of the Observants, the most numerous branch, was estimated at about 80,000. Since 1848 their number has again begun to increase. They are found in every part of Europe. In Asia they have a province in Palestine, whose mem-

bers are the guardians of the holy sepulchre and other Christian sanctuaries, and are celebrated for their hospitality to pilgrims and travellers. In China they have charge of two apostolic vicariats. The Franciscans were the earliest missionaries to America, having come over with Columbus on his second voyage in 1493. Their first formal establishment in the new world was in 1502, when 12 friars, with a prelate named Antonio de Espinal, accompanied Ovando to San Domingo. They went to Florida with Pamphilo de Narvaez in 1528, one of their number, Juan Juarez, bearing the rank of bishop; but of this band of missionaries we know little. They seem to have effected no establishment, and all perished miserably. An Italian Franciscan, Mark of Nice, penetrated into New Mexico and California in 1539, and gave the name San Francisco to the country which he visited. The exaggerated reports of what he had seen and heard led adventurers to those regions, and with them came a number of Franciscans, some of whom remained behind after the return of the expeditionists and were martyred. Father Andres de Olmos founded a successful mission in Texas in 1544. Subsequently priests of this order established themselves permanently in Florida, California, Mexico, and other parts of the South and West, and were among the first to plant Christianity in Canada, and in what are now the northern and north-eastern states of the Union. Their labors in Canada date from 1615, when 4 Recollects (3 priests and one lay brother), came over from France and took charge of the Huron, Algonquin, and Montagnais missions, which they and their brethren conducted alone, until the Jesuits came to aid them in 1625. The Recollects figured largely in the missionary history of Canada for many years. The celebrated explorer Hennepin was a Franciscan missionary. The foundations of the order in California, notwithstanding the numbers who were put to death by the Indians, still remain, and have recently been reënforced by accessions from Europe. They are numerous in all parts of Central and South America. Their present houses in the United States, except those in California, have been founded very recently, chiefly by Italians and Germans. They have a convent and college at Alleghany, Cattaraugus co., N. Y., which now (1859) numbers 12 members, and is intended as the nucleus of a large establishment; and there are houses of the order at Teutopolis, Ill. (3 members in 1858), and Cincinnati (4 members). All these are Observants. The Conventuals have convents in Italy, Austria, Bavaria, Switzerland, Malta, Poland, Turkey, and since 1858 in the United States. We find Franciscans soon after the death of St. Francis as professors of theology at the university of Paris, which in 1244 was commanded by Pope Innocent IV. to admit Franciscans and Dominicans to academical dignities. In union with the Dominicans they strove for several centuries to extend in the theological schools the influence of the monastic orders at the expense

of the secular clergy. With the Dominicans they maintained various philosophical and theological controversies, which are partly still kept up as an ancient inheritance of both orders, the Franciscans being realists, anti-Augustinians, and defenders of the immaculate conception, while the Dominicans are nominalists and Augustinians, and were formerly opponents of the immaculate conception. Among the celebrated men produced by the order are Anthony of Padua, Bonaventura, Alexander of Hales, Duns Scotus, Roger Bacon, Nicolaus de Myra, Occam, Cardinal Ximenes, and the popes Nicholas IV., Alexander V., Sixtus IV., Sixtus V., and Clement XIV. In the first period of their history they had a considerable number of mystical writers and composers of hymns, as Thomas de Celano, the author of *Dies Ira*, and Giacomone da Todi, the author of the *Stabat Mater*.—St. Francis also established an order of nuns, who are generally called, from its first abbess Clara of Assisi, Poor Clares or Clarisses. Another branch were the Tertiarians or penitents of the third order of St. Francis, who remained in the world, but followed a rule and discipline similar to those of the first and second orders. They received their rule from St. Francis in 1221. This order includes a great many kings and queens (as Louis IX. of France, and the mother and wife of Louis XIV.) and popes among its members, Pius IX. being one. The Tertiarians afterward began to live in community and take vows, but this practice was in time abandoned. New communities of Tertiarians subsequently sprang up, devoted to teaching, and became independent of the parent order. They have houses in Pennsylvania, Indiana, Michigan, Wisconsin, and Brooklyn, N. Y. Among the communities of women, the Elizabethines, founded in 1395 by Angelina di Corbaro, are the most important. In France they were also called daughters of charity. In 1843 they had about 1,000 members. In the United States there are establishments of sisters of the third order of St. Francis in the dioceses of Vincennes, Milwaukee, Cincinnati, and Sault Ste. Marie.—The habit of the Observants consists of a cowl with a pointed capuche, a cord as a girdle, and sandals. Its color differs in different localities. In England and Ireland it is gray, whence the name "gray friars." Some congregations let the beard grow. The Conventuals generally wear a black cowl and capuche. They also wear shoes, and are always without beards.—The principal work on the Franciscans is the *Annales Fratrum Minorum* (2d ed., 16 vols., Rome, 1731), by the Irish Franciscan Lucas Wadding (died in 1657). The author himself carried the history of his order to the year 1540; De Luca continued it to 1553 (vol. xviii., Rome, 1740). His work was then interrupted, until a few years ago it was taken up again by order of the general, and 2 new volumes were published at Rome.

FRANCKE, AUGUST HERMANN, a German preacher, and founder of the orphan house at Halle, born in Lübeck, March 23, 1663, died

June 8, 1727. He studied at the universities of Erfurt, Kiel, Gotha, and Leipsic, and founded in Leipsic a school for the interpretation of the Scriptures, which attracted a great number of students. Accused of pietism, he was obliged to renounce this employment in 1691, and passed to Halle, where he taught the Greek and oriental languages in the university. Here he founded a charitable institution for the education of poor children and orphans, which soon became one of the most considerable in Germany. A chemist, whom he had visited on his death-bed, bequeathed to him the recipe for compounding certain medicines which afterward yielded an annual income of more than \$20,000, and made the institution independent. It combined an orphan asylum, a pædagogium, a Latin school, a German school, and a printing press for issuing cheap copies of the Bible.

FRANCOLIN, a gallinaceous bird of the grouse family, sub-family *perdicinæ* or partridges, and genus *francolinus* (Steph.). There are about 30 species found in the warm parts of the eastern hemisphere, especially in Africa; some prefer open plains, where they roost in trees, and others woody places; when alarmed, they conceal themselves in the brushwood, or run with considerable speed, taking wing only when hard pressed; their food consists of bulbous roots, grains and insects, and they feed in early morning and at evening. The bill is longer than in the common partridge; the wings are moderate and rounded, the 3d, 4th, and 5th quills the longest; the tarsi are strong and spurred; the feet 4-toed. The francolin of Europe (*F. vulgaris*, Steph.), in the male, has the plumage of a general yellowish brown color, each feather with a dark centre; the ear coverts white; circle round the eyes, cheeks, and sides of head, and the throat, deep black, below which is a broad chestnut collar extending around the neck; the rump and tail white barred with black, the outer feather of the latter entirely black; breast and lower parts black; sides blotched with black and white; under tail coverts chestnut; bill black. The female is without the black markings and chestnut collar, and her bill is brown. This is the only species indigenous in Europe, where it is found in the southern parts; it also occurs in northern Africa and the greater part of Asia. The flesh is delicate, and much esteemed in India. According to Gould, this genus seems to form a connecting link between the brilliant pheasants and tragopans of the East and the sober-colored partridges of Europe; to the splendid colors of the former it unites the form and habits of the latter.

FRANCONI, ANTOINE, an equestrian artist, born in Venice in 1738, died in Paris, Dec. 6, 1836. At first a mountebank and perambulating physician, he afterward gave bull fights at Lyons and Bordeaux, and associated himself in 1783 with Mr. Astley, who was the proprietor of a circus in Paris. He became subsequently celebrated as the founder of the *cirque olympique* in Paris, which was opened in Dec. 1807. As

he had become blind, the establishment was conducted by his sons Laurent and Minette. In 1833 they all withdrew from the arena excepting their adopted brother Adolphe. The elder Franconi recovered his sight in the latter part of his life. At his request his funeral was attended by his favorite horse.

FRANCONIA (Ger. *Franken*, or *Franken-Land*, land of the Franks), an old duchy and afterward a circle of the German empire. In the 5th century it formed the central part of Thuringia, and on the dismemberment of that kingdom fell to the Franks, under whom it had several names. That of Franconia was given about the 10th century, when it constituted the E. part of the Frankish territories, and was governed by dukes who for some years were independent. In 1512 Maximilian I. erected a part of it into a circle of the empire, containing the towns of Nuremberg, Schweinfurt, Rothenburg, Weissenburg, and Windsheim. Between 1801 and 1819 it was partitioned among Würtemberg, Baden, Hesse-Cassel, Saxony, and Bavaria, the last named state receiving the largest portion, and still retaining the name in the 8 circles of Upper, Middle, and Lower Franconia.

—UPPER FRANCONIA (Ger. *Oberfranken*) nearly corresponds with the former circle of Upper Main, and lies in the N. E. part of the kingdom, bordering on Saxony; area, 2,226 sq. m.; pop. in 1855, 493,913. It is a mountain region, occupied in the N. E. by a portion of the Fichtelgebirge, and rich in gypsum, marble, gold, silver, lead, and iron. Agriculture and cattle raising are carried on with success. Capital, Baireuth.—MIDDLE FRANCONIA (Ger. *Mittel-Franken*) comprises that portion of territory anciently known as the circle of Rezat, and includes the former margraviate of Anspach, the free city of Nuremberg, the bishopric of Eichstadt, and part of Baireuth; area, 2,798 sq. m.; pop. in 1855, 533,587. It touches Würtemberg on the W. It is intersected by branches of the Franconian Jura, and a small portion of the mountainous district is too rough for tillage, but $\frac{1}{4}$ of the circle is in a high state of cultivation, producing the grape, tobacco, pasturage, and hops. There are few minerals, but important manufactures are carried on in most of the towns. Capital, Nuremberg.—LOWER FRANCONIA (Ger. *Unter-Franken*), nearly identical with the former circle of Lower Main, comprises the old bishoprics of Würzburg and Fulda, with several smaller territories; area, 3,604 sq. m.; pop. in 1855, 589,076. It is bounded N. by the Saxe duchies, S. by Würtemberg and Baden, W. by Darmstadt, and N. W. by Hesse-Cassel. Its N. part is traversed by the Rhöngebirge, and its S. W. by the Spessart mountains. There are several extensive forests, but the plains and river bottoms are well cultivated, producing grain, potatoes, hops, and the grape. Capital, Würzburg.

FRANCONIA, a post township of Grafton co., N. H., 75 m. N. of Concord; pop. in 1850, 584. It is situated in the midst of the magnificent scenery of the White mountains, and con-

tains the celebrated natural curiosity called the "old man of the mountain." This consists of 5 immense granite blocks, altogether 80 feet long, on an overhanging cliff of Profile or Jackson mountain, so disposed that, as seen from the road 1,000 feet below, they closely resemble the outline of a human face. Beneath it lies a small pond sometimes called the "old man's wash-bowl." Between Profile mountain and Mt. Lafayette is Franconia Notch, in which is Echo lake, where the human voice is several times distinctly reverberated from side to side. The S. branch of the Ammonoosuck river passes through the township, supplying several extensive iron works with water power. A rich vein is worked about 8 miles from the furnace, the ore from which yields between 50 and 63 per cent. Franconia is reputed to be in winter the coldest place in the United States, the temperature sometimes falling to 49° F. below zero, while in summer it reaches 100° above.

FRANKEL, ZACHARIAS, a German Hebrew theologian and archæologist, born in Prague in 1801, studied at Pesth, officiated as rabbi in Töplitz, and subsequently in Dresden, and in 1855 became the director of the Jewish theological seminary of Breslau. He is one of the most esteemed representatives of the moderate progressives in modern Jewish theology, and his critical writings are valuable.

FRANKFORT, a city of Franklin co., Ky., capital of the county and state, situated on the N. E. (right) bank of Kentucky river, 62 m. above its mouth in the Ohio, and 24 m. N. W. from Lexington; lat. 38° 14' N., long. 84° 40' W.; pop. in 1850, 3,308; in 1855, about 5,000. It is built on a high plain lying between the river and a bluff 150 or 200 feet high, and is regularly laid out, with neat-looking houses. The principal edifices are the state house, 86 feet long by 54 wide, built of Kentucky marble, and having a handsome Ionic portico, the state penitentiary, court house, and gaol. On one of the hills which overlook the city is a cemetery, in which are buried several of the governors and other state officers, and also the remains of Daniel Boone, the pioneer in the settlement of Kentucky. The city has a branch of the bank of Kentucky, with a capital of \$350,000, and in 1850 contained 4 churches, an academy, and 7 newspaper offices. It is supplied with excellent water conveyed through iron pipes from a spring 2 m. distant. Both the trade and the manufactures are important. The Louisville and Lexington railroad passes through the city, and the Kentucky river is navigable thus far by large steamboats, while by means of dams and locks it has been improved so that small craft can ascend to its head branches. In this part of its course it flows through a limestone valley. Its banks here are generally high, and its width opposite Frankfort is about 250 feet. A chain bridge connects the city with the village of South Frankfort on the S. W. bank. The surrounding country is remarkable for its picturesque scenery.

FRANKFORT-ON-THE-MAIN (Ger. *Frankfurt am Main*), one of the free cities of Germany, the seat of the German diet, the birthplace of Goethe, and celebrated for its historical associations, is situated in a fertile valley on the right bank of the river Main, 20 m. above its confluence with the Rhine, near the Taunus mountains; distance by rail from Mentz 21 m., from Heidelberg 54 m., from Basel 224 m., and from Munich 325 m. The territory of Frankfort comprises, beside the city, 9 villages; area, about 90 sq. m.; pop. in 1856, 74,784, and of the city alone 64,287, inclusive of 944 Frankfort soldiers, but exclusive of 4,000 Austrian, Prussian, and Bavarian troops. The finest street of the ancient city is the Zeil, united in 1856 with the Neue Kräme, and also through the new Liebfrauenstrasse with one of the principal squares, the Liebfrauenberg. The other remarkable public squares are the Rossmarkt, with a monument in honor of the art of printing inaugurated in 1857, the Goethe square, with Schwanthaler's statue of Goethe, and the Römerberg. In the latter is the Römer, or council house, where the German emperors were elected and entertained in the Kaisersaal, the walls of which are covered with portraits of the emperors. The golden bull of Charles IV. which regulated the election of the emperors is preserved in the building. The Judenstrasse of Frankfort contains the houses in which Börne and the founder of the house of Rothschild and his children were born. The Neue Juden or Bornheimerstrasse forms a continuation of the Judenstrasse. The counting house of Rothschild is situated upon this street. The streets which command most traffic are the Fahr-gasse and Schnurgasse; during the great annual fairs of Easter and Michaelmas they are crowded with strangers and traders. Frankfort possesses more beautiful promenades than perhaps any other city in the world; delightful villages, as Bockenheim, Bornheim, Oberrad, &c., are within a short distance of the city, as well as several famous watering places, such as Homburg and Soden; and Wiesbaden is within an hour's distance by railway. There are several private and public picture galleries. The Städel museum, so called after its founder, who bequeathed to it \$400,000 beside valuable art collections, contains a library and a school of art. Bethmann's garden contains Dannecker's "Artadne" and his colossal bust of Schiller. In the public library are about 70,000 volumes and many important MSS. The museum of the Senkenberg society of naturalists contains among its principal collections that of Dr. Rüppel, the Abyssinian traveller. Beside a gymnasium, there are about 25 public and many private schools. The city is divided into 90 alms districts for the relief of the poor, and there are over 30 charitable institutions and hospitals. There are 8 Catholic, 6 Lutheran, and 2 Reformed churches, and 4 Lutheran chapels. The principal of them is the cathedral or church of St. Bartholomew, a Gothic struc-

ture, the tower of which is still unfinished. The most celebrated Lutheran church is that of St. Paul (formerly *Barfüsserkirche*), where the German parliament was held in 1848 and 1849. A new synagogue for the orthodox Jews was opened in 1856, and one for the rationalistic Jews in 1858. The theatre of Frankfort was enlarged and embellished in 1855, and is among the best in Germany. The new post office on the Zeil is a stately building, as well as the new exchange. The principal business of Frankfort is banking. There are about 20 first-class banking houses, foremost among which are those of Rothschild, Bethmann, Grunelius, Metzler, Gontard, and Heyder. The number of houses, chiefly Jewish, engaged in the stock and exchange business amounts to at least 200. The magnitude of this business is due partly to the great wealth of the city, and partly to its geographical situation, which makes it a convenient medium of exchange between Vienna and Paris, Trieste and Hamburg, and Vienna and Berlin. A new bank with a capital of \$4,500,000 was established in 1854. The chief local manufactures are carpets, table covers, jewelry, playing cards, oilcloth, tobacco, snuff, and Frankfort black. A chamber of industry was established in 1855. The suburb of Sachsenhausen, on the left bank of the Main, and united to Frankfort by a fine stone bridge, is an important market for fruits and vegetables. Leipzig has taken from Frankfort the supremacy which it once possessed in the book trade, but there are 30 booksellers in the city, and several important publishing and engraving establishments. There are about 20 daily and periodical publications; the principal political daily journals are the *Frankfurter Journal*, the *Postzeitung*, and the *Journal de Francfort*. The government is republican, and vested in two burgomasters, who are annually elected by the senate, a senate, a legislative assembly, and a permanent committee of citizens. The burgomasters preside over the senate. According to the new law of 1856, that body is composed of 21 members elected for life, 4 of whom are chosen from the ranks of accomplished lawyers (*Syndiken*), and 4 from those of mechanics. The legislative assembly, which has 88 members in all, is composed of 57 members (including 4 Jews) chosen from the citizens, 20 members from the permanent committee of citizens, and 11 deputies from the rural districts. The revenue of 1858 was estimated at \$900,000, the expenditures at \$850,000, and the public debt at \$3,350,000, beside a debt of \$280,000 contracted for the construction of railways. Frankfort and the free cities of Hamburg, Lübeck, and Bremen occupy the 17th place in the Germanic confederation, and have one vote in the smaller council of 17. Frankfort has a separate vote in the general assembly (*Plenum*), and furnishes a contingent of 1,044 men to the federal army. The German diet has been held since 1851 in the palace of Prince Thurn and Taxis, which in 1848 and 1849 was also the seat

of the cabinet of the vicar of Germany.—Frankfort is mentioned in 794, under the name of *Palatium Franconenford*, as the place selected by Charlemagne for the seat of an imperial convention and religious council. The election and coronation of the German emperors there subsequently gave great importance to the city. Under Napoleon I. it became the capital, first of a principality, and then of a grand duchy, with an area of about 2,000 sq. m., and a population of 300,000. Since 1814 it has recovered its independence, and since 1816 it has been the seat of the German diet. On April 3, 1833, the city was the theatre of a political outbreak for which many students were arrested. In 1848 and 1849 it derived political importance from the German parliament held there. A riot broke out during the excitement about the Schleswig-Holstein war (Sept. 18, 1848), in which the Prussian major-general Auerswald and Prince Felix Lichnowsky were killed by the mob.

FRANKFORT-ON-THE-ODER, a Prussian city, capital of an extensive circle of the same name in the province of Brandenburg, on the left bank of the river Oder, 49½ m. by rail from Berlin, and 170 m. from Breslau; pop. of the circle about 900,000, and of the city in 1855, 80,938. The prosperity of the town is due to its situation on the railway between Berlin and Silesia, to its navigable river, which is connected by canals with the Vistula and the Elbe, and to its 3 annual fairs, at which large quantities of cotton, woollen, silk, and other goods are sold, though to a less extent than formerly. The city has 3 suburbs, fine streets, public squares and gardens, a theatre, many charitable institutions, a Roman Catholic church, a synagogue, and 6 Protestant churches. The university was removed to Breslau in 1810; a gymnasium still remains, beside which there are 10 schools. Beyond the wooden bridge which connects the old town on the left bank of the Oder with the suburb on the right bank is a monument to Prince Leopold of Brunswick, who was drowned here in 1785, while attempting to rescue a family during an inundation. The battle of Kunersdorf was fought within 8 m. of the town in 1759, and there is in Frankfort a monument of the poet Kleist, who died from a wound received in this battle.

FRANKINCENSE, the fragrant gum resin, known in medicine as *olibanum*, the product of the tree *Boswellia serrata*, which grows among the mountains of central India and upon the Coromandel coast. It is imported from Calcutta in the form of roundish lumps or tears, which have a pale yellow color, are somewhat translucent, and are covered with a whitish powder produced by friction. It has an agreeable balsamic odor, but its taste is acid and bitter. Like the common balsam gum, it softens when chewed, adheres to the teeth, and whitens the saliva. It readily inflames, and imparts in burning a fragrant odor. This is the property which rendered it so highly esteemed with the

ancients, by whom it was introduced as one of the ingredients in their incense, which was burned (*incensum*), according to Maimonides, to conceal the smell arising from the slaughtered animals of the sacrifices. According to others, the smoke of its burning was regarded as in itself an acceptable offering, because it was symbolical of prayer and of interior worship (Ps. cxli. 2; Rev. viii. 3, 4). Olibanum is but imperfectly soluble in water. Alcohol takes up about $\frac{4}{5}$ of it, forming a transparent solution. Braconnot obtained 8 parts of volatile oil, 56 of resin, 30 of gum, and 5.2 of insoluble glutinous matter; loss 0.8. The article finds but little use in medicine except for fumigations, and rarely as an ingredient of plasters.—Another variety of frankincense is obtained from Arabia and the N. E. portion of Africa. The tree which produces it has not been described; it does not appear, however, to be the same species, if of the same genus, as that from which the Indian olibanum is obtained.

FRANKLIN, the name of counties in many of the United States. I. A W. co. of Me., bordering on Canada East, and drained by Dead and Sandy rivers, branches of the Kennebec; area, 1,600 sq. m.; pop. in 1850, 20,027. It has no navigable streams, but there are several mill creeks and small ponds. The surface is undulating, with a few mountainous elevations, the chief of which are Mt. Blue, Mt. Abraham, and Saddleback mountain. The soil is adapted to grain, potatoes, and pasturage. The productions in 1850 were 47,860 bushels of wheat, 210,942 of potatoes, 84,879 of Indian corn, 120,064 of oats, 49,717 tons of hay, 540,720 lbs. of butter, and 163,609 of wool. There were 15 grist mills, 25 saw and planing mills, 6 flour mills, 5 starch factories, 9 tanneries, 1 woollen factory, 36 churches, 1 newspaper office, and 6,789 pupils attending public schools. Formed in 1830 out of portions of Oxford and Somerset counties. Capital, Farmington. II. A N. W. co. of Vt., bordering on Canada East and Lake Champlain, and drained by Missisque and Lamoille rivers; area, 630 sq. m.; pop. in 1850, 28,586. The surface is irregular, the soil fertile, and the chief productions are marble, iron, oats, potatoes, wool, and hay. In 1850 it yielded 258,757 bushels of potatoes, 55,488 of wheat, 145,840 of oats, 78,619 tons of hay, 1,899,445 lbs. of butter, 1,196,660 of cheese, and 209,350 of wool. There were 3 flour and grist mills, 4 woollen factories, 2 iron foundries, 15 tanneries, 47 churches, 2 newspaper offices, and 7,537 pupils attending public schools. The commerce of the county is carried on through Lake Champlain, which is navigable here for vessels of 90 tons, and over the Vermont central railroad. Organized in 1792. Capital, St. Albans. III. A N. W. co. of Mass., bordering on Vermont and New Hampshire, intersected by the Connecticut and drained by Miller's and Deerfield rivers; area, about 650 sq. m.; pop. in 1855, 31,652. The surface is hilly and in some places mountainous, the soil is good, and the staples

are Indian corn, potatoes, and hay. In 1855 the productions were 258,616 bushels of Indian corn, 247,217 of potatoes, 49,849 tons of hay, and 884,807 lbs. of butter. There were 6 cotton and 5 woollen factories, 2 iron foundries, 26 tanneries, 3 factories of cutlery, 1 of edge tools, and 8 of agricultural implements. In 1858 it contained 94 churches and 2 newspaper offices. The principal channels of transportation are the Connecticut river railroad, and the Vermont and Massachusetts railroad. The Connecticut river has been made navigable here for boats. Formed from Hampshire co. in 1811. Capital, Greenfield. IV. A N. E. co. of N. Y., bordering on Canada East, drained by Saranac, Chateaugay, Salmon, St. Regis, and Racket rivers; area, 1,764 sq. m.; pop. in 1855, 25,477. The St. Lawrence touches its N. W. corner. It has an uneven surface, diversified by a great number of small lakes. The S. E. portion is occupied by the Adirondac mountains, the highest peak of which in this co. is Mt. Seward, 5,100 feet above tide. Bog iron is found in considerable quantities. The soil is adapted to grain and pasturage, and much of it consists of rich sandy loam. The productions in 1855 were 87,594 tons of hay, 70,913 bushels of wheat, 144,617 of oats, 88,615 of Indian corn, 484,425 of potatoes, and 1,050,040 lbs. of butter. There were 11 grist, 85 saw, 1 oil, 1 carding, and 2 wool mills, 17 manufactories of starch, 1 of soap, 1 of saleratus, 2 of agricultural implements, 8 of coaches and wagons, 5 of cabinet ware, 2 of woollen goods, 1 machine shop, 1 furnace, 1 brick yard, 6 tanneries, 2 newspaper offices, 167 school houses, and 35 churches. A railroad from Ogdensburg to Rouse's Point passes through the county. Formed from Clinton co. in 1808. Capital, Malone. V. A S. co. of Penn., bordering on Maryland, bounded E. by South mountain, N. W. by Tuscarora or Cove mountain, and drained by several creeks; area, 740 sq. m.; pop. in 1850, 89,904. Most of it consists of a rich limestone valley, well watered, and abounding in slate, marble, and iron. In the N. part rises Parnell's Knob, a lofty peak forming the S. W. termination of the Kittatinny range. The productions in 1850 were 837,062 bushels of wheat (the greatest quantity produced by any county of the state except Lancaster), 539,976 of Indian corn, 393,447 of oats, 33,591 tons of hay, 67,466 lbs. of butter, and 44,192 of wool. There were 85 flour and grist mills, 30 saw mills, 6 foundries, 6 forges, 5 furnaces, 10 woollen factories, 37 tanneries, 17 distilleries, 7 newspaper offices, 78 churches, and 8,579 pupils attending public schools. The county is traversed by the Cumberland valley railroad. Capital, Chambersburg. VI. A S. co. of Va., bounded N. E. by Staunton river, N. W. by the Blue Ridge; area, 864 sq. m.; pop. in 1850, 17,430, of whom 5,726 were slaves. The surface is undulating or moderately uneven; the principal mineral is iron, the soil is fertile, and the productions in 1850 were 76,831 bushels of wheat, 431,408 of Indian

corn, 187,792 of oats, 1,125,404 lbs. of tobacco, and 13,952 of wool. There were 14 flour and grist mills, 80 saw mills, 2 forges, 1 furnace, 24 tanneries, 15 tobacco factories, 25 churches, and 700 pupils attending public schools. Value of real estate in 1856, \$2,453,264, showing an increase of 85 per cent. since 1850. Organized in 1784. Capital, Rocky Mount. VII. A N. co. of N. C., intersected by Tar river; area, about 450 sq. m.; pop. in 1850, 11,713, of whom 5,507 were slaves. The surface is level and the soil fertile. The productions in 1850 were 898,081 bushels of Indian corn, 53,798 of oats, and 800,968 lbs. of tobacco. There were 12 corn and flour mills, 10 saw mills, 2 tanneries, and 17 churches. The Raleigh and Gaston railroad passes along or near the W. border of the county. Formed in 1779. Capital, Lewisburg. Value of real estate in 1857, \$1,077,721. VIII. A N. E. co. of Ga., bordering on S. C., drained by North and Hudson's forks of Broad river, and bounded on the N. E. by the Tugaloo; area, 650 sq. m.; pop. in 1852, 10,900, of whom 2,227 were slaves. It has a hilly surface and a productive soil, the river bottoms being particularly fertile. In 1850 it yielded 2,653 bales of cotton, 447,050 bushels of Indian corn, 104,764 of oats, and 114,331 of sweet potatoes. There were 4 saw mills, 1 flour mill, 1 cotton factory, and 80 churches. Gold has been found in small quantities, and iron is abundant. Value of real estate in 1856, \$1,076,157. Capital, Carnesville. IX. A W. co. of Florida, bounded S. by the gulf of Mexico; area, 462 sq. m., including the islands of St. George and St. Vincent; pop. in 1850, 1,561, of whom 877 were slaves. The Appalachicola river, here navigable by steamboats, flows for some distance along its W. border, and then traverses its centre. Its valley is very fertile, but the soil elsewhere is sandy and little cultivated. The surface is low, and much of it covered with swamps and ponds. In 1850 the county contained 6 grist and 6 saw mills, 2 tanneries, 1 newspaper office, 8 churches, 1 academy, and 1 school. No returns were made of the agricultural products. Capital, Appalachicola. X. A N. W. co. of Ala., bordering on Mississippi, and bounded N. by Tennessee river, here navigable by steamboats; area, 1,260 sq. m.; pop. in 1850, 19,610, of whom 8,197 were slaves. It has a fertile, well cultivated soil, and a hilly surface partly covered with oak and other timber. The productions in 1850 were 15,045 bales of cotton, 892,891 bushels of Indian corn, 95,556 of oats, and 69,708 of sweet potatoes. There were 5 saw and 8 grist mills, 1 iron foundery, 7 tanneries, 2 newspaper offices, 88 churches, and 466 pupils attending public schools. The railroad from the head to the foot of Muscle shoals in the Tennessee has its W. terminus in this county, which is also traversed by the Memphis and Charleston railroad. Capital, Russellville. XI. A S. W. co. of Miss., watered by Homochitto river; area, about 780 sq. m.; pop. in 1850, 5,904, of whom 3,350 were slaves. Its surface is uneven, and its

soil fertile near the rivers, but the land elsewhere consists chiefly of pine barrens. In 1850 the productions were 4,347 bales of cotton, 189,195 bushels of Indian corn, 4,995 of oats, 44,039 of sweet potatoes, and 83,220 lbs. of rice. There were 9 corn and flour mills, 4 saw mills, 14 churches, and 182 pupils attending public schools. Capital, Meadville. XII. A N. E. parish of La., watered by Bœuf and Macon bayous, the former of which is navigable by steamboats; area, 739 sq. m.; pop. in 1855, 3,621, of whom 1,908 were slaves. Its surface is hilly and its soil fertile. Cotton is the staple production. In 1855 there were raised 3,898 bales of cotton, and 88,320 bushels of Indian corn. Value of real estate, \$544,701. Capital, Winnsborough. XIII. A N. W. co. of Ark., intersected by Arkansas river; area, 770 sq. m.; pop. in 1854, 3,976, of whom 572 were slaves. It has a hilly surface and some fertile soil, and in 1854 produced 1,156 bales of cotton, 244,285 bushels of Indian corn, and 5,384 of wheat. Capital, Ozark. XIV. A S. co. of Tenn., bordering on Alabama, and drained by the sources of Elk river; area about 780 sq. m.; pop. in 1850, 13,768, of whom 3,623 were slaves. The surface is hilly, the S. E. part being traversed by a branch of the Cumberland mountains. The soil is generally fertile. In 1850 it produced 788,380 bushels of Indian corn, 139,711 of oats, and 30,895 lbs. of tobacco. There were 25 corn and flour mills, 15 saw mills, 1 newspaper office, 85 churches, and 3,340 pupils attending public schools. It is traversed by the Nashville and Chattanooga railroad, which here passes through a tunnel 2,200 feet long. Capital, Winchester. XV. A N. co. of Ky., intersected by the Kentucky river; area, about 212 sq. m.; pop. in 1850, 12,462, of whom 3,365 were slaves. The river, which in this part of its course is navigable by steamboats, flows for some distance between perpendicular limestone cliffs several hundred feet high. In the N. part of the county it is joined by the Elkhorn. The surface is beautifully diversified and the soil productive. In 1850 it yielded 549,723 bushels of Indian corn, 25,335 of wheat, 98,742 of oats, and 87,125 lbs. of tobacco. There were 18 corn and flour mills, 10 saw mills, 2 woollen factories, 5 newspaper offices, 17 churches, and 556 pupils attending public schools. The Louisville and Lexington railroad passes through Frankfort, the capital of the state and county. Organized in 1794. XVI. A central co. of Ohio, watered by Scioto and Olentangy rivers; area, 530 sq. m.; pop. in 1850, 42,910. It has a level surface and a rich and generally well cultivated soil. In 1850 it produced 97,993 bushels of wheat, 2,521,988 of Indian corn, 174,963 of oats, 19,644 tons of hay, and 90,587 lbs. of wool. There were 14 corn and flour mills, 32 saw mills, 8 iron founderies, 8 woollen factories, 14 tanneries, 14 newspaper offices, 58 churches, 4 colleges, and 14,287 pupils attending public schools. Several railroads centre at Columbus, the county seat and state capital. XVII. A S. E. co. of Ind., bordering on Ohio, drained

by Whitewater river and its head streams; area, about 380 sq. m.; pop. in 1850, 17,968. It has a diversified surface and a generally fertile soil. It supplies provisions for the Cincinnati market. In 1850 the productions were 1,002,149 bushels of Indian corn, 124,289 of wheat, 100,279 of oats, and 6,392 tons of hay. There were 12 corn and flour mills, 25 saw mills, 7 tanneries, manufactories of cotton and paper, 42 churches, 2 newspaper offices, and 2,315 pupils attending public schools. Blue or Trenton limestone is abundant. The Whitewater canal traverses the county. Capital, Brookville. Organized in 1810. XVIII. A S. co. of Ill., watered by Big Muddy river and Saline creek; area about 400 sq. m.; pop. in 1855, 7,182; in 1858, about 9,800. It is heavily timbered and fertile. In 1850 the productions were 268,690 bushels of Indian corn, 24,883 of oats, and 8,008 of wheat. There were 14 corn and flour mills, 2 saw mills, 1 newspaper office, 15 churches, and 350 pupils attending public schools. Capital, Benton. XIX. An E. co. of Mo., bounded N. by the Missouri river; area, 874 sq. m.; pop. in 1856, 12,918, of whom 1,358 were slaves. It is drained by Maramec river, which is navigable by small steamboats, and with a little improvement might be made a channel of communication with the Virginia mines in this county. Rich mines of copper, lead, and coal are found on its banks and in other parts of the county. The surface is uneven and well timbered; the soil mostly fertile. In 1850 the productions were 51,960 bushels of wheat, 521,382 of Indian corn, 72,103 of oats, and 656,821 lbs. of excellent tobacco. There were 15 corn and flour mills, 8 saw mills, 1 newspaper office, 18 churches, and 461 pupils attending public schools. The Pacific railroad passes through the county, and a branch road from Franklin village in the E. part to the S. W. boundary of the state is in course of construction. Capital, Union. XX. A N. co. of Iowa, recently formed, drained by Iowa river and branches of the Red Cedar river; area, 576 sq. m.; pop. in 1856, 780. Productions in 1856, 761 bushels of wheat, 1,767 of oats, and 18,625 of Indian corn.

FRANKLIN. I. A port of entry and the capital of St. Mary's parish, La., situated on the right bank of the bayou Teche, 65 m. by water from the gulf of Mexico; pop. in 1853, about 1,400. It is the shipping point for large quantities of cotton, sugar, and maize, which are produced in the neighborhood, and is accessible by large steamboats. II. A post village and the capital of Johnson co., Ind., situated in a township of its own name on Young's creek, 20 m. S. S. E. of Indianapolis; pop. in 1858, about 2,000. It is one of the principal stations on the Madison and Indianapolis railroad, and the E. terminus of the Martinsville railroad. Beside the county buildings, it contains a large seminary, 5 or 6 churches, and a newspaper office. It is the seat of Franklin (Baptist) college, founded in 1835 under the name of the Baptist manual labor institute.

FRANKLIN, BENJAMIN, an American philosopher and statesman, born in Boston, Jan. 17, 1706 (O. S., Jan. 6) died in Philadelphia, April 17, 1790. His birth is recorded (of course under the second date) in the public register of Boston, and it appears that he was baptized on the same day. He was the youngest son, and youngest child except 2 daughters, of a family of 17 children; it appears that his lineal ancestors had also been youngest sons during 4 successive generations. It is a common saying among modern Englishmen that England owes her greatness to her younger sons. Franklin was called upon to endure no greater hardships perhaps than his brothers, yet certainly derived impulse in his career from those early privations which appear to foster greatness. His father, a non-conformist, had emigrated to New England in 1682 in search of religious freedom; his mother, the second wife of his father, was Abiah Folger, daughter of a distinguished colonist, Peter Folger, author of a poem in defence of liberty of conscience. Franklin's father, originally a dyer, became in Boston a tallow chandler and soap boiler. Having bound out his elder sons apprentices to trades, he designed the youngest "as a tithe of his sons" for the church; the child was accordingly placed at school at the age of 8 years, and manifested early aptitude for study. Before the end of a year, however, the proposed disbursement of the "tithe" was reconsidered, in consequence of narrowed circumstances; and at the age of 10 he was employed in cutting wicks and attending to the shop. This state of things became distasteful to an active, enterprising boy, whose disposition was for the sea, and who was the leader of his playmates in all their adventures. His father forbade all thought of the sea, and apprehending wilfulness about it, bound him an apprentice to his brother James, a printer. The boy, always fond of reading, and with access now to books, often sat up the most part of a night engaged in study. His earliest favorites were Defoe's "Essay on Projects," Mather's "Essays to do Good," Bunyan's works, Plutarch, and Burton's historical collections. He conceived also a fancy for poetry, and wrote ballads, the "Lighthouse Tragedy," the "Pirate Teach, or Blackbeard;" wretched stuff, he calls them. These were published, but his father looked discouragingly upon this proceeding, and "thus," adds the autobiographer humorously, "I escaped being a poet." Meeting with an odd volume of the "Spectator," he was so much delighted that he contrived ingenious methods of mastering the style and acquiring an ability in composition which he considered a principal means of his subsequent advancement. Mr. Sparks thinks him nevertheless to have been singularly regardless of literary reputation. It was less a primary object, after achieving a mastery of language, to become distinguished by it as an accomplishment, than to acquire power through it over the human mind, and the means of communicating most effectually and in the

most attractive manner the benefit of his discoveries and research. Franklin had been disinclined to arithmetic, but at the age of 16 he felt its need, mastered it without assistance, and studied navigation. He read also at this period "Locke on the Human Understanding," the "Port Royal Logic," and a translation of Xenophon's "Memorabilia," with the style of which he was particularly pleased. He had read Shaftesbury and Collins, and becoming a sceptic, applied himself to skilful devices of argumentation gathered from the "Memorabilia," practised them as exercises in conversation, and often defeated antagonists whose cause and understanding were, as he afterward confessed, deserving of the victory. When about 16 years of age he met with a book by "one Tryon," recommending vegetable diet, which he adopted; it proved economical, and he gained thus an additional fund for purchasing books, and saved also much valuable time. "I made the greater progress," he said, "from the clearness of head and quicker apprehension which generally attend temperance in eating and drinking." Meantime he wrote a paper in a disguised hand for the "New England Courant," a journal published by his brother; it was printed as an anonymous contribution, met with approbation, and excited curiosity. Other communications followed in the same manner, and at length the young author was discovered. The brother took it amiss, and the circumstance was a first occasion of hard words; the young apprentice was beaten by a passionate master, who was little restrained by ties of consanguinity. From this early subjection to tyranny, Franklin thinks he may have first imbibed that hostility to arbitrary power which was one day to inspire a French statesman with one of the noblest lines of modern Latinity:

Eripuit cælo fulmen, sceptrumque tyrannia.

Exception was taken by the general court to the political character of Franklin's newspaper. The elder brother was arrested and imprisoned, and the future publication of the journal by James Franklin was forbidden. In this conjuncture the younger Franklin undertook to elude the interdict by consenting to be nominal printer; an arrangement which required the cancelling of his indenture as apprentice. The brother, however, required new and secret indentures, which were accordingly executed. The paper reappeared, and was continued for several months, nominally printed and published by Benjamin Franklin. A fresh difference soon arose between the brothers, and the apprentice, supposing his master would not produce the secret articles of agreement, asserted his liberty. His brother's influence, however, prevented him from getting employment at any of the printing offices in Boston, and he resolved to go to New York in search of work. He accordingly induced the captain of a trading vessel to take him secretly on board, on pretence of escaping the consequences of an unfortunate intrigue. He sold his books, and in 8 days was in New York, at the age of 17, friendless, almost penniless, and

without recommendations. Disappointed there, he continued his flight to Philadelphia. His voyage from New York to Perth Amboy in an open boat was eventful; he saved the life of a fellow passenger, a drunken Dutchman, who fell overboard; and after being 30 hours without food or water, he at length disembarked at Amboy, suffering from fever, which he says he cured by drinking plentifully of cold water. He walked thence to Burlington, and took boat to Philadelphia, arriving after some difficulty and danger at the foot of Market street at 9 o'clock on a Sunday morning. He had one dollar, and about a shilling in copper coin; the latter he gave to the boatmen. He bought 8 rolls of bread, and ate one as he walked up the street with the others under his arms, his pockets stuffed with stockings and shirts, and thus equipped he passed by the house of his future father-in-law; his future wife was at the door, and remarked the awkward and ridiculous appearance of the passer-by. He gave his rolls to a poor woman, and walked idly into a Quaker meeting house, where, there being no audible service, he fell into a comfortable sleep; it was the first house and the first repose of which he had the benefit in Philadelphia. He loved in after life to dwell upon these adventures, and found it well for his children to compare the "unlikely beginnings" of a homeless wanderer with the "figure he made afterward;" he might have added, in the words of a future eulogist, "as an ornament of America, and the pride of modern philosophy." He found employment as a printer without delay, obtained lodging at Mr. Read's, the father of the young lady who had noticed him eating his roll on the morning of his arrival, and tried to forget Boston. The governor of the province, Sir William Keith, accidentally saw one of his letters, and was struck with evidences of the writer's superiority. To the amazement of Franklin, Sir William sought him out, proposed to him to set up business for himself, and promised him the public printing. He was induced by these promises to consent to go to England to purchase types and material, and previously to doing so, to return to Boston to obtain his father's consent. This was withheld, and Franklin returning to Philadelphia remained some time longer with his first employers. In the mean time he had made progress in his courtship of Miss Read. The governor invited him often to his house, and adhered apparently to his original intention of setting him up in independent business. Arrangements therefore were completed for the voyage to London. His father's permission was no longer withheld. Miss Read consented to an engagement, and he embarked, being just 18. On arriving in London he discovered that he had been grossly deceived by the governor. Sir William Keith, "a good governor for the people, planned many excellent laws," but having "nothing else to give, had given expectations." Franklin was alone in a foreign country, without credit or acquaintance, and almost penniless. He

promptly sought a printer, and took service for nearly a year. He fell into some extravagance, however, and committed follies of which he became ashamed, and from which he returned self-rebuked to industry and temperance. He wrote and published a metaphysical criticism upon Wollaston's "Religion of Nature;" his employer saw his talent and ingenuity, but expostulated against the principles advanced in his essay. The pamphlet was an introduction to some literary acquaintances. He had altercations with his fellow journeymen on the subject of temperance; they were beer-drinking sots, and many of them he reformed altogether; he was strong and athletic, while they could carry less and did less work. His skill in swimming attracted observation, and he gave exhibitions of the art at Chelsea and Blackfriars, which excited so much attention that he meditated opening a swimming school, and wrote 2 essays upon swimming; but in the mean time he entered into engagements with a good man, Mr. Denham, to return to Philadelphia and be his clerk in a dry goods shop. They sailed together from Gravesend, July 23, 1726, and landed at Philadelphia, Oct. 11. He kept an interesting journal of the voyage. He had been 18 months in London, had profited by advantages of acquaintanceship and books, but was unimproved in his fortunes. Sir William Keith had been superseded as governor; Franklin met him in the street, but seeing that he looked ashamed, passed on without remark. To Miss Read he had behaved badly. He had written to her but once during his absence, and that was to say that she was not likely to see him soon. She had been persuaded to marry another, and was now in sore affliction, her husband having absconded in debt, and under suspicion of bigamy. Franklin attributed her misfortunes to his own conduct, and resolved if possible to repair his error. It was doubtful whether a marriage with her would be valid; it had not been clearly ascertained that his "predecessor," as he styles him, had had a previous wife, and Franklin, whom Mr. Tuckerman calls the incarnated common sense of his time, did not forget that he might be called upon to pay his predecessor's debts. "We ventured, however," he adds, "over all the difficulties, and I took her to wife on the 1st of September, 1730." She proved a good and faithful helpmate; they throve together, and always endeavored to make each other happy. Some time before his marriage he suffered a serious illness; he believed himself to be dying, and was rather disappointed to find that he was getting well, and that he was to go over all the "disagreeable work" of dying some time or other again. A similar illness carried off his employer; and Franklin, forming a connection shortly afterward with a person who had money, established a newspaper, the "Pennsylvania Gazette," which was managed with great ability. He had already written the "Busybody," a series of amusing papers, for another journal, and was the leading member of a club called the *junto*,

in which questions of morals, politics, and philosophy were discussed, and which he considered the best school of mutual improvement in the province. He very soon became a man of mark; his great intelligence and industry, his ingenuity in devising better systems of economy, of education and improvement, now establishing a subscription and circulating library, now publishing a popular pamphlet upon the necessity of paper currency (having previously contrived a copper-plate press, and engraved and printed the New Jersey paper money), and presently also his valuable municipal services, rapidly won for him the respect and admiration of the colonies. In 1732 he first published his almanac, under the name of Richard Saunders. It took the name of "Poor Richard's Almanac," and was continued profitably about 25 years. It is unnecessary here to allude to the profit derived from it to the people; the wise saws, the aphorisms, and encouragement to virtue and prosperity through the excellent proverbial sentences with which he filled the corners and spaces, became very popular, and they were at length spread over England and France in reprint and translations. In 1733, at the age of 27, he began to study the French, Italian, Spanish, and Latin languages; and after 10 years' absence from Boston, he revisited the scenes of his childhood, healing family differences, and consoling the deathbed of his brother with promises of provision for his son. Returning to Philadelphia, he was elected clerk to the assembly. Soon afterward he was appointed postmaster, and turning his mind upon municipal affairs, wrote papers and effected improvements in the city watch, and established a fire company. He became the founder of the university of Pennsylvania, and of the American philosophical society (1744), took active part in providing for defence against a threatened Spanish and French invasion, and invented the economical stove which bears his name; he declined to profit pecuniarily from this invention, although invited to do so by the offer of a patent. While in Boston in 1746, he witnessed some imperfect experiments in electricity; and having now means sufficient to withdraw from private business, he purchased philosophical apparatus and began his investigations (for an account of which see *ELECTRICITY, ELECTRO-MAGNETISM, and LIGHTNING*). The invention of the lightning rod was a practical application of discoveries the most brilliant which had yet been made in natural philosophy. He was not allowed, however, to proceed immediately with his scientific pursuits. He was elected to the assembly in 1750; was appointed commissioner for making an Indian treaty, and in 1753 deputy postmaster-general for America; and was presented with the degree of master of arts by Harvard and Yale colleges. In 1754, the French war impending, he was named a deputy to the general congress at Albany. He proposed a plan of union for the colonies, which was unanimously adopted by the convention, but rejected by the board of trade in England as too democratic. He was ever afterward actively and zealously

engaged in national affairs. We find him in Boston in 1754; and the French war having begun, he assisted Mr. Quincy in procuring a loan in Philadelphia for New England. He visited Braddock in Maryland, and modestly remonstrated against that general's expedition which resulted so disastrously. As postmaster-general, he was called upon, however, to facilitate the march of the army, and labored faithfully, and even to his own pecuniary disadvantage, in the service. After the defeat of Braddock, he was the means of establishing a volunteer militia, and took the field as military commander. After a laborious campaign it was proposed to commission Franklin as general in command of a distant expedition; but he distrusted his military capacities and waived the proposal. He resumed his electrical researches, and wrote accounts of experiments, which were read before the royal society of London, and procured for him the honor of membership; they also obtained for him the Copley gold medal, and were published in England and France. Sir Humphry Davy says of these papers that their style and manner are almost as admirable as the doctrine they advance. Franklin, he said subsequently, seeks rather to make philosophy a useful inmate and servant in the common habitations of man, than to preserve her merely as an object of admiration in temples and palaces. The great aim of his mind was ever practical utility, and although it has been said of him by English historians that he had usually a keen eye to his own interests, they are forced to add that he had ever a benevolent concern for the public good. Franklin, an active member of the Pennsylvania assembly, was indefatigable with his pen. The proprietary persisted in measures conflicting with the privileges of the inhabitants and with the public good; in consequence of which the deputies resolved to petition the home government for redress, and appointed Franklin their commissioner for the purpose. He published afterward (1759) the "Historical Review," which contained his papers in aid of the cause of his constituents, and had in the meanwhile obtained so much reputation, that Massachusetts, Maryland, and Georgia intrusted him with the agency of their affairs also. On making the English coast, the ship in which he had embarked narrowly escaped the rocks. In describing the circumstance to his wife he said: "Were I a Roman Catholic, I should perhaps vow to build a chapel in gratitude for this escape; but as I am not, if I were to vow at all, it should be to build a lighthouse." He arrived in London, July 27, 1757. Honors and compliments in abundance awaited him. Oxford and Edinburgh conferred upon him their highest academical degrees. He made personal acquaintance with the most distinguished men of the day, but never failed to bestow his principal attention upon the object of his mission. An illness of 8 weeks retarded progress, and great difficulties followed from many circumstances. Three years elapsed, and at length he succeeded

in the principal objects of his mission to the entire satisfaction of his constituents. He suggested to the ministry the conquest of Canada, and his scheme was adopted. With Lord Kames and others in Scotland he passed 6 weeks of the "densest happiness," as he called it, of his life. He gave Lord Kames the famous "Parable against Persecution." He made further experiments in electricity, invented a musical instrument, the armonica (musical glasses), and received from the ministry a high proof of their consideration in the appointment of his son to the governorship of New Jersey. At the end of 5 years he reëmbarked for home, reaching Philadelphia Nov. 1, 1762. He received the official thanks of the assembly. New difficulties arising between the province and the proprietaries, he was again appointed agent to the English government, to petition that the king take Pennsylvania affairs into his own hands. He reached London early in Dec. 1764. The revolution was imminent. The project of taxing the colonies had been announced, and Franklin was the bearer of a remonstrance against it on the part of the provincial government of Pennsylvania. He was indefatigable in his exertions to prove the unconstitutionality and impolicy of the stamp act; and when the repeal of this obnoxious measure was attempted he underwent an examination before the house of commons (Feb. 8, 1766). The talents and greatness of the man are said to have never been more favorably exhibited than on this occasion. His conduct made it an everlasting record of his firm and patriotic spirit, of his wise and prompt foresight, the semblance of an almost inspired sagacity. The repeal of the stamp act was an inevitable consequence. He subsequently travelled in Holland and Germany with his friend Sir John Pringle; and visited Paris, where he met with due attention. Temporary tranquillity in America, after the repeal of the stamp act, was followed by commotions in Boston occasioned by the equally offensive revenue act, and others subversive of colonial rights. In 1772, a member of parliament, to convince Franklin that every perverse measure and every grievance complained of by the Americans originated not with the British government, but with tories in America, gave to Franklin a number of letters written from Massachusetts by Gov. Hutchinson and Lieut. Gov. Oliver, warmly urging coercive measures against the colonies. Franklin immediately sent these letters to the speaker of the Massachusetts house of representatives. Their publication caused great and just indignation in America, and was of invaluable service to the popular cause. The Massachusetts house petitioned the king that he would remove Hutchinson and Oliver from the government. Franklin appeared before the privy council, Jan. 29, 1774, to present their petition and advocate the removal. "He was now," says Bancroft, "thrice venerable, from genius, fame in the world of science, and age, being already nearly threescore years and ten."

He was grossly reviled and shamefully insulted by Wedderburn the solicitor-general, who made against him a long personal harangue, amid the applauding laughter and cheering of the lords in council. Franklin bore this contumely with his accustomed patience and dignified equanimity. The petition was rejected, and the next day Franklin was dismissed from the office of deputy postmaster-general. Meanwhile he calmly pursued his honest and patriotic course, and found time for further research in science, for journeys again to Paris, Scotland, and Wales, and a visit to Ireland. He had determined to await in England the result of the continental congress. In the mean time Mrs. Franklin died. His parents and 15 of his sisters and brothers had all long been dead. A daughter alone was to remain to his solitude, his cherished son being about to sacrifice the ties of kindred to loyalty or political ambition. Franklin embarked for home in March, and arrived May 5, 1775, just 16 days after the battle of Lexington. He had labored faithfully in England to save the mother country from the final outbreak, and now repaired as faithfully to his duties in the congress. As a member of the committees of safety and foreign correspondence he performed most valuable services, exerting all his influence for a declaration of independence. That instrument he had the honor to assist in drafting, and to sign, July 4, 1776. He was sent soon after to Paris as commissioner plenipotentiary, together with Silas Deane and Arthur Lee. During the voyage he continued some interesting experiments which he had begun in the spring of the same year in relation to the Gulf stream. He was the first to make observations of this current; and his chart of it, published 90 years ago, still forms the basis of charts now in use. The learned superintendent of the coast survey, Prof. Bache, made this statement in a lecture in Feb. 1858, and added that Franklin's theory illustrating in general the results of the great transfer of tropical water to the north is advocated by modern philosophers. On arriving in France, Franklin established himself almost immediately at Passy. A French writer (Lacretelle) of high celebrity says that "by the effect which Franklin produced, he appears to have fulfilled his mission, not with a court, but with a free people." Men appeared to look on him as a sage come from a new world to unfold mysteries. He was not at first received officially, but soon gained influence with the ministry; and upon receipt of news of Burgoyne's disaster, he had the happiness to conclude the treaty of Feb. 6, 1778. English emissaries came to Paris thereupon to sound Franklin upon the subject of reconciliation, of which they discovered that independence was to be the sole basis. His prudence and sagacious firmness defeated every attempt of the British government to sow discord between America and her ally. He was now accredited to the French king as minister plenipotentiary (1778), and subsequently one of the commissioners for negotiating peace with the mother country. His

diplomatic career forms a chief chapter in the history of his country. He signed the peace Nov. 30, 1782, and now longed to return. He was not able to do so, however, until 1785, when, after 53 years in the service of his country, he retired to private repose. Before leaving Paris he concluded the treaties with Sweden and Prussia, embodying many of his great international principles. He had been throughout the whole period of his mission an object of marked enthusiasm. His venerable age, his plain deportment, his fame as a philosopher and statesman, the charm of his conversation, his wit, his vast information, his varied aptitudes and discoveries, all secured for him not only the enthusiastic admiration of Europe, but a circle of ardent friends, embracing the very widest range of human characters. His simple costume and address, and dignified aspect, among a splendidly embroidered court, commanded the respect of all. "His virtues and renown," says M. Lacretelle, "negotiated for him; and before the second year of his mission had expired, no one conceived it possible to refuse fleets and armies to the countrymen of Franklin." On his return to Philadelphia (Sept. 14, 1785), he was elected "president of Pennsylvania." Washington, with whom he enjoyed an uninterrupted friendship, was among the first to welcome him. At the age of 82, he consented to be a delegate to the convention for forming the federal constitution. He entered actively and heartily into the business of the convention. He served also as president of the society for political inquiries, and wrote interesting and vigorous papers upon many important subjects. In his 84th year he wrote to Washington: "For my personal ease I should have died two years ago; but though those years have been spent in excruciating pain, I am glad to have lived them, since I can look upon our present situation." His faculties and affections were unimpaired to the last. At his death 20,000 persons assembled to do honor to his remains. He was interred by the side of his wife in the cemetery of Christ church. Throughout the country every species of respect was manifested to his memory; and in Europe extraordinary public testimonials are on record of honor due to one of the greatest benefactors of mankind. Fault has been found with his religious character. He confesses that during a period of his life, before the age of 21, he had been a thorough deist; and it has been said that 5 weeks before his death he expressed a "cold approbation" of the "system of morals" of "Jesus of Nazareth." Whatever his faith and doctrine may have been, his reverence for religion and Christian institutions was constantly manifest. It was Franklin who brought forward a motion for daily prayers in the Philadelphia convention. The motion was rejected, as "the convention, except 8 or 4 persons, thought prayers unnecessary." We find him advising his daughter to rely more upon prayer than upon preaching; and as a practical moral adviser he has left us beautiful teachings,

at least, of scarcely surpassed human wisdom. At the most critical epoch of his public life, when beset with menace, jealousy, bribery, and official caprice and injustice, he said: "My rule is to go straight forward in doing what appears to me to be right, leaving the consequences to Providence." Franklin was a strong, well formed man. His stature was 5 feet 9 or 10 inches. His complexion was light, his eyes gray. His manners were extremely winning and affable. His name is not borne by any of his descendants. His daughter, Sarah, the wife of Richard Bache, bore 7 children, whose living descendants are numerous.—The last of his race who bore his name was his grandson, William Temple Franklin, who died in Paris, May 25, 1823, and who published in London and Philadelphia, between 1816 and 1819, editions of his grandfather's works. The complete edition of the works of Franklin, edited by Jared Sparks, appeared in Boston in 12 vols. 8vo. in 1836-'40, with notes and a life of the author (new edition, Philadelphia, 1858).

FRANKLIN, SIR JOHN, an English admiral and arctic explorer, born at Spilsby, Lincolnshire, April 16, 1786. He was the youngest son of a respectable yeoman, whose patrimonial estate was so burdened with mortgages that to maintain and educate a family of 12 children he was obliged to sell it and engage in trade. John, his youngest son, was intended for the clerical profession, and received his early education at St. Ives and at the grammar school of Louth. He soon showed, however, a decided predilection for the sea. While a school boy at Louth, he, with one of his comrades, took advantage of a holiday to walk to the coast, 12 miles distant, merely to look at the ocean, which he then saw for the first time, and upon which he gazed for many hours with intense satisfaction. His father, hoping that his inclination for the life of a sailor would be removed by an experience of its discomforts, permitted him to make a voyage to Lisbon in a small merchant vessel. But this experiment only confirmed the boy's fondness for the sea, and his father, deeming it hopeless to overcome so strong a propensity, yielded to it, and procured him admission to the navy as a midshipman at the age of 14. He entered on board the ship of the line *Polphemus*, and served in her at the battle of Copenhagen, April 2, 1801. A midshipman who stood at his side was shot dead during the engagement. In the ensuing summer he joined the *Investigator*, which was commanded by his cousin, Capt. Flinders, and was commissioned by the English government to explore the coasts of Australia. After nearly two years spent in this service, which was eminently of a nature to qualify him for his future pursuits, the *Investigator* proving unseaworthy, Franklin and the rest of her officers sailed for home in the store ship *Porpoise*; but that vessel was wrecked Aug. 18, 1803, on a reef about 200 miles from the coast of Australia, and he and his companions remained for 50 days on a sand bank 600

feet in length until relief arrived from Port Jackson. Franklin was carried to Canton, where he obtained passage to England in a vessel of the China fleet of Indiamen, commanded by Sir Nathaniel Dance. On their voyage home they were attacked in the strait of Malacca, Feb. 15, 1804, by a strong French squadron, which they beat off. Franklin during the battle acted as signal midshipman. On reaching England he joined the ship of the line *Bellerophon*, and in 1805 took part in the battle of Trafalgar as signal midshipman, performing his functions with distinguished coolness and courage in the midst of a hot fire. Of 40 persons who stood around him on the poop, only 7 escaped unhurt. For 6 years subsequently he served in the *Bedford* on various stations, the last of which was the coast of the United States during the war of 1812-'15. He commanded the boats of the *Bedford* in a fight with the American gun boats at New Orleans, one of which he boarded and captured. He was wounded in the action, and for his gallantry was made a lieutenant. In 1818, the British government having fitted out an expedition to attempt the passage to India by crossing the polar sea to the north of Spitzbergen, Franklin was appointed to the command of the *Trent*, one of the two vessels of the expedition; the other, the *Dorothea*, being commanded by Capt. Buchan. After passing lat. 80° N. the *Dorothea* received so much damage from the ice that her immediate return to England was decided on. Franklin begged to be permitted to continue the voyage with the *Trent* alone, but his commander, Capt. Buchan, would not consent, and the two vessels returned to England together. Franklin's conduct on this occasion brought him prominently into notice, and gave him a high reputation as a bold and thorough seaman and a competent surveyor and scientific observer. In 1819, on the recommendation of the lords of the admiralty, he was appointed to the command of an expedition to travel overland from Hudson's bay to the Arctic ocean for the purpose of exploring the coast of America eastward from the Coppermine river. (For an account of this and his other arctic expeditions, and of those sent in search of him, see ARCTIC DISCOVERY.) Franklin returned to England in 1822. During his absence he had been promoted to the rank of commander, and shortly after his arrival home was made a post captain and elected a fellow of the royal society. In 1823 he published a narrative of his journey, and in August of the same year he married Eleanor Porden, daughter of an eminent architect. In 1825 he was appointed to the command of another overland expedition to the Arctic ocean. When the day assigned for his departure arrived, his wife was lying at the point of death. She, however, insisted that he should not delay his voyage on her account, and gave him as a parting gift a silk flag, which she requested him to hoist when he reached the polar sea. She died the day

after he left England. He returned home by way of New York, arriving at Liverpool, Sept. 24, 1827, and on March 8, 1828, he was married to Jane Griffin, the present Lady Franklin. In the same year he published a narrative of his second expedition. In 1829 he was knighted, and received the degree of D.C.L. from Oxford university and the gold medal of the geographical society of Paris. In 1830 he was sent to the Mediterranean in command of the *Rainbow*; and having rendered some service to the Greeks in their struggle for independence, he was decorated by King Otho with the cross of the Redeemer of Greece. While on this station he was noted for his attention to the comfort of his crew, and the sailors expressed their sense of his kindness by calling his vessel the "*Celestial Rainbow*" and "*Franklin's Paradise*." In 1836 he was made governor of Tasmania or Van Diemen's Land, in which office he continued till 1843. He was a very popular governor, and originated and carried many measures of great importance to the colony. He founded a college and gave it large endowments from his own funds, and exerted himself to have it conducted in the most liberal manner, without regard to distinctions of sect. In 1838 he founded the scientific association now known as the royal society of Hobarton; during his administration its papers were printed at his expense. When the colonial legislature voted an increase to the governor's salary, Sir John refused to accept it for himself, but secured the additional appropriation for the benefit of his successor. On the day of his departure from the colony the most numerous gathering of the people that had ever been seen in Tasmania attended him to the place of embarkation, the bishop of the colony walking at their head. He was also complimented by addresses from every district of the island. Long afterward the remembrance of his virtues drew from the inhabitants of Tasmania a contribution of £1,700, which was sent to Lady Franklin to assist in paying the expenses of the search for her missing husband. In 1845 Sir John was appointed to the command of a new expedition to discover the N. W. passage. It consisted of the ships *Erebus* and *Terror*, which were furnished and fitted out in the strongest and most complete manner, and manned by picked crews, amounting in all, officers and men, to 138 persons. They sailed from Sheerness, May 26, 1845. Franklin's orders were to return in 1847. He was last seen by a whaler who met him in Baffin's bay, July 26, 1845. In 1848, no tidings of the expedition having reached England, the anxiety of the public as to his fate led to the fitting out of several expeditions in search of him. In the spring of 1850, as Dr. Rae ascertained in 1854, a party of about 40 white men were seen by the Esquimaux on King William's island, and a few months later the savages found their bodies at a point not far to the N. W. of Back's Great Fish river. From articles picked up by the

Esquimaux it is certain that these men were a portion and probably the last survivors of Franklin's expedition. He himself had doubtless already perished, for the party as described by the Esquimaux contained no man so old as Franklin, who in 1850 would have been 64 years of age.—See "*Narrative of a Journey to the Shores of the Polar Sea in 1819-'22*," by Capt. John Franklin (London, 1823); "*Narrative of a Second Expedition to the Shores of a Polar Sea, in 1825-'27*," by the same (London, 1828). These works have been reprinted in England and America.—**ELEANOR ANN**, an English poetess, first wife of the preceding, born in July, 1795. Her father, William Porden, was the architect of Eaton hall, and of other noted buildings. At an early age she manifested remarkable talents, and especially an aptitude for languages. Almost unassisted she taught herself Greek and Latin when only 11 or 12 years old. She soon acquired several other languages, and a general knowledge of all the principal sciences, especially of botany, chemistry, and geology. At the age of 15 she began to write, and in her 17th year she produced a poem in 6 cantos, "*The Veils, or the Triumphs of Constancy*," which attracted considerable attention on its publication in 1815. Her next publication, "*The Arctic Expedition, a Poem*" (1818), led to her acquaintance with Capt. Franklin, and to their marriage in Aug. 1823. In the previous year her longest and best poem, "*Cœur de Lion, or the Third Crusade*," in 16 cantos, was published. She died of consumption, Feb. 22, 1825, the day after her husband sailed on his second expedition to the Arctic shores. Her poems, with the exception of "*Cœur de Lion*," were collected and published in London in 1827.—**LADY JANE**, second wife of Sir John Franklin, an Englishwoman distinguished for the devoted perseverance with which she has labored for the rescue of her husband from the perils of his last arctic expedition, born about 1800. She was the second daughter of John Griffin, Esq., F.S.A., and is of French Huguenot descent on her mother's side. While in Tasmania she rendered a permanent service to the country by paying out of her private purse a bounty of 10 shillings each for the destruction of a dangerous species of serpent, which in consequence was soon exterminated. She has expended nearly all her fortune in the search for her husband, and is still urging new expeditions to seek for his remains.

FRANKLIN, WILLIAM, the last royal governor of New Jersey, son of Benjamin Franklin, born in Philadelphia about 1731, died in England, Nov. 17, 1813. In childhood he was, like his father, remarkably fond of books, and likewise of an adventurous disposition. He sought to go to sea in a privateer during the French war (1744-'8), and, disappointed in this, obtained a commission in the Pennsylvania forces, with which he served in one or two campaigns on the Canadian frontier, and rose to be captain before he was of age. After his return to Philadelphia he soon obtained offi-

cial employment through his father's influence. From 1754 to 1756 he was comptroller of the general post office, and was during part of the same period clerk of the provincial assembly. In 1757 he accompanied his father to London, where he studied law and was admitted to the bar in 1758. In 1762, while yet in Europe, he was appointed governor of New Jersey, to which province he returned in 1763. In the revolutionary contest he remained loyal to Great Britain, and some of his letters containing strong expressions of tory sentiments having been intercepted, he had a guard put over him in Jan. 1776, to prevent his escape from Perth Amboy. He gave his parole that he would not leave the province, but in June of that year he issued a proclamation as governor of New Jersey summoning a meeting of the abrogated legislative assembly. For this he was arrested by order of the provincial congress of New Jersey and removed to Burlington as a prisoner. He was soon after sent to Connecticut, where he was detained and strictly guarded for upward of two years, till in Nov. 1778, he was exchanged for Mr. McKinley, president of Delaware, who had fallen into the hands of the enemy. Gov. Franklin after his liberation remained in New York till Aug. 1782, when he sailed for England, in which country he continued to reside till his death. The English government granted him £1,800 in remuneration of his losses, and in addition a pension of £800 per annum. William Franklin's adherence to the royal cause led to an estrangement between him and his father, which continued after the revolutionary contest was over. The son made advances toward a reconciliation in 1784, which drew from the father the declaration that he was willing to forget the past as much as possible. In 1788, however, in a letter to Dr. Byles, he speaks of his son as still estranged. In his will, he bequeathed to William his lands in Nova Scotia, and released him from all debts that his executors might find to be due from him, and added this clause: "The part he acted against me in the late war, which is of public notoriety, will account for my leaving him no more of an estate he endeavored to deprive me of."

FRANKLINITE, a mineral composed of peroxide of iron, oxide of zinc, and oxide of manganese, in appearance much like the magnetic oxide of iron. It is found in considerable quantity only in Sussex co., N. J., although it is also mentioned as accompanying ores of zinc in amorphous masses at the mines of Altenberg (Vieille Montagne), near Aix la Chapelle. The composition of the Franklinite of New Jersey is:

Constituents.	Berthier.	Tompson.	Dickinson.	Albich.
Peroxide of iron.....	66.00	66.10	66.115	63.86
Oxide of zinc.....	17.00	17.43	21.771	10.81
Oxide of manganese...	16.00	14.96	11.987	13.17
Silica.....	0.127	..

Its hardness is 5.5–6.5; specific gravity, 5–5.09. It occurs in large veins or beds at the mines of the New Jersey zinc company at Stirling hill and Mine hill in Sussex co., accompanied by the

red oxide of zinc, lying between the crystalline limestone and the gneiss rocks. At Stirling hill it constitutes the main substance of two beds of considerable magnitude, lying in immediate contact with each other, divided only by a parting seam, running S. W. and N. E., and dipping S. E. about 40° from the hill against which the beds seem to repose, toward and under the bed of the Walkill river. The upper of these beds, lying immediately under the crystalline limestone, is composed chiefly of the red oxide of zinc with the Franklinite interspersed in granular masses, often assuming the appearance of imperfect crystals. It presents a thickness varying from 3 to 8 feet, and is traced with great uniformity of structure. At times almost perfect crystals of Franklinite are found, particularly where the bed comes in contact with the superincumbent limestone; these crystals are of the regular octahedral form with the edges replaced. The Franklinite constitutes about 45 per cent. of the mineral contents, the rest being mainly red oxide of zinc. This bed is extensively worked by the New Jersey zinc company, who remove annually about 8,000 tons of the ore to their works at Newark, where they manufacture from it the white oxide of zinc used for paint; the residuum, after the oxide of zinc is driven off, being Franklinite, is smelted into iron. The underlying bed appears on the surface or outcrop to be almost a pure massive Franklinite, amorphous in structure, although occasionally also exhibiting very large and nearly perfect crystals of the Franklinite; it contains no red oxide of zinc, which fact is the distinctive feature between this and the overlying bed, which is generally known as the bed of red zinc. As the underlying bed of Franklinite descends it becomes less pure, the Franklinite being replaced by the crystalline limestone, with the Franklinite and willemite (anhydrous silicate of zinc) thickly interspersed in grains and imperfect crystals. It preserves this character in its entire depth as far as explored, nearly 200 feet below its outcrop; this bed is about 12 feet in thickness, but is not worked. Several hundred feet westwardly of these main beds, and higher up on the hill, another bed of Franklinite, mixed with a little of the red oxide and a good deal of the silicate of zinc, is found, running the entire length of Stirling hill; on the S. W. point of this vein a considerable quantity of ore is mined by the Passaic zinc company, and by them manufactured into the white oxide of zinc at their works at Bergen, near Jersey City. The other locality where the Franklinite is found in large masses is on Mine hill, about 1½ miles N. E. from Stirling hill, following the course of the Walkill to the village of Franklin. Here there are also found two distinct beds lying in immediate juxtaposition; but their relative position, as compared with that of the beds at Stirling hill, is reversed, the Franklinite being the easternmost and uppermost, and the zinc being the underlying and westernmost. The formation generally on Mine hill seems

considerably disturbed, and much less regular than on Stirling hill. The Franklinite on Mine hill, which promises from surface indications to be a rich and regular body of ore, has however not proved so in the numerous openings and explorations made by the Franklinite iron company, who erected a large blast furnace here some 4 years since for the express purpose of working this ore. They found it so much disturbed, and immediately below the outcrop so much mixed with other and useless substances, chiefly an impure garnet (silicate of iron), as to make the ore unfit for any metallurgical purpose. The attempts to smelt it did not prove successful, and the works were abandoned. The underlying or westerly bed, on the other hand, is much purer, and is composed of massive Franklinite, interspersed throughout with more or less red oxide of zinc in spangles or small lamellar masses. Its outcrop is plainly traceable along the entire crest of Mine hill for nearly half a mile in length, varying from 3 to 5 feet in thickness; it has been worked to some extent by the New Jersey zinc company. A late examination of this ore by Professors J. D. Dana and B. Silliman, jr., shows it to be composed of 46 to 48 per cent. of Franklinite, the rest being mainly red oxide of zinc, yielding, exclusively of the zinc in the Franklinite, 26 per cent. of oxide of zinc.—As has been already stated, the New Jersey zinc company, after extracting the zinc in the shape of the white oxide from the ores of Stirling and Mine hills, smelt the residuum, consisting almost wholly of Franklinite, into iron. Attempts had been made many years since by some of the iron works in the neighborhood to smelt the Franklinite ore which appeared in such large masses and so easy to be mined; but none of these early operations proved successful, owing, no doubt, to the great quantity of zinc in the ore, which in its process of volatilization absorbs a large amount of heat, and thereby tends to chill the furnace. Early in 1853 Mr. E. Post, of Stanhope, N. J., undertook to work the ore with anthracite in one of the blast furnaces at Stanhope, and succeeded in making some pig iron of excellent quality; but these operations were soon discontinued. In the same year Mr. C. E. Detmold successfully and permanently established the manufacture of iron from the zinc and Franklinite ores at the works of the New Jersey zinc company (of which he was then president), by smelting the residuum, after the zinc had been driven off, for the purpose of making the white oxide. This branch of industry is calculated to become one of much importance, as the iron produced from this residuum not only yields a bar iron of remarkable purity, fibre, and strength, but is especially suited to the manufacture of steel. The furnace in which this iron is made is 18 feet high and 8½ feet diameter of bosh; it produces annually about 2,000 tons, and works uninterruptedly with very great regularity. The pig iron produced is almost identical in character, appear-

ance, and structure with the best lamellar iron made of the famous spathic ores of Siegen and Müsen in Germany. Its fracture shows large and brilliant silver-white lamellar facets, sometimes beautifully crystallized, and so hard as to cut glass; these crystals are not attracted by the magnet. (See Prof. J. Wilson's special report in the "General Report of the British Commissioners," presented to parliament, Feb. 6, 1854.) An analysis of this iron gives in 100 parts: iron, 88.80; carbon combined, 5.48; carbon free (graphite), 0.00; manganese, 4.50; silicon, 0.20; zinc, 0.30; sulphur 0.08; phosphorus, 0.15; loss, 0.99.

FRANKS, a confederacy of German tribes, which first appeared under this name near the lower Rhine, about the middle of the 3d century. The name is variously derived from *framea*, a weapon of the ancient Germans mentioned by Tacitus, from a Germanic word meaning free, and from another meaning exile. It is now generally believed that the tribes which constituted the bulk of the Frankish confederacy were the same which were known to the Romans in the time of the first emperors, under the names of Sigambri, Chamavi, Ampsivarii, Bructeri, Chatti, &c. The first mentioned were the most powerful. A part of these tribes had passed the Rhine as early as the 1st half of the 1st century. In the 3d and 4th larger bodies successively passed into the N. E. part of Gaul, which country was finally wrested by them from the Romans in the 5th century. Under Probus they appear as dangerous enemies of the Romans. Carausius, who was appointed to defend the province against them both by land and sea, having betrayed his master, and assumed the purple in Britain, made them his allies, surrendering to them the island of the Batavi and the country on the Scheldt. Constantius I. and Constantine the Great expelled them from this territory, but they soon invaded it again, and were finally left in its possession by Julian. From that period they appear to form two separate groups, the Salian (from the old German *sal*, sea, or from *Sala*, the ancient name of the river Yssel), and Riparian (from the Latin *ripa*, bank of a river). The former continued the attacks on Gaul during the 5th century, and conquered the greater part of it under the Merovingian king Clovis; the latter spread southward on both sides of the upper Rhine, extending their conquests W. as far as the Meuse, and E. as far as the head of the Main. From them the country adjacent to the Main derives its modern name of Franconia. The Franks form an element in the modern population of France, as well as of S. W. Germany. Their two divisions had separate laws, which were afterward collected in two codes, known as *Lex Salica* and *Lex Ripuariorum*.

FRASCATI, a town of the Papal States, in the Campagna, on the N. W. declivity of the Tusculan mount, 8 m. E. S. E. from Rome; pop. about 5,000. It was the favorite summer residence of the Roman nobility and cardinals

for some centuries; and many of their magnificent villas remain as monuments of the taste and opulence of their proprietors. Of these the most celebrated is the villa Aldobrandini, which is adorned with numerous fountains, water works, and paintings. The villa Rufinella was once the property and abode of Lucien Bonaparte. On the summit of the mountain, at an elevation of 2,000 feet above the level of the sea, and about 2 miles from Frascati, are the ruins of Tusculum, round which clustered in the palmy days of republican and imperial Rome the villas of her patricians, orators, and emperors.

FRASER, CHARLES, an American artist, born in Charleston, S. C., Aug. 20, 1782. In early life he evinced a strong disposition to become a painter, and at 12 or 14 years of age was in the habit of employing his pencil to depict the scenery of Charleston and its neighborhood. His friends, however, deeming it necessary that he should adopt one of the learned professions, at the age of 16 he became a student of law. At the end of 3 years he commenced the study of his favorite art, but becoming discouraged he resumed his legal studies in 1804, and in 1807 was admitted to practice. By close attention to business he was enabled to retire at the end of 11 years with a competency, and in 1818 he reëmbarked in the career of an artist. The example of Malbone, with whom in his youth he had been on terms of intimacy, induced him to give his attention to miniature painting, a branch of the art which he has followed more persistently than any other, and in which he has attained eminent success. In 1825 he painted the portrait of Lafayette, and probably nearly every citizen of South Carolina distinguished in the history of the state during the last 50 years has been numbered among his sitters. He has also produced many portraits, landscapes, interiors, historical pieces, and pictures of *genre* and still life, the greater part of which are owned in South Carolina. Mr. Fraser also possesses a high reputation in the South as a contributor to periodical literature, and the author of occasional addresses. He has produced several poems characterized by elegance of diction and elevation of thought. In 1857 an exhibition of his collected works was opened in Charleston, numbering 313 miniatures, and 139 landscapes and other pieces in oils.

FRASER RIVER. See COLUMBIA, BRITISH.

FRATERNITIES, or CONFRATERNITIES (Lat. *fraternitas*, brotherhood), associations of men for mutual benefit or pleasure, or in a more restricted sense, religious societies for purposes of piety or benevolence. In the latter meaning it generally designates lay organizations. During the middle ages such fraternities were extremely popular, and scarcely any external act of devotion, except joining a religious order, was thought more meritorious. Many sorts of these societies might be mentioned. With some, like the confraternity of Notre Dame, founded at Paris in 1168, and composed of 36 priests and 36 laymen, sym-

bolical of the 72 disciples of Christ, the main object was perfection in spiritual life; such are the numerous sodalities (Lat. *sodalitas*, a companion) which have spread from Rome all over the world. With others it was practical philanthropy; with others, penitential works. There were fraternities of pilgrims; fraternities of the Passion, whose members performed mysteries in the theatres; fraternities of merchants, tradesmen, and artisans; and fraternities, like the *fratres pontifices*, who flourished in the south of France from the 13th to the 15th century, who took upon themselves the construction and repair of bridges, roads, and hospitals, the keeping up of ferries, and the security of the highways. Many of them obtained the sanction of the church; others met with great opposition, and were finally suppressed as heretical. Not a few acquired in time a political character, or concealed one from the first under the guise of religion. The brethren of the white caps, so called from their peculiar head gear, were established about the end of the 12th century in the south of France by one Durand, a carpenter. Their professed design was to rid the country of the marauders disbanded from the armies of Henry II. and Philip Augustus; but having accomplished this, they undertook to forbid the lords to receive dues from their vassals, and were consequently soon put down. During the struggle between Simon de Montfort and Count Raymond of Toulouse, a confraternity of white brethren was founded at Toulouse (1210), in the interest of Montfort, and was opposed by the black company attached to Count Raymond. The whites were afterward remembered for their cruelty at the taking of Lavaur (1211). Of other associations, both orthodox and otherwise, some of the most noted are the Beguins or Beghards (see BEGUINS); the Alexians, called also Lollards, Cellites, and Matemans, who devoted themselves to works of benevolence, and have left much of their spirit to the burial societies of Cologne and other European cities; the brothers of the common life, founded about 1380, and composed mainly of clergymen engaged in copying books; the flagellants; the calendar brothers of Germany; the brothers of death of the order of St. Paul, founded at Rouen in 1620, and suppressed by Pope Urban VIII.; and the fraternity of the Holy Trinity, founded by St. Philip Neri in 1548, for the relief of pilgrims and others. St. John of God, a Portuguese, established in the 16th century a society for the relief of the sick and poor, the members of which were known in Spain as brethren of hospitality, in France as brethren of Christian love, and in Germany as brethren of mercy. The brothers of the Christian schools, the brethren of the holy cross, and many similar associations for works of charity and education, are now spread over the world. Of the purely lay fraternities, one of the most extensive is the benevolent society of St. Vincent de Paul, founded in the 17th century, which has branches in most of the cities of the United States. In

the city of Rome there are nearly 200 societies whose members visit the hospitals, bury the dead, instruct poor children, and supply portionless girls with dowers. The confraternity of St. Yves, composed of lawyers, undertakes the defence of the poor before the courts; that of the *pericolanti* protects young girls whose virtue is in danger; that of St. Jerome, *della carita*, is specially devoted to prisoners. The fraternity of St. Giovanni Decollato attends culprits to execution. The *sacconi*, so called from a peculiar dress which conceals the face and prevents the wearer from being recognized, go about the city at certain times barefooted to collect alms for pious purposes. Among fraternities may be numbered several congregations of priests who apply themselves to special objects, and generally live in common, without being bound by the ordinary monastic vows. Such are the priests of the oratory, organized at Rome by St. Philip Neri, in 1548, for mutual edification; the French oratory of Jesus, founded by Cardinal Berulle in 1611, for the reformation of the clergy; and the society of St. Sulpicius, which takes an active share in the education of candidates for orders.

FRAUD. There are few principles of law more often or more emphatically asserted than that fraud avoids every contract tainted with it, and annuls every transaction. It is seldom that this is not true; but there are certain rules and qualifications which must be known, if the practical application of the principle would be understood. Thus, fraud does not so much make the contract tainted with it void, as voidable. This is an important practical distinction, for a void contract has, and can have, no efficacy whatever, being simply nothing; whereas he who is defrauded in a contract or transaction may still be on the whole benefited by it, and he may certainly waive his right to avoid it for the fraud; and if he does so, the fraudulent party cannot insist that his own fraud has liberated him from his own engagements, and annulled his obligations. It is very difficult to give a legal definition of fraud; but it may be said to be any deception by which another person is injured. This definition, however, leaves it necessary to explain how far such deception may be carried, and what its character must be, before the law recognizes it as fraud, and will permit a party injured by it to find legal redress, either by annulling his engagements or otherwise. For it is certain that all deception is not fraud in law. The Roman civil law used the phrase *dolus malus*, evil deceit, to express the fraud which the law dealt with. We have no similar phrase in our law, but we have an exactly similar distinction, although it is one which it is difficult to define, or even to illustrate. The law of morality and of religion is plain and simple: "Do unto others as you would have them do unto you;" and any craft or cunning, any concealment or prevarication, or consent to self-deception, by which one may make gain over another, is clearly a violation of this

law. But it is certain that there is a large amount of craft, and a very cunning kind of deception—active or passive—of which the law takes no cognizance, and which characterize a very large proportion of the common transactions of society. Somewhere the law draws a line between that measure and that manner of deception against which it directs men to protect themselves by their own caution, under the penalty of suffering without remedy any mischiefs which may result from their want of skill or care, and that larger or deeper or more important kind of deception, which it considers unreasonable to require that men should guard themselves from without its aid, and which therefore it will lay a strong hand upon and suppress or render harmless whenever it is detected. But where this line is drawn it would be impossible to declare by any formula. Indeed, there are whole classes of cases in which it may be considered as not yet settled what the law is in this respect. Thus, the law of warranty has been expressly founded in England and the United States upon the rule *caveat emptor*, or, let the buyer beware; and it was once applied almost to the extent of holding that if a buyer did not choose to obtain an express warranty of the thing sold, he was remediless, whatever might be the amount of deception practised upon him, or rather, whatever might be the degree or the way in which he was permitted to deceive himself. But, in the article **WARRANTY**, we shall show that there has been an important modification of the law in this respect.—While it is impossible to state precisely by definition what frauds the law will recognize and treat as such, and what it will not, there are some leading principles which run through the adjudication on this subject, and may help to a just understanding of this matter. One of these is, that the fraud must be material to the contract or transaction, and as it were enter into its very essence and substance; and the best test of this may be found in the question, would the transaction have taken place if the fraud had not been practised? For if it would not, the fraud was material. Another is, that the fraud must work an actual and substantial injury, for mere intention or expectation is not enough. Another is, that the defrauded party must not only have believed in point of fact the false statement, but must have had a rational right to believe it, because he cannot call upon the law to protect him from the consequences of his own neglect or folly. Here the law looks carefully at the injured person's ability to protect himself; and it is far more liberal in its suppression of fraud, or in remedying its consequences, when that fraud was practised against one who from age, infirmity of mind or body, or the confidence arising from a fiduciary relation, has a right to call on the law for its protection. Another distinction which the law makes is founded on practical reasons, which amount indeed to a necessity, but is scarcely sustained by principles of morality; it is that

between concealment and misrepresentation. In some branches of the law, as that of insurance, the distinction is of little value, but generally it has much force. Thus, if one buys goods who is at the time insolvent, but says nothing about his affairs, the sale is valid, and the property passes to the buyer, leaving the seller only his claim for the price. But if the buyer, being insolvent, falsely represents himself to the seller as having sufficient resources to justify the sale or credit, this is a fraud which permits the seller to avoid the sale, and to reclaim the goods. (See FALSE PRETENCES.) The question how far one is bound to communicate to another any special facts which he knows, or indeed any information which he possesses, has often passed under adjudication. That a sale is not voidable merely because the buyer knew what the seller did not, and bought because of his better knowledge, is both certain and obvious; and perhaps it is equally certain and obvious that if the law annulled all transactions of this kind, a very large proportion of all the buying and selling—of all that goes under the name of speculation—must come to an end. The supreme court of the United States has distinctly held that a buyer is not bound to communicate to a seller extrinsic circumstances which were very material to the price, and were known to the buyer alone. Still, while the law is so in general, there are cases in which the concealment of special knowledge invalidates a transaction founded upon that concealment. It has also been distinctly held, that if one injures another by such fraud as the law recognizes, he is responsible although not interested in the transaction, and not himself gaining by the fraud; as, for example, when one knowingly gives false recommendations of a person seeking employment.—It may be proper to mention the doctrine of constructive fraud, or that by which the law treats as fraudulent certain acts which have, or which are adapted to have, the effect of fraud, although none be intended; as, for example, if one buys a chattel, and leaves it, however honestly, in the possession of the seller, this is a void sale as against a third party who buys of the seller not knowing the previous sale. This not taking away what one buys is held in some courts to be conclusive evidence of constructive fraud, and in others to be only what is called a badge of fraud, or a very suspicious circumstance indicating fraud, but open to explanation. (See SALE.)

FRAUDS, STATUTE OF. This is a very peculiar law, and in its extent and systematic form is quite unknown out of the British empire and the United States. It originated, nearly two centuries ago, in the earnest desire of eminent English jurists to prevent the numerous frauds which were perpetrated by means of suborned and perjured witnesses; and it was thought that the more effectual way of doing this would be a provision that a large number of the most common contracts should be incapable of legal enforcement unless they were reduced to writ-

ing and signed by the party whom it was sought to charge. For this purpose, in the 29th year of Charles II. (1678), the "statute for the prevention of frauds and perjuries" was enacted; and it is commonly known by the shorter name of the "statute of frauds." It has been doubted by wise lawyers and judges, from the time it was enacted to the present, whether this statute has not caused and protected as many frauds as it has prevented. But the same reasons which led to its enactment have always produced a prevailing belief that it was on the whole a useful statute. Hence, its provisions have been enacted more or less entirely, or declared to be law by adoption, in nearly if not quite all the states of the Union. In no one of them is the English statute verbally copied; and perhaps the provisions are not precisely the same in any two states. But they all copy parts of the original statute, and most of them enact its most material parts; and the difference between the enactments of different states is, generally speaking, not important. The reason why the statute has been deemed by so many useless, or worse, is, that it has been found impossible to make all its provisions, or even its more important ones, universally known. Hence, while by its requirement of written evidence it tends strongly to suppress that large class of frauds which was founded upon mere perjury, it tends also to expose innocent parties to grievous fraud through their ignorance of this requirement. They make, and perhaps carefully, important bargains, with all the details well adjusted; but they do not take the precaution to have their agreements reduced to writing and verified by the signature of the parties; and after complying with their part of the bargain in good faith, they learn for the first time in court, or from their counsel, that their bargain gives them no legal right nor remedy, because of the omission of that which they had never supposed to be requisite. We shall proceed to give the most general rules in regard to the provisions of this statute (meaning thereby both those which are most widely adopted, and those of the most important and frequent application) which have been sanctioned by the jurisprudence of the United States; without, however, attempting to go into a close consideration of the details and diversities of state enactment or adjudication, which would be inappropriate in a work like this, and impossible within the space which can be given to this subject.—By the 4th section of the English statute, which is the one that our statutes copy most frequently, no action can be brought upon an agreement not reduced to writing and signed by the party to be charged therewith, or by some person by him authorized, if by the action: 1, any executor or administrator is to be charged to answer damages for the deceased out of his own estate; 2, or if any person is to answer for the debt, default, or miscarriage of another; 3, or upon any agreement in consideration of marriage; 4, or upon any contract for the sale of lands, or any interest in or concerning them; 5,

or any agreement not to be performed within one year from the making thereof. In reference to all these, it is held that a signing is sufficient if substantial, although not literal and formal. Thus, if in a letter signed by the party, he alludes to and recognizes the agreement; so if the party writes his name at the beginning or in any part of the agreement, with the intention that it shall verify the instrument as his own; or if a broker, for both parties or either party, writes their or his name in his book, they or he assenting. But where, as in some of our statutes, the word used is not "signed" but "subscribed," there it has been said, but may not be certain, that the name must be written at the bottom of the agreement. So the name may be printed, or written in pencil. An agent may sign, and may sign sufficiently although he write only his own name; and any ratification of his signature would be equivalent to a previous authority. But one of the contracting parties cannot sign as the agent of the other. An auctioneer or his clerk, or a broker, may be agent for either party or both; and his entry of the name of a seller or purchaser, at the time of the sale, satisfies the requirement of the statute, unless there be some agreement or condition to the contrary. The written agreement need not be in any precise or regular form, but must contain all the substantial elements of the bargain. In England, and in some of our states, as in New York, Maryland, and Georgia, it must recite the consideration of the contract. In others, as in Maine, Massachusetts, Mississippi, Tennessee, and Texas, if the promise be in writing and signed, the consideration may be proved by other evidence. The agreement may be contained in letters, and written on several pieces of paper, if they are such that they can be read together consistently with their purpose and character. And if a contract be severable in its own nature, and in some of its parts the statutory requirement is satisfied and in some not, the contract is still enforceable for those parts which comply with the statute. If a written contract be sued, it may be shown in defence that it has been altered. But if a plaintiff rests upon his written contract, but can maintain his action by it only by showing that it was orally altered, it is no longer the written contract on which he rests, and the action is defeated. Of the special clauses, the 2d, relating to a promise "to answer for the debt, default, or miscarriage of another," makes this statute cover all guarantees; and it is of great importance in respect to them. But it will be more convenient to state the law in this behalf under the title GUARANTEE. The 3d clause, which relates to promises "in consideration of marriage," is held not to apply to a promise or contract to marry, but to all promises of settlement, advancement, or other provision in view of marriage, and therefore all these must be in writing and signed. And it must be a promise to the other party; thus a promise of an advancement made to a daughter, in writing, not known to the intended husband

until after the marriage, is not a promise to him, and cannot be enforced by him. The 4th clause relates to any promise or contract for "the sale of lands, tenements, or hereditaments, or any interest in or concerning them." The very broad scope of this phraseology has been considerably curtailed by adjudication. Thus, a contract for the sale of growing crops may be within the requirement of the statute or without it, according to circumstances. If the crop is already reaped, it is certainly severed from the land, and is of course a mere chattel; but even if it be still growing, if the intention of the parties be to reap it when grown and remove it at once from the land, this is not held to be a contract for a sale of an interest in lands; and the same rule was applied to a sale of mulberry trees in a nursery. While there is some uncertainty in the cases, we think the same rule of construction applies to growing grass, trees, or fruits, making writing unnecessary for the enforcement of a contract respecting them. A mere license to use land for some special purpose, as to stack hay, or leave a wagon on it for a short time, is not a bargain for an interest in lands. But a contract to convey lands for certain services is within the statute; and if it be not in writing, and the services be rendered, the party rendering them cannot enforce the contract or have the lands; but he may sue for the value of his services, and in determining that value, the value of the lands may be taken into consideration. The 5th clause relates to an agreement "that is not to be performed within one year from the making thereof." Here, the important principle has become well settled, that a contract or agreement is not within the statute, and therefore need not be in writing, if it be in reality and in good faith capable of a full and substantial performance within one year, unless extraordinary circumstances interfere to prevent it; and this principle is applied even where the parties themselves do not contemplate any performance of the contract within a year from the making of it. Thus, if one agrees to work for another "for one year," no time for the beginning of the service being fixed, he has a right to begin instantly, and then all his service will be rendered within the year, and the contract need not be in writing. It is important to remember, that if a contract which should have been in writing, but is not, is wholly performed on one side, and is such that nothing remains but the payment of the consideration money, there are many cases in which an action may be maintained in some form for the money due.—Another section (the 17th of the English statute) enacts that "no contract for the sale of any goods, wares, or merchandises, for the price of £10 or upward, shall be good, except the buyer shall accept part of the goods so sold and actually receive the same, or give something by way of earnest to bind the bargain, or in part payment," or that some note or memorandum be signed as

before. This provision, in some form or other, is very common in the United States. The sum is variously fixed, in different states, at about \$30 to \$50, rarely less or more. The principal questions which have arisen under this clause are, what delivery and acceptance, or what earnest, or what part payment, will satisfy the statute, so as to make the writing unnecessary. In the first place, there must be both delivery and acceptance. A meets B, and they agree orally that A shall buy 100 bales of cotton which B has for sale, for \$25,000. B sends the cotton forthwith to A's store. This, according to common law, completes the sale and B's right to demand the price. But, by the statute of frauds, if there be no note or memorandum in writing signed by A, he may instantly, and without assigning any reason, send all the cotton back to B. As to what is a delivery, it may be said, in general, that it is any transfer of possession and control, made by the seller, for the purpose and with the effect of putting the goods out of his hands and into the hands of the buyer. It may be an actual delivery; or it may be constructive, as by the delivery of the key of a warehouse, or making an entry in the books of the warehouse keeper, or the delivery of an endorsed bill of lading, or even pointing out as the buyer's own massy goods that are difficult of removal, as timber in a dock, or a large stack of hay. So a part may be delivered for the whole, and carry with it constructively the delivery of the whole. On the other hand, as to what constitutes acceptance, we must look mainly at the intention of the party; for if he so acts as to manifest his assent to the delivery, and his intention to accept and retain the goods, or so as to justify the seller in believing that the buyer so assents and intends, this will have the effect of fixing his liability for the price, whatever be the way in which he expresses this assent and intention. Hence, mere delay, or holding the goods for a considerable time in silence, is an assent and acceptance. But as he has a right to examine the goods and see whether he chooses to accept them, he must be allowed time enough for this purpose; and his silence during a period of time that is not more than sufficient for this is not evidence of acceptance. It has been much questioned whether the sale of shares or stocks in incorporated companies, as, for example, in corporations for manufacturing purposes, for railroads, and the like, is a sale of "goods, wares, and merchandises" within the meaning and operation of the statute. In England the prevailing authority is that these shares are not "goods, wares, or merchandises" within the statute, and therefore the bargain need not be in writing. Perhaps the prevailing rule in the United States is the other way. But the authorities are to some extent conflicting, and the question may not be considered as settled. As to giving any thing by way of earnest (the exact words of the English statute are "in earnest"), almost any

thing which has an actual value, though a small one, may suffice. Thus, a dime, or even a cent, might be sufficient, but not a straw or a chip, though it were called "earnest money;" it would be safe, however, if earnest were relied upon as clinching the bargain (to use an old phrase), to give money of some real and considerable value. So, part payment has the same effect as earnest money; but it must be an actual part payment. Therefore, if the seller owes the buyer, and it is a part of the bargain that the debt shall be discharged and be considered as a part of the price to be paid, the contract must nevertheless be in writing, because this is not a part payment within the meaning and requirement of the statute. If, however, the debt were certainly and irrevocably discharged, as by the giving up of a note of hand, the decision might be otherwise. The difficult question has been much considered, whether a bargain that A should make and sell a certain article to B, is a contract for the sale of the thing, which must be in writing, or a mere bargain whereby B hires A to work for him in a certain way, which need not be in writing. Perhaps no better rule or principle for deciding this question can be found than the following. A contract to buy a thing presently, which the seller has not now, is just as much within the requirement of the statute as a bargain for a present sale; and if by the bargain the seller may himself buy, or make, or procure in any way he likes, the things he agrees to sell, this is only a contract for the sale of the goods, and must be in writing. But if the seller, and he alone, is, by the bargain, to manufacture these, and in a certain way and of certain materials, or after a certain model, or if in any way it appears that the seller is to make certain things and charge therefor a price for his labor, skill, and material, although all these are included in the mere sale price of the article, then it is a contract for the manufacture of the goods, and not merely a contract for their sale, and it need not be in writing. The statute itself, both in England and the United States, speaks of part payment only; but courts of equity, both there and here, have strongly inclined to the rule, that part performance of any of the contracts within the statute of frauds shall have the same effect that part payment has upon a contract of sale by the statute. There has been some doubt expressed as to the expediency of the rule; but it may now be considered as settled, that courts of equity, or courts of law having equity powers (as most American courts of law now have), will enforce an oral contract which should have been in writing, provided there has been an actual and substantial part performance of it by the party sought to be charged. —There are other sections in the English statute, and in some of our American statutes of frauds, or statutes for analogous purposes, which prescribe in what way WILLS must be made, others which relate to TRUSTS; and others to LEASES, which will be considered under those titles.

FRAUNHOFER, JOSEPH VON, a German optician, born in Straubing, Bavaria, March 6, 1787, died June 7, 1826. The son of a glazier, he exercised in boyhood the trade of his father. He received little education, studied the laws of optics in the intervals of labor, and in 1806 was taken as optician into an establishment for the manufacture of mathematical instruments. He gradually made himself familiar with astronomy and mathematics, and united with Reichenbach and Utzschneider in founding at Benedict-Beurn an establishment for the fabrication of dioptric instruments, which was transferred to Munich in 1819. He manufactured the finest crown glass, much superior to the English, for achromatic telescopes and prisms, and invented a machine for polishing surfaces in parabolic segments, a heliometer, microscope, and the celebrated parallactic telescope of the observatory of Dorpat. By using fine prisms that were free from veins he discovered about 590 black lines crossing the solar spectrum, and projected the most important of these in a drawing of the spectrum. Similar lines he found in the spectra of the moon and of some of the planets and fixed stars, but none in artificial white light. Upon his tomb is the inscription: *Approximavit sidera.*

FRAYSSINOUS, DENIS LUC, count, a French prelate, born in Curières, department of Aveyron, May 9, 1765, died in St. Géniez, Dec. 12, 1841. He studied theology in the Sulpician seminary of Laon at Paris, was admitted to orders in 1789, disappeared during the revolutionary persecution, and began at Paris in 1803 the conferences upon the proofs of Christianity which were the basis of his reputation. His eloquence and genius attracted the cultivated youth of the capital, and operated effectively against the reigning philosophy. When in 1809 the French empire came into collision with the holy see, his conferences were interrupted, and in 1811 he retired to Aveyron, and returned only with the Bourbons. In Oct. 1814, he resumed his conferences, and was made successively royal preacher, bishop of Hermopolis *in partibus*, grand master of the university (1822), member of the French academy, peer of France, and minister of ecclesiastical affairs (1824). He recalled the Jesuits into the schools and churches. In 1830 he was intrusted by Charles X. with the education of the duke of Bordeaux, whom he soon after accompanied into exile. He returned to France in 1838, after which he lived in retirement. His principal works are funeral orations on the prince of Condé, Cardinal Talleyrand, and Louis XVIII.; a treatise on the "True Principles of the Liberty of the Gallican Church;" and a collection of his conferences under the title of a "Defence of Christianity."

FRECKLE (*lentigo, ephelis lentiformis*). True freckle is characterized by the presence of small round yellow spots, never larger than a lentil, scattered chiefly over the face, neck, chest, and hands. It is commonly constitutional, appearing in childhood and lasting during life. Sometimes it seems caused by exposure to the

sun, and in this case the spots may disappear with the removal of the cause; the subjects of it are commonly of light complexion. Freckle is unattended with itching or pain, and is a blemish rather than a disease. Treatment has very little influence over it. Mr. Wilson ("Diseases of the Skin") recommends a lotion containing 5 grains of corrosive sublimate of mercury to half a pint of bitter almond emulsion.

FREDEGONDA, a Frankish queen, the rival of the famous Brunehaut, born about 545, died in 596. Her beauty having attracted the attention of Chilperic I., king of Neustria, she became his concubine. She contrived by a trick the repudiation of the queen, Audovera, but was disappointed in her scheme by the second marriage of Chilperic with Galsuinda, a Visigoth princess and sister of Brunehaut, or Brunchilde, who had been married to his brother Siegbert, king of Austrasia. Attributing this marriage to the influence of the Austrasian queen, Fredegonda vowed deadly hatred to both sisters. She removed Galsuinda by assassination, became her successor, and brought about a war of the two brothers, in which Siegbert was victorious, but soon fell through the hands of her assassins (575). Brunehaut, who became her captive, escaped death and returned to her own country; but Meroveus, the son of Chilperic by his first wife, who had been secretly married to her, fell a victim to the revenge of his stepmother. A series of atrocious crimes followed. Pretextatus was treacherously murdered; Clovis, the brother of Meroveus, was executed on the false accusation of having caused the death of Fredegonda's 3 children, who were carried away by an epidemic; the mother of the princes was strangled, their sister outraged and confined in a convent. Finally, she contrived the assassination of her husband, and assumed the government in the name of her son Clotaire. She now successfully resumed the war against Austrasia, and remained in power till her death.

FREDERIO. I. A N. co. of Md., bordering on Penn., and separated from Va. on the S. W. by the Potomac river; area, about 770 sq. m.; pop. in 1850, 40,987, of whom 3,913 were slaves. A branch of the Blue Ridge of Virginia, called South mountain, runs along its western border, but most of the land in the central and eastern parts is undulating. The soil is fertile and well watered by the Monocacy river, Cotoctin, Pipe, Linganore, and Bennett's creeks. It consists of decomposed limestone or slate, producing abundantly the various kinds of grain, potatoes, and pasturage. In 1850 it yielded more butter and hay than any other county in the state, and more wheat than any except Washington. The productions that year amounted to 781,864 bushels of wheat, 782,603 of Indian corn, 180,922 of oats, 23,838 tons of hay, and 723,064 lbs. of butter. There were a great number of mills and factories, 79 churches, 7 newspaper offices, and 5,182 pupils attending public schools. Copper, iron, manganese, excellent limestone,

and fine white marble are among the most valuable mineral products. Facilities for transportation from the interior are numerous, as the county is traversed by the Baltimore and Ohio railroad, and has on its S. W. border the Potomac river and the Ohio and Chesapeake canal. Capital, Frederic City. II. A N. E. co. of Va., abounding in magnificent mountain scenery; area, 378 sq. m.; pop. in 1850, 15,975, of whom 2,294 were slaves. It occupies part of the great valley of Virginia, is highly productive, well cultivated, and in all respects one of the richest portions of the state. Two or three small affluents of the Potomac supply it with good water power. The staples are grain, butter, and live stock; in 1850 the productions amounted to 311,060 bushels of wheat, 199, 242 of Indian corn, 50,701 of oats, 6,433 tons of hay, and 193,394 lbs. of butter. There were 73 mills, 11 factories, 1 iron furnace, 1 foundery, 7 tanneries, 31 churches, and 360 pupils attending public schools. Blue limestone is abundant. A railroad extends from Harper's Ferry to Winchester, the capital, and turnpike roads intersect the county in all directions. Value of real estate in 1856, \$5,742,751.

FREDERIC CITY, the capital of Frederic co., Md., situated on Carroll's creek, 2 m. from its mouth in Monocacy river, and 60 m. W. of Baltimore; pop. in 1850, 6,028. A branch railroad 3 m. long connects it with the Baltimore and Ohio railroad. It is a well built city, with wide regular streets, lined with houses of brick or stone. It contained in 1850 a handsome court house, a gaol, 12 churches, 3 banks, an insurance office, various scientific and literary institutes, 5 newspaper offices, 3 founderies and machine shops, a fulling mill, a woollen factory, 2 rope factories, 12 corn and flour mills, 8 saw mills, a paper mill, and several other manufactories. It is the seat of a college with 90 students, under the charge of the Jesuits, of a house for novices of the same order, and of a convent and academy of the Visitation nuns. Its trade is extensive, and the surrounding country is remarkably productive.

FREDERIC, the name of several monarchs and princes, arranged below under their respective countries in the following order: Bohemia, Denmark, Germany, Prussia (including Brandenburg), Saxony, and Württemberg.

I. BOHEMIA.

FREDERIC, elector palatine (V.) and king of Bohemia, born in Amberg in 1596, died in Mentz, Nov. 19, 1632. He was the son of the elector Frederic IV., and, by his mother, grandson of William I. of Orange. He received a careful education, succeeded his father in the palatinate in 1610 as a minor, married Elizabeth, daughter of James I. of England, became the leader of the Protestant union, and in the 2d year of the 30 years' war (1619) was elected king of Bohemia by the revolted people. Induced by his ambitious wife, who preferred "*sauerkraut* with a king to roast beef with an elector," he accepted the regal crown, which he

soon after lost, through the battle of Prague (Nov. 8, 1620) rapidly won by his cousin Maximilian of Bavaria, the head of the Catholic league. Leaving the crown, the insignia, and the charter of Bohemia, Frederic hastily escaped to Holland, and lived in exile, under the ban of the empire and persecuted by ridicule, till his death.

II. DENMARK.

FREDERIC VI., king of Denmark, son of Christian VII. and the princess Caroline Matilda, born Jan. 28, 1768, died Dec. 3, 1839. He was declared regent at the age of 16. His education had been much neglected, but he remedied this misfortune by great natural intelligence, firmness of purpose, and a capacity for observation. With the help of his minister Count Bernstorff he applied himself to the abolition of feudal serfdom, the reformation of the criminal code, the breaking up of monopolies, the establishment of a better financial system, and the prohibition, earlier than any other government, of the slave trade. March 16, 1792, was the date of the edict against the slave trade, providing for its enforcement on and after Jan. 1, 1804. In 1797 Bernstorff died; he had recommended to the regent to observe a strict neutrality in the wars of the epoch, but this soon became impossible. In 1797 the Danish admiral Steen Bille gained a complete victory over the Tripolitans, who had for some time disturbed the trade of the Mediterranean; and in 1800 the regent concluded a convention with England, whose claim of right to search Danish merchantmen for goods contraband of war had led to much recrimination, and even some acts of open hostility. But in Dec. 1800, Denmark having signed the maritime confederacy with Russia, Sweden, and Prussia, on terms similar to the armed neutrality of 1780, the flames of war broke out afresh. Every Danish vessel in English ports was seized on Jan. 14, 1801. On March 20, Sir Hyde Parker, with Nelson second in command, entered the Cattegat with a fleet of 47 vessels, 18 of which were line-of-battle ships. The regent was summoned to withdraw from the neutral convention, and to open his ports to the English. The demand was rejected, and a furious engagement followed, in which the Danish fleet was almost annihilated. An armistice was now concluded for 14 weeks, during which Denmark consented to withdraw from the maritime confederacy, and this led to a peace, when the confederacy was broken up by the assassination of the czar Paul, June 24, 1801. Frederic, however, persisted in the policy of neutrality, and on Aug. 8, 1807, a British fleet again passed the strait at Elsinore, and appeared off Copenhagen. The prince was summoned to an alliance with England, to surrender his fleet, his capital, and his castle at Elsinore. The British envoy assured him that Denmark should lose nothing, and that his new allies, the English garrisons, would pay for every thing they needed. Upon his refusal, the capital was bombarded for 8

days (Sept. 2-5). A capitulation was then made, the fleet was transferred to a British admiral, the arsenal and docks were destroyed, and every ship and boat, as well as every available piece of timber, rope, or shipwright's tool, were carried off to England. Denmark threw herself at once into the arms of France, and sent forth a fleet of privateers which preyed incessantly upon British commerce. The father of the Danish regent, the unhappy Christian VII., died March 12, 1808, and Frederic ascended the throne. He had been married in 1790 to the daughter of the landgrave of Hesse-Cassel. On Dec. 10, 1809, Sweden signed away Finland to Russia; and in the course of the following month, a treaty was concluded by Denmark with Sweden which was designed to reestablish the good relations of the two countries. Both were exhausted by the wars of their great neighbors, and both soon became subject to the imperious rule of Napoleon. Denmark remained his most faithful ally, and suffered accordingly. In 1814 she was robbed of Norway, in exchange for which she received Pomerania, which she afterward ceded to Prussia. Frederic was at last compelled to send 10,000 men to the allied army against the French emperor. The state had become bankrupt in 1813. The peace brought with it an immense fall in the price of provisions; and real estate remained at a great depreciation of value as late as 1826. The wisdom and devotion of the king gradually brought about improvement in general affairs. A national bank was reestablished. The farmers were allowed to pay their taxes in kind. Order was restored to the finances, and confidence returned. The last part of Frederic's reign is remarkable for the establishment of a representative council as a popular branch of the government (May 28, 1831), which was received by his subjects with every demonstration of joy.

FREDERIC VII., king of Denmark, son and successor of Christian VIII., born in Copenhagen, Oct. 6, 1808, ascended the throne Jan. 20, 1848. His mother was the princess Charlotte Frederica, of Mecklenburg-Schwerin. From 1826 to 1828 he travelled in various parts of Europe, and studied in Geneva. He was married Nov. 1, 1828, to the princess Wilhelmina Maria of Denmark, whom he divorced in 1837, and in the same year he was removed by royal order to Fredericia in Jutland. His exile ended with his father's accession to the throne in 1839. In June, 1841, he was married to the princess Caroline Charlotte Marianne of Mecklenburg-Strelitz, whom he also put away in Sept. 1846; and in Aug. 1850, he contracted a morganatic marriage with a milliner of Copenhagen whom he had created Countess Danner in 1848. The principal events of his reign are the revolt of Schleswig-Holstein in 1848 and the abolition of the Sound dues in 1857, for an account of which see DENMARK. Frederic has no children, and the heir presumptive is his uncle, Prince Ferdinand, who is also childless.

III. GERMANY.

FREDERIC I., emperor of Germany, surnamed Barbarossa (Redbeard), son of Duke Frederic II. of Swabia, and Judith, daughter of Henry the Black, duke of Bavaria, born in 1121, drowned June 10, 1190. His uncle, Conrad III., the first German emperor of the house of Swabia (Hohenstauffen), had so entirely won the confidence of the princes and nobles of both Italy and Germany, that upon his recommendation Frederic, then duke of Swabia, was unanimously elected his successor (1152). His elevation was received throughout Europe with marked satisfaction. After reducing several revolted Italian cities and receiving the crown of Italy at Pavia, he went to Rome, reestablished the pope's supremacy there, which had been shaken by Arnold of Brescia, and was crowned emperor, but not until the pope (Adrian IV.) had obliged him to perform several humiliating ceremonies which Frederic was afterward enraged to learn that the Romans regarded as acts of temporal vassalage. His next care was to pacify the empire by settling the disputes between the archbishop of Mentz and the count palatine of the Rhine, and the difficulties concerning the duchy of Bavaria. He reduced Boleslas of Poland to vassalage, and in 6 years had restored the empire to the prosperity which it enjoyed under Henry III. He now turned his attention again to Italy, where the smaller towns were groaning under the oppression of Milan, and in 1158 he appeared before the latter city with 115,000 troops and forced it to submission. It soon rebelled again, and its fortifications were destroyed and its inhabitants exiled. Meanwhile Pope Adrian had died (1159), and Alexander III. been chosen to succeed him. Frederic, however, supported an antipope, Victor IV., and Alexander was forced to take refuge in France. Victor died in 1164, and the emperor thereupon set up another antipope, who took the title of Pascal III., and crowned the emperor and his consort a second time in the church of St. Peter at Rome in 1167. The Lombard cities, which had formed a powerful league against Frederic, next awakened the imperial resentment, but a terrible pestilence which broke out in his army dissipated all his plans and forced him to return to Germany in disguise, with only a few followers. The cities of Lombardy now consolidated their league. The defences of Milan were restored, and a new city sprang up in a beautiful and naturally fortified spot, which in honor of the pope and in defiance of the emperor was called Alexandria or Alessandria. During this time Frederic was busily engaged in regulating the affairs of Germany, adjusting internal troubles, settling the contests in the north between Henry the Lion, duke of Saxony and Bavaria, and his adversaries, and strengthening his own power. After nearly 7 years passed at home, he prepared once more to enter Italy. In the autumn of 1174 he invested Alessandria, but after a siege of 7 months, during which

his army suffered greatly from sickness and fatigue, and a fruitless assault, he drew off his forces and opened negotiations with the Lombards who had come to the relief of the city. The deliberations however were soon broken off, and on May 29, 1176, a decisive battle was fought near Legnano, in the vicinity of the lake of Como, in which Frederic was defeated with great loss, and was supposed for some days to have been killed. He reappeared at Pavia, where the empress had already put on mourning. He now acknowledged Alexander as pope, the ban of excommunication under which he had lain for 10 years was taken off, and in July, 1177, an interview took place at Venice, between the pontiff, the emperor, and several other potentates, in which a complete reconciliation was effected. Frederic humbled himself again at the pope's feet, and received from him the kiss of peace, at which the Germans exclaimed: "Lord God, we praise thee!" The cities of Lombardy obtained a truce for 6 years. The war had lasted 20 years. New troubles were now raised in Germany by the ambitious duke Henry the Lion. He was finally subdued, however, and banished for 8 years to England, where, having previously married Matilda, the daughter of the English king Henry II., he became the founder of the royal family of Brunswick. The Lombard truce was followed in 1183 by a definitive treaty of peace on terms honorable to all parties, and when Frederic made a journey to Italy soon afterward he was received by his old enemies with the wildest acclamations of joy. Tranquillity reigned in all his dominions when the news of the fall of Jerusalem in 1187 caused Pope Clement III. to proclaim the 8d crusade. The old emperor took the cross, and in the spring of 1189 put himself at the head of 150,000 warriors, crossed Hungary, severely punished the Greeks, whom he suspected of treasonable designs, penetrated into Asia Minor, defeated the Moslems in several engagements, and took Iconium (Konieh). The army reached the banks of the Seleph or Calycadnus, June 10, 1190. The vanguard had crossed by a bridge, when the emperor, impatient to join his son, Duke Frederic of Swabia, who led the advance, plunged with his war horse and heavy armor into the stream, was overpowered by the current, and was borne away. His dead body was recovered and buried by his son. Some historians have preferred a less well authenticated account that he lost his life in consequence of bathing in the Cydnus. Frederic was a man of noble and magnanimous qualities, of great mental endowments, and of spirit equal alike in reverses and prosperity, though somewhat arrogant and occasionally cruel in the heat of war. He was a patron of letters and a man of learned accomplishments, and all these advantages were moreover enhanced by remarkable elegance and majesty of aspect. After divorcing his first wife (1156), he was married to Beatrice of Burgundy. His son Frederic, founder of the Teutonic knights, lost his life in

the 8d crusade, and another son, Henry VI., succeeded to the empire.

FREDERIC II., a German emperor of the house of Hohenstauffen, and king of Naples and Sicily, son of Henry VI. and Constantia of Sicily, born at Jesi, near Ancona, Dec. 26, 1194, died in Fiorenzola, Dec. 12, 1250. He was educated with great care by his mother under the guardianship of Pope Innocent III., acquired an extensive knowledge of ancient and modern languages, as well as of different sciences, including philosophy, which he learned from a Saracen teacher, and poetry, which he cultivated himself, and soon developed those chivalric and royal talents, that active, energetic, and buoyant spirit which made him one of the most distinguished monarchs of the middle ages. He was hereditary duke of Swabia and other dominions in Germany, but for his investiture and coronation as king of Naples and Sicily his mother sacrificed to Innocent III. (1209) some of the most essential rights of the state. His uncle, Philip of Swabia, who disputed the throne of Germany after the death of Henry VI. with Otho IV., having fallen in a battle, Frederic was assisted by the pope to reestablish the imperial dignity of his house. He repaired to Germany in 1212, was joyfully received by the Ghibellines, compelled Otho to retire, was crowned at Aix la Chapelle in 1215, and generally acknowledged in 1218. Leaving his son Henry, whom he caused to be declared king of the Romans, in Germany, he started in 1220 for Italy, hastened to Rome, where he was crowned as emperor, and thence to his hereditary kingdom, whose affairs he arranged while preparing for a crusade, according to a solemn promise given to the see of Rome. Men of science, poets, and artists flocked to his court, the university of Naples was founded, the medical school of Salerno became flourishing, collections of art were procured, and Peter de Vineia prepared an extensive code of laws to suit all the classes and nations of Germany and Italy, which Frederic, no less ambitious than his grandfather Barbarossa, was scheming to unite into one hereditary empire. These schemes, however, were checked by the independent spirit of the Lombard cities, which refused to send their representatives to the proposed diet of Cremona, reestablished their league under the lead of Milan and barred the passages of the Alps, and still more by the antagonistic exertions of the popes Honorius III. and Gregory IX., who finally compelled the emperor to start upon his long delayed crusade (1227). But a pestilential disease which broke out on board the fleet obliged him to land at Otranto; the expedition only reached the Morea, and Gregory IX., boldly pursuing the policy of Gregory VII., punished the emperor with excommunication and interdict. It was in vain that Frederic started again the next year, reached the Holy Land, and fought successfully against the Mussulmans; the policy of the pope, who declared him unworthy before absolution

to battle for the cross, roused against him the patriarch of Jerusalem and the 8 orders of knights in the East, and also produced the usurpation of his father-in-law, John of Brienne, titular king of Jerusalem, in the Italian kingdom. Having concluded a truce of 10 years with the sultan of Egypt, which brought into his possession the holy cities and the whole coast of Judea, he returned as crowned king of Jerusalem, reconquered his kingdom, defeated the intrigues of his enemies, and finally gained his absolution (1230). The Lombard cities, however, still maintained their league, being now supported by the rebellion of Henry, the son of the emperor. Frederic returned to Germany after an absence of 15 years, restored his imperial dignity, and pardoned his son. But a new rebellion drew upon the prince the punishment of imprisonment for life, in the 7th year of which he died. His younger brother Conrad was made king of the Romans in his stead, and Frederic marched against the Lombards, and defeated them at Cortenuova (Nov. 26-27, 1237); all the cities surrendered except Milan, Brescia, Piacenza, and Bologna, whose resistance was again encouraged by Gregory IX. Irritated by Frederic's having made his natural son Enzo king of Sardinia, the pope again excommunicated the emperor on Palm Sunday, 1239. Frederic marched against Rome, took Ravenna (1241), but paused to listen to a proposal that the feud should be decided by an assembly of bishops. Soon, however, changing his mind, he had the Genoese fleet, which was conveying 100 prelates to Rome, intercepted by Enzo. Gregory IX. did not long survive these reverses. The short papacy of Celestine IV. and a long interregnum followed, which was terminated by the election of Innocent IV. The new pope, once the friend of the emperor, became his bitterest enemy, confirmed his excommunication, fled to Lyons in France, where he convoked a council, cited Frederic before this tribunal, rejected his defender Thaddeus of Suessa, declared the throne of Germany vacant, and subsequently recognized two new emperors, Henry Raspe of Thuringia, who was defeated by Conrad, and William of Holland. The old emperor was now deserted by many of his allies, and lost a battle before Parma, and another near Bologna, in which Enzo was made prisoner. He even became convinced that his old friend Peter de Vineia had treacherously attempted to poison him, for which Peter was sent to prison, where he killed himself by dashing his head against the wall. In spite of all these disasters Frederic continued the struggle until he died.

FREDERIC III., surnamed the Pacific, emperor of Germany (IV. as king of Germany, V. as archduke of Austria), son of Duke Ernest of Styria, and a Polish princess, born in Innspruck, Sept. 21, 1415, died in Lintz, Aug. 19, 1493. Having begun his reign over Styria, Carinthia, and Carniola, together with his brother Albert the Prodigal, in 1435, he be-

came, after the death of the emperor Albert II. (1439), guardian of his son Ladislas the Posthumous, and was unanimously elected king of Germany (1440). Being of an exceedingly cautious and peaceful disposition, he accepted this burdensome dignity only after 11 weeks' hesitation, and was crowned at Aix la Chapelle in 1442. Possessed of many private virtues, he was nevertheless inadequate to the task of ruling the German empire in that period of anarchical turbulence, or even of defending the interests of his house, though these were much dearer to his heart than the interests of the empire, against the attacks of the warlike and ambitious Matthias Corvinus, king of Hungary, George Podiebrad of Bohemia, and Charles the Bold of Burgundy. The only weapon he seems to have wielded with dexterity was diplomacy, but this, too, served only the private purposes of the house of Austria, of which he may be regarded as the second founder, in spite of his indolence. Wars, however, in which his part was generally passive, filled nearly the whole reign of this peace-loving monarch, which was the longest of any German emperor's, lasting for 53 years. His brother Albert, duke of Upper Austria, repeatedly attacked him; the Hungarians under John Hunyady invaded Austria (1445-'52); the Armagnacs, whom the emperor had called to aid him against the Swiss, committed depredations (1445); Matthias Corvinus and George Podiebrad defeated the imperial forces; the Turks ravaged Carniola (1469); hostilities broke out with Charles the Bold of Burgundy, and a war was carried on in the Netherlands, which Maximilian, the son of Frederic, had received after the death of Charles the Bold (1477) with the hand of his daughter Mary, and where he was made captive in 1488. Frederic was also humiliated by the usurpation of Sforza at Milan (1447), after the death of the last Visconti; by the Swiss, who routed the Armagnacs, and compelled him to an unfavorable treaty (1449); in the quarrel of the succession of the palatinate (1449), which threatened to cost him his throne; by continual lawlessness in Germany, where he was even once cited before the secret tribunal of the *Vehme*; and by the successive encroachments of the popes, particularly of Pius II. (once his secretary as *Aeneas Sylvius*). His chief efforts to avert the invasion of the Turks were a journey to Rome for a conference with the pope (1468), and the convening of a diet at Ratisbon (1471), both without result. His last years were cheered by the successes of his son Maximilian, whom he had made king of Rome (1486), and finally intrusted with all the cares of his dominion (1490), himself retiring to Lintz, where he was engaged in his favorite studies of astrology, alchemy, and botany till the end of his life. He was the last king of Germany who was crowned emperor of Rome and king of the Lombards. Having inherited Lower Austria on the death of Ladislas, and Upper Austria on that of his brother Albert, he raised these united provinces to the dignity of an archduchy. The crown of

Germany became nearly hereditary in his house, the next successor being his son Maximilian I. His device is said to have been *A. E. I. O. U.*: *Austria est imperare orbi universo.*

FREDERIC III., king of Germany. See LOUIS THE BAVARIAN.

IV. PRUSSIA.

FREDERIC WILLIAM, elector of Brandenburg, usually styled the Great Elector, and the founder of the Prussian monarchy, born in 1620, died in Potsdam, April 29, 1688. He came to the electoral power at the age of 20 (1640), on the death of his father, George William, the 10th elector. The father had been a feeble prince, with a traitorous minister. His estates had been continually ravaged by Swedes and imperialists during the first 22 of the 30 years' war. The cities lay almost in ruins, the villages for the most part burned and depopulated, and a part of his paternal inheritance had been confiscated by the Swedes. The young prince began his reign by dismissing his father's unworthy council, by regulating his finances, and by negotiating with so much address as to regain his lost provinces, which were guaranteed to him by the peace of Westphalia 8 years later. A year after his accession he concluded a treaty of neutrality with the Swedish queen Christina, and 8 years after, by an armistice with Hesse-Cassel, the strong outpost city of Cleves and the county of Mark in Westphalia were added to his dominions. The treaty of Westphalia was concluded in 1648, when the elector, who had just claims to the whole of Pomerania, received but the eastern portion of that country; but as an indemnification for the loss of the western division and the island of Rügen, he obtained the county of Hohenstein, the bishoprics of Minden, Halberstadt, and Kamin, as lay principalities, and the reversion of the archbishopric of Magdeburg. He had withdrawn from the war in great part 7 years before, but his army was much improved. He formed an alliance with Charles X. of Sweden in 1655 against Poland. The sequel was the fall of Warsaw, and Frederic's achievement of the independence of his Prussian duchy, formerly under enfeoffment to Poland. Louis XIV. at this time was pursuing with persevering ambition his project of a Rhine frontier, and the conquest of the Spanish Netherlands. He seized a line of frontier towns, and invaded Holland (1672). One only of the German princes, the elector of Brandenburg, seemed conscious of the danger, and after arming his exposed Westphalian dominions he appealed successfully to the emperor Leopold of Austria, to Denmark, to Hesse-Cassel, and other German states. A joint army was placed under the command of an imperial general; but the Austrian coöperation was crippled through the machinations of Leopold's privy councillor, Lobkowitz, who became a creature of the French ministers. Frederic William was compelled thus to come to terms with France, with the loss of Wesel and Rees (1678). Immediately after this event, Austria resuming

operations against the French, the elector again took up arms, and Louis, in order to furnish occupation for the electoral forces in their own country, engaged the king of Sweden to advance upon Berlin. The Swedes accordingly entered Brandenburg by a rapid forced march. Frederic arrived suddenly from the Rhine at Magdeburg, and hurrying across the Elbe at the head of his cavalry (but 6,000 in number), surprised the Swedes at Fehrbellin. His infantry (11,000) were many miles in the rear, but he attacked the enemy without delay, June 28, 1675. The rout was complete. Frederic pursued the flying enemy into Pomerania, and reduced the greater portion of the province. By a treaty of peace (June 29, 1679) the elector restored nearly all his conquests, and received from France 300,000 crowns. He now devoted himself to the prosperity of his dominions, and the extension of their area. He founded universities, welcomed over 20,000 Protestant exiles, whom Louis XIV. banished from France, and made it the aim of his life to oppose French aggression, and to protect the liberties of Germany.

FREDERIC I., 1st king of Prussia, born in Königsberg, July 22, 1657, died Feb. 25, 1713. He was the son of Frederic William, the great elector, whose heir apparent he became on the death of his elder brother. Deformed by having been dropped when a child from the arms of his nurse, and of weak constitution, his education was neglected, and thus his stepmother could the more easily persuade the old elector to bequeath in his will a part of his possessions to her children. But Frederic, who was no less ambitious than his father, and was assured of the favor of the emperor Leopold I., took, on his accession as elector in 1688, under the name of Frederic III., immediate possession of the whole inheritance, declaring the will null, and satisfying his stepbrothers with offices and pensions. While vying in brilliancy with the court of Louis XIV., he also strenuously pursued the policy of aggrandizement so successfully carried on by his father. Seeking the alliance of influential princes, he lent several of them his troops, on condition of mutual support or payment in money. Thus 6,000 of his soldiers aided William of Orange to secure the throne of England, and fought in the great battle of the Boyne; 20,000 fought successfully against the French, who had ravaged the Palatinate (1689); 15,000 joined the quadruple alliance of the Empire, Spain, Holland, and England, and fought on the Rhine (1690); 6,000 were sent (1691) to assist the emperor in his Hungarian war against the Turks, and contributed to the victories of Zálánkemén, Belgrade, and Zentha. But all these services procured Frederic in the peace of Ryswick (1697) politically only the confirmation of the stipulations granted to his father by the treaties of Westphalia and St. Germain. Private negotiations, however, with several reigning houses, founded on exchanges, purchases, and promises, gave him in part the immediate possession of, in part hereditary

claims to, various territories, which greatly enlarged the limits of his dominions. The chief object of his ambition, the royal crown, had still to be gained. This was finally accomplished after long negotiations by a treaty with the emperor, concluded Nov. 16, 1700, and based on the humiliating obligation to aid the emperor with 10,000 troops in the threatening war of the Spanish succession, to support the house of Austria in every debate in the diet, and to vote for its princes at every imperial election. Hastening to Königsberg in the midst of winter, Frederic and his wife, the sister of George I. of England, were crowned with the greatest splendor, Jan. 18, 1701. On this occasion he founded the order of the black eagle. Prussia was soon acknowledged as a kingdom by most of the states of Europe; by Spain and France in the treaty of Utrecht; the pope, the republic of Poland, and the Teutonic order, were the last to recognize it. In the wars of Charles XII. of Sweden Frederic took no part, being actively engaged in the support of his ally the emperor in the long struggle against Louis XIV. He sent to the army on the Danube 20,000 men, who took part in the battle of Blenheim (1704), and to Italy 6,000, who greatly contributed to Eugene's victory at Turin (1706). When he died the war was not terminated, though in its chief point long before decided in favor of the French pretender to the Spanish succession. Frederic is praised for his natural kindness, love of his subjects, and loyalty to his allies; but his vanity, love of pomp, and extravagance, which led to ruinous extortions, deserve unmitigated blame. He founded the university of Halle, the Berlin academies of science and of sculpture and painting, and the supreme court of appeal. Like his father he was a consistent defender of the interests of Protestantism in Germany.

FREDERIC WILLIAM I., the 2d king of Prussia, son of Frederic I. and Elizabeth, a princess of Hesse-Cassel, born in 1688, died May 31, 1740. The new monarchy (dating from 1701) had been ungraciously recognized by the crowned heads of Europe, and the crown prince early conceived the design of making for Prussia a conspicuous place among the powers by means of an army. He ascended the throne Feb. 25, 1713, and by strict economy was enabled to maintain a peace establishment of 60,000, and at length of 72,000 men, being $\frac{1}{5}$ part of his subjects. The ruling mania of his life was to form a corps of giant soldiers; and for this purpose his envoys ransacked the world. An Irish recruit measuring 7 feet was induced to enlist by a bounty paid in cash equivalent to \$6,200, a sum much greater than the year's salary of the Prussian ambassador who found him in the streets of London. During a reign of 27 years Frederic preserved uninterrupted peace for Prussia, with the exception of a short misunderstanding with Charles XII., and a little idle soldiering under Prince Eugene. In 1713 he had concluded with Sweden, during Charles's absence in Tur-

key, a treaty, the object of which was to preserve Swedish Pomerania from Russia and Saxony. In consideration of 400,000 thalers, Frederic received the cities of Stettin and Wismar, and was to mediate between the belligerents. Charles, returning subsequently from Turkey, insisted on the restoration of Stettin, but refused to refund the money. Frederic promptly declared war, and took the field in person; and the result was the acquisition of Pomerania as far as the river Peene, with Stettin, and the islands at the mouth of the Oder, on payment of 2,000,000 thalers (about \$1,400,000). The following characteristic speech was addressed by the king to his privy council when about to take the field for this war: "As I am a man, and may therefore die of a shot, I command you to take good care of Fritz [the crown prince Frederic, then 8 years old]; and I give all of you, my wife to begin with, my curse, if you do not bury me at Potsdam in the church vault there, without feasting and without ceremony." The wife of this amiable husband, Sophia Dorothea of Hanover, bore 10 children; among whom the eldest son (afterward Frederic the Great) and a daughter, Wilhelmina, incurred the ferocious hatred of the father. The king strove hard to cut off the young prince from the succession, and endeavored to force him to renounce it. The youth consented on condition of his father declaring that he was not his father. The old king, whose conjugal sentiment was severely shocked at this unanswerable retort, was silenced by it, and died at length in his son's arms. His son wrote of him: "He had an industrious spirit in a robust body, with perhaps more capacity for minute details than any man that ever lived; and if he occupied himself with little things, it was that great results might be the consequence." His character was singularly full of contradictions. He was at once just and cruel; parsimonious and liberal; a careful and a brutal father; a defender of Lutheranism, yet punishing metaphysicians with exile. He left to his son \$6,000,000 surplus money, and 72,000 soldiers.

FREDERIC II., 3d king of Prussia, known as Frederic the Great, born in Berlin, Jan. 24, 1712, died at the chateau of Sans Souci, Aug. 17, 1786. He was the eldest son of King Frederic William and the princess Sophia Dorothea, daughter of George I. of England. From childhood up to the age of 20 he was subjected to a cruel paternal tyranny. His father's savage nature vented itself upon the son, apparently an especial object of aversion. The prince, educated chiefly by French refugees, conceived a strong passion for French literature. He knew nothing of any other foreign language. Latin his father positively forbade. Frederic, devoted to poetry, but ignorant of Dante or Shakespeare, Virgil or Homer, surrendered himself to Voltaire and the *Henriade*. "My royal titles," he wrote to his idol, "shall run thus: 'By the grace of God, king of Prussia, elector of Brandenburg, possessor of Voltaire,' &c." Within a week he wrote to Al-

garotti that he knew Voltaire was a scoundrel, but that he could make use of him. *Je veux savoir son Français; que m'importe sa morale?* Frederic was endowed by nature with a vigorous and acute understanding, with firmness of temper, and indomitable will. After narrowly escaping death from his father's hand, he determined to seek safety in England with his uncle George II. He was overtaken, brought a prisoner to Cüstrin, was made to witness the execution of a young officer who had been privy to his flight, was himself condemned as a deserter, and was only saved by the interposition of the emperor of Austria, the kings of Sweden and Poland, and the states of Holland. His father caused him to be informed that if he would renounce the throne he should be allowed to study, travel, or do whatever he pleased. "I accept," said Frederic, "if my father will declare that I am not his son." Released after a long imprisonment, he was appointed a councillor of war, and charged with duties which virtually banished him from court. In 1738 his father required him to marry Elizabeth Christina, daughter of the duke of Brunswick-Bevern, and in 1734 permitted him to take up his residence at the castle of Rheinsberg. Here he could pursue his favorite amusements unmolested. A few French and German savants, poets, and artists were his guests, and with these he could practise his flute without fear of its being broken over his shoulders; he dined with no fear of plates hurled at his head; he could write verses without being kicked and dragged by the hair; in short, he was released from intercourse with his father. Here he wrote many of his works, including the "Anti-Macchiavelli" (the Hague, 1740). Meantime the heart of the old king grew softer; a reconciliation followed; and the father, pressing his son to his heart, sobbed forth with almost his latest breath: "My God, my God, I die content, since I have such a noble son and successor." On the death of Frederic William in 1740, Frederic became king at the early age of 28. His character had been wholly misconceived by his subjects and by the world. One class thought him a mere sensualist, a rhapsodical voluptuary; others looked forward to a reign of moderation, peace, and universal benevolence. Both of these classes of judges, with "Anti-Macchiavelli" before them, and a knowledge of the epicurean abode at Rheinsberg, might find ground for their predictions; and both were equally confounded at the almost instantaneous transformation effected by the crown. A military despot, listening to no council, confiding in no friend, bent upon the single purpose of enlarging his monarchy, he regarded himself as an instrument appointed to elevate Prussia, and embody in the parvenu title of Prussian king that substantial possession of royal power which could only come from enlarged dominion. The pragmatic sanction of Charles VI., guaranteed solemnly by Europe, and by no member of the family of nations more solemnly than by Prussia, had, it was supposed, se-

cured the peaceful inheritance of the Austrian dominions to the young Maria Theresa as archduchess of Austria and queen of Hungary and Bohemia. Frederic, immediately on her father's death, sent her an offer of pecuniary aid and his vote for her husband Francis as emperor of Germany, on condition of the cession of the duchies of Glogau and Sagan, to which, as well as the greater part of Silesia, the house of Hohenzollern laid claim. This being rejected, on Dec. 18 he entered Lower Silesia at the head of his army, routed the handful of Austrians who were quartered on the frontier, and overran the province. In 6 weeks he returned to Berlin in triumph. It was the dead of winter, and the queen, almost incredulous of what had happened, was honored with proposals of peace and alliance. Frederic officially pretended to justify himself, but privately acknowledged that "ambition, interest, the desire to make people talk about me, carried the day; and I decided to make war." He had inherited from his father a splendid army of 70,000 men, at that period the finest troops in the world. There was in the treasury a surplus of \$6,000,000. He felt that a bold stroke might be made, and that by means of a strong military organization he could obtain for his two and a half million subjects a foremost place among the great nations around him. Hastening in the spring (1741) to rejoin his troops, he fought his first battle at Mollwitz. His army was victorious, but their leader had fled. He had beheld real war for the first time, and so completely lost self-command as to put spurs to his horse and gallop many miles from the field. His personal courage, which this event seemed for the moment to call into question, had been previously well established, when, a volunteer under Prince Eugene against the French, he sacrificed the pleasures of Rheinsberg for a few weeks; but he saw during that campaign nothing of the fury and carnage of war. The battle, fought April 10, 1741, decided the fate of Silesia. It was, however, the signal for a general war in Europe, known as that of the Austrian succession. Bavaria, with France, now took up arms. A French, Saxon, and Bavarian army invaded Bohemia, while Frederic marched into Moravia. The fortunes of the youthful queen grew darker still, when England, her last ally, determined to be a neutral spectator of the conflict. Frederic gained a second victory at Chotusitz (Czaslau), May 17, 1742, and at once effaced by personal prowess the blot upon his victory at Mollwitz. Accepting English mediation, Maria Theresa made peace with Prussia by a treaty concluded at Breslau, June 11, and ceded Silesia and the county of Glatz. Frederic withdrew from Moravia, while the Austrians everywhere triumphed against France and Bavaria. England meanwhile declared for Austria, and British troops fought at Dettingen. Frederic grew anxious in the midst of ceaseless Austrian victories, and in Aug. 1744, marched into Bohemia at the head of 100,000 men, and took Prague.

He felt that he had no right to expect forbearance after his own perfidious conquest of Silesia; and accordingly, with no more notice than at first, he threatened Vienna. He confesses, however, that this campaign was filled with blunders; that no general ever committed graver faults; and it appears that during this year he first learned to be a general. He retreated rapidly, but only to retrieve the past. Next year, at Hohenfriedberg, he defeated a joint army of Austrians and Saxons, June 4, 1745, in a manner which placed him at the head of contemporary commanders. This victory was followed by those of Sorr (Sept. 30) and Kesseldorf (Dec. 15), and the fall of Dresden; and having no longer reason to fear that Maria Theresa could avenge herself, he deserted his French ally, and made peace with England and Austria by the treaty of Dresden (Dec. 22), by which he acknowledged Francis as emperor, and was confirmed in the possession of Silesia. Frederic by this time had doubled the number of his subjects, and had succeeded so well in humbling Austria and her allies, that he appeared to hold in his hand the balance of power in Germany. His people now enjoyed 11 years of peace, during which he devoted himself to the organization of his states and his army, the advancement of the arts, agriculture, manufactures, commerce, and education, the amelioration of the laws, and the increase of the public revenues. He also resumed his literary occupations, and wrote his "Memoirs of the House of Brandenburg" (2 vols., Berlin, 1751), his poem of the "Art of War," and many other productions in prose and verse. This was a period, nevertheless, of constant anxiety and insecurity; and learning, in 1756, that a new coalition was forming against him, Frederic at once prepared for the encounter. Although at the moment in alliance with France and Sweden, he resolved to rely as far as possible upon himself alone. Wholly distrusting the French ministry, he turned suddenly to England. His offer was readily accepted. Prussia threw off France; and England, Austria. The two rejected parties forthwith allied themselves, and the whole face of affairs was changed. Sweden, the tool of France, followed the French leading; and Frederic, with scarcely 5,000,000 subjects, including the conquered Silesians, found himself alone on the continent against 100,000,000. It was resolved to crush him; but those who made this resolution knew little of the prodigies of which this man was capable. He had foreseen their designs, detected all their secret intrigues, and resolved to strike the first blow. Accordingly, in June, 1756, with 70,000 men, he entered Saxony, and commenced the famous 7 years' war. His army had grown to 160,000 men. His enemies could bring 600,000 troops into the field, and there was not a politician in Europe who did not look upon his destruction as certain. He himself scarcely doubted it. He knew, however, that he had some advantages. He had an overflowing treasury at home, and plenty of money from England, and

he hoped that genius, judgment, and resolution, with ordinary good fortune, might at least sustain him until his enemies should quarrel among themselves. At Dresden he seized some state papers which exposed the designs of the coalition. They were published, and the world saw that this time he had right on his side. Saxony was reduced, and became in effect for the time a part of his dominions. He levied troops and supplies; and thus, within a few weeks, one of the confederates was made to turn his weapons against the others. The next campaign opened with the great battle of Prague, May 5, 1757. Frederic was victorious, but lost 12,000 men. A second battle was fought and lost at Collin, June 18. Frederic abandoned Bohemia. French troops invaded Prussia, and his army lost confidence. French, Swedes, and Russians were marching upon Berlin; and Frederic, mourning the death of his mother, whom he tenderly loved, provided himself with poison, and, resolving never to be taken alive, meditated suicide. He marched from Bohemia against the French. With half their numbers he defeated them at Rossbach, and took 7,000 prisoners (Nov. 5). On Dec. 5, at Leuthen, with 80,000 men, he attacked 80,000 Austrians (according to Kohlrausch), killed or captured 21,000 of their number, and took 180 guns, 50 standards, and 4,000 wagons. Early in 1758 he was again ready for action, and with 87,000 troops fought almost hand to hand with 60,000 Russians at Zorndorf. It was the fiercest and bloodiest battle of the war. Frederic ordered that no quarter should be given, so enraged was he with the devastations committed by the invaders; and 19,000 Russians and 11,000 Prussians lay upon the field, dead or wounded, at the close of this fearful day. The Russian survivors abandoned Prussia immediately, and Frederic marched into Saxony. He had beaten French, Austrian, and Russian armies in turn, each with more than double his force; but close upon these triumphs followed a chain of disasters which would have overthrown any other commander. At dead of night he was surprised and terribly defeated at Hochkirchen, but rallying in an incredibly short time he rescued Dresden from an overwhelming army of Austrians, and went into winter quarters at Breslau. The 4th year opened with the Austrians overrunning Saxony, Russians victorious upon the Oder, Frederic utterly routed at Kunersdorf, and Berlin saved only by the king's miraculous energy. The 5th year saw the capital in the hands of the enemy, while Frederic won great battles at Liegnitz and Torgau. The 6th year was also unfavorable, but he still fought on. The circle seemed to be closing around him, and he grew savage with despair. England deserted him, but Russia withdrew from the coalition. Frederic broke into Silesia and defeated the Austrians at Bückersdorf. The armies of France were meanwhile withdrawn, France declaring future neutrality; and Prussians and Austrians stood alone against each other. The

empress now gave way, and in Feb. 1763, peace was signed at Hubertsburg, leaving Frederic in possession of Silesia, the sole object, short of saving Prussia itself, for which he had fought. After an absence of 8 years he reëntered Berlin in triumph. The city had been more than once plundered; the population had suffered frightfully. He found the number of his subjects diminished by $\frac{1}{12}$; a sixth of the male able-bodied adults had died upon the field of battle. Cossacks and Croats had slaughtered young and old, women and children. Fields were unsown; villages and hamlets were deserts. But, say historians, Frederic did not owe a dollar. His first object was the thorough restoration and reorganization of the army. During every moment of the 24 remaining years of Frederic's life, he was armed at all points. His energies, meanwhile, were employed with equal devotion in the restoration of his country. The corn which had been provided for the next campaign was bestowed forthwith upon the destitute. In Silesia taxes were remitted for 6 months; in Pomerania and New Brandenburg for 2 years. Immense sums of money were expended in agricultural and industrial improvements; in all, during the remainder of his reign, 24,000,000 thalers. To meet these and other similar ends, the most rigid economy was practised. The royal household was so frugal that the king saved annually from the sum appropriated to his court nearly 1,000,000 thalers. His envoys in England and France each had salaries less than \$5,000 a year. The king himself had but one fine dress during the remainder of his life. Shabby old garments and snuffy yellow waistcoats were his daily wear; and when it was found at his death that he did not possess a single decent shirt, he was buried in one belonging to his *valet de chambre*. In one fancy alone was he ever enticed from an excess of economy; this was his love of building. He was himself the great exemplar of industry. Twenty hours in the 24 he spent in some active bodily or mental employment. He rose at 4, and retired at midnight. Dinner was the scene of intellectual activity, a school of wit and discussion. Religious persecution was unknown in his dominions; perfect order reigned throughout; property was secure; speech and the press were free. Lampoons and libels on himself he wholly disregarded. "My people and I," he said, "understand each other. They are to say what they like, and I am to do what I like." Cheap and speedy justice was administered. In commercial policy and international law he was in advance of his time. Devoted as he was to letters, he never allowed the passion for literature to divert him from duty. He had no knowledge of the force of the German language, and spoke of it with contempt. Yet he never wrote French correctly. Respectable as he was as a historian, and voluminous as a versifier, he never learned to spell the language which he idolized. It has been said of him that in action he was a German prince, and in speculation a French philosopher. In the year

1772 was contemplated the dismemberment of Poland. It originated between Frederic and Catharine of Russia; for it is certain that a most unwilling consent was wrung from Maria Theresa. Frederic took possession of his share in Sept. 1772, and issued in justification of himself a manifesto so vain, that it has been called an insult added to the injury. No other war-like event occurred, except the threatening of another war with Austria on the subject of the Bavarian succession. The emperor Joseph II. laid claim to it, and entered Bavaria with an army in 1778. Frederic interposed as protector of the rightful heir, the duke of Deux Ponts. Some skirmishes ensued, when Maria Theresa prevailed upon her son to forego his claims. Peace was accordingly signed, May 13, 1779. Later important public acts of his life were the establishment, in 1785, of the so called confederation of princes (*Fürstenbund*); and a treaty with the United States of America, embodying the most elevated principles of international rights. Without much community of political sentiment, he was friendly to the American patriots, and gave evidence of his dislike of British policy in employing Hessian troops across the Atlantic, by levying the same toll per head upon the recruits which passed through his dominions as was charged upon "bought and sold cattle." Washington commanded his admiration, and Mount Vernon received among its treasures a Prussian sword of honor, forwarded from Potsdam with the words: "From the oldest general in the world to the greatest." Frederic died after a severe attack of dropsy, at the age of 74; he left no children by his wife, with whom he never cohabited, and was therefore succeeded by a nephew, Frederic William II., to whom he left a treasury containing a surplus of 72,000,000 thalers, an army of 220,000 men, a territory increased by 29,000 sq. m., and a people industrious, intelligent, and happy. On his accession he had 2,240,000 subjects; at his death the number exceeded 6,000,000. His works were published by order of the king of Prussia, under the auspices of the royal academy of sciences (30 vols., Berlin, 1846-'57). Extensive works on Frederic have been written by Kolb and Preuss. Of Carlyle's "History of Frederic," to be completed in 4 vols., 2 vols. have been published (Aug. 1859). *Friedrich der Grosse und Katharina II.*, by Kurd von Schlözer of St. Petersburg, appeared in Berlin in 1859.

FREDERIC WILLIAM II., king of Prussia, born Sept. 25, 1748, died Nov. 19, 1797. He was the grandson of Frederic William I., nephew of Frederic the Great, and son of the prince Augustus William, who, having incurred the resentment of his brother the king by an unsuccessful retreat after the disastrous battle of Collin (1757), shortly after died. Frederic William, having become heir presumptive to his uncle, received from him but rare marks of cordiality or affection, was rather austere educated, and often exposed to all the dangers of the war during the last period of the 7 years'

struggle. He enjoyed little freedom in the second and peaceful half of Frederic's reign, was obliged to repudiate his first wife, Elizabeth of Brunswick, because of ill conduct, and lived in a circle of his own, in which some visionaries of the then powerfully organized sect of illuminati were particularly conspicuous, who maintained their influence over him even after his accession to the throne. This took place on Aug. 17, 1786. Freed from his long continued restraint, the new king gave himself up without moderation to his voluptuous inclinations. Mistresses and favorites reigned in the court and squandered the treasures of the state. The favor of the people he sought to gain by ostentatious mildness; even the discipline of the army, so renowned under Frederic, was relaxed. The first important act of his policy abroad, which was but slightly influenced by the energetic minister Herzberg, was to reinstate in power his brother-in-law the stadtholder of the Netherlands, who had been deposed by the anti-Orange party. A Prussian army under the duke of Brunswick entered Holland, occupied Amsterdam, and restored the ancient order of things, which was confirmed by a treaty concluded in 1788, at the Hague, by Prussia, England, and Holland. Alarmed by the alliance of the emperor Joseph II. with Catharine II. of Russia, and by the successes of the Russians in the war against Turkey, he concluded a treaty with the latter power guaranteeing all its possessions. An army was assembled in Silesia, near the Bohemian frontier. Before the outbreak of the war, however, Frederic William wavered, and finally restored his good understanding with Austria by the treaty of Reichenbach (1790), concluded with the successor of Joseph, Leopold II., who soon also made peace with the Porte. Russia, however, was allowed to continue her operations undisturbed, and the encouraging promises made to the Belgian patriots were soon forgotten. Herzberg resigned. The interview at Pilnitz with the emperor (1791) prepared the first coalition against the French revolution. The hostile operations began in the spring of 1792. The duke of Brunswick entered France in June; the king and the crown prince, the son of his second wife, Louisa of Hesse-Darmstadt, joined him soon after. Want of harmony and repeated blunders on the part of the allies, revolutionary fanaticism and the skill of the commanders on the side of the French, soon turned the scale in favor of the latter, compelling Frederic William to keep the defensive, and finally to conclude the treaty of Basel (1795) with the republic, in which he ceded his territories beyond the Rhine, contracting for future indemnities and a kind of protectorate over northern Germany. His participation in the affairs of Poland, fickle and treacherous as his policy was, was productive of more advantageous results. Having encouraged the so-called Long Polish diet in its efforts to regenerate the state and to make it independent of Russia, by a treaty in which he guaranteed its integrity (1790), he afterward,

when engaged in the war with France, found it more convenient and more profitable to share the prey with Russia and Austria. He marched his army into Poland, and actively promoted the second and third dismemberment of the unhappy republic (1798-'95). His share was large, extending to the Niemen, and including the capital, Warsaw. These wars and the extravagance of the court exhausted the finances of Prussia. Intolerant edicts and severe restrictions of the press contributed to make his reign unpopular. It must, however, be acknowledged that it was not without merit in developing the resources of the state and the welfare of the people by useful internal improvements. The juridical organization of Prussia was also greatly promoted under Frederic William.

FREDERIC WILLIAM III., son and successor of the preceding, born Aug. 3, 1770, died June 7, 1840. Educated with care by his virtuous mother, Louisa of Hesse-Darmstadt, he had ample opportunity of comparing, at the courts of Frederic the Great and of his father, the opposite influence of royal virtues and vices upon the affairs of his state; and he early contracted the love of order, discipline, economy, and labor, which in after time contributed no little to the prosperity of his people. He accompanied his father to the conference of Pilnitz, and to the army of the first coalition against France, and in 1793 married the beautiful and accomplished princess Louisa of Mecklenburg-Strelitz, after his accession to the throne (1797) the most popular queen of Prussia. The great task of the new reign was to purge the court and the administration of the creatures and abuses of the preceding. This was done with energy. The unpopular edicts restricting the press and the freedom of religious instruction were abrogated, and economy and order restored in the administration. In his foreign policy the young king maintained the neutrality imposed by the treaty of Basel, the temporary stipulations of which were made definite by the treaty of Lunéville (1801). For its cessions on the left bank of the Rhine, Prussia soon after received ample compensations in small territories deprived of their independence as members of the empire by decree of the Germanic diet. Satisfied with his acquisitions and political influence in the north of Germany, Frederic William refused to join the third coalition against France which was formed by England, Russia, and Austria. But when the French armies had infringed the neutrality of the Prussian territories, Frederic William secretly allied himself with Alexander of Russia, during a sudden visit of the latter at Berlin. Hesitation, however, spoiled the effect of this alliance, and the battle of Austerlitz was followed by a new treaty with Napoleon (Dec. 1805). Ceding Anspach, Cleves, and Neufchâtel, it received Hanover from the conqueror. The consequence of this exchange was what Napoleon wanted, a declaration of war by England against Prussia. The latter was also embroiled with Sweden. Having made peace

with these enemies, Frederic William made peremptory demands on Napoleon in behalf of the neutrality of his state and its allies in northern Germany. Napoleon answered with prompt hostilities, and the battles of Jena and Auerstädt were both fought on Oct. 14, 1806. The powerful Prussian army was broken, Berlin was occupied by the enemy, and the fortresses surrendered at the first summons. The aid of Alexander was of little avail. After a winter campaign in Prussian Poland and the indecisive battles of Pultusk (Dec. 26) and Eylau (Feb. 8, 1807), Napoleon conquered peace by the battle of Friedland, won on the anniversary of Marengo (June 14). The treaty of Tilsit (July) sacrificed one half of Prussia, parts of which were transformed into the duchy of Warsaw, and others attached to the kingdom of Westphalia. The other half remained for years in the hands of the conqueror, and was treated as a subdued province. The king, who paid a visit with the queen to Alexander, could not return to his capital before 1809. This gloomy period, however, became one of the most successful in the history of the state by a series of salutary and energetic reforms, undertaken and executed particularly under the celebrated ministers Stein and Hardenberg. Serfdom was abolished, the towns obtained some independence in the management of their own affairs through city representatives, the royal domains were sold, convents and ecclesiastical foundations converted into state property, public instruction was organized, and the new university of Berlin founded. The new system of military organization of Prussia had also its origin in that period. In 1810 the king lost his wife, the faithful companion of his misfortunes. In 1812 he was compelled to aid Napoleon with an army against Russia. Forming the left of the great French army of invasion, it was saved on the retreat by a special arrangement between its commander, York, and Diebitsch. York was officially blamed, but soon received a due acknowledgment of his patriotic act. Having transferred his residence to Breslau (Jan. 1813), Frederic William now issued his famous proclamation, which was answered by a general rising of the nation against France. The capital of Prussia alone is said to have contributed a force of 10,000 men. Fortunately, prudent measures had been adopted in secret to prepare for the struggle. The youth, meeting privately, had been drilled in the use of arms in small detachments. Thus the power of the people answered to their will. The militia having been summoned, war against France was declared on March 17. The situation had its dangers. The French still held the fortresses of Prussia and Poland; their army in the dominions of the king still amounted to 60,000. But the hour of success had passed for Napoleon. The continual desertion of his allies served to strengthen the phalanx of the coalition after every defeat of his armies. His enormous new levies were not sufficient to cover the extraor-

dinary losses, and to face so many enemies. The Prussians fought bravely in various engagements in 1813 and 1814 (see BLÜCHER), and the king often gave proofs of personal activity and courage. He entered Paris with his allies, accompanied Alexander on his visit to England, made, in Aug. 1814, a triumphal entry into his capital, and repaired to the congress of Vienna. The stipulations of this congress conferred on Prussia greater power than it possessed before the wars, enlarging it particularly with parts of Saxony, one of the last allies of Napoleon. The sudden return of the captive of Elba called the Prussian army again to arms, and Blücher, after his previous defeat, appeared at Waterloo in time to finish the great struggle. The last 25 years of the reign of Frederic William form a period of undisturbed peace and prosperity for Prussia. Closely allied with the czar Alexander, and afterward with Nicholas, the king pursued a policy of strict conservatism. Much was done for internal improvements, little for political reform. Revolutionary agitations, wherever they manifested themselves, were suppressed with severity. Science, however, was patronized, and the king could boast of the friendship of the Humboldts. The last years of his reign were agitated by a strife with the Roman Catholic clergy. The eldest of his 4 sons succeeded him as Frederic William IV. One of his daughters was married to the emperor Nicholas. In 1824 he had formed a morganatic marriage with the countess Augusta of Harrach, whom he made duchess of Liegnitz.

FREDERIC WILLIAM IV., son and successor of the preceding, born Oct. 15, 1795. He received a careful scientific education, though his boyhood was passed in the most disastrous period of Prussian history, and his youth in that of the great struggle against Napoleon. Ancillon, Delbrück, Scharnhorst, Kneesebeck, Savigny, Ritter, and Rauch were among his teachers in philosophy, belles-lettres, military science, political economy, and art. He was often present on the scene of action during the last campaign against Napoleon, became familiarly acquainted with many distinguished men of his age, of whom Humboldt remained attached to him through life, and developed his taste for the fine arts while residing in Paris after its occupation by the allies, and on a journey to Italy in 1828. Admitted to the councils of his father, he evinced a marked independence of opinion with much administrative ability. As military governor of Pomerania, his affability gained him general popularity. Great expectations had been formed of his future career when he succeeded to the throne (June 7, 1840). His first solemn declaration at Königsberg, a limited political amnesty, the reinstating of Arndt, the old liberal poet, the reappointment to office of the popular lieutenant-general Von Boyen, the conciliatory termination of a difficulty between the state and the Roman Catholic clergy, were hailed with applause; but the appointment of statesmen like Hassenpflug and Eich-

horn, the patronage bestowed on the nobility, as well as on the representatives of the historico-romantic and pietistic schools, the dismissal of Bruno Bauer from his professorship, the suspension of Braun, the expulsion from the kingdom of Prussian and non-Prussian democrats, among others of Herwegh, Itzstein, and Hecker, the severe application of literary censorship, and the cordial relations of the court with the czar Nicholas, the brother-in-law of the king, soon destroyed the hopes of the liberal part of the nation. An attempt on the life of the king by the dismissed burgomaster Tschsch in 1844 was punished with death. The development given to the representation by provincial estates, which had been introduced under the preceding reign, by the convocation of their standing committees in 1842, and by the convocation of the united provincial estates of the kingdom in Feb. 1847, was made less significant by the distinct declaration of the king that the representatives, far from becoming legislators, would be allowed only to give advice to the unlimited sovereign, and that he would never consent to bind his inherited authority by a written compact. Periodical meetings of the united assembly were asked for in vain. The government, though granting general toleration, declared against the separation of the church from the state, and the emancipation of the Jews, and avowedly sought to rule the kingdom in conformity with the views of the school generally known as pietists. Much more was done for the material interests of the state through internal improvements, commercial union with foreign states, and the commercial union with the north of Germany (*Zollverein*), which also extended the political influence of Prussia. The Polish conspiracy of 1846, which threatened the eastern possessions of the king, was detected in time in the duchy of Posen; the outbreak in the same province was easily suppressed; the insurgents of Cracow, who laid down their arms on Prussian territory, were treated with rigor. The people were already politically agitated by the lively discussions of the diet (from April 11 to June 22, 1847), and of its standing committees, assembled Jan. 18, 1848, and also by the trial of the insurrectionists of Posen, and of Mieroslawski, the destined leader of the Polish movement, as well as by the victory of the liberals in Switzerland over the *Sonderbund*, the constitutional movements in Italy, and the revolution in Sicily, when the news of the French revolution of Feb. 24 involved the whole of Germany in a flame. The popular movement was victorious all over the south-west and south of the confederation, before Frederic William was forced to yield to its irresistible current. Even after the fall of Metternich in Vienna (March 13), he was determined to maintain his royal authority, and to grant liberties only as free gifts. Threatening popular gatherings in Berlin were dispersed by his faithful soldiery before he proclaimed the freedom of the press and the promise of a change in the form of gov-

ernment. These concessions were received with enthusiasm, but the people still demanded the removal of the hated troops from the capital, and for this purpose a deputation of citizens repaired to the palace (March 18), while a crowd of people assembled before it. The deputation was refused admittance, and soldiers advanced from the court of the palace to clear the place. Some shots were fired. Immediately the people dispersed in every direction with cries of "Treason! they are murdering us! revenge!" Hundreds of barricades were erected in a few hours, the arsenal was stormed, and a furious fight ensued, which raged till the morning of the next day, when the king commanded the retreat of the troops and their removal from the city. The corpses of the fallen combatants were carried into the courtyard of the palace, and the king was compelled to appear before them with uncovered head; the palace of his then very unpopular brother, the prince of Prussia, was declared national property. The ministry was dismissed, a civic guard organized, and a general amnesty granted. Mieroslawski, who had been sentenced to death, was carried in triumph through the streets of Berlin, and 250 of his associates left the prison with him, and hastened to Posen to commence the restoration of Poland, the new ministry promising its assistance. The king now openly and ostentatiously declared his purpose to take the lead in Germany; the diet was again assembled (April 2), to elaborate a new election law. It was dissolved after the passage of that law on April 5, and a constituent assembly was convened in Berlin (May 22), while the delegates of Prussia also appeared in the national German parliament which in Frankfort-on-the-Main had superseded the diet of the princes (*Bundestag*). Prussian troops were sent to Schleswig-Holstein to assist the German inhabitants in their revolt against the king of Denmark. In Posen, however, where the Poles had risen in a bloody insurrection, the troops restored order after furious contests with the half-unarmed bands under Mieroslawski (April and May). This was the first reactionary victory. Others followed. While the revolution was losing its time in endless speech-making, framing of constitutions, and scheming on the reorganization of Germany as a united empire, in the assemblies of Frankfort, Berlin, Vienna, and elsewhere; while it was wasting its power in party strifes and useless undertakings, and degenerating through the excesses of the populace, the governments, which had maintained their armies, paved the way for a complete restoration of their power by mutual understanding, skilful counter-revolutionary manoeuvres, continually changing ministries, and varying programmes. In Prussia the men who, by their zeal, activity, or popularity, best assisted the government during the dangerous period of the revolution, were the ministers Camphausen, Pfuel, Radowitz, Brandenburg, and Manteuffel, and the generals Willisen and Wrangel. Emboldened by the tried fidelity of

the army and the growing desire for order among the wealthier classes, by the reaction in France, and the successes of the Austrian government in Prague, Lombardy, and Vienna, Frederic William prorogued the Prussian constituent assembly, transferring it to the town of Brandenburg, closed its sessions by an armed force under Wrangel (November), and finally dissolved it shortly after its reassembling in Brandenburg (Dec. 5), promulgating a liberal constitution of his own (*octroyirte Verfassung*). The last act of the assembly of Berlin, the decree ordering the refusal of taxes (Nov. 15), remained without effect; the new elections took place according to the king's constitution, and the two chambers were convened in Berlin (Feb. 26, 1849), which remained in a state of siege. Of these the lower house was still too revolutionary, and both were dissolved (April 27). In the mean time the king had not only abandoned the cause of Schleswig-Holstein by the armistice of Malmoe, but had also refused to accept the hereditary imperial crown of Germany offered him (March 28) by the Frankfort parliament. The Prussian army now suppressed the revolution in Dresden, after a bloody struggle of 3 days (May), and in the Palatinate and Baden (June), while it was almost a mere spectator in the renewed struggle in Schleswig-Holstein. A confederation of Prussia with Saxony and Hanover (*Dreikönigsbund*, confederation of three kings), and some minor northern states, formed March 26, was hailed by the so called party of Gotha (Gagern, Dahlmann, &c.) as the last anchor of hope for a union of Germany. It ended in failure. Opposed by Austria and its southern allies, it was given up by Saxony, Hanover, and others; its parliament of Erfurt assembled in vain (March 20, 1850). Frederic William, who had in the mean time convoked a new Prussian assembly and confirmed a new constitution with his royal oath (Feb. 6), followed for some time a more popular course in the affairs of Hesse-Cassel (October), but soon yielded to the threats of Austria and her allies (November). Order was restored in Hesse and Schleswig-Holstein, and the ancient Germanic diet was once more established in Frankfort. The revolution was over. A second attempt on the life of the king by Sefeloge (1850) had no connection with it. Only Neufchâtel remained with Switzerland as a conquest of the movement, and was finally, after some threats of war in 1857, ceded to that republic. The policy of the government was peaceful, and Prussia took no part in the war in Turkey, though it participated in the peace of Paris (1856). The constitution was modified and remodified; the revolutionary members of the assembly of 1848, Jacoby and others, were persecuted; the nobility (*die Junker*) and the pietists received new influence; the freedom of the press and of religion was circumscribed. In 1857 the king was seized by a malady connected with temporary insanity, which increasing by degrees, compelled him (Oct 23, 1858) to give up the personal manage-

ment of affairs, and to repair for the restoration of his health to the Tyrol and subsequently to Italy. His marriage with Elizabeth, princess of Bavaria, being without issue, his brother William, prince of Prussia, born March 22, 1797, became regent. The son of the regent, and heir presumptive to the throne in case of the expected abdication of the king, Prince Frederic William (born Oct. 18, 1831), married Victoria, princess royal of Great Britain (born Nov. 21, 1840), Jan. 25, 1858.

V. SAXONY.

FREDERIC III., surnamed the Wise, elector of Saxony, born in Torgau, Jan. 17, 1463, died May 5, 1525. He succeeded his father Ernest, in 1486, only in a part of his possessions, governing the rest in common with his brother John the Constant, who also became his successor. He was the founder of the university of Wittenberg, and though not an avowed adherent of the reformation, greatly promoted it by his protection. He procured safety for Luther during the diet of Worms, and subsequently sheltered him in the castle of Wartburg. His influence with the emperor Charles V. was due particularly to the circumstance that after the death of Maximilian I. he had refused to accept the crown of Germany, which was conferred, according to his advice, upon that monarch. The peasants' war embittered the last days of his life.

FREDERIC AUGUSTUS I., 1st king of Saxony, eldest son of the elector Frederic Christian, born Dec. 28, 1750, died May 5, 1827. He succeeded his father in Dec. 1763, under the tutelage of Prince Xaver, was declared of age Sept. 15, 1768, and in the following year married Maria Amalia, princess of Deux Ponts. The only fruit of this marriage was a daughter, the princess Augusta. The claims of his mother to the possessions of her deceased brother, the elector Maximilian Joseph of Bavaria, induced him to ally himself with Frederic the Great against Austria in the short war of the Bavarian succession. Subsequently he joined the league of princes (*Fürstenbund*) formed under the protectorate of the Prussian monarch. In 1791 he refused to accept the succession to the throne of Poland, offered him in the name of that country by Prince Adam Casimir Czartoryski. He also rejected the instances of a conference of the emperors Leopold II. and Frederic William II. of Prussia, held at Pilnitz (1791), to join as an independent sovereign the first coalition against the French revolution, though he did not withhold his contingent as a member of the German empire when the war had been declared. In 1796 he took part in the treaty of peace and neutrality concluded with the French republic by the district of Upper Saxony. He maintained his neutrality during the war of 1805, but in the following year joined Prussia in the unhappy contest decided by the battle of Jena. Saxony, which fell into the hands of the French conqueror, was severely punished, and Frederic Augustus was finally

compelled to throw himself into the arms of Napoleon. Having concluded the treaty of Posen (Dec. 1806), he assumed the title of king, and joined the Rhenish confederation. For the cession of several districts of western Saxony annexed to the new kingdom of Westphalia he was scantily compensated by a part of Lusatia, and after the peace of Tilsit (1807) more liberally by the duchy of Warsaw. He was a faithful vassal of the French emperor during the wars of 1809 against Austria, and 1812 against Russia, and in 1813, when Saxony became the chief scene of the conflict. Having personally joined Napoleon shortly before the battle of Leipsic, he was declared after its bloody issue a prisoner of war by the emperor Alexander, was sent to Berlin, and afterward to the chateau of Friedrichsfeld, but was subsequently allowed to reside at Presburg during the deliberations of the congress of Vienna. That congress restored to him half of his German possessions, the other half being annexed to Prussia; the duchy of Warsaw was made a dependence of Russia as the kingdom of Poland. Returning to his capital in June, 1815, Frederic Augustus spent the last 12 years of his life in healing the wounds of his diminished country by promoting its agricultural, commercial, and mining interests, by establishing or developing institutions of art and science, and particularly by a strict administration of justice. His grateful subjects bestowed upon him the surname of Just. His brother Anthony succeeded him.

FREDERIC AUGUSTUS II., king of Saxony, born May 18, 1797, died Aug. 9, 1854. He was the eldest son of Maximilian, brother of the kings Frederic Augustus I. and Anthony. Having lost his mother, Carolina Maria Theresa, princess of Parma, at the age of 7, he was educated principally under the care of Forell, a distinguished Swiss, and of Gen. Watzdorf. Though often compelled to leave the capital of his uncle during the later campaigns of Napoleon in Germany, and frequently to change his abode, he eagerly pursued his studies, which included political economy, law, and military science. Botany, however, became his favorite pursuit. When, in Sept. 1830, in consequence of the revolutionary movement in Paris, Dresden became a scene of political commotions, Frederic Augustus was placed by the old king Anthony at the head of the committee for public tranquillity. As the prince was very popular, this measure greatly contributed to quiet the agitation. On June 6, 1836, Frederic Augustus succeeded to the throne. As he was but partially occupied with political affairs, he made botanical tours and journeys to Istria, Dalmatia, and Montenegro (1838), to England and Belgium (1844), to Vienna and Hungary (1845), and to the Tyrol (1846). The movements of 1848, beginning in Saxony, as everywhere else in Germany, with great enthusiasm for liberty and German union, were followed in May, 1849, by a revolutionary outbreak in Dresden. This having been suppressed through the

intervention of Prussia, things soon returned to their ancient order, and the reactionary movement continued to the death of the king, which was occasioned by a fall from his carriage on a new tour in the Tyrol. He was twice married, first to Carolina, daughter of the emperor Francis, and, after her death in 1832, to Maria, daughter of Maximilian I. of Bavaria. Both marriages being without issue, he was succeeded by his brother John, the present king.

VI. WÜRTENBERG.

FREDERIC I. (WILHELM KARL), 1st king of Württemberg, son of the duke Frederic Eugene, born Nov. 6, 1754, died Oct. 30, 1816. He received his first instruction from his accomplished mother, a princess of Brandenburg-Schwedt, and completed his education at Lausanne, after the French fashion of that period, served in the bloodless war of the Bavarian succession, accompanied his brother-in-law, the future Russian emperor Paul, on a journey to Italy in 1782, took service in Russia as governor-general of Russian Finland, and after having left it in 1787, lived for some time in retirement. In 1790 he was a spectator of the sessions of the French national assembly; in 1796 he fought unsuccessfully against the French on the Rhine, and being compelled to leave his country, retired to Anspach, and subsequently to Vienna and London. In the following year he returned to Württemberg, succeeding his father on the ducal throne. He shared in the war of 1799, received by the treaty of Luneville as a compensation some territories on the left bank of the Rhine, and was allowed to assume the electoral dignity. In 1805 he made an alliance with Napoleon, joined the Rhenish confederation, and received from its protector the title of king. He deserted Napoleon after his disasters. The treaty of Vienna left him in possession of his kingdom. To conciliate his people after 10 years of despotic sway he gave them a charter, which was rejected by the estates. His first wife was a princess of Brunswick Wolfenbüttel, who bore him two sons, William, his successor, and Paul, and a daughter, Catharine, afterward princess of Montfort; his second wife was the princess Charlotte Augusta Matilda of England, who died in 1828.

FREDERICSBURG, a city of Spottsylvania co., Va., pleasantly situated in a fertile valley on the right bank of the Rappahannock river, at the head of tide water, 65 m. N. from Richmond, and 110 m. above Chesapeake bay; pop. in 1850, 4,062. It contains a court house and gaol, and in 1850 had 5 churches, 2 seminaries, an orphan asylum, 2 banks, a grist mill, and 2 large tanneries. The Rappahannock, beside supplying it with good water, which is distributed in pipes, is valuable for its motive power, available at the falls just above. A canal extending to a point 40 m. further up the stream affords means of transportation for the products of a rich farming country, and the Richmond, Fredericksburg, and Potomac railroad connects the city with the state and federal capitals. The

exports, comprising grain, flour, tobacco, &c., are valued at \$5,000,000 annually. Marble and freestone abound in the vicinity. Just beyond the limits of the city an unfinished monument, begun in 1883, marks the tomb of the mother of Washington, who died here in 1789.

FREDERICTON, a city and port of entry of New Brunswick, capital of the province and of the county of York, situated on the right bank of the river St. John, 80 m. from the bay of Fundy, and 54 m. N. N. W. from St. John; lat. 45° 55' N., long. 66° 32' 30" W.; pop. in 1852, 4,458. The river is here $\frac{1}{4}$ of a mile wide, and is naturally navigable to this point by vessels of 120 tons; light steamers can ascend to Grand Falls, 140 m. above Fredericton. The sum of \$40,000 was appropriated by the legislature in 1849 for the improvement of the upper course of the river, and the work was commenced during the following year. The city became a port of entry in 1848, and is now the chief entrepot of commerce with the interior and an important station of passenger travel. Merchandise is brought up the river by steamer, except during winter, when transportation is effected by sledges over the ice. Great quantities of timber are collected at Fredericton, and then floated down to St. John, whence they are exported to foreign parts. The lumber business is one of the principal sources of the wealth of the city. Fredericton stands on a low point of land formed by a sharp bend in the river, and is encircled on the land side by a range of hills. It has broad, regular streets, adorned with many fine gardens and shade trees, and with several elegant public buildings. The government house, the residence of the lieutenant-governor, is a stone building at the W. end of the town. The province hall, in which are held the sessions of the legislative bodies; the barracks, capable of accommodating 1,000 infantry and a company of artillery; churches belonging to the Baptists, Episcopalians, Methodists, Presbyterians, and Roman Catholics; and King's college, a freestone structure 170 feet long and 62 feet wide, are the principal other edifices. Fredericton was formerly called St. Ann's, and was made the seat of government by Sir Guy Carleton in 1785. It has suffered at times from terrible conflagrations, one of which in 1825 laid $\frac{1}{4}$ of the town in ashes, while another in Nov. 1850, was still more disastrous.

FREDERIKSBORG, a royal palace built by Christian IV. of Denmark in 1606-'20, near the town of Hillerød, on the island of Seeland, 22 m. N. N. W. from Copenhagen. It is a Gothic castle of red brick, covering 8 small islands in a little lake. The *Riddersal*, or knight's hall, has a ceiling elaborately decorated with carvings, gildings, and paintings, on which 26 artists are said to have worked for 7 years. It has also a collection of portraits, and a richly ornamented chapel, in which all the late kings of Denmark have been crowned. The pulpit and altar in the last are of ebony and silver, exquisitely wrought, and containing upward of 600 pounds of the precious metal.

sitely wrought, and containing upward of 600 pounds of the precious metal.

FREDERIKSHALD, or FREDERIKSHALL, a seaport of Norway, province of Aggerhuus, on the Iddefjord near its junction with the gulf of Swinesund, Skager Rack, 57 m. S. E. from Christiania, near the frontier of Sweden; pop. in 1855, 7,408. The harbor is excellent, and is accessible to the largest class of shipping. The great fire of 1759 nearly destroyed the town, but it has been handsomely rebuilt. It stands around the base of a gigantic rock, on the summit of which, 400 feet perpendicularly over the sea, is the historic fortress of Frederiksteen. The old name of the town was Halden. Charles XII. was killed here, Nov. 30, 1718. Frederiksteen was formerly a fortress of great strength. On 3 sides it is inaccessible. On the only accessible side, close under the outer walls, a rude monument is said to mark the spot of the king's death. The castle was invested in 1814 by the Swedish crown prince, Bernadotte, and its hopeless defence was a prelude to the almost immediate conquest of the kingdom and its union with Sweden, Nov. 4, 1814. About 8 m. E. of the town there is a lake, the *Fem Sœ*, the stream from which flows into the fiord near Frederikshald. The waterfalls upon the stream are the most picturesque in S. Norway.

FREDRO, MAKSYMILIAN, a Polish statesman and writer, died in 1676. He spent his life in the service of his country, in the camp as well as in the council, and rose to the dignity of palatine of Podolia. He wrote several works in Polish and Latin, being honored in some with the name of the Polish Tacitus. His principal works are *Monita Politico-Moralia; Fragmenta Scriptorum Togæ et Belli*, "Considerations on Military Service," and "Proverbs and Advice," the latter two in Polish, and all abounding with curious details and keen observations.

FREE CHURCH OF SCOTLAND, an ecclesiastical body originally formed by a separation from the national establishment in the year 1843. No separation so large from any ecclesiastical body had occurred since the St. Bartholomew ejectment of 2,000 ministers from the national establishment of England in 1662. On May 18, 1843, the general assembly of the established church of Scotland met as usual in Edinburgh, the Rev. David Welsh, D.D., being the moderator, and the marquis of Bute being the representative of the queen. After prayer the moderator read a solemn protest on the part of the church of Scotland against the wrongs inflicted on her by the civil power, which protest was signed by 208 members of the assembly. He then laid the protest upon the table, and bowing respectfully to the representative of royalty, left the house, followed immediately by Dr. Thomas Chalmers, Dr. Robert Gordon, Dr. Patrick McFarlane, Dr. John McDonald, Dr. Thomas Brown, and rank after rank of the country ministers. The protesters withdrew to a large hall at Canon mills, preceded and followed by sympathizing crowds, and

there organized the Free Protestant church of Scotland under the moderatorship of Dr. Thomas Chalmers. It was then found that 475 ministers had separated themselves from the national church. The amount of capital surrendered that day by the protesting brethren, in relinquishing their stipends from the establishment, was stated to be not short of £2,000,000 sterling.—The French revolution had considerably affected the standing both in the church and in society of the evangelical party in the church of Scotland. Their doctrines had hitherto been looked upon as tainted with fanaticism, but the general horror of infidelity awakened by the events in France caused them to be regarded with greater favor, while their impressive preaching, exemplary lives, and solid learning began to give character to the cause with which they were identified; and though as yet a mere handful in the church, they were every day rising in numbers and power. Under the successive leaderships of Erskine, Sir Henry Moncrieff, Andrew Thomson, and Chalmers—men who inherited the principles and many of the varied gifts of Knox, and Melville, and Henderson, the heroes of the first and second reformatations, the evangelical party became stronger and stronger until a fair opportunity for testing the power of parties in the church occurred in 1834. In 1706 the treaty of union between England and Scotland was consummated. It contained a special guarantee for the integrity of the church of Scotland as established in 1689 under the reign of William and Mary, free from prelacy, from the royal supremacy in things spiritual, and from the law of patronage. But 4 years after the consummation of the treaty of union (1711) the parliament of Britain violated its pledge, and under the leadership of Bolingbroke lay patronage was reimposed upon the Scottish church. In this act Sir David Dalrymple, one of the Scottish members, sneeringly said that he would be willing to acquiesce, provided that it should be designated by its right name: “An act for the encouragement of immorality and Jacobitism in Scotland.” Bishop Burnet, the historian, says of it that it was passed “to spite the Presbyterians, who from the beginning had set it up as a principle that parishes had from warrants in Scripture a right to choose their ministers.” Such was the sense of the wrong inflicted by this act, that the Scottish church for a long period annually renewed her protest against it; and during several years after it was passed no patron was found to appropriate the powers which it conferred upon him. Toward the close of the century, however, forced settlements of ministers upon parishes became frequent, and multitudes of the best of Scotland’s people were driven forth from her communion. Against such proceedings it was in vain that the evangelical party earnestly and frequently protested; their protests were those of a small minority, whose principles the majority despised and hated. But that minority grew in numbers

and in power, especially from the beginning of the present century, and under such leaders as Thomson and Chalmers one abuse after another was rooted out; and at last an act was passed by the general assembly in 1834 designed to be a corrective of the evils of lay patronage—an act which gave to the male heads of families in every parish the right of objecting to any presentee whom the patron might wish inducted into the pastorate over them. This act, commonly called “the veto act,” though proposed by one of the senators of the college of justice, the late Lord Moncrieff, and though believed by the church to be entirely within her power as a church established by law to enact, very soon brought her into conflict with the patrons, and through the patrons with the civil courts. On a vacancy occurring in a certain parish the patron presented his *protégé*, who however was vetoed by almost the entire body of inhabitants. The presentee appealed to the civil courts, who at once commanded the presbytery to proceed to his settlement. The presbytery refused; for the law of the church had given the male heads of families, being communicants, a right to object if they could prove sufficient cause to exist. The civil courts of course stood mainly on the interpretation of the law of 1711–’12. The evangelical party, now the majority in the general assembly, believing that law to be both unconstitutional and contrary to the word of God, resolved to stand upon their rights given them by the head of the church in the Holy Scriptures and ratified by the revolution settlement and the treaty of union; and inasmuch as the battle was not theirs only, but that also of the Christian people of Scotland, they resolved to abide by the decision to which they had come in 1834, viz.: that the Christian people had a right by law and by warrant of God’s word to be heard in regard to the appointment of a minister over them; and that the acts of ordaining to the ministry and of inducting into a pastoral charge were spiritual acts, in regard to which the church alone had jurisdiction. The supreme civil court of Scotland had interposed its authority against the ordination and induction of a minister. The assembly, when appealed to for advice, by a large majority authorized the presbytery to proceed with the settlement according to the laws of the church. The presbytery were threatened by the civil court with imprisonment and fine should they dare in the exercise of their spiritual functions to set at defiance the interdict of the civil court. Thus a clear and direct collision occurred between the ecclesiastical and civil courts. The ordination and induction of the presentee were consummated, and immediately a complaint was laid against the presbytery before the civil court. They were summoned to appear before the bar of the court, June 14, 1839, which they did. The judges heard their reply, and took a period of 4 days to consider the case, during which it was understood that 5 of the judges voted for a sentence of imprisonment,

and 6 for the more lenient measure of a rebuke. The rebuke was accordingly pronounced, and the presbytery were dismissed from the bar with the intimation, designed to reach the furthest ear of the church, that a sentence of imprisonment would certainly be pronounced against any presbytery that should afterward be found chargeable with a similar offence. Other cases involving the same principles rapidly arose, and elements of a still more deplorable character were brought into the arena of strife, all of them evincing the purpose of the civil court to reduce the national church to a mere creature of the state. For example, the civil court required a presbytery to take a clergyman on trial, and admit him to the office of the ministry in a particular charge, and to intrude him also on the congregation contrary to the will of the people. The civil court interdicted the establishment of additional ministers to meet the wants of an increasing population. It interdicted the preaching of the gospel and all ministration of ordinances throughout a whole district by any minister of the church under authority of the church courts. It interdicted the execution of the sentence of a church judicatory prohibiting a minister from preaching or administering ordinances within a particular parish, pending the discussion of a cause in the church courts as to the validity of his settlement therein. It interdicted the general assembly and lower judicatories of the church from inflicting church censures—in one case where the minister was accused of theft and pleaded guilty of the charge; in another where a minister was accused and found guilty of fraud and swindling; and in another where a licentiate was accused of drunkenness, obscenity, and profane swearing. It suspended church censures when pronounced by the church courts in the exercise of discipline, and took upon itself to restore the suspended ministers to the power of preaching and the administration of ordinances. It assumed to judge of the right of individuals elected members of the general assembly to sit therein, and interdicted them from taking their seats. By these things the creed of the church as well as her liberties was interfered with, her efforts to promote purity of morals at home and to advance the cause of truth abroad were frustrated, and as a last resource she was compelled to appeal to the parliament of Great Britain. Her "claim of rights," carefully prepared, was presented to the house of commons, March 7, 1843, by the Hon. Fox Maule (now Lord Panmure, and a ruling elder and a member of the general assembly of the Free church); but it was refused by a majority of 211 against 76. It is worthy of notice, however, that of 37 Scottish members present at the division 25 voted for Mr. Maule's motion. The question now was: Will the church retire from her declared principles, or will she, to preserve her liberties, relinquish her connection with the state? The nature of the case admitted of no compromise. If true to herself, the church must resign the position she

had occupied since the times of reformation as the national church of Scotland. Without hesitation the decision was made, and 475 ministers gave unto Cæsar the things that were Cæsar's, that they might give unto God the things that are God's. Very few of those who had acted openly with the evangelical party continued in the established church; but while 475 ministers left the establishment, many of the congregations also left it whose ministers remained in; and hence, as well as from the continued accession of numbers in every district of the country, the number of churches now exceeds 800. Retaining all its old and honored standards without the relinquishment of a single principle, the Free church has brought them out into action instinct with new life. The missionaries belonging to the establishment in 1843 to a man threw in their lot with the Free Protestant church; and yet, with churches and parsonages to build for her ministers at home and schools to erect for her children, her college to equip for the training of ministers, and her funds to establish for aged and infirm ministers and ministers' widows and orphans, the number of her missionaries has been largely increased, and there are now over 800 in foreign countries employed directly or indirectly under her jurisdiction and supervision. Her ministers are paid out of a common fund, to which every member of the church is expected to contribute according to his ability, and the dividend accruing from this fund every congregation is at liberty to supplement at its pleasure. To the general statement that since the period of its organization in 1843 down to May 1, 1859, no less a sum than £6,000,000 has passed through the hands of her treasurer to be applied to her various schemes, we add the following abstract, presented to the general assembly in 1859, showing the whole sums raised for the various objects of the Free church of Scotland, for the year from March 31, 1858, to March 31, 1859:

	£	s.	d.
1. Sustentation fund.....	110,485	7	6
2. Building fund.....	41,179	2	0½
3. Congregational fund.....	94,481	19	6
4. Missions and education.....	55,896	11	0
5. Miscellaneous.....	41,834	12	10

Total.....342,877 12 10½

The material work accomplished by the Free church may be thus summed up: 800 churches erected, a few of them in the cities magnificent structures, along with 600 parsonage houses; 900 school houses; 2 normal schools in the cities of Edinburgh and Glasgow, attended by an average of 1,500 pupils, with a staff of 200 teachers under training; 8 colleges, the principal one in Edinburgh, presided over by the Rev. Dr. William Cunningham, the others in Glasgow and Aberdeen; the assembly hall in Edinburgh, erected during 1858-'9 at a cost of £6,000; and mission premises in the chief cities in the 8 presidencies of India. The average salary of the ministers is £180, with parsonage house and garden, and in some parishes small glebes.

FREE CONGREGATIONS (Germ. *Freie Gemeinden*), religious bodies formed since 1846 of seceders from the Protestant state churches of Germany. They were preceded by a free association of the liberal or rationalistic party in the church of Prussia, designed to oppose the faith of the symbolical books and vindicate the right of every member of the church to form his own creed from the Bible. The members of this association, which was organized in 1841, called themselves Protestant Friends, while by their opponents they were called Friends of Light. They held several general assemblies at Köthen, the first in the autumn of 1842, the most important in 1845. The leading men in this movement were Uhlich, Dr. Schwarz, and Wislicenus in the Prussian province of Saxony, Rupp at Königsberg, and Archdeacon Fisher at Leipsic. The first formal separation from the state church took place at Königsberg, Jan. 16, 1846, after the dismissal of Rupp from his office by the church government. In the same year another Free congregation was formed at Halle, under Wislicenus, and in 1847 another under Uhlich at Magdeburg. Soon their number rose to more than 100. The first conference assembled at Nordhausen, Sept. 6-8, 1847, at which a strictly congregational form of church government was adopted. No congregation was ever to be bound by the decrees of general conferences, but only to receive from them proposals and advice. The constitution of the individual congregations showed many differences, but was in every case based on thoroughly democratic principles, usually conferring on every member over 20 years old, male or female, the right of voting and of holding office. The apostle's creed was unanimously rejected, and by common consent the words: "I believe in God and his everlasting kingdom, as it has been introduced into the world by Jesus Christ," were adopted instead. Several congregations, as that of Marburg, under the leadership of Prof. Bayr-hoffer, also rejected the belief in a personal God apart from the human spirit and the world, but the great majority adhered to that belief. The Prussian edict of toleration of March 30, 1847, secured to them provisional toleration, and permitted public officers to join them, except in the case of school teachers and others whose office presupposed their membership in one of the state churches. The year 1848, and especially the publication of the *Grundrechte* (fundamental laws) of the German people, were very favorable to their cause, with which the democratic party showed a great sympathy. Both suffered from the success of the counter revolution in 1849 and 1850. Since 1850 decrees, more or less restricting the liberty of their worship, have been issued in nearly all the German states. In Bavaria, baptism performed by their clergymen or members was declared invalid. Hesse-Darmstadt silenced their itinerant preachers. Prussia, though the edict of toleration of 1847 was not formally abrogated, closed most of their meetings, alleging as a reason that they

were wholly or partly meetings for political purposes. The supreme ecclesiastical council of Prussia excluded them from participation in the sacramental acts of the evangelical church, and prohibited them from acting as sponsors at baptism, and from speaking at funerals in an evangelical cemetery. A conference at Halberstadt, which was held Oct. 3 and 4, 1849, and at which 12 congregations were represented by 9 of their preachers, discussed the propriety of a fusion with the German Catholics, and declared that the most efficient means of the world's redemption and universal happiness was not forms, ordinances, priesthood, and church, but the free spirit, free brotherhood, and free associations. The conference of Leipsic and Köthen, which was commenced in the former place Aug. 22, 1850, and was transferred to Köthen in consequence of difficulties with the police, determined to recommend to the Free congregations and the German Catholic congregations to fuse, which was almost unanimously agreed to by both denominations. In Prussia there were in 1855 about 16,000 souls belonging to the Free or German Catholic congregations, the number of congregations amounting to 50, with 26 preachers. Since Nov. 1858, a steady and considerable increase of members and congregations has taken place, owing to the greater toleration conceded to them by the new Prussian ministry, which abolished the prohibition of their meetings, and exempted their children from compulsory attendance at the religious instructions of the ministers of the evangelical state church. In the province of East Prussia, a provincial congress met, April 25, 1859, at Königsberg, and elected a provincial board of directors. A federal constitution for the united Free and German Catholic congregations of all Germany was adopted at a general council of the dissenters at Gotha, June 16 and 17, 1859.

FREE MASONRY, the system of secrets, ceremonies, and principles peculiar to the order or society of free masons. The origin of free masonry is very obscure. Some writers on the subject, as for instance William Preston, author of a treatise on masonry published in 1792, regard it as coeval with the creation of man. Others, more moderate, find its origin in the religious mysteries of the ancient world, and particularly in a supposed branch of those religious associations formed by the architects of Tyre, who, under the name of the "Dionysiac Fraternity," constituted an association of builders exclusively engaged in the construction of temples and theatres in Asia Minor, and who were distinguished by the use of secret signs and other modes of mutual recognition. The masonic writers place the arrival of the Dionysiacs in Asia Minor at the time of the Ionic migration, when the inhabitants of Attica were compelled to abandon their own country in search of a more fruitful soil and a more extensive territory, and suppose that the Greeks, already advanced beyond their contemporaries

in a knowledge of the arts and sciences, carried with them into their new territories the mysteries of Athene and Dionysius in all the purity which distinguished these religious associations before they were corrupted by the subsequent licentiousness of the mother country. The date of the Ionic migration is fixed at 1044 B. C., about half a century before the commencement of the building of the temple, thus giving ample time for the establishment of the Dionysiac fraternity in the city of Tyre at the time when Hiram was called upon to assist Solomon in the execution of his design, which he did by sending him a band of Dionysiac workmen, at the head of whom was a widow's son, to whom is attributed the organization of free masonry. The rituals which are used in the lodges of the order are based on the supposition of the truth of this theory. Solomon's temple figures prominently among the symbols of free masonry, and masonic writers abound in allusions to it, one of the latest of their text books calling it "that stupendous edifice which has been and always will remain the admiration of the world." Among many well informed masons, however, no credit is given to these pretensions to so remote an origin, based as they are on exaggerated ideas of the magnitude and importance of Solomon's temple in the architectural history of the world. The celebrity of Solomon's temple and the popular notions of its splendor and vastness may be traced to the period of the middle ages, in which secret associations of practical masons or builders were formed, to which the lodges of the present day probably owe their origin. It was but natural that those who formed the rituals of those imaginative times should resort to the sacred writings and to the most famous structure recorded in them for the mystical and symbolical source of their organization. The great Gothic cathedrals and other buildings of the middle ages, several of which were each many times larger than Solomon's temple, were erected by companies of builders who encamped around them, and who had a peculiar social organization which enabled them to preserve for their own use and benefit many professional secrets, and furnished facilities for mutual defence and assistance of great value in the midst of rude and turbulent communities. Dr. Henry, in his "History of Great Britain," cites the following account of their origin: "The Italians, with some Greek refugees, and with them French, Germans, and Flemings, joined into a fraternity of architects, procuring papal bulls for their encouragement and their particular privileges; they styled themselves free masons, and ranged from one nation to another as they found churches to be built; their government was regular, and where they fixed near the building in hand they made a camp of huts. A surveyor governed in chief; every tenth man was called a warden, and overlooked each nine." In this manner and by these "free masons" were built the magnificent convent of Ba-

talha in Portugal about the beginning of the 15th century, the cathedral of Strasbourg from 1015 to 1439, of Cologne, founded in 1248 and continued for several centuries, beside many famous structures in England and Italy. Rebold, who has written learnedly on this subject, says that the masonic corporations were diffused throughout Europe in the beginning of the 7th century under the same general regulations, but recognized by different names in different countries. Thus in Italy they were known as colleges of architects; in France as free corporations, and sometimes as "pontifical brothers," from the fact that they monopolized the construction of bridges; and in England and Scotland as free masons, a name assumed in consequence of the exclusive privileges which they enjoyed as a corporation of builders. It appears that from an early period many persons who were non-operative masons or architects were admitted into the community, and that men of eminence, and more particularly ecclesiastics, were numbered among its members. These latter, says Mr. Hope, "were especially anxious themselves to direct the improvement and erection of their churches and monasteries, and to manage the expenses of their buildings, and became members of an establishment which had so high and sacred a destination, was so entirely exempt from all local and civil jurisdiction, acknowledged the pope alone as its direct chief, and only worked under his immediate authority, as his own immediate ministers; and thence we read of so many ecclesiastics of the highest rank—abbots, prelates, bishops—conferring additional weight and respectability on the order of free masonry, by becoming its members—themselves giving the designs and superintending the construction of their churches, and employing the manual labor of their own monks in the classification of them." Thus in England in the 10th century the free masons are said to have received the special protection of King Athelstane, who granted them a charter to hold their annual assemblies and to frame the necessary laws for their own government as a corporate body. They met at the city of York in the year 926, and the regulations they there adopted, under the title of the "Gothic Constitutions," after being long lost, were discovered by Mr. Halliwell, the distinguished antiquary, a few years since in the old royal library of the British museum, and published by him in their original form. They penetrated into Scotland about the beginning of the 12th century, and among other edifices, erected the abbey of Kilwinning, which afterward became the cradle of Scotch masonry. In the 13th century we find the same body of architects at work in Germany, and there is a record of a convention held by them in 1275 in the city of Strasbourg, where they were engaged in the construction of its cathedral; at which time, in imitation of their English brethren, they assumed the name of free masons, and took the obligations of fidelity and obedience to the laws and regulations

of the society. In the course of time the operative character of the association began to become less prominent, and the speculative to assume a preëminence which eventually resulted in a total disseverance of the two. At what precise period we are to date the commencement of this predominance of the speculative over the operative element, it is impossible to say. The change was undoubtedly gradual, and is in all probability to be attributed to the increased number of learned and scientific men who were admitted into the ranks of the fraternity. The "Charter of Cologne," a curious masonic document purporting to date from the year 1585, speaks of "learned and enlightened men" as constituting a part of the society long before the 16th century, but by many masons the authenticity of this instrument is not admitted. The diary of the celebrated English antiquary, Elias Ashmole, describes his initiation into the order in 1646, when there is no doubt that the operative character was fast giving way to the speculative. Preston tells us that about 30 years before, when the earl of Pembroke assumed the grand mastership of the masons of England, "many eminent, wealthy, and learned men were admitted." In 1663 an assembly of the masons was held in the city of London, and the earl of St. Albans was elected grand master. At that assembly certain regulations were adopted, among which the qualifications prescribed as necessary for candidates to possess clearly point to the speculative character of the institution as the most important consideration. And finally, at the beginning of the 18th century, and during the reign of Queen Anne, who died in 1714, a regulation was adopted, as we are informed by Preston, which provided "that the privileges of masonry should no longer be restricted to operative masons, but extend to men of various professions, provided they were regularly approved and initiated into the order." In 1717 the lodges then in active existence in the city of London united together and formed the grand lodge of England, upon the basis here indicated. This, it must be observed, was not the establishment of a new and hitherto unheard of society, as some of the opponents of the order have maintained, but the reorganization of an old one in a new and more popular form. Long previous to this period the general assemblies of the masons had been annually held in England as in other countries; but Sir Christopher Wren, the grand master in the reign of Queen Anne, having become old and infirm, had neglected the interests of the institution, and the society had fallen into decay, so that in 1715 there were but 4 lodges in active work in the whole south of England, although it is admitted that the masons in the north were in a more prosperous condition. On the death of Sir Christopher Wren no successor was appointed, and the general assemblies were no longer convened. It was during this unpromising condition of affairs that the 4 lodges already mentioned met at the celebrat-

ed Apple Tree tavern in Covent Garden, London, and reorganized the grand lodge of England, renewed the annual meetings, and collated and compiled the old rules and regulations which had long been in existence, but for some time past neglected, with the addition of a few new ones now become necessary since the wholly speculative element of the society had so completely taken the place of its former both speculative and operative organization. Free masonry, thus modified in its character, began rapidly to spread throughout the world as a speculative system of symbolism. In 1725 it was introduced in its new form into France, in 1729 into Ireland, in 1731 into Holland, Russia, and Spain, in 1733 into Italy, and in 1736 into Scotland, at which time, Sinclair of Roslin having resigned the hereditary grand mastership of the masons of that kingdom, which had long been vested in his family by royal grant, the grand lodge of Scotland was organized on the same principle that had been adopted 19 years before by the masons of England. An attempt was made in 1730 to introduce the organization into America by the appointment of a provincial grand master of New Jersey, but we have no record of the incumbent having established any lodge under the authority of his deputation. In 1733, however, a lodge was opened at Boston, which was speedily followed by the organization of other lodges in the different colonies. After the assumption of independence by the United States, the lodges of America, all of which derived their warrants of authority originally from the grand lodge of England or that of Scotland, availed themselves of the privileges possessed by such bodies in all independent countries, and organized grand lodges in their respective states. In no country in the world has free masonry flourished with more vigor than in the United States; and notwithstanding a severe but ineffectual opposition to it, which commenced in 1829 by the organization of an anti-masonic party (see ANTI-MASONRY), it has increased in numerical extent with such steady progress that at the present day it numbers, in all parts of the confederation, nearly 5,000 lodges and between 150,000 and 200,000 members. In spite of many attempts to suppress it by both church and state in various countries of Europe, it is firmly planted in every part of that continent, and many lodges beside have been established in Africa and Asia. Its organization in Europe has been frequently used for political purposes, and especially as a cloak to conspiracies against the governments. The employment of it, however, for such objects, is a violation of its constitution, which prohibits political, partisan, or sectarian discussions in the lodges. The most remarkable of these perversions of the institution was in Mexico in 1825, and in the years immediately following. Free masonry had shortly before 1825 been introduced from Scotland, and had been eagerly embraced by a large body of influential politicians who were

in favor of the independence of the country, but opposed to democracy. They formed a powerful party, which from the Scotch origin of their lodges called themselves the *Escoceses*. An opposition party of democratic principles was formed, with which the American minister, Mr. Poinsett, coöperated, and which called itself the *Yorkinos*, because it constituted a masonic society which had received its charter from the masons of New York through the agency of Mr. Poinsett. The conflict of these parties led for a time to civil war.—The primary organization of the masonic fraternity is into lodges, which must each be composed of at least 7 master masons in good standing. The first and lowest degree of masonry is that of entered apprentice, the second of fellow craft, the third of master mason. The officers of a lodge in the United States are 9 in number: worshipful master, senior warden, junior warden, treasurer, secretary, senior deacon, junior deacon, tiler, and chaplain. There are also two stewards. Of these officers the master, the wardens, and the tiler are essential to any lodge organization. The tiler keeps the door and guards against intrusion. The officers are elected annually by ballot. In each state of the Union there is a grand lodge composed of the representatives of the subordinate lodges, over which it exercises a certain jurisdiction. Its officers are styled grand and deputy grand masters, grand wardens, grand treasurer, grand secretary, grand chaplain, grand deacons, grand marshal, grand pursuivant, grand sword bearer, grand stewards, and grand tiler. There is also a still higher degree of masonry, the members of which are termed royal arch masons, and form royal arch lodges. And beyond this there is still a long series of degrees bearing various titles.—See the "Masonic Text Book," by John Dove (12mo., Richmond, 1854); "A Text Book of Masonic Jurisprudence," by Albert G. Mackey, M.D. (12mo., New York, 1859); the "History of Free Masonry," by J. W. S. Mitchell, M.D. (2d. ed., 2 vols. 8vo., Marietta, Ga., 1859).

FREE THINKERS, a name applied to the opponents of Christianity in England, in the 17th and 18th centuries. Lord Herbert of Cherbury, Hobbes, Toland, Tindal, Woolston, Chubb, and Anthony Collins were among the most noted of their writers. Bolingbroke, Shaftesbury, and David Hume were counted among their ablest representatives. They were never an organized philosophical or religious sect. The French writers who labored for the overthrow of Christianity, partly from the standpoint of deism, partly from that of materialism, and who called themselves *esprits forts*, were in England called free thinkers. Voltaire, D'Alembert, Diderot, and Helvetius are the most celebrated among them. In Germany the rationalists have often been called free thinkers by their opponents.

FREE TOWN, a town of W. Africa, capital of the British colony of Sierra Leone, on the left bank of Sierra Leone river, about 5 m. from

the sea; lat. 8° 29' N., long. 13° 9' W.; pop. estimated at 16,000. It is situated on an inclined plane, 50 feet above sea level at high-water mark. The streets are wide, well laid out, and ornamented with rows of orange, lime, banana, or cocoanut trees. Several of the houses are commodious and substantial stone buildings. The principal public edifices are St. George's church, the church missionary and Wesleyan missionary institutions, the grammar school, market house, custom house, gaol, and lunatic asylum. The governor's residence, barracks, and government offices are situated on some hills above the town. The navigable entrance of the Sierra Leone river is narrow, there being a large shoal called the Bullom shoal in its centre.

FREEDMEN (*liberti*, *libertini*), the name of manumitted slaves in Roman antiquity. They were called *liberti* with reference to their masters, and *libertini* with reference to their new rank or condition. According to various circumstances, defined by law, the freedmen became Roman citizens, Junian Latins (from the Junian law which gave them freedom), or *dediticii*. The last were neither free nor slaves. The Junian Latins suffered great disabilities as to property, but could in various ways rise to citizenship. But even the freedmen of the first class were not genuine (*ingenui*) citizens, and remained under certain obligations to their masters. The freedmen wore a cap as a sign of freedom, and took the names of their previous owners. The sons of freedmen became genuine citizens. In later times the number of manumitted slaves increased to an alarming extent, and some of the emperors passed laws restricting manumission. (See **SLAVERY**.)

FREEHOLD. See **ESTATE**.

FREEMAN, JAMES, D.D., an American Unitarian minister, born in Charlestown, Mass., April 22, 1759, died in Newton, Mass., Nov. 14, 1835. He belonged to the class which entered the Boston Latin school in 1766, under Master John Lovell. After graduating at Harvard college in 1777, he went to Quebec to visit his father, returned to Boston in 1782, and became reader at the King's chapel in Boston, an Episcopal church. Becoming Unitarian in his views, he induced the society to alter their prayer book in 1785, and in 1787 he was ordained by his own wardens and people by a peculiar service. He continued rector of King's chapel for 55 years, till his death. He was one of the founders of the Massachusetts historical society, was distinguished for his general culture and social virtues, and his published sermons have been regarded as models of English style. They are extensively quoted by Southey in his "Doctor" and his "Commonplace Books." But Dr. Freeman's chief distinction is that he was the first minister in the United States who openly assumed the name of Unitarian, and that through his means the first Episcopal church in New England became the first Unitarian church in America.

FREEPORT, a township of Cumberland co., Me., on Casco bay, at the mouth of Harrasacket river, 17 m. N. E. from Portland; pop. in 1850, 2,629. It was formerly called Harrasacket settlement, and received its present name on its incorporation in 1789. It contains 4 villages, one of which is called Freeport, 5 churches (1 Baptist, 1 Congregational, 1 Freewill Baptist, 1 Universalist, and 1 Union house), 2 post offices, 84 public schools, 8 saw and shingle mills, and 9 ship yards. In April, 1854, 10 vessels were in course of construction here. Ship-building, navigation, and agriculture are the principal branches of industry. The Kennebec and Portland railroad passes through the town.

FREESTONE, a name often given to the sandstone used for building purposes. (See **SANDSTONE**.) The name is probably due to its working freely under the tools.

FREEWILL BAPTISTS, or **FREE BAPTISTS**, a denomination of evangelical Christians in the northern United States and Canada. Its founder was Benjamin Randall (1749-1808), who was one of Whitefield's hearers at Portsmouth, N. H., Sept. 28, 1770; and the impressions made by the sermon, and more especially by the tidings of the preacher's death 2 days later, resulted in his conversion. At first a Congregationalist, he connected himself in 1776 with the Baptist church in South Berwick, Me., and soon after entered the ministry, but was called to account for preaching a doctrine different from that of his brethren. In 1780 he organized in New Durham, N. H., a church holding views similar to his own, which was the nucleus of the new denomination. The distinctive tenets of Randall and his coadjutors were the doctrines of free salvation and open communion, as opposed to those of election and close communion held by the Calvinistic Baptists. They also insisted upon the freedom of the will, as essential to man as a subject of moral government, and therefore as inviolable by the divine sovereignty, and not to be contravened by any explanation of the latter doctrine. Their opponents styled them "General Provisioners," "Freewill Baptists," and "Free Baptists," by the second of which names they have usually been designated, though the last is now preferred in some of their own publications. In government they are Congregationalists. The first church held a conference once a month, which was called a monthly meeting. When other churches were formed in neighboring localities, a general meeting by delegation from the churches was held once in 3 months, which was termed a quarterly meeting. As Randall and his associates travelled and extended the denomination through New Hampshire and the adjacent states, numerous quarterly meetings were organized, and yearly meetings were instituted, consisting of delegates from associated quarterly meetings. At length the organization was completed by the institution in 1827 of the general conference, the most important assembly of the denomination, which is composed of

delegates from all the yearly meetings, and convenes once in 3 years. To all these bodies the laity and clergy are alike eligible, and they all combine the services of public worship with the discussion and decision of questions of business and benevolence. In 1827 a correspondence was opened between the Freewill Baptists of New England and a few churches in North Carolina of similar sentiments, the result of which was that the latter in 1828 published their records as the "Minutes of the Freewill Baptist Annual Conference of North Carolina." They soon numbered 45 churches and about 8,000 members, and though never formally united with the denomination in the North, maintained a constant correspondence with it, and subscribed for nearly 500 copies of its organ, the "Morning Star" newspaper. In 1839 Dr. William M. Housley of Kentucky, once a close communion Baptist clergyman, who for doctrinal reasons had taken a letter of dismission and commendation from his former connection, attended the general conference of the Freewill Baptists at Conneaut, Ohio, and there applied for ordination to the ministry. He had already been admitted to the church in that place, and appeared before the conference in order to obtain denominational endorsement as a minister. The prospect was presented of a large accession to the sect from Kentucky, and a council reported that Dr. Housley had approved himself qualified for the sacred office, excepting only that he was a slaveholder. But for this reason alone the council declined to "ordain him as a minister or fellowship him as a Christian," and the general conference after a spirited discussion finally voted without opposition "that the decision of the council is highly satisfactory." The connection of the denomination with slaveholding churches in North and South Carolina was brought before the same conference, and was entirely dissolved. From that time the Freewill Baptists have maintained the position then taken upon the question of slavery. A few unrecognized churches in North Carolina, however, still continue to bear their name. There are several benevolent societies of denominational interest, supported and encouraged by all the churches. The principal of these are the foreign and home mission societies, the education society, and the anti-slavery society, and by all of them an aggregate sum averaging about \$10,000 is annually raised. They celebrate anniversary meetings together in the autumn, which are numerous attended from the interest taken in the reports and discussions on prominent reformatory and benevolent movements. The foreign mission society has several stations in Orissa, India. Early noted only for fervent piety, the Freewill Baptists have recently given special attention to the interests of education, and since 1847 have raised nearly \$800,000 for educational purposes. They have a flourishing college at Hillsdale, Mich., to which persons of both sexes and all colors are admitted, a theological school at New Hampton, N. H., and 8

seminaries of high grade and repute at the latter place, at Whitestown, N. Y., and at Lewiston, Me., together with other schools of less note. The Maine state seminary at Lewiston received a liberal endowment from the state on its establishment in 1857. The Freewill Baptist printing establishment is at Dover, N. H., where are published the "Morning Star," which for 33 years has been their weekly organ, the "Myrtle," a Sabbath-school paper, and the "Quarterly," each number of which comprises at least 120 pages. Biographies have been published of Randall, Colby, Marks, Phinney, Martin Cheney, and other clergymen, which throw light upon the history and spirit of the denomination. A general history of the Freewill Baptists is now in preparation under the direction of the general conference. In 1800 the whole number of communicants was less than 3,000. In 1829, when complete returns were for the first time obtained, there were 8 yearly meetings, 22 quarterly meetings, 311 churches, 263 ministers, and 12,860 communicants. There are now (1859) 29 yearly meetings, 183 quarterly meetings, 1,306 churches, 1,138 ministers, and 56,026 communicants, an increase of fourfold within a generation, and of 5,714 communicants within the last year. They are found in all the free states, but are most numerous in New England. There is also in New Brunswick and Nova Scotia a separate and rapidly increasing conference of Free Baptists, of about 4,000 members, not included in the above computation. They have a weekly organ, the "Religious Intelligencer," published at St. John, N. B. The Freewill Baptists correspond by letters and delegations with the General Baptists of England, with whom they agree in doctrine.

FREEZING MIXTURES. From ancient times various methods have been practised of producing low degrees of heat for the preparation in hot weather of grateful cooling mixtures. Some of these, the object of which is more particularly the production of ice, are described in the article upon that subject. Methods of producing intense cold are also noticed in **EVAPORATION**. Freezing mixtures, properly so called, are solutions of a solid in a fluid, cold being produced by the tendency of the former in passing to the liquid state to render latent a portion of the sensible heat of the mixture. What is called the heat of fluidity is derived chiefly from that which had previously existed within the solid itself in a sensible state. The property of nitre or saltpetre, a common natural production of the East, to render water cold by solution, was known, it is believed, to the ancient Hindoos, though in the "Institutes of Akbar" the discovery is attributed to that prince, who ruled from 1556 to 1605. The directions there given are to throw one part of nitre into a vessel containing 2 parts of water, and then stir in this mixture rapidly for a quarter of an hour a pewter or silver vessel tightly stopped and containing the liquid to be cooled. As early as the year 1556 it was a common practice with wealthy

Italian families to cool liquors in a similar manner, and they are supposed to have derived the method from India or Persia. They added gradually 20 to 25 parts of nitre to 100 parts of cold water, and whirled rapidly round in it a globular, long-necked bottle containing the wine or water to be cooled. The salt was afterward recovered by crystallization, and was then ready for the same use again. Boyle, and afterward Fahrenheit, extended this practice to other saline solutions, and Mr. Walker of Oxford and Lowitz of St. Petersburg, in the latter part of the last century and early part of the present, were particularly successful in introducing new salts and developing the principle of their action. The former published essays in the "Philosophical Transactions" in 1795, and again in 1801, with tables of the most important mixtures. Those salts were found to produce the greatest effect which dissolved the most rapidly, and the processes were much more effectual when the materials were previously cooled by immersion in other frigorific mixtures, or when freshly fallen dry snow, or, in lieu of this, finely powdered ice, was added. Mr. Walker thus succeeded in obtaining a degree of cold equal to -100° F. With snow and common salt Fahrenheit reduced the temperature to -32° , and originally proposed this as the method for fixing the zero point of his scale. In this process the salt, by its affinity for water, causes the snow to melt, and the water thus produced dissolves the salt, and both becoming liquid, a large quantity of the sensible heat is rendered latent. The tables of Mr. Walker, still referred to in chemical works, are as follows:

FRIGORIFIC MIXTURES WITH SNOW.

The effect of the following mixtures is increased by the salts being finely powdered, so that the

solution may be most rapidly accomplished. The diluted nitrous acid named is composed of fuming nitrous acid 2 parts by weight and 1 of water, the mixture being allowed to cool before using; the diluted sulphuric acid, of equal weights of strong acid and water, and allowed to cool.

Mixtures.	Parts by w't.	Temp. falls from 50° F.	Cold produced.
Chloride of ammonium...	5	to +10°	40°
Nitrate of potassa.....	5		
Water	16		
Chloride of ammonium...	5	to + 4°	46°
Nitrate of potassa.....	5		
Sulphate of soda	8		
Water	16	to + 4°	46°
Nitrate of ammonia.....	1		
Water	1		
Nitrate of ammonia.....	1	to - 7°	57°
Carbonate of soda.....	1		
Water	1		
Sulphate of soda.....	8	to - 8°	58°
Diluted nitrous acid.....	2		
Sulphate of soda	6		
Chloride of ammonium...	4	to -10°	60°
Nitrate of potassa.....	2		
Diluted nitrous acid.....	4		
Sulphate of soda.....	6	to -14°	64°
Nitrate of ammonia.....	5		
Diluted nitrous acid.....	4		
Phosphate of soda.....	9	to -12°	62°
Diluted nitrous acid	4		
Phosphate of soda.....	9	to -21°	71°
Nitrate of ammonia.....	6		
Diluted nitrous acid.....	4		
Sulphate of soda.....	8	to 0°	50°
Hydrochloric acid.....	5		
Sulphate of soda	5		
Diluted sulphuric acid....	4	to + 8°	47°

The following is recently recommended as a convenient and efficient preparation: One part by weight of crude powdered sal ammoniac is to be intimately mixed with 2 parts of pulverized saltpetre, and to this mixture, when required for use, is to be added an equal bulk of carbonate of soda.

FREIBERG, or FREYBERG, a walled town of Germany, the mining capital of Saxony, on the Münzbach, 25 m. S. W. of Dresden; pop. about 12,000. It is situated on the N. declivity of the Erzgebirge. The streets are regular, well built, lighted, and paved. There are handsome monuments to Prince Maurice of Saxony, and to Werner, the great mineralogist, and a fine Gothic cathedral, built in the 15th century. The mining academy, founded in 1765, has a museum of model mining machines, and a library of 18,000 volumes. The staple manufactures consist of gold and silver lace, brassware, white lead, gunpowder, shot, iron and copper ware, linens, woollens, ribbons, tape, leather, and beer. Freiberg is an ancient city, and was long the residence of the Saxon princes. Werner, Humboldt, Mohs, and Jameson were students at its academy. The mining district of Freiberg is divided into 5 circles, and contains 150 mines, yielding silver, lead, copper, cobalt, &c. The total mineral product in 1854 amounted to about \$800,000, and in 1850 to \$1,000,000.

FREIBURG, or FREYBURG, a city of Ger-

many, in the grand duchy of Baden, capital of the circle of the Upper Rhine, on the Dreisam, 83 m. by railroad S. W. of Karlsruhe, and 40 m. N. E. of Basel; pop. about 16,000. It is elevated 940 feet above the level of the sea, and has walls with 8 gates. The streets are in general open and well built, particularly the Kaiserstrasse, which is remarkable for its width and the excellence of its houses. The principal public edifices are the archiepiscopal and ducal palaces; the cathedral, one of the most beautiful and perfect specimens of Gothic architecture in Germany; the old and new universities, the former of which was founded in 1454, has a library of 100,000 volumes, and is famous as a school of Catholic theology; the government offices, courts of justice, town hall, museum, theatre, gymnasium, orphan asylum, hospitals, and seminaries. The manufactures consist of leather, paper, sugar, starch, tobacco, soap, bells, musical instruments, gunpowder, and chemicals. There are also several bleach fields and dye works. The Basel and Mannheim railway passes through Freiburg.

FREIGHT, in law, and in common practice, either the cargo which a ship carries, or the price paid to the charterer of a ship for the carriage of goods. In the earliest case in which the word occurs (Bright *vs.* Cowper, 1 Brownlow and Goldsborough, 21), it is used to mean the cargo carried. But it means in the law, almost exclusively, the money earned by the carriage; and it is principally used in this sense by merchants. (For the law of freight, see SHIPPING.)

FREILIGRATH, FERDINAND, a German poet, born in Detmold, June 17, 1810. Early in life he engaged in mercantile business at Soest in Westphalia, and was afterward a clerk at Amsterdam and Barmen. A volume of poems which he published in 1838 made him one of the favorite poets of Germany. The king of Prussia conferred on him in 1842 an annual pension, which he resigned in Jan. 1844, having adopted democratic opinions. Being persecuted for political reasons, he went in 1845 to Switzerland. In 1846 he went to London, where he was employed until 1848 by the firm of Huth and co. After the outbreak of the revolution in Feb. 1848, he returned to Germany, and for 3 years took an active part in the efforts of the democratic party. In Aug. 1848, he was arrested on account of his poem *Die Todten an die Lebenden* ("The Dead to the Living"), and tried, but acquitted. In May, 1851, a new writ of arrest was issued against him on account of the second part of his "Political and Social Poems" and his membership in the democratic central committee of Cologne. But he had already left Germany for London, where of late he has managed the London office of the Swiss bank. His *Gedichte* (Stuttgart, 1838; 18th ed., 1857), with which he began his poetical career, is still the most popular of his works. His political poems *Ca ira* (Herisan, 1846), *Die Revolution* (Leipsic, 1848), *Februar-Klage* (Berlin, 1848), and *Neuere politische und sociale*

Gedichte (Cologne, 1849; 2d part, Brunswick, 1850), are also valued by those who accord with their principles. Some of these poems, as *Robert Blum*, *Die Revolution*, *Die Todten an die Lebenden*, are classed among the best political poetry of Germany. A tasteful selection of German poetry was published by him in 1854, under the title *Dichtung und Dichter* (Dessau, 1854), and another of English poetry at Stuttgart in 1853, under the title "The Rose, Thistle, and Shamrock." The first complete edition of all his works appeared in New York (*Sämmtliche Werke*, 6 vols., 1858-'9). Some of his poems have been translated into English by Longfellow, of whose "Hiawatha" he in turn published a German version.

FRELINGHUYSEN, FREDERIC, an American lawyer, born in New Jersey, April 13, 1753, died April 13, 1804. He was graduated at Princeton college in 1770, and in 1775 was sent as a delegate from New Jersey to the continental congress. In 1776 he joined the revolutionary forces, and served with distinction as captain of a volunteer corps of artillery at the battles of Monmouth and Trenton. In the battle of Trenton, it is said, he shot Col. Rall, the commander of the Hessians. He was promoted to be colonel, and served during the remainder of the war. After the peace he filled various state and county offices, and in 1790, when the New Jersey and Pennsylvania troops were called to take part in the expedition against the western Indians, he was appointed major-general by President Washington. In 1793 he was elected a senator of the United States, which post he occupied for 3 years, when, in consequence of domestic bereavement, he resigned, and devoted the remainder of his life to his family and private affairs.—THEODORE, an American statesman, son of the preceding, born at Millstone, Somerset co., N. J., March 28, 1787. He was graduated at Princeton college in 1804, studied law with Richard Stockton, and in 1808 was admitted to the bar, where he soon became distinguished as an eloquent advocate. During the war with Great Britain in 1812-'14, he raised and commanded a company of volunteers. In 1817 he was elected attorney-general of New Jersey by a legislature opposed to him in politics, and held the post till 1826, when he was chosen U. S. senator. In the same year the legislature had elected him a judge of the supreme court, which office he declined to accept. In the senate Mr. Frelinghuysen acted with the whig party. He exerted himself in behalf of the Indians; advocated the bill to suppress the carrying of mails on the sabbath; supported Mr. Clay's resolution for a national fast in the season of the cholera; spoke in favor of the extension of the pension system, and acted in unison with Mr. Clay upon the question of the tariff, and the compromise act of 1832. He remained in the senate till 1835, when he was superseded by a democrat. In 1838 he was chosen chancellor of the university of New York, and took up his residence in that city.

In May, 1844, the whig national convention at Baltimore nominated him for vice-president and Henry Clay for president. They received 105 electoral votes, while their successful competitors, James K. Polk and George M. Dallas, received 170 votes. In 1850 Mr. Frelinghuysen resigned the chancellorship of the university of New York to become president of Rutgers college, New Brunswick, N. J., and removed to that city, where he now resides.

FREMONT, JOHN CHARLES, an American explorer, born in Savannah, Ga., Jan. 21, 1813. His father was a Frenchman who had settled in Norfolk, Va., where he supported himself by teaching his native language. His mother, whose maiden name was Anne Beverley Whiting, was the daughter of an opulent and prominent Virginian, connected by marriage with the Washington family. She was left an orphan at an early age, and when 17 years old was persuaded by her relatives to marry Major Pryor, a rich and gouty gentleman 45 years her senior. This union was childless and unhappy, and at the end of 12 years was terminated by a divorce which the friends of both parties combined to procure from the legislature. Major Pryor soon married his housekeeper, and Mrs. Pryor married Mr. Fremont. He died in 1818. The widow with 8 infant children settled in Charleston, S. C. At the age of 15 John Charles entered the junior class of Charleston college. For some time he stood high in college, and made remarkable attainments in mathematics. "But about this time," says Mr. Bigelow, one of his biographers, "he became acquainted with a young West Indian girl, whose raven hair and soft black eyes interfered sadly with his studies." His inattention and frequent absences at length caused his expulsion from the college. After this event he obtained employment as a private teacher of mathematics, and took charge at the same time of an evening school. In 1838 he obtained the position of teacher of mathematics on board of the U. S. sloop of war *Natchez*, which was then in the port of Charleston, from which she sailed on a cruise to the coast of South America. Fremont was absent in her for more than two years, and on his return to Charleston received from the college which had expelled him the degrees of bachelor and master of arts. Shortly afterward he passed successfully a rigorous examination at Baltimore for the post of professor of mathematics in the navy, and was appointed to the frigate *Independence*; but he soon resolved to quit the sea, and engaged himself as a surveyor and railroad engineer on a line between Charleston and Augusta, Ga. Subsequently he assisted in the survey of the railroad line from Charleston to Cincinnati, and particularly in the exploration of the mountain passes between South Carolina and Tennessee. He was engaged in this work till the autumn of 1837, when, in consequence of its suspension, he accompanied Capt. Williams of the U. S. army in a military reconnoissance of the mountainous Cherokee country in Georgia, North Carolina,

and Tennessee. In anticipation of hostilities with the Indians this survey was rapidly made in the depth of winter, and was Fremont's first experience of a campaign amid mountain snows. In 1838-'9 he accompanied M. Nicollet, a Frenchman and a distinguished man of science, in explorations of the country between the Missouri and the British line. These explorations were made under the authority of the government, and while engaged in them in 1838, Fremont received from President Van Buren, under date of July 7, a commission as 2d lieutenant in the corps of topographical engineers. While at Washington in 1840, employed in the preparation of the report of these expeditions, Fremont became acquainted with Miss Jessie Benton, a daughter of Col. Thomas H. Benton, at that time a senator from Missouri. An engagement was formed, but as the lady was only 15 years of age, her parents, notwithstanding their high personal regard for Fremont, objected to the match, and suddenly, probably through the potent influence of Col. Benton, the young officer received from the war department a peremptory order to make an examination of the river Des Moines upon the western frontier. The survey was rapidly executed, and shortly after his return from this duty the lovers were secretly married, Oct. 19, 1841. In the following year Fremont projected a geographical survey of the entire territory of the United States from the Missouri river to the Pacific ocean, the feasibility of an overland communication between the two sides of the continent being a leading idea in his scheme of explorations. He accordingly applied to the war department for employment on this service, and having received, at his own suggestion, instructions to explore the Rocky mountains, and particularly to examine the South pass, he left Washington, May 2, 1842, and on June 10 began his expedition from a point near the mouth of the Kansas, a few miles beyond the Missouri border, whence he proceeded up the Platte river and its tributaries, through bands of hostile Indians, to the South pass, which was carefully examined. He next explored the Wind River mountains, the loftiest peak of which, 13,750 feet above the sea, he ascended, Aug. 15, accompanied by 4 of his men. This mountain is now called Fremont's peak. From the Wind River mountains, which he left Aug. 18, Fremont returned to his starting place by nearly the same route that he had followed in going out. He reached the mouth of the Kansas, Oct. 10, 1842, after an absence of 4 months. He had encountered much hardship and many perils, and had successfully accomplished all the objects of the expedition. Over the whole course of his extended route he had made barometrical observations to ascertain the elevations both of the plains and of the mountains, and astronomical observations for latitudes and longitudes. The face of the country was noted as fertile or sterile, the practicability of routes was settled, military positions indicated, and large contributions made to geology and

botany. His report of the expedition was laid before congress in the winter of 1842-'3. It attracted great attention both at home and abroad. It was praised by Humboldt in his "Aspects of Nature," and the London "Athenæum" pronounced it one of the most perfect productions of its kind. Immediately after the publication of his report Fremont planned a second expedition of a much more comprehensive character than the first. He determined to extend his explorations across the continent, and to survey the then unknown region lying between the Rocky mountains and the Pacific ocean. In May, 1843, he commenced his journey with 89 men, and, in pursuance of his instructions, proceeded up the Kansas river far enough to ascertain its character, and then crossed over to the Platte, which he ascended to its source in the mountains, where the Sweet Water, one of its tributaries, springs from the neighborhood of the South pass. He reached the pass on Aug. 8, went through it, and saw the head waters of the Colorado flowing toward the gulf of California. On Sept. 6, after travelling over 1,700 miles, he came in sight of the Great Salt lake, of which no accurate account had ever been given, and of which very vague and erroneous notions were entertained. His investigations effected important rectifications in our geographical knowledge of this portion of the continent, and had subsequently a powerful influence in promoting the settlement of Utah and of the Pacific states. From the Salt lake he proceeded to the upper tributaries of the Columbia river, whose valley he descended till on Nov. 4 he reached Fort Vancouver, near the mouth of the Columbia. On Nov. 10 he set out on his return to the states. He selected a S. E. route, leading from the lower part of the Columbia to the upper Colorado, through an almost unknown region, crossed by high and rugged mountain chains. He soon encountered deep snows, which impeded his progress and forced him to descend into the great basin, and presently found himself in the depth of winter in a desert, with the prospect before him of death to his whole party from cold and hunger. By astronomical observation he found that he was in the latitude of the bay of San Francisco, but between him and the valleys of California was a range of mountains covered with snows which the Indians declared no man could cross, and over which no reward could induce them to attempt to guide him. Fremont boldly undertook the passage without a guide, and accomplished it in 40 days, reaching Sutter's Fort on the Sacramento early in March, with his men reduced almost to skeletons, and with only 83 out of 67 horses and mules remaining, and those that survived so weak and thin that they could barely walk while led along. He resumed his journey March 24, and proceeding southward, skirted the western base of the Sierra Nevada, crossed that range through a gap, entered the great basin, and again visited the Salt lake, from which through the South pass he re-

turned to Kansas in July, 1844, after an absence of 14 months, during the greater part of which he was never out of sight of snow. The reports of this expedition occupied in their preparation the remainder of 1844. Fremont was brevetted captain in Jan. 1845, and in the spring of that year he set out on a third expedition to explore the great basin and the maritime region of Oregon and California. The summer was spent in examining the head waters of the rivers whose source is in the dividing ridge between the Pacific and the Mississippi valley, and in October he encamped on the shores of the Great Salt lake. From thence he proceeded to explore the Sierra Nevada, which chain he crossed again in the dead of winter with a few men to obtain supplies from California for his party, with whom, after perilous adventures among the mountains and some successful encounters with hostile Indians, he made his way into the valley of the San Joaquin, where he left his men to recruit, and went himself to Monterey, which was at that time the capital of California, to obtain from the Mexican authorities permission to proceed with his exploration. Permission was granted, but was almost immediately revoked, and he was peremptorily ordered to leave the country without delay. Fremont as peremptorily refused to comply. His men, exhausted by the hardships they had suffered and destitute of supplies and animals, were in no condition to repass the mountains and the deserts from which they had just emerged. The Mexican governor, Gen. Castro, mustered the forces of the province and prepared to attack the Americans, who were only 62 in number. Fremont took up a strong position on the Hawk's peak, a mountain 30 m. from Monterey, built a rude fort of felled trees, hoisted the American flag, and, having plenty of ammunition, resolved to defend himself. He wrote to the American consul at Monterey, in reply to a private message, March 10, 1846: "We have in no wise done wrong to the people or the authorities of this country, and if we are hemmed in and assaulted here, we will die, every man of us, under the flag of our country." The Mexican general formed a camp with a large force of artillery, cavalry, and infantry, in the plain immediately below the position held by the Americans, whom he hourly threatened to attack. On the evening of the 4th day of the siege, Fremont, tired of inaction, withdrew with his party and proceeded toward the San Joaquin. The fires were still burning in his deserted camp when a messenger arrived from Gen. Castro to propose a cessation of hostilities. Without further molestation Fremont pursued his way northward through the valley of the Sacramento into Oregon. Near Tlamath lake, on May 9, he met a party in search of him with despatches from Washington, directing him to watch over the interests of the United States in California, there being reason to apprehend that the province would be transferred to Great Britain. There was also reason to believe that

Gen. Castro intended to destroy the American settlements on the Sacramento. Fremont promptly retraced his steps to California. Gen. Castro was already marching against the settlements. The settlers rose in arms, flocked to Fremont's camp, and under his leadership the result was that, in less than a month, as Col. Benton says in his "Thirty Years' View:" "All the northern part of California was freed from Mexican authority, independence proclaimed, the flag of independence raised, Castro flying to the south, the American settlers saved from destruction, and the British party in California counteracted and broken up in all their schemes." On July 4 Fremont was elected governor of California by the American settlers; and on the 10th of that month he learned that Commodore Sloat, who commanded the U. S. squadron on the coast, had taken possession of Monterey. Fremont proceeded to join the naval forces, and reached Monterey with his 160 mounted riflemen on the 19th. Commodore Stockton about the same time arrived at Monterey with the frigate Congress, and took command of the squadron with authority from Washington to conquer California. At his request Fremont, who had now, May 27, 1846, been promoted to the rank of lieutenant-colonel, organized a force of mounted men, known as the "California battalion," of which he was appointed major. He was also appointed by Com. Stockton military commandant and civil governor of the territory, the project of making California independent having been relinquished on receipt of intelligence that war had broken out between the United States and Mexico. He was actively employed for some time in suppressing insurrections of the Mexican inhabitants, and in averting by his personal influence a war with the Walla-Walla Indians. On Jan. 13, 1847, he concluded with the Mexicans articles of capitulation which terminated the war in California, and left that country permanently in the possession of the United States. Meantime Gen. Kearney of the U. S. army, with a small force of dragoons, had arrived in California. A quarrel soon broke out between him and Com. Stockton as to who should command. They each had instructions from Washington to conquer and organize a government in the country. Fremont had accepted a commission from Com. Stockton as commander of the battalion of volunteers, and had been appointed governor of the territory. Gen. Kearney, as Fremont's superior officer in the regular army, required him to obey his orders, which conflicted with those of Com. Stockton, whose authority Fremont had already fully recognized as commander-in-chief of the territory—an authority which had also been admitted by Gen. Kearney for a considerable period after his arrival. In this dilemma Fremont concluded to obey the orders of Com. Stockton. Despatches from Washington received in the spring of 1847 at length terminated this conflict of authorities by

directing Com. Stockton to relinquish to Gen. Kearney the supreme command in California. Fremont hesitated no longer to place himself under Gen. Kearney's orders, who, however, treated him with marked aversion, and refused him permission to join Gen. Taylor's army, then serving in northern Mexico. In June, 1847, Gen. Kearney set out overland for the United States, ordering Fremont to accompany him, and treating him with deliberate disrespect throughout the journey, until at Fort Leavenworth, Aug. 22, 1847, he put him under arrest, and directed him to repair to Washington and report himself to the adjutant-general. On his way to Washington, passing through St. Louis, a large number of the most respectable citizens addressed him a letter recapitulating his claims to public admiration for his geographical explorations and military operations, and inviting him to a public dinner. This honor he declined under the circumstances of his arrest, and arrived at Washington Sept. 16. He found letters there informing him that his mother was dying in South Carolina. Obtaining leave of absence, in 8 days he reached Charleston. His mother died a few hours before he reached her residence. Immediately on his arrival at Washington, Fremont asked for a speedy trial on Gen. Kearney's charges, and accordingly a court martial was held, beginning Nov. 2, 1847, and ending Jan. 31, 1848, which found him guilty of "mutiny," "disobedience of the lawful command of a superior officer," and "conduct to the prejudice of good order and military discipline," and sentenced him to be dismissed from the service. A majority of the members of the court recommended him to the clemency of President Polk. The president refused to confirm the verdict of mutiny, but approved the rest of the verdict and the sentence, of which, however, he immediately remitted the penalty. Fremont promptly declined to avail himself of the president's pardon, alleging as a reason: "I do not feel conscious of having done any thing to merit the finding of the court; and this being the case, I cannot, by accepting the clemency of the president, admit the justice of the decision against me." He accordingly forthwith resigned his commission as lieutenant-colonel. The friends of Col. Fremont and a large portion of the public considered this court martial and the charges that led to it as an attempt, in the language of one of his biographers, "instigated by professional and personal jealousy to break down the character and to ruin the prospects of an aspiring and deserving rival." On Oct. 14, 1848, Fremont started upon a 4th expedition across the continent, at his own expense. With 33 men and 120 mules he made his way along the upper waters of the Rio Grande through the country of the Utahs, Apaches, Comanches, and other Indian tribes, then at war with the United States. His object was to find a practicable passage by this route to California. In attempting to cross the great Sierra, covered with snow,

his guide lost his way, and Fremont's party encountered horrible suffering from cold and hunger, a portion of them being driven to cannibalism to sustain life. All of his animals and one third of his men perished, and he was forced to retrace his steps to Santa Fé. Undaunted by this disaster, he gathered around him another band of 30 men, and after a long search discovered a secure route, which conducted him eventually to the Sacramento in the spring of 1849. He now determined to settle in California, where in 1847 he had bought the Mariposas estate, a very large tract of land, containing rich gold mines. His title to this estate was contested, but after a long litigation it was decided in his favor in 1855 by the supreme court of the United States. In 1849 he received from President Taylor the appointment of commissioner to run the boundary line between the United States and Mexico. Regarding this appointment as intended to signify Gen. Taylor's disapproval of the court martial which had dismissed him from the army, he accepted it to show his sense of the value of the good opinion of that distinguished soldier. The legislature of California, which met in Dec. 1849, elected him on the first ballot one of the two senators to represent the new state in the senate of the United States. He consequently resigned his commissionership, and departed at once for Washington by way of the isthmus. He took his seat in the senate, Sept. 10, 1850, the day after the admission of California as a state. In drawing lots for the terms of the respective senators, Fremont drew the short term, ending March 8, 1851. The senate remained in session but three weeks after the admission of California, and during that period Fremont devoted himself almost exclusively to measures relating to the interests of the state he represented. For this purpose he introduced and advocated a comprehensive series of bills, 18 or 20 in number, embracing almost every object of legislation demanded by the peculiar circumstances of California. On Sept. 12 he voted against Mr. Seward's amendment providing for the abolition of slavery in the district of Columbia, which, however, only received 5 votes; on the 14th he voted against an amendment providing that if a free person in the district of Columbia should induce a slave to run away, or should harbor a fugitive slave, he should be imprisoned in the penitentiary 5 years; on the 16th he voted for the bill suppressing the slave trade in the district; he also voted against an amendment authorizing the corporations of the district to prohibit free negroes within their limits. Fremont returned to California in the first steamer that sailed after the adjournment of Congress; he was prevented from returning to Washington next session by a severe attack of fever contracted upon the isthmus. In the state election of 1851, in California, the party which had opposed the introduction of slavery, and had placed the proviso against it in the state constitution, was defeated. As Fremont was one of the

leaders of this party, he failed of reelection to the senate, after 142 ballotings in the state legislature. The next 2 years he devoted to his private affairs, and visited Europe in 1852, where he spent a year, and was received with distinction by many eminent men of letters and of science. In 1850, while he was in the senate, Baron Humboldt, on behalf of the king of Prussia, had sent him "the great golden medal for progress in the sciences." At the same time the geographical society of Berlin elected him an honorary member. A few months earlier the royal geographical society of London had awarded him the "founder's medal" for his "preëminent services in promoting the cause of geographical science." While in Europe he learned that congress had made an appropriation for the survey of 3 routes from the Mississippi valley to the Pacific. He immediately returned to the United States for the purpose of fitting out a 5th expedition on his own account to complete the survey of the route he had taken on his 4th expedition. He left Paris in June, 1853, and in September was already on his march across the continent. The result of this 5th expedition was satisfactory. He found passes through the mountains on the line of lat. 38° and 39° N., and reached California in safety, after enduring great hardships. For 50 days his party lived on horse flesh, and for 48 hours at a time were without food of any kind. In the spring of 1855 Fremont with his family took up his residence in New York, for the purpose of preparing for publication the narrative of his last expedition. His name now began to be mentioned in connection with the presidency by those who were combining to act against the democratic party on the basis of opposition to the extension of slavery. In April, 1856, he was invited to attend a meeting in New York of those who opposed the Kansas policy of President Pierce. In his letter of reply he said: "I heartily concur in all movements which have for their object to repair the mischiefs arising from the violation of good faith in the repeal of the Missouri compromise. I am opposed to slavery in the abstract and upon principle, sustained and made habitual by long-settled convictions. While I feel inflexible in the belief that it ought not to be interfered with where it exists, under the shield of state sovereignty, I am as inflexibly opposed to its extension on this continent beyond its present limits." The republican national convention, which met at Philadelphia, June 17, 1856, deeming this letter satisfactory, nominated Fremont for the presidency by a vote of 359 to 196 for John McLean, on an informal ballot. On the first formal ballot Fremont was unanimously nominated. He accepted the nomination in a letter dated July 8, 1856, in which he expressed himself strongly against the extension of slavery and in favor of free labor. A few days after the Philadelphia convention adjourned, a national American convention at New York also nominated

Fremont for the presidency. He accepted their support in a letter dated June 30, in which he referred them for an exposition of his views to his forthcoming letter accepting the republican nomination. After a most spirited and exciting contest, the presidential election resulted in the choice of Mr. Buchanan by 174 electoral votes from 19 states, while Fremont received 114 votes from 11 states, including the 6 New England states, New York, Ohio, Michigan, Iowa, and Wisconsin. Maryland gave her 18 electoral votes for Mr. Fillmore. The popular vote for Fremont was 1,841,514; for Buchanan, 1,838,232; for Fillmore, 884,707. In 1858 Mr. Fremont returned to California, where he has since resided.

FREMONT, a S. W. co. of Iowa, bordering on Missouri, and bounded W. by the Missouri river, which separates it from Nebraska; area, about 500 sq. m.; pop. in 1856, 3,368. It has a rich soil and a diversified surface with extensive prairies and timber land, watered by Nishnabotona river. The productions in 1856 were 1,088 tons of hay, 12,460 bushels of wheat, 9,614 of oats, 306,448 of Indian corn, 13,166 of potatoes, and 45,806 lbs. of butter. In 1855 the county contained a carding machine, 7 saw mills, 2 grist mills, 3 or 4 churches, and about 20 public schools. It was named in honor of Col. J. C. Fremont. Capital, Sidney.

FRENCH BROAD RIVER, a river of North Carolina and Tennessee, rising in Henderson co. of the former state, near the foot of the Blue Ridge, flowing N. W. into Tennessee, bending toward the S. W., and discharging into Holston river, 4 m. above Knoxville. It is about 200 m. long, and is navigable by steamboats as far as Dandridge. For about 40 m. from Ashville to the Tennessee line, it is remarkable for its beautiful scenery, flowing through deep mountain gorges, or overhung by high cliffs. Nearly opposite the Warm Springs, in Buncombe co., N. C., are precipices known as the Chimneys and the Painted Rocks. The latter, which are between 200 and 300 feet high, derive their name from some Indian pictures still to be seen on them.

FRENCH HORN. See **HORN**.

FRENCH POLISH, a varnish made by dissolving some resinous substance, as shell lac, copal, or mastic, in alcohol, and designed for polishing the flat surfaces of furniture by being rubbed in with soft rubbers made for the purpose. Almost every maker of it has his own recipe, by which it appears that the proportions of the resin or even the kinds used are not essential. Some add dragon's blood or other coloring matter to give a dark tint to it, while others prefer it colorless. The consistency is reduced to the fancy of the operator by adding more alcohol after the solution is made. In its use the surface of the wood is first well smoothed with sand paper. The rubber, which may be a small ball of clean cotton covered with a linen rag, is then moistened with the varnish by laying it upon the mouth of the bottle and inverting

this upon it. Another rag is then laid over it and wet with 2 or 3 drops of linseed oil. As this is moved over the wood with free circular sweeps and light pressure, the varnish exudes through the rag and is evenly spread over the surface, the supply being regulated by the pressure of the hands. Care is required not to lift the rubber directly from the work, but to sweep it off, as in blending with a brush. In a few moments the outer rag becomes clogged so that the polish cannot pass freely through; it is then necessary to renew it. The rubbers are often thrown away and replaced with new ones, as they become hard and liable to scratch the work. When the grain of the wood appears to be uniformly filled up it is left to harden for an hour or two, and is then smoothed down with very fine sand paper. These processes are repeated till the wood appears uniformly bright and smooth. The cloudy marks may be removed by gently rubbing with a clean rubber and rag, the latter moistened with a few drops of alcohol—the rubbing being first in circular sweeps, and ending in straight strokes passing in the direction of the grain of the wood. After drying a few days, the work should be again rubbed with the finest sand paper, and then polished with varnish of the thinnest consistency.—A polish recommended as preferable to the above on account of not being injured by water, and better covering any stains or scratches in the wood, is thus prepared. Three or four pieces of sandarach of the size of a small egg are boiled with a bottleful of linseed oil, rendered drying by litharge or other drier, for an hour, and while cooling a teaspoonful of Venice turpentine is gradually added. If too thick, spirits of turpentine may be used to thin it. After rubbing it on the furniture and exposing it a short time to the sun, it is to be rubbed off. Every day the wood should be rubbed, and in 8 or 10 days the polish should be again applied, and afterward once in one or two months.

FRENEAU, PHILIP, an American poet and journalist, born in New York, Jan. 13, 1752, died near Freehold, N. J., Dec. 18, 1832. He was of Huguenot descent, and was educated at Nassau hall, N. J., where James Madison was his room-mate and intimate personal friend. As a boy he showed considerable satirical power and facility in versification, and while at college wrote the "Poetical History of the Prophet Jonah," in 4 cantos. It was his first intention to study law, but he finally engaged in a seafaring life. During the war of the revolution his pen was busy on the patriotic side, and his political burlesques in prose and verse were widely circulated and relished. Some of his verses, descriptive of memorable events on land and sea, are genuine specimens of the national ballad. In 1780 he was captured by a British cruiser while on his way to the West Indies, and was subjected to a long and cruel confinement on board the Scorpion prison ship in New York harbor, which he has commemorated in his poem entitled the "British Prison Ship." For sev-

eral years after the war he was employed alternately as newspaper editor and sea captain. Upon the establishment of the federal government at Philadelphia he was appointed French translator in the department of state under Mr. Jefferson, and at the same time became editor of the "National Gazette," which was made the vehicle of bitter attacks upon the administration of Gen. Washington. It is doubtful, however, whether Freneau is responsible for all the articles on this subject. According to his own statement, the most severe of the series were written or dictated by Jefferson. The paper was discontinued in Oct. 1793, and in 1795 Freneau started a newspaper near Middletown Point, N. J., which he continued for a year, and printed there an edition of his poems. Then, after editing for a year "The Time Piece," a tri-weekly sheet, which he established in New York, devoted to belles lettres and general news, he resumed his old employment as master of a merchant vessel. The second war with Great Britain reanimated his muse, and he recorded in stirring verse the triumphs of the American arms. The remainder of his life was spent in retirement at his residence in New Jersey, with frequent visits to Philadelphia and New York, where his acquaintance with eminent statesmen and authors was extensive. He lost his life by exposure and cold, while going on foot in the night during a snow storm to his residence near Freehold. Freneau, although little known to the present generation, was a true poet and an able writer of essays and political articles. His poems embrace all the popular forms of composition, and show considerable skill in versification. His humor is illustrated in his numerous satirical poems, and in the political squibs which he so readily threw off. Many of his smaller poems possess great elegance of diction, and 50 years ago were favorites throughout the country. Campbell and Scott did not scruple to borrow whole lines from him, and Jeffrey predicted that the time would come when his poetry, like "Hudibras," would command a commentator like Grey. Several editions of Freneau's poems were published during his life, but they have been long out of print.

FRERE, JOHN HOOKHAM, an English poet and diplomatist, born in 1769, died in Malta, Jan. 7, 1846. He was educated at Eton, and while a school boy translated the remarkable war song upon the victory of Athelstan at Brunenburg from the Anglo-Saxon of the 10th century into the Anglo-Norman of the 14th. It is found in the first volume of Ellis's "Specimens of the Early English Poets," and Scott affirmed that of all the modern poems that had been produced as ancient, this was the only one that he had seen which could not have been detected on internal evidence. When a school boy at Eton in connection with Canning and Robert Smith he started and carried on to 40 numbers a weekly paper called the "Microcosm." He entered parliament in 1796, succeeded Canning as under-secretary for foreign affairs in 1799, and

was minister plenipotentiary in Spain in 1818-'19. He afterward filled other diplomatic stations in Portugal and Prussia, and during his leisure made exquisite translations from the Greek and Spanish, for which Prof. Wilson classed him with Coleridge, styling them the two most perfect versifiers of the time. In 1817 he published an extravaganza of the Pulci and Casti school, under the title of Whistlecraft's "Prospectus and Specimen of an Intended National Poem" (also called the "Monks and the Giants"), which treated in a light and satirical way the adventures of King Arthur. Its peculiar stanza and sarcastic pleasantry formed the immediate exemplar of Byron in his "Beppo" and "Don Juan." Frère united with Canning, Ellis, and Gifford, as a contributor to the "Anti-Jacobin," and was one of the founders of the London "Quarterly Review." For many years before his death he resided in Malta, receiving from the government a liberal diplomatic pension.

FRÉRET, NICOLAS, a French scholar, born in Paris, Feb. 15, 1688, died in the same city, March 8, 1749. Admitted in 1714 to the academy of inscriptions and belles lettres, of which he was afterward perpetual secretary, he was imprisoned for his first memoir, which discussed the origin of the French. On recovering his liberty in 1715, he began to produce the long series of memoirs which gave him distinction as a chronologist, geographer, philosopher, mythologist, and philologist. The annals of the Assyrians, Chaldeans, Egyptians, and Indians, the principal ancient and oriental cosmogonies and theogonies, and numerous questions of history and geography are among the objects of his research. He wrote on chronology against Newton. An incomplete collection of his works was made by Leclerc de Septchènes (20 vols., Paris, 1796-'99). A more complete edition was undertaken by Champollion-Figeac (Paris, 1825), but only the first volume was issued.

FRÉRON, ÉLIE CATHERINE, a French critic and journalist, born in Quimper in 1719, died in Paris, March 10, 1776. He studied under the Jesuits in the college of Louis le Grand at Paris, in which he was for a short time professor. At the age of 20 he joined Desfontaines in conducting his journal of criticism, and in 1746, after the death of the latter, commenced a periodical of similar character entitled *Lettres à Madame la Comtesse de * * **. This was suppressed in 1749, but resumed under the title *Lettres sur quelques écrits de ce temps*, in which he was associated with the abbé de La Porte. This was succeeded in 1754 by *L'année littéraire*, which Fréron conducted alone, and which was the chief foundation of his reputation. In this he showed himself a passionate admirer of the age of Louis XIV., and a decided adversary of the new philosophical and literary doctrines. His invectives produced against him the most violent hatred, and the rest of his life was a warfare with the encyclopædists. Throughout the literary history of the time his name is in-

separable from that of Voltaire, who was stung to madness by the passionless satires which appeared weekly in *L'année littéraire*. Fréron never missed an opportunity to attack him, and Voltaire repaid him with equal malice. He stops in the midst of a grave historical discussion to insult Fréron; he assails him in his most dignified tragedies, in *La pucelle* and *Candide*; he hurls against him the philippic of *Le pauvre diable*, and in the comedy of *L'Écossaise* calls his journal *L'âne littéraire*. Fréron sustained the conflict alone, and large volumes might be collected of epigrams and satires by men of genius of which he was the object; yet though he was defeated at last, and died in grief for the suppression of his journal, he is now remembered as one of the calmest observers and keenest analyzers of the society of his time, as a man of admirable taste, and the founder of newspaper criticism in France.—LOUIS STANISLAS, a French revolutionist, son of the preceding, born in Paris in 1765, died in St. Domingo in 1802. A schoolfellow of Robespierre and Camille Desmoulins, he became one of the most fervent of the revolutionary party, and published a ferocious newspaper, *L'orateur du peuple*. He was at the same time a member of the club of Cordeliers. On the flight of the king to the frontier, he insisted upon his deposition, and afterward participated in the insurrection of Aug. 10, and in the slaughters of Sept. 1792. He was now elected to the convention, where he took his seat among the Montagnards; he voted for the king's death, and contributed to the fall of the Girondists. Being appointed one of the commissaries of the convention sent with the army against Marseilles and Toulon, he signalized himself by such brutalities that he was censured even by the committee of public safety. After the death of Danton, he sided with the Thermidorians against Robespierre, and in conjunction with Barras commanded the troops who arrested the dictator and his adherents at the *hôtel de ville*. He now unrelentingly pursued the members of the committee of public safety, procured the condemnation of Fouquier-Tinville, became the chief of a reactionary band of young men known as *la jeunesse dorée*, was instrumental in suppressing the Jacobins, and energetically opposed all attempts at insurrection. Under the directory, he was sent to the south on a mission of peace; but his former cruelties were still remembered by the people. He was on the point of committing bigamy by marrying Pauline Bonaparte, the sister of the first consul, when his wife came forward and prevented the match. He accepted an appointment as subprefect in the island of St. Domingo, and soon after his arrival there was carried off by the yellow fever.

FRESCO PAINTING (Ital. *fresco*, fresh), a method of ornamenting the walls and ceiling of buildings by painting designs in colors ground in water and mixed with lime upon the freshly laid plaster. This art was a favorite one with

the ancient Greeks, and was practised by other nations of antiquity. Their work, as described by Vitruvius, was frequently done upon stucco, which was prepared with extreme care, in order that the paintings should receive the most delicate finish and be of the most permanent nature. But with the moderns the common plaster of lime and sand is preferred for a foundation; it is longer in setting and gives a softer effect to the painting. This style of painting was much practised by the most celebrated Italian artists, and the walls of many of the Italian palaces, churches, and convents are still adorned with the works designed by their hands. The outlines of the designs are first executed upon thick paper attached to cloth, which is stretched upon a frame. These are called cartoons, from the Italian *cartona*, pasteboard. The famous cartoons of Raphael, designs that have never been surpassed in beauty by the work of man's hands, were of this character, made to be copied in tapestry, though equally suitable to be applied to the decoration of walls by fresco painting. The cartoons serve to give copies upon tracing paper, and these being attached to the wall in portions of convenient size, the outline is transferred to the wet plaster by going over the lines with a sharp point. Other methods of transfer are, however, in use; as covering the back of the design with black lead or some other coloring matter, applying this to the wall, and then going over the face of the drawing with a point; and still another method is to prick the figures through the cartoon, sometimes upon a separate sheet laid behind it, and then, placing either the cartoon itself or the duplicate sheet upon the plaster, to dust through the holes from a muslin bag a black coloring matter, which attaches itself in the lines of the figures to the walls. However, many of the great painters have worked immediately on the plaster without the intervention of any guide whatever. The preparation of the walls is still an object of especial care. All the mortar should be fresh work, and of clean sand and good lime. When the rough coat is perfectly dry and hard, the smoother layers are added of the most carefully prepared mortar. In Munich this lime is sometimes slaked 2 or 3 years before it is used, being kept, after thorough stirring and reduction to an impalpable consistency, in a pit covered with clean sand a foot or more in thickness, over which earth is laid. Pure rain or distilled water should be used in mixing it, and also perfectly clean sand. The rough coat being dampened till it will absorb no more water, the finer plaster is laid on, and when this begins to set, a still finer coat is applied containing a smaller proportion of sand. Before this dries, the design must be transferred and the painting completed; consequently but small portions can be plastered at a time. The drying may be checked by occasional sprinkling with water, or, as is sometimes practised, by keeping wet sheets pressed to the design, as it is attached to the

wall. The lines between the work of one day and that of the next are made to come in portions of the painting where they will be concealed by the colors. As any retouching of the work is impracticable, it is necessary that it should be executed skilfully at once, and the painter must also work rapidly before the ground becomes too dry and hard to take the colors. If others are afterward applied mixed up with size, white of egg, or gum, they do not long continue to harmonize with the rest of the work. The colors must be of substances not liable to be affected by contact with the lime; and those of a mineral nature are consequently almost exclusively used. Lime prepared in the manner described as practised at Munich, or the dust of white marble, makes a good white. Chrome, the ochres, verditer, lapis lazuli, &c., furnish many of the colors. The brushes must be so soft as not to roughen the plaster surface.—In addition to the process above described, which was called by the Italians *buon fresco*, or the true fresco, the early masters had other methods of painting on lime or plaster, to which the general name of fresco is usually applied. The most important of these was that known as *fresco secco*, or dry fresco, so called because the plastering, having been allowed to dry thoroughly, was remoistened before the color was applied, whereby the artist was enabled to quit or resume his work at pleasure, and to avoid the joinings observable in the true fresco painting. This process was universal in Italy until the close of the 14th century, when *buon fresco* in a measure took its place. In this style were probably executed the paintings in Pompeii and Herculaneum. Sometimes also the masses of color were laid upon the wet plaster, and the picture was subsequently finished in *fresco secco* or *tempera*.—A new method of preparing the wall and painting in fresco has been introduced into Germany by Prof. Von Fuchs, called the stereochrome. The wall is coated with a preparation of clean quartz sand mixed with the least possible quantity of lime; and after the application of this the surface is scraped to remove the outer coating in contact with the atmosphere. It is then washed with a solution of silica, prepared with silica 28.21 parts in 100; soda 8.90; potash 2.52; water 65.37. The wall is thus said to be fixed; and if too strongly fixed, must be rubbed with pumice. As the painter applies his colors he moistens the work by squirting distilled water upon it. When finished it is washed over with the silica solution. The picture also, as it is in progress, is washed with the same solution, and the colors thus becoming incorporated in the flinty coating, the picture is rendered hard and durable as stone itself. In this process the artist may leave the work and return to it at any time, and he is also able to retouch and alter any portions of it he may see fit. The new museum at Berlin has been recently adorned by this process by Kaulbach. The decorations are historical pictures, the dimensions of which are 21 feet in height and 24½ in width; and single colossal figures, friezes,

-arabesques, &c. They have the brilliancy and vigor of oil paintings, with no dazzling effect from whatever direction in regard to the light they may be viewed.—Ancient paintings in fresco have been transferred from walls crumbling by decay to canvas, and thus preserved. The wall being thoroughly cleaned, cloth is glued to it, and successive layers are added and glued on. When quite dry the whole is torn off, taking the fresco with it. Cloth is now attached with stronger glue to the back of the fresco, and the adherence of the layers on the other side is loosened by the continued application of warm water, until they are all removed and the painting is left upon the cloth at its back. Such was the process successfully employed in removing and preserving the paintings on the old walls of the convent of Sta. Eufemia at Brescia in 1829.—The history of fresco painting during the first two centuries after the revival of art is a history of art itself, as nearly every considerable work was executed by that process. As a means of conveying thoughts, ideas, and information, not then, as now, acquired through literature, it continued to subserve a useful purpose even after the invention of printing. Hence the early masters, laboring for the edification of men in general, and not for the gratification of individuals—or, to adopt the language of the ancient fraternity of the painters of Sienna, “being teachers to ignorant men, who know not how to read, of the miracles performed by virtue and in virtue of the holy faith”—rarely painted easel pictures, but lavished all their genius and thought upon mural decoration or fresco painting. As late as the latter half of the 16th century Vasari declares it to be “more masterly, noble, manly, secure, resolute, and durable than any other kind of painting;” and he records the opinion of Michel Angelo that fresco was fit for men, oil painting only for women, and the luxurious and idle. The abbey church of St. Francis in Assisi, near Perugia, witnessed the first development of fresco painting in modern times. About the middle of the 13th century Giunta of Pisa commenced a series of paintings on its walls, and during the next two centuries Cimabue, Giotto, Taddeo Gaddi, Simone Memmi, and nearly every other painter of note, were invited to add to its adornment. Neglect and exposure have injured these works, but as the earliest specimens of modern Christian art, they still possess an absorbing interest. Next in date to these, and of far greater importance, are the decorations of the Campo Santo in Pisa, a burial ground, about 400 feet in length by 118 in breadth, enclosed by high walls with an arcade something like the cloisters of a monastery running all around it. It was completed about 1285, and until the close of the 15th century its walls employed the services of some of the chief masters of fresco. The early paintings by Buffalmacco, Giotto, and others, have nearly disappeared, and time, neglect, and damp have seriously impaired the effect of the others; but

efforts are now making to restore them, or to arrest the progress of decay. A series painted by Orcagna about 1385, representing the last judgment, hell, and other subjects according with the character of the place, are considered among the grandest specimens of early art. After him came Simone Memmi, Taddeo Gaddi, Francesco da Volterra, Antonio Veneziano, and others, whose labors extended to the close of the century. The wars and internal dissensions which distracted Pisa subsequently interrupted the decoration of the Campo Santo for many years; but tranquillity having been restored, Benozzo Gozzoli was invited in 1468 to complete the work. The whole of the north wall, 400 feet in length, was assigned to him, and in the course of the next 16 years he covered this immense space with a series of frescoes representing the principal events in the Old Testament—*un' opera terribilissima*, as Vasari calls it. Beside the works enumerated as belonging to the 14th century, we may mention Giotto's celebrated series in the Arena chapel at Padua, representing scenes from the life of the Virgin, and the same master's recently discovered portraits of Dante and other Florentine citizens in the chapel of the Bargello at Florence; the series by Taddeo Gaddi and Simone Memmi in the Spanish chapel in the church of Sta. Maria Novella, Florence, representing the “Triumph of the Church;” Spinello's “Overthrow of the Rebel Angels” in the convent of S. Agnolo, at Arezzo; and the series representing the “Fruits of Good Government and the Triumph of Peace,” painted by Ambrosio Lorenzetti in the Palazzo Publico of Sienna. In the 15th century, to which belongs what has been called the *renaissance* or new birth of art, increased wealth and intelligence, the result of greater political and religious freedom, caused an increased demand for easel pictures, the value of which was greatly enhanced by the introduction of oil as a medium for mixing colors; but fresco painting still maintained its supremacy, and claimed for its function the religious and moral teaching of the people, and the representation of sacred history. The noblest achievements in art are therefore still those of the fresco painters. The great names of the century are Pietro della Francesca, of whose frescoes in the church of S. Francesco, in Arezzo, Vasari says that “they might be called too beautiful and excellent for the time in which they were painted;” Masolino; Filippo Lippi, who painted the frescoes in the Duomo at Prato; Fra Angelico da Fiesole; Masaccio, whose series of the life of St. Peter in the Brancacci chapel in the church of Sta. Maria del Carmine, in Florence, to which additions were afterward made by Filippino Lippi, formed an epoch in art; and Ghirlandaio, the master of Michel Angelo, whose frescoes representing the histories of John the Baptist and the Virgin afforded models for Leonardo da Vinci, Raphael, and Michel Angelo. Luca Signorelli, Andrea Mantegna, the great founder of the Mantuan school, Francesco Francia, who decorated the

church of St. Cecilia in Bologna, Perugino, the master of Raphael, Fra Bartolommeo, and some others, belong partly to this century and partly to the next, which witnessed at once the culmination of the art of fresco painting, its corruption and decline. The 8 most illustrious painters of this latter era, Leonardo da Vinci, Michel Angelo, and Raphael, embodied their loftiest conceptions on the walls and ceilings of churches and palaces, and their numerous disciples filled all Italy with imitations, degenerating toward the close of the century into lifeless mannerisms. Leonardo's chief work is the well known "Last Supper," executed for the refectory of the convent of Sta. Maria delle Grazie at Milan, and of which only the mouldering remains are now visible. It has been called the most perfect work executed since the revival of painting. Of Michel Angelo's frescoes, the most famous are the series on the ceiling of the Sistine chapel, representing the "Creation" and the "Fall of Man," with the grand figures of the prophets and sibyls, and the "Last Judgment," on the end wall of the chapel—the whole combining to a degree never since equalled grandeur of form and sublimity of expression. In simple beauty and severe dignity, as well as in their technical excellences, Raphael's frescoes perhaps exhibit the highest development of Christian art. The most famous are those covering the walls and ceilings of the chambers in the Vatican, known as the "Stanze of Raphael," although many of these works, as well as the decorations of the *loggie* or open colonnades of the Vatican, were painted by Giulio Romano and other scholars of Raphael from his designs. Raphael's hand is seen chiefly in the series of "Theology" or the "Dispute of the Sacrament," "Philosophy" or the "School of Athens," "Poetry" or "Parnassus," and "Jurisprudence," in the Camera della Segnatura, and in the "Expulsion of Heliodorus from the Temple," the "Mass at Bolsena," "Attila," and the "Delivery of St. Peter," in the stanza of Heliodorus. He also painted the 4 celebrated sibyls in the Chigi chapel in the church of Sta. Maria della Pace, and the "Galatea" in the Farnesina villa in Rome. The frescoes in the Vatican having suffered by neglect were skilfully restored by Carlo Maratti in the last century. Giulio Romano also painted the well known "Fall of the Giants" in the Palazzo del Te at Mantua. Shortly after the completion of the works in the Vatican, Correggio painted in the church of S. Giovanni in Parma his fresco of the "Ascension," and that of the "Assumption" in the Duomo of the same city, in both of which the art of chiaroscuro and relief is carried to perfection. Parmigiano, his pupil, left unfinished some frescoes in the Steccata at Parma, in which a figure of Moses breaking the tablets has been greatly extolled. The Zuccheri, Andrea del Sarto, Sebastian del Piombo, Vasari, and nearly every other distinguished painter of the age, practised fresco painting, and sometimes on the most extensive scale; but the art rapidly deteriorated until

toward the close of the century, when the Carracci, Domenichino, Guido, and other painters of the eclectic school, restored to it somewhat of its former vitality. Their efforts, however, were but transient, and after the middle of the 17th century, with a few exceptions, no work in fresco of more than moderate merit was executed in Italy. No mention has been made of the great Venetian painters, because they seldom attempted fresco, except on the façades and exteriors of buildings, but developed their genius in oil painting.—The present century has witnessed a revival in fresco painting in various countries of Europe, more particularly in Germany, where, with the exception of a few rude mural decorations in some of the older cathedrals, the art seems never previously to have been practised. The movement was due to the enthusiasm of a knot of young German artists established in Rome at the commencement of the century, whose first works were executed in the house of the consul-general of Prussia, M. Bartholdy, and in the Villa Massimi. In these works Cornelius, Overbeck, Schnorr, Schadow, Koch, and others participated, and Overbeck subsequently painted the "Vision of St. Francis" in the church of the Angeli at Assisi, in the neighborhood of the place where more than 5 centuries before Cimabue and Giotto had executed their first frescoes. Overbeck and a portion of the new school adopted the severe style of the early Italian masters, while others sought to create at once what they considered a national Teutonic school of painting. They were hailed throughout Germany as the regenerators of art, and King Louis of Bavaria invited Cornelius to Munich to decorate the Glyptothek and Pinakothek, as the galleries of sculpture and paintings in that city are called. Under the influence of this master a school of fresco painting sprung up in Munich, numbering among its pupils Kaulbach, Zimmermann, Hess, and many others, whose works cover the walls of the Basilica of St. Bonifacius, the Königsbau, the Festbau, the Allerheiligen-Kapelle, and many other buildings. In the Ludwigskirche is executed Cornelius's largest fresco, the "Last Judgment." In the new museum, the royal palace, and elsewhere in Berlin, are also grand specimens by Cornelius, Kaulbach, Schnorr, and others.—Mural decoration made little progress in France until the present century; but within the last few years many churches in Paris have been embellished by Amaury-Duval, Mottet, Brémont, and others. The most celebrated mural painting in Paris, Delaroche's "Hemicycle" in the *palais des beaux arts*, is painted in oil, although it is commonly called a fresco, and has all the breadth and freedom of that method. The erection of the new houses of parliament gave the first decided impulse to fresco painting in England, and in response to an invitation from a select committee of the British parliament the principal artists sent to exhibitions held in Westminster hall in 1843-'45 cartoons and specimens of fresco for the decoration of the build-

ing. Some of these works, comprising abstract representations of religion, justice, &c., and passages from British history and mythology, have been executed by Cope, Dyce, Ward, Mac-lise, Herbert, Watts, &c.; others are in progress. A summer pavilion in the gardens of Buckingham palace has been painted in fresco by Leslie, Eastlake, Mac-lise, Ross, Stanfield, Uwins, and Dyce. Watts is now engaged upon the hall of Lincoln's Inn, and several churches in London have been painted with frescoes in the style of early Christian art. Lastly, in Oxford, Dante Gabriel Rossetti and others of the so called "pre-Raphaelites" have undertaken to adorn the theatre of the Union debating society with a series of paintings on subjects from the romances of King Arthur.

FRESNEL, AUGUSTIN JEAN, a French physicist, born in Broglie, department of Eure, May 10, 1788, died at Ville d'Avray, near Paris, July 14, 1827. In his childhood he is represented to have had little taste for languages and a very bad memory; but he was nicknamed the man of genius by his brothers, for he devoted his leisure to the determination of the proper calibres and lengths of toy guns, and the proper woods for the fabrication of bows. At the age of 13 he was sent to the central school at Caen, and in his 17th year he entered the polytechnic school, where he gained the applause of Legendre by a peculiar solution of a question in geometry. From the polytechnic school he passed to the school of bridges and roads. After graduating, he was sent into the department of Vendée to superintend the engineering operations of the government, and remained in this service between 8 and 9 years. Upon the landing of Napoleon from Elba in 1815, he joined the Bourbon army of the south as a volunteer, but ill health compelled him to abandon military life, after which he proceeded to Paris. His first memoir, written in 1814, was a demonstration of the phenomenon of the stellar aberration. His first experimental researches were made in 1815 after he began to reside in Paris, and from this time until his death his discoveries and scientific memoirs followed each other rapidly. At the commencement of 1815 he hardly knew what was meant by the term polarization of light, and in less than a year he stood at the head of investigators of the subject. In 1819 he gained a prize offered by the French academy of sciences for an article on diffraction. In 1823 he was elected a member of the academy by a unanimous vote. In 1825 he was made an associate of the royal society of London, and in 1827, just before his death, that society presented him with the Rumford medal. In May, 1824, he was appointed secretary of the commission of lighthouses. He at the same time held the position of engineer of the pavements of Paris; and he was also one of the examiners of the polytechnic school. From the end of 1824 until his death his health was so bad from the effects of unremitting labor that he was obliged to give up all work.—

The true laws of the complicated phenomena of double refraction were demonstrated by Fresnel. It is now known that nearly all crystals possess the property of double refraction. Before Fresnel's investigations it was supposed that Iceland spar and quartz were alone endowed with it. Fresnel in conjunction with Arago explained the interferences of polarized light, giving all the phenomena, and determining all their laws. He proved that all the colors engendered in doubly refracting crystals are particular cases of the interference of polarized light, and also discovered the phenomena which are called circular polarization, and explained their laws. He was an able and enthusiastic advocate of the wave theory of light, against that of emission or material emanations. In 1811 a lighthouse board or commission of lighthouses was formed in France. One of the duties of this commission was to determine whether the system of lighting apparatus then in use might not be improved. In 1819 Arago volunteered to take charge of the experiments on the subject, provided Fresnel and Mathieu were joined with him. The proposition was accepted, and Fresnel devoted the whole strength of his mind to the subject. The result was the system of lens-lighting apparatus which has changed the mode of lighthouse illumination over the whole world, and is universally known as the Fresnel system. The most perfect system of lighting apparatus known before the invention of the Fresnel system was that of parabolic reflectors. In this, for a fixed light, the reflectors are arranged around one or more horizontal circles with their axes parallel to the horizon, and passing (produced) through the centres of the circles. In a revolving light the reflectors are arranged with their axes parallel to each other and to the horizon. By making the system revolve, a bright flash is produced by the combined action of all the reflectors, when the eye is in or near the axis of one of them. As the rays proceeding from a lamp at the focus of a parabolic reflector are parallel to the axis after deviation by the reflector, it is evident that systems arranged as above indicated will show a bright light in the horizon to an observer situated in or near the axis of any one of the reflectors, since the reflected beam does not lose its intensity except by atmospheric absorption. Therefore the greater the number of reflectors, the better will be the light; and to produce as nearly as possible a uniform light at the horizon, the number of reflectors in important fixed lights is sometimes very great, as many as 24 having been used. In all cases the reflectors are made of copper carefully shaped to the form of a paraboloid of revolution, and covered with a uniform coating of pure silver. The objections to the reflector system are: 1, the want of uniformity of the light; 2, the great annual expense, each lamp requiring 50 gallons of sperm oil per year; 3, the rapid deterioration of the reflectors from the necessity of daily cleaning the silvered surface, the silvering requiring en-

tire renewal at least once in 10 years; 4, the great loss of light caused by the reflection and by the necessary imperfections in form in a parabolic reflecting surface. As soon as he began to study the subject, Fresnel conceived the idea of substituting lenses for the reflectors. A convex lens possesses the property of making all rays proceeding from its principal focus parallel after deviation. It produces the effect by refraction that parabolic reflectors produce by reflection. If therefore a plano-convex lens could be formed which would not much exceed in thickness ordinary plate glass, the loss of light by absorption in passing through such a lens would be much less than it would be in the case of reflection. For the two refracting surfaces the loss does not much exceed $\frac{1}{20}$, while by reflection it is about $\frac{1}{4}$. But if the exterior surface of the lens is spherical, it is evident that, supposing the lens to embrace all rays which are contained in a belt $22\frac{1}{2}^\circ$ above and $22\frac{1}{2}^\circ$ below the horizon, and in a horizontal angle of 45° , the thickness would become so great for a large principal focal distance that much of the light would be absorbed, and the lens would become useless. The weight, too, would be so great, that it would be nearly impossible to make the apparatus revolve by machinery available at the top of a lighthouse. For these reasons a lens light which existed in England when Fresnel made his experiments was considered a failure. If now a circular central part of the curved surface of a plano-convex lens is moved parallel to itself until at its edges the glass is very thin, the diminution of thickness will not affect the parallelism of the rays after deviation, and the absorption will be very much lessened. If another part of the lens, of a convenient breadth and concentric with the first part, be moved as was the first part until its edges become very thin, the thickness of this will not much increase the absorption, and so of the whole surface of the lens; that is, it can be divided into thin concentric rings of convenient breadth and of nearly the same curvature as the lens, which will absorb but little light, and at the same time will send out the rays parallel to each other, and, if properly adjusted, parallel to the horizon. Buffon first imagined this manner of constructing a lens. Condorcet in 1773 suggested that the rings might be made in separate pieces, and Sir David Brewster made the same suggestion in 1811. Fresnel, without knowing Condorcet's or Brewster's suggestions, conceived the idea of making the lenses in steps and in separate pieces, and, following up his ideas, had the lenses manufactured and applied to lighthouses. To him therefore is the credit of the first application of lenses to lighthouses due, and the system is properly called by his name. The vertical central section of Fresnel's lens, instead of being that of a plano-convex lens, is a figure bounded on the side toward the lamp by a vertical straight line, and on the outside by a serrated line. This last line is a portion of the arc of a circle at its central part, and reced-

ing from the centre consists of portions of arcs of circles bounded by horizontal lines. The first lens apparatus made by Fresnel consisted of 8 lenses like that above described, arranged in the form of an octagonal prism. It is evident that an eye situated in the horizon would perceive a bright flash whenever one of these lenses came in front of it, and supposing the octagonal prism to be revolved about its vertical axis, there will be 8 flashes in one revolution. In Fresnel's first apparatus, and in all very large ones manufactured within 10 or 12 years after his invention, the rays in the portion of the sphere above the belt deviated by the lens were brought to the horizon by a combination of lenses and plane reflectors, and those below by the combination of curved glass reflectors similar to the slats of Venetian blinds, except that the reflectors are not precisely parallel, but are placed at such angles that all the light they receive shall be thrown to the horizon. The interval between the flashes is diminished by arranging the auxiliary mirrors so that they will reflect the light a little to one side of the beam refracted by the lenses. This makes the flash longer, and correspondently diminishes the dark interval. In order to produce a fixed lens light which shall show uniformly entirely around the horizon, if the central vertical section of the lens (the section bounded by the serrated line above described) be revolved about the vertical line drawn through the principal focus of the lens, it will generate a solid of revolution, which when made of glass will fulfil the required condition for all rays $22\frac{1}{2}^\circ$ above and $22\frac{1}{2}^\circ$ below the horizon. Those above and below this zone are brought to the horizon by a combination of lenses and reflectors on the same principle as those described for a revolving lens. But Fresnel was not satisfied with the use of reflectors for bringing to the horizon the rays above and below the central belt of 45° . On account of the acuteness of the angles at which these rays must be incident upon any deviating surface, it was not practicable to bend them to the horizon merely by refraction at two surfaces. He therefore calculated the dimensions of a series of annular prisms, so arranged that the rays from the lamp incident upon the first surface of the prisms were refracted by it toward the horizon, were incident upon the second surface at an angle greater than that of total reflection, were reflected by it, and were so refracted by the third surface that they emerged from the prism horizontal. Thus all the rays proceeding from the lamp, except those obstructed by the glass chimney and the lamp itself, were utilized by the lens, forming the very perfection of a lighthouse apparatus. Fresnel did not live to see his idea of using the prisms instead of reflectors in the large lens apparatus carried out; but small apparatus were made on this principle for harbor lights with entire success. It is believed that the annular prisms were first used in an apparatus of the largest kind in one made at Paris under the direction

of Alan Stevenson, engineer of the commission of northern lights of Scotland. The prismatic rings placed above and below the annular lens will with the lens throw all the rays to the horizon, and the combination will thus answer admirably for a fixed light. The annular prisms to fulfil their object must be arranged in conical or bee-hive shape above and below the annular lens. For a revolving light, a vertical central section of the annular lens with a meridian section of the system of prisms was revolved around the horizontal line joining the centre of the annular lens and the principal focus of the combination. The revolution was continued far enough to generate a larger or smaller solid as the interval between the flashes was greater or smaller, the dimensions at the top and bottom of the lens regulating the amplitude of the revolution. Thus a polygon of 8 sides answers for an interval of one minute, supposing the time of revolution to be 8 minutes, one of 16 sides to an interval of 30 seconds, and one of 24 sides to an interval of 10 seconds, supposing the time of revolution to be 6 minutes. In order to lengthen the flashes, the upper and lower systems of prisms were moved a little to one side of the central annular lenses. The flash from the prisms was therefore produced a little after that from the lens, but so soon after as to appear a part of it. Another distinction was formed by revolving a system of cylindrical vertical lenses around a fixed apparatus and outside of it. These lenses collected the rays incident upon them, and emitted them parallel to each other and to the horizon. When one of the lenses came opposite the observer, the eye received a bright flash preceded and followed by a short eclipse. Before and after the eclipses the fixed light was visible. This arrangement is called a "fixed light varied by flashes." Nearly the same appearance is given by using the upper and lower prismatic rings of the fixed light and the annular lenses of the revolving light. By revolving the latter, the eye perceives a flash from the annular lens, and in the interval between the flashes perceives the light from the fixed part of the apparatus. It will be seen that the variations which this system admits for the same order are numerous, far surpassing in number those of reflector lights. The latter can only be either fixed or revolving, and it has been found impossible in practice to diversify the intervals between the flashes to any extent. The radii of the spherical surfaces forming the lenses, and the radii and other dimensions of the prismatic rings, are calculated by known formulæ from the index of refraction, the position of the exterior surfaces of the lens with reference to the source of light, and the distances of the various concentric rings and prismatic surfaces from the horizontal plane passed through the principal focus. The surfaces of the lenses are limited in breadth by the condition that the solid of revolution shall not be thick enough to absorb a material portion of the light. This condition makes their breadth about

1.5 inches. Spherical aberration is nearly eliminated by a proper use of the formulæ in calculating the radii of the surfaces. The index of refraction of the glass used is 1.51. In the large lenses the rings are ground in segments of circles, are fastened into brass armatures, and are put together at the lighthouse. The small lenses are placed in their armatures, and are put together ready for erection at the workshops. The glass used is that commonly called flint glass. It is that of St. Gobain, and, although not as colorless as crown glass, was selected because it could be obtained more free from bubbles and striæ than crown glass. It is cast in pieces, exceeding the intended size of the finished parts by about $\frac{1}{4}$. There are 6 orders of lenses, arranged according to size. The 3 first and largest are used in seacoast lights, and the 3 last in harbor and river lights, and generally in those of lesser importance. They are beautiful exemplifications of science applied to one of the every-day necessities of mankind. Fresnel's invention has also been adapted to small lanterns used for steamers' signal lights, pier head and ferry lights, &c., and many of this kind are now manufactured in the United States of pressed glass. The 1st order fixed lens apparatus is about 6 feet in diameter and 9 feet high. The central zone consists of the central plano-convex belt and 16 steps (*échelons*), arranged in equal numbers above and below it. The lower set of prisms is 6 in number, and the upper set 13. This last set is arranged in the form of a cone, and the whole apparatus is a most beautiful object. In the revolving 1st order lens, having an interval of 10 seconds, there are 17 upper and 8 lower prisms. The 6th and smallest order of lens is 11.8 inches in diameter and 17.5 inches high. The central zone is composed of the plano-convex belt and 4 steps, 2 on each side of it. There are 3 prisms below and 5 above the central zone. As the lamps in use when Fresnel made his invention were entirely incompetent to supply enough light from one burner for the use of the higher orders of lens apparatus, he in conjunction with Arago made a thorough investigation of the subject of lamps. The result was that he adopted for the 1st order lens a burner about $8\frac{1}{2}$ inches in diameter, giving a flame about $4\frac{1}{2}$ inches high, and containing 4 concentric wicks. The intensity of the light of this lamp is about equal to that of 25 ordinary Carcel burners which have a diameter of about $\frac{1}{4}$ of an inch. The lamp is placed in the centre of the apparatus. As the heat evolved by such a lamp is very great, there might be danger of melting the burners, and of burning up the wicks. To avoid these difficulties, Fresnel adopted the Carcel lamp, which, by a system of clockwork, pumps up to the burner 4 times as much oil as is consumed. By this means the burners are always kept comparatively cool, and the wicks sometimes burn a whole night without requiring snuffing. For the 2d order lens apparatus a lamp with 8 concentric wicks was adopted; for

the 3d and 4th orders, lamps with 2 concentric wicks were used, and for the 5th and 6th orders, ordinary Argand burners are used. Very slight changes in any of the details of the lamps have been made since they were first settled by Fresnel. The annual consumption of oil by the lenses of the different orders is as follows: 1st order, 684 gallons; 2d, 461; 3d, 221; 4th, 156 to 190, according as two wicks or one are used; 5th, 70; 6th, 60. In the 1st order octagonal revolving lens the quantity of light sent to the horizon by one of the octagonal faces and its reflectors is between 3,000 and 4,000 times the light of a single Carcel burner, being 8 times as much as that sent to the horizon by the best reflectors that are made. To get the useful effect of the whole lens, the above numbers must be multiplied by 8, that being the number of annular lenses doing the work of that number of burners at the same time. The useful effect of the lens light is to that of the reflector light as 4 to 1; that is, one gallon of oil burned in a lens light throws as much light to the horizon as 4 gallons burned in a reflector light. The brilliancy of a 1st order lens light as compared with the best reflector lights is as 83 to 16, or as 5 to 1.—The first lens apparatus manufactured under the direction of Fresnel was erected in 1823 in the Cordouan lighthouse at the mouth of the Gironde, on the coast of the bay of Biscay. The auxiliary lenses and reflectors for utilizing the rays above and below the central belt have been removed, and are now replaced by the prismatic rings. In 1825 the lens system was adopted for the coasts of France, and as early as 1838, 12 lighthouses on the coast were illuminated by the Fresnel system. In 1845 there were 151 lens lights on the French coast, and it is not probable that there is a single reflector light in France at present. It was next adopted by the Dutch, and in 1834 the authorities of the Scotch lighthouses authorized the erection of a 1st order lens in Inchkeith lighthouse. The Trinity house corporation next adopted the lens system in 1837, and it has since been used by all European maritime nations and their colonies. In 1838 the attention of the United States government was first directed to the Fresnel system. In 1846 a commission consisting of two officers of the navy was sent abroad to examine and report upon the lighthouse establishments of Europe. In 1851 a temporary lighthouse board was authorized by congress, which consisted of 2 officers of the navy, 2 officers of army engineers, 2 civilians of high scientific attainments, and an officer of the navy as secretary. A permanent lighthouse board was established in 1852, and entered upon the performance of its duties in Oct. 1852. Under this board 506 lenses have been erected in the lighthouses of the United States. Of these, 26 are of the 1st, 19 of the 2d, 62 of the 3d, 188 of the 4th, 101 of the 5th, and 110 of the 6th order. Five lenses had been introduced before the creation of the board.—See A. FRESNO, an E. co. of California, bordering on Utah, and comprising that portion of the gold-mining region commonly known as the extreme southern mines; pop. in 1856 estimated at 2,400. The precious metal, which is found in the beds of streams and in veins of quartz, is collected chiefly by Chinamen. The eastern and central parts of the county are traversed by the Sierra Nevada; the western part consists mainly of rush-covered marshes called *tulés*. There is good farming land, however, in the neighborhood of King's river, and the pasturage is said to be excellent. Wheat and barley are the principal crops, and the productions in 1858 amounted to 6,000 bushels of wheat, 20,000 of barley, 3,000 of Indian corn, 2,000 of potatoes, and 400 tons of hay. Formed from Mariposa, Merced, and Tulare counties in 1856. Capital, Millerton. An Indian reservation called Fresno and King's river farms, established in 1854, is situated in this county. The farms are about 2,000 acres in extent, 600 of which are under cultivation; and the Indians number 2,555, about 800 of whom are permanent settlers in the reservation, well furnished with agricultural implements, live stock, &c.

FREYBURG, or FRIBOURG, a canton of Switzerland, the 9th in extent; area, 565 sq. m.; pop. in 1850, 99,890, of whom 87,753 were Catholics, the Protestants living almost exclusively in the district of Morat. With the exception of 3 detached portions situated geographically in the canton of Vaud, it is bounded N. and E. by Bern, S. and S. W. by Vaud, and N. W. by the lake of Neuchâtel. On the latter lies also the largest of the detached portions, with the town of Estavayer; the 2 smaller ones, Surpierre and Vuissens, are a little S. The surface of the canton is mountainous, especially in the S., S. W., and E. The principal mountains are the Dent de Brenlieu, 7,886 feet high, the Dent de Folliéran, 7,667 feet, and Mt. Moleson, 6,572 feet. Coal, limestone, limestone slate, and gypsum are found. The principal rivers are the Sarine (Saane), Broye, Sense, and Chandon. One half of the lake of Morat and a considerable part of the lake of Neuchâtel belong to this canton, which has beside several smaller lakes. It has also several mineral springs, all of which are sulphurous. The climate is milder in the N. than in the S. The productions in the basins of the rivers are hemp, flax, maize, and fruit; in the N. W., corn, wine, vegetables, and tobacco. In the higher regions, consisting of meadows, Alps, and forests, cattle rearing and the cultivation of the forests are the chief pur-

suits. The Gruyère (Greierz) cheese is made here. Horses, sheep, goats, hogs, chamois, roes, hares, lynxes, a few wild boars, and in the N. numbers of wild fowl, are found. The chief articles of export are cheese and timber. There are manufactures of straw hats, leather, tobacco, cotton goods, watches, and silk, but only to a small extent. The common language is a mixture of French and German in several dialects; the German prevails around the capital and in the district of Morat; the official language is French, but all official acts are published in both languages. The new constitutions of March 4, 1848, and May 27, 1857, agree in all essential points with the constitutions of the other cantons. The legislative assembly, the grand council, is chosen for a period of 4 years by a direct vote of all citizens who are over 20 years old; but 10 additional members are elected by the grand council itself. The state council (executive) consists of 7 members chosen by the grand council for a period of 8 years. Freyburg sends 5 members to the national council, and 2 to the federal senate. Its contingent to the federal army amounts to 4,432 men, and its contribution for federal expenses to 39,956 francs. Education in this canton was formerly in a lower state than in many others; but in 1829 there were 229 primary schools, attended by 12,835 children. There is a Protestant college at Morat. Chief towns, Freyburg, Romont, Bulle, and Morat. The canton of Freyburg belonged in the middle ages, as a part of the Uechtland, to Franche Comté. In 1481 the town of Freyburg with its territory joined the Swiss confederacy by the compact of Stanz. The reformation never got a foothold in Freyburg, and it has ever remained one of the strongholds of the Roman Catholic church in Switzerland. During the civil war of 1847, in which the canton joined the *Sonderbund*, it was occupied by Gen. Dufour without much opposition.—FREYBURG, or FRIBOURG, the capital of the above canton, on the Sarine, consists of the lower (German) town in the narrow valley of the river, and the upper (French) town, which rises like a terrace on a succession of sandstone rocks; pop. 9,580. The great glory of the town is the suspension bridge over the Sarine, built in 1832-'4, 905 feet long, 28 feet wide, and 174 feet high. The town has 8 convents and 4 churches, beside several chapels. The principal church, that of St. Nicholas, has a spire 376 feet high, being the highest in Switzerland, and an organ with 7,800 pipes, reckoned one of the finest in Europe. Before the town hall stands the linden tree planted in 1480 in commemoration of the victory at Morat over Charles the Bold in 1476. Before the expulsion of the Jesuits from Switzerland, in 1847, Freyburg had a celebrated Jesuits' college, founded in 1584, restored to the Jesuits in 1818, and counting from 300 to 400 pupils, mostly from Switzerland, France, and Germany. It was reopened as a Catholic college, Oct. 15, 1858, with about 200 pupils. Other objects

worthy of notice are the 4 public squares, mint, arsenal, state prison, town library, lyceum with a cantonal museum, observatory, economical society and society of historians, savings bank, theatre, 2 public baths, breweries, manufactories of tobacco, chicory, straw hats, earthenware, iron tools, and woollen yarn, and several dye houses and tanneries. It is the seat of government, and of the bishop of Lausanne and Geneva.

FREYCINET, LOUIS CLAUDE DESAULSES DE, a French navigator, born in Montélimart, Aug. 7, 1779, died near Lorient, Aug. 18, 1842. In 1799 he served in the Mediterranean under Admiral Brueys. The next year he accompanied Baudin on his scientific expedition to Australia, and being appointed to edit the nautical and geographical portion of the narrative, devoted 10 years to this task. In 1817 he was intrusted with the command of a new expedition, the object of which was to study the figure of the globe, the elements of terrestrial magnetism, and certain meteorological phenomena in the southern hemisphere. After 3 years' navigation he returned to Havre in 1820, having sailed round the earth, and bringing a great number of observations, charts, and curious specimens for museums. A narrative of this voyage was published (13 vols. 4to., with 4 atlases, Paris, 1824-'44), and gained for Freycinet admission into the academy of sciences.

FREYTAG, GEORG WILHELM FRIEDRICH, professor of oriental languages in the university of Bonn, born in Lüneburg, Sept. 19, 1788. He studied theology and philosophy at Göttingen, and in 1811 became tutor there, which office he renounced in 1815, through hatred of French domination, and was chaplain in the army of the conquerors which entered Paris in 1815. He resigned his office to study the Arabic, Persian, and Turkish languages under Sylvestre de Sacy, and has held the professorship of those languages in the university of Bonn since 1819. Beside Arabic text books, he has published a translation of *Caabi Ben Sohair Carmen in Laudem Muhammedis dictum* (4to., Bonn, 1822), *Proverbia Arabum* (3 vols. 8vo., 1838-'44), *Fakihet al Kholefa*, by Ibn Arabshah (vol. i., Arabic text, Bonn, 1832; vol. ii., translation, 1858), and a large *Lexicon Arabico-Latinum* (4 vols., Halle, 1830-'37), which was followed by an abridgment in 1837.

FREYTAG, GUSTAV, a German author, born in Kreuzberg, Silesia, July 13, 1816, studied at the universities of Breslau and Berlin, and wrote poetry and plays, some of which were favorably received. A complete edition of them was published in Leipzig, in 8 vols. (1848-'50). Since 1848 he has edited in concert with Julius Schmidt a periodical called *Die Grenzboten*, and in 1854 he was appointed councillor of the court and lecturer of the duke of Gotha. In 1855 appeared his novel *Soll und Haben*, which has gained for him a wide popularity. It was translated into French (1857), into English ("Debit and Credit," 1858), and a 7th edition

was published in Leipsic in 1858. His drama *Die Fabier* appeared in 1859.

FRIAR (Lat. *frater*, brother), a name applied to the members of certain religious orders who are not cloistered, particularly to the mendicants. The principal orders of friars are the Augustinians or black friars; the Franciscans, gray friars, or friars minors; and the Dominicans, or preaching friars.

FRICTION (Lat. *frico*, to rub), an action arising between the surfaces of two bodies, one of which is caused to move upon or over the other; and also the mechanical resistance to motion consequent on such action. No surfaces can be made absolutely hard or smooth; when one surface is made to slide over another, the slight asperities of the one interlock with those of the other, so that the surfaces must be separated or the points abraded to allow of the motion; but if one surface roll upon another, the prominent points are successively raised, without the need of complete lifting of the body or of wearing off those points. Hence there are two kinds of friction, the sliding and the rolling. The former of these in amount greatly exceeds the latter; it is a leading element in the stability of structures and fabrics of all kinds, and the most important resistance and source of waste in all machinery, and is therefore a chief object of regard in the arts of construction and the science of engineering. To this form of friction attention will here chiefly be given.—Sliding friction increases with the roughness of the surfaces in contact; hence, it is in practice diminished as these surfaces become worn, also by polishing, and by the use of unguents or lubricants, which smooth the rubbing surfaces by filling their depressions. It increases, almost universally, in exact proportion with the entire pressure, owing to weight or other causes, with which the two surfaces are held together; but at very great pressures, somewhat less rapidly. Consequently, in all ordinary cases, so long as the entire weight or pressure remains the same, the friction is, in general, entirely independent of the extent of the surfaces in contact. The exceptions are, some increase when the rubbing surfaces under the same total pressure are very greatly extended, or when either surface is comparatively soft; and considerable lessening of friction when, the bodies being very hard, the rubbing surface is made very small, as in the runners of skates upon ice. For ordinary rates of motion, the total friction within a given space or distance is in like manner entirely independent of the velocity with which one surface is caused to move over the other; but in very slow motions it is increased, and in very rapid motions perceptibly diminished. Friction is also increased in proportion to the tendency of the surfaces to adhere; hence it is usually found greater between bodies of the same kind (steel on steel proving almost an exception) than between those of different kinds; it is usually greater when the surfaces have been

long in contact, and at the beginning of motion, and always so, unless corrected by lubricants, between metallic surfaces so highly polished that air may be excluded from between them. The friction of smoothly polished iron on iron has been found not quite $\frac{1}{3}$ the total pressure; of iron on brass, $\frac{1}{4}$; that of an iron axle in a box of brass, lubricated, $\frac{1}{10}$; that of brass on copper, less than on itself. The least possible friction is secured by pivots or edges of polished steel, turning in cups or grooves in the hardest gems. Applications of the above principle are seen in the use of brass boxes for axles of iron and steel, leather between surfaces of iron, &c. The brass bearings or boxes in which the iron shafts of propellers turn, however, having been found to be rapidly worn under the varying pressures due to pitching and rolling of the vessel, boxes of the hardest wood are now substituted; these being kept wet with water or oil, the heat of friction is carried off, and the wear is found to be almost inappreciable. The above principles may be still further generalized. Friction is in effect an equivalent force exerted in a direction opposite to that in which the sliding occurs. Its whole amount is the product of two factors: the first of these, which sums up the effect of the nature and condition of the surfaces, is called the coefficient of friction; the second, which is the sum of all pressures, as weight, strain, and the adhesion due to magnetism (when employed), which act to urge the two bodies together, i. e., perpendicularly to the surface of contact, is called the normal pressure. But this law holds only where, with dry surfaces, the pressure is not enough to indent or abrade either; or, with wet surfaces, not enough to force out the unguent. In either of these cases, the friction increases more rapidly than the ratio of normal pressure. The coefficient of friction (f) is thus the constant ratio of the whole friction (F) to the normal pressure (p); or, $F = p \times f$. The work caused by friction by sliding for a certain distance (s) is $W = p \times f \times s$; and in the case of wooden axles, the number of revolutions per minute (n), and radius (r), the work per second $= 0.1047 \times f \times n \times r \times p$. Extensive tables of the value of f are found in works on practical engineering. The recent results of the elaborate experiments of Morin differ in some particulars from the usually received conclusion as to the relations of like and unlike surfaces. He finds the value of f for wood on wood, dry, .25-.5; do. do., soaped, .2; metals on oak, dry, .5-.6; do. do., wet, .24-.26; do. do., soaped, .2; do. on elm, dry, .2-.25; leather on oak, wet or dry, .27-.35; do. on metals, dry, .56; do. do., wet, .36; do. do., greased, .23; do. do., oiled, .15; metals on metals, dry, .15-.2; do. do., wet, .3; smooth surfaces, with unguents occasionally applied, .07-.08; do., well applied, .05; do., best results, .03-.036. The limit of the normal pressure allowable, with unguents, rapidly diminishes as the speed increases. For lubricants, in case of very slight pressure, as in the

machinery of watches, the most limpid oils should be used; as the pressure becomes greater, successively, the thicker oils (not including the drying oils), grease, tallow with tar or black lead, black lead alone, or, with very heavy machinery, soapstone. For metal on metal, oils are best, or, if the velocity be such as to burn them, black lead; for wood, the fatty unguents and tar are preferred. The power lost in friction, as is well known, gives rise to heat; this, if moderate, is useful in softening the lubricant; if excessive, prejudicial by decomposing it, softening metal pivots, or firing neighboring combustibles. Constant and copious supply of a good unguent usually averts these effects. Elevation of temperature thus becomes a test of the value of lubricants; a rubbing velocity of 4 to 5 feet per second has been observed to heat good fatty or soapy unguents 40° or 50° , good mineral ones 30° . The obliquity or inclination of the direction of friction to the common perpendicular of the surfaces is known as the angle of repose, and it is the angle of which the coefficient of friction is the tangent. This is the angle formed by either surface, as an inclined plane, with the horizon, at which the other body, the surfaces and pressure being the same, will just begin to slide upon it by the action of gravity. At less angles, friction holds the surfaces in stable contact; and thus it becomes an element of stability in structures, walls, and fences, and of strength in cordage, thread, and woven fabrics. Rolling friction is usually very slight, and diminishes with increase of velocity; in carriages the chief resistance is transferred from the rim of the wheel to the axle, a mechanical gain; and this resistance may be further and almost indefinitely lessened, by the contrivance of an axle rolling upon the rims of smaller, or friction wheels. The resistance of cordage in machinery is due sometimes in part to ordinary friction; always in good part to friction of the fibres and their rigidity, which oppose the bending of the ropes. Applications of friction to useful purposes, beside those already named, are brakes of various kinds, the "locking" of wheels, the "shoe" used in descending declivities, and the so-called adhesion to the rails by the driving wheels of locomotives, enabling them to exert their force upon the train, which Nicklès of Nancy has proposed to increase by electro-magnetism.

FRIDAY, the 6th day of the week, called by the Saxons *Frige daeg*, or day of Frigga (the wife of Odin), whence our name, and by the Romans *dies Veneris*, or Venus's day. (See GOOD FRIDAY.)

FRIEDLAND, a town of E. Prussia, on the Alle, 27 m. S. E. from Königsberg, memorable for a battle gained by the French under Napoleon over the Russians under Benningsen, June 14, 1807, the anniversary of the battle of Marengo. After the combat at Heilsberg the Russian army, numbering about 50,000 men, under Benningsen, concentrated at Friedland. Early on the morning of June 14, Benningsen,

learning that Lannes was in the neighborhood with a single division, despatched a column to compel him to retire. Not succeeding at once, he brought out the rest of his troops, and was insensibly led into a general action against the whole French army, which, with Napoleon at its head, had been gradually assembling. By 5½ o'clock the French advanced with great impetuosity and drove the Russian left wing back to the village. A gallant charge of the Russian imperial guard had nearly changed the fortune of the day; but upon being again repulsed they retreated across the Alle, burning the bridges and suburbs behind them. The Russian centre and right, being thus unsupported, gave way after an obstinate contest, and succeeded in fording the river with nearly all their guns, though with terrific loss. The French had between 70,000 and 80,000 men in action, and lost 8,000 men and 2 eagles. The Russians lost 17,000 men and 17 guns. The battle of Friedland led to the peace of Tilsit.—Another town of Friedland in the Bohemian district of Leippa is the capital of the domain of Friedland, which now belongs to the count of Clam-Gallas, and from which Wallenstein derived his title of duke of Friedland; pop. 4,500.

FRIENDLY (or TONGA) ISLANDS, a group in the southern Pacific ocean lying between lat. 18° and $21^{\circ} 30' S.$, long. 174° and $175^{\circ} 30' W.$ The name of Tonga is that by which they are known by the natives. They were discovered by the Dutch navigator Abel Tasman in 1643, and visited and described in 1773 and 1777 by Cook, who gave to them the name of Friendly from the apparently hospitable and kindly reception he met with from the inhabitants. It has since been ascertained, however, that the character of the natives is no better than that of the other Polynesians, and that they were deterred only by fear from attacking Cook, against whom it is now known they plotted treacherously notwithstanding their warm professions of friendship. They consist of about 32 greater and 150 smaller islands, about 30 of which are inhabited; pop. about 25,000. The islands are mostly of coral formation, and are surrounded by dangerous coral reefs. A few, however, are of volcanic origin, and in Tofooa there is an active volcano. They are divided into 3 groups, viz.: the Tonga at the south, the Hapai in the centre, and the Vavao at the north. The climate is healthy, but humid; much rain falls, and none of the islands is destitute of fresh water. The mean temperature during the stay of the U. S. exploring expedition at Tongataboo (April, 1840) was 79.25° . The trade winds are by no means constant. Earthquakes are frequent, but not formidable; hurricanes both frequent and destructive. The natives cultivate yams, sweet potatoes, bananas, cocoanuts, bread fruit, sugar cane, shaddock, limes, and the *ti* (*spondias dulcis*); the pandanus is one of their most useful trees, of which they make their mats; a little corn is grown, and they have the papaw apple (*papaya*) and watermelon. The missionaries

have successfully introduced the sweet orange from Tahiti, but many other imported fruit and vegetable seeds have failed. The flora resembles that of the Feejee group. Of native quadrupeds they have only the hog, dog, and rat. Tongataboo, or Sacred isle, is the principal island. It is about 18 m. long and 12 broad; it is low and level, of coral formation, and rises nowhere more than 60 feet above the level of the sea. In pagan times it exercised a sort of religious supremacy over the other islands. The only important article of export from the Friendly islands is cocoanut oil. Port Refuge in Vavao is the best harbor, and is much frequented by British and American whalers. The port of Be'a on Tongataboo is celebrated as the place where in 1840 Capt. Croker, of H. B. M. sloop Favorite, was defeated by the pagan party. In this engagement, undertaken in behalf of the Christian missionaries and their native partisans, Croker and many of his officers and men were slain. The Friendly islanders contrast favorably with their neighbors, the Feejeeans, in appearance and disposition. The islands were formerly governed by several independent chiefs, but they are now nearly all under the sway of a native Christian prince, called King George. When pagans, the natives were devoted to war; the women went nearly naked. They offered human sacrifices, and cut off their little fingers and toes as preparatory offerings to their gods. Their mythology was, like that of the other Polynesians, a low type of polytheism. The spirits of all chiefs go to Bulotu; those of the poor people remain in this world to feed upon ants and lizards. They represent the island of Bulotu as not far distant, but do not attempt to settle its precise position. Nearly all the population of the islands is now Christian. They were first visited in 1797 by agents of the London missionary society, but in 1827 came under the charge of the Wesleyan society of Great Britain. The group is divided into 3 missionary stations, viz.: Tongataboo and Hapai, commenced in 1829, and Vavao, in 1830. The smaller islands are intrusted to the supervision of native teachers, and are visited occasionally by the missionaries. A printing press has been in operation at Vavao since 1832. Many of the women can sew, and a great number of the natives have learned to read and write, both in their native tongue and in English; a few have been taught arithmetic and geography. King George is a constant preacher, and is thus described by a missionary: "In the pulpit he was dressed in a black coat, and his manner was solemn and earnest. He held in his hand a small bound manuscript book, but seldom looked at it. It was affecting to see this dignified man stretching out his hands over his people, with one of his little fingers cut off as an offering to a heathen god." Of late years some Catholic missionaries have come to these islands from France. Intercourse with the eastern islands of the Feejee group is frequent, and many Tongese have emigrated thither.

FRIENDS, a sect of Christians, commonly

called Quakers, which originated in England about the middle of the 17th century. It was founded by George Fox, a native of Drayton, Leicestershire. He was apprenticed to a shoemaker, but at the age of 19, under the conviction of a divine call, he became an itinerant preacher, and went from place to place exhorting those who had the curiosity to hear him to repentance and the commencement of a new life. Mingled with his exhortations there was a general complaint of the coldness and insufficiency of all the religious forms and organizations then in existence, and the assertion that the office of Christian teacher had degenerated from a sacred calling to a secular trade; that nothing but a spiritual unction could fit a man to minister in holy things; and that he in whom this divine call was felt was made a minister by the very fact. The times in which Fox appeared were times of great social and religious agitation in England, the times of Cromwell and the commonwealth. The principles of religious toleration were neither understood nor practised, and George Fox immediately fell under persecution. His life was literally little better than a pilgrimage from prison to prison. But persecution, as usual, made him the object of public attention, and enlisted the sympathies of the people in his cause. His missionary life extended over 40 years, in the course of which he travelled repeatedly all over England and Scotland, beside visiting the continent, and performing a missionary tour among the infant colonies of America. After making multitudes of converts in all directions, he set about the task of organizing them into a church. That organization was original, and grew mainly out of the peculiar doctrines on which the sect was founded. Every Christian community must have its public assemblies; the sect of Friends itself could not have come into existence without them. Who were to preside and speak in these assemblies? There could be no clergy in the old sense of the term; there was no succession to presidency, or teaching by ordination; the power to teach and preside was the immediate gift of God. They came together, and those presided who were made the leaders by personal endowment. Those spoke who were moved to do so by an internal impulse, and those were recognized as teachers who were found by experience to speak to the edification of the assembly. Their church architecture was prescribed and controlled, as was everything else, by their fundamental doctrine of the "inner light" and immediate divine impulse. There was no pulpit in their churches, and there was no one authorized to stand in it if there had been one constructed; there was accordingly, in the place of a pulpit, a long row of benches, slightly elevated above the rest, which was appropriated to the elderly and more venerable members of the society, and especially to those who were oftenest impelled to address their fellow believers. It is easy to see that the ordinances would be omitted from such a church organization as this; he who

should administer them would immediately become a priest; a sacerdotal order is the inevitable result of the celebration of the rites of Christianity. There could be no such thing either as a liturgy or stated prayers; he who should from Sabbath to Sabbath officiate in this capacity, would to all intents and purposes become a clergyman, and be regarded as such, notwithstanding the doctrines of the divine call and the inner light. But Fox did not stop at the organization of single churches, for the accommodation of single neighborhoods. He instituted monthly, quarterly, and yearly meetings, which should embrace large areas of territory, and thus extend fellowship, sympathy, and coöperation among isolated societies, and keep alive the primitive idea of a church. The business of these meetings was not, as in most ecclesiastical associations, the discussion of theological dogmas, or the comparison of different theological opinions—though there were from the first in the Quaker church, as in all churches, differences of dogmatic belief—but the enforcement of a moral discipline in the discharge of the most essential duties of social life. The followers of George Fox set themselves immediately about some great practical reforms. War, slavery, intemperance, litigation, extravagance, profanity, were made the subjects of the most solemn protest, and participation in them the ground of censure and admonition, and perseverance in them the sufficient cause of expulsion from the community. The strictness of their morality was carried out into what the world considered asceticism. Fashionable dressing, dancing, and the theatre were forbidden, and the luxury of music was set aside as one of the seductive vanities of this life. The whole society was considered as bound to a watchful guardianship over the daily life of each of its members, and if one was seen going astray, his brethren were to admonish, and, if possible, to reclaim him. In the denominational meetings, or, as in other sects they would have been called, ecclesiastical assemblies, the time was taken up with subjects of practical morality; attention was rather turned to the great facts of a religious life than to the diversities of speculative opinion. On the great moral and reformatory enterprises above stated the position of the Quaker church was strong, and its opponents were compelled to admit that the Quaker profession was a guarantee of a morality above the common level of the world. There were other peculiarities, both of principle and practice, of which the Quakers were equally tenacious, which failed to carry the same moral convictions with them, and which operated to their disadvantage. They entertained the opinion that it was morally wrong to comply with the usages of society in their daily salutations and manifestations of mutual respect. They conceived that it had the evil tendency of ministering to human pride to uncover the head, or use the royal style of the plural number in the presence of each other. Accordingly, nothing could induce the Quaker to take off his hat from

respect to any human presence. He thought it his duty to use the plain address of "thee" and "thou," instead of using a plural pronoun to designate a single individual. Then the protest against the vanity of fashion in dress led them to continue to use the same style which happened to be in vogue when the sect came into existence. Thus, by a process by no means anticipated, the Quaker dress itself became a fashion, the badge and uniform of a religious sect; and it is impossible to estimate the effect, either for good or for evil, which this fortuitous circumstance has had upon the condition and fortunes of the whole denomination. Another peculiarity which the followers of George Fox introduced was the participation of women in the office of public teaching. But with the principles with which they started, it could not have been otherwise. According to their theory, the real ministry of the Christian community is merely the organ by which "the Spirit speaks to the churches." If it speaks through a woman, there is nothing to be said. Edifying speech is of itself a sufficient authentication of a religious teacher. The discerning of spirits must be of necessity as much a divine gift as the possession of supermundane power. Another peculiarity of the rising sect was of a more serious character, and led to great practical inconvenience, as it touched its relations to the state. If the power to teach and edify the church is a divine gift, and in no measure the result of study and preparation, then it would seem unreasonable that the religious teacher should have any pecuniary support, or at least that such support should be given on compulsion. He may devote himself to some secular pursuit, as other men, for 6 days of the week, and be equally prepared for his sacred function when the seventh day arrives as if he spent his whole time in study and thought. Most especially were the Quakers dissatisfied with the manner in which the clergy were supported in England by the system of tithes. The Episcopal church was a part of the civil constitution, and all the property in the realm was taxable for the support of the clergy of the establishment. The tax was levied on all holders of property, whatever might be their religious opinions. The Quaker made it a matter of conscience to resist the payment of these church dues, and hence he was harrassed by perpetual litigation. He was compelled to take an antagonistic position to the laws of his country; he regarded the law as an oppression, and the magistrate considered him a bad and contumacious subject. There was another Quaker principle which did not commend itself to the moral convictions of the public, the refusal to bear arms, and to be enrolled in the military force of the country.—The first outbreak of Quakerism was powerful; it spread rapidly, and was received in remote regions. It was established extensively in England and America, became one of the recognized sects of Christianity, and was left to its own natural laws of propagation and endur-

ance. It was found in the lapse of time to be calculated rather for permanency than increase. The quietness of its worship, and even absolute silence of some of its meetings, deprived of the enlivening influence of sacred music, which had formed a part of Christian worship from the beginning, made its assemblies unattractive to the masses, and even to the young of their own community. Another cause which set a limit to the propagation of the Quaker church was the want of a distinct clerical order, to think, write, and speak for them, and by consequence, of an extensive denominational literature. For every theological book produced by the Quakers, other sects have sent forth a hundred. No method was adopted and no pains were taken to preserve the best things of their best minds. No man who has ever attended a yearly meeting of the Friends, can deny that he has heard preaching the most pungent and eloquence of the first order. But it was unwritten, and there was no reporter. The most striking thoughts were spoken into the air, and perished with the utterance. No press multiplied them a thousand fold and scattered them broadcast over the land, or made them part and parcel of the literature of the age. The loss of power from this circumstance alone has been immense. There was another circumstance, proceeding from the same cause, which tended to circumscribe the influence of the denomination. The style of Quaker preaching, uncorrected by the free criticism of the literary world, became peculiar and technical in its phraseology. Although to the initiated it was pregnant, perspicuous, and forcible, full of meaning and edification, to a stranger it was shorn of its power by lying out of the path of common thought and expression. It has always had the merit of being eminently practical. It has never wasted much time in the discussion of doctrines, and nothing can be more simple than the practical precepts of Christianity. It was found, as years rolled on, that the Friends as a sect had strongly developed the element of endurance. In the absence of amusements and the banishment of intoxicating drinks, the most common occasions of youthful aberration were removed. It was found that though for a few years these restrictions might alienate the young from the society, the years of reflection and sobriety would generally bring them back. It was a part of the discipline of the sect to discourage marriages with the outside world, and to confine matrimonial connections to the members of their own denomination. This tended strongly to perpetuate the sect, and to keep their well-saved wealth among themselves. Another cause, however, has operated in another direction. George Fox made his converts chiefly among the rural population. They were spread almost all over England. Their property was in land and real estate, or such personal effects as were obvious to the eye of the tax gatherers, and easily subjected to assessment and distraint. The Quaker, by his principles, was bound to resist

the payment of tithes, and he did so to the damage of his worldly estate; vexation and loss were his constant portion. In the lapse of two centuries, this cause has produced a marked and important effect on the followers of Fox. It drove them from the rural districts into the cities, and compelled them to change the investment of their capital, and with it their habits and mode of life. Numbers of them accumulated enormous wealth, with which came influence and social position. They became the associates and rivals of nobles and statesmen; they found themselves in great assemblies sitting at the side of the dignitaries of the church, who had seats in the house of lords and participated in national legislation. This was certainly a great change since the days when a paid priesthood was an abomination, and the churches of the establishment were denounced and derided as steeple houses. Desertions from the profession became numerous, and what was wholly improbable and unanticipated, the deserters went directly into the Episcopal church, and adopted that form of Christianity which before had been the most obnoxious. Great wealth and unquestioned position operated likewise against the discipline of the sect. Of all discipline since the days of the apostles, that of the Friends was originally the most stringent. Delinquents and offenders were made to feel at once and emphatically that they had violated rule and were forfeiting the good opinion of their fellow Christians. Their dwellings were subjected to a domiciliary visitation, and their offences were made a matter of solemn reproof. But he who lived in a splendid palace must be endued with an eminent gift of Christian meekness, to be able to receive such a visit with any becoming degree of humility and submission; and those who administer such an act of discipline must have an assurance quite as extraordinary in order to do it with emphasis and effect. The consequence of this great change of position has been a decline of the ancient discipline, and a relaxation of the watchfulness which the Friends once thought themselves bound to maintain over each other. That neglect of discipline is symptomatic of a diminished interest in their denominational peculiarities, and this too is regarded by many even of themselves as a sign that their mission as a sect in England is nearly accomplished. It is admitted that their numbers do not increase, and that at no time have they exceeded 200,000 in England and America. They have never been solicitous, however, about their census, and no accurate return of their number can be obtained. They estimate their membership in the United States at about 100,000, principally in the states of Pennsylvania (23,000), Indiana (20,000), Ohio (14,000), New York (10,000), Rhode Island (8,000), Maryland (8,000), Virginia (6,000), and North Carolina (3,000).—The great peculiarity of the Quakers, as we have already said, was the doctrine of "the inward light," which "lighteth every man that cometh into the world." This

doctrine gives a coloring to every other religious opinion. It teaches that God gives to every human being sufficient light, if he will rightly use it, to redeem and save him. Even the heathen are taught directly by God. Those who take heed to the light shining within are progressively illuminated and prepared for heavenly happiness. Those who slight and condemn it, whether pagan or Christian, reject the counsel of God against themselves. This has been regarded by theologians of the liberal school as the basis of a great theological reform, while those of the opposite opinion looked upon it as a fatal departure from "the faith once delivered to the saints," and the introduction of other errors no less dangerous. The previous doctrine had been, that by the fall man had lost all capacity for spiritual good. It was restored only to a few, and those few selected by the divine pleasure. This appearance of partiality on the part of God was removed by the doctrine of universal light, and thus the divine administration was relieved from a supposed reproach, and not only so, but this doctrine laid the foundation of spiritual freedom and emancipation. Accordingly, the largest liberty of thought was enjoyed in the Quaker church from the very first, and the widest differences of opinion were promulgated by speech and writing, without scandal and without offence. As early as 1668, William Penn and George Whitehead held a public discussion with a clergyman of the establishment, in which they maintained that the common doctrine of a tri-personal God was not found in the Scriptures. Afterward, Penn wrote and published an elaborate treatise, which he entitled "The Sandy Foundation Shaken," in which he maintained that the common doctrines of vicarious atonement and justification by imputed righteousness were as destitute of support from the Scriptures as the Trinity itself. He lived ever after in full communion with his brethren, unaccused of heresy. Almost two centuries elapsed before there was any schism in the body on account of doctrinal speculations. About the year 1827 this peaceful sect, without creed or confession as it was, began to be distracted by dogmatic debate. A member named Elias Hicks, a native of the state of New York, began to be disturbed in the exercise of his ministry by a questioning which arose concerning his orthodoxy. He was a man of uncommon depth and strength of mind, as well as force of character, great natural eloquence, and unswerving rectitude of life. While he had embraced the religion of George Fox, he had adopted the theology of William Penn. These views he was capable of setting forth with great power, though they were only occasionally and sparingly introduced. His preaching was mainly of a practical and devotional character. By the mere force of character, talent, and industry, he rose to the first rank in his sect, and his preaching everywhere attracted a crowd. Some of his expressions were doubtless extravagant and unguarded, and led to the suspicion that he was

on the borders of total unbelief. Those who had held Quakerism with an orthodox theology became alarmed, imagining that such doctrines tended to the total subversion of the sect. But whatever might have been the alarm of a portion of the hearers of Hicks, his opinions met the convictions of a part, often of a majority of them. His doctrines were canvassed, discussed, and criticized, and everywhere became the prevailing topic of debate. Parties were formed, pamphlets were written, and periodicals were established, advocating one or the other side of the great controversy. Gradually the difference became more and more marked, till at last a schism took place in a small sect of the Christian faith which had lived in peace for almost 200 years. This division did not extend to England, and was regarded by the Friends there with great regret. But the unity of the sect once broken, other divisions have succeeded, extending to England as well as America, so that the harmony of the denomination seems to be broken up.

FRIENDS OF PROGRESS. See PROGRESSIVE FRIENDS.

FRIES, ELIAS, a Swedish botanist, born Aug. 15, 1794. He was appointed adjunct professor of botany at Lund in 1819, and professor in 1828. In 1834 he was called to the chair of economy at Upsal, to which in 1851 that of botany was attached, and in 1853 he was made rector of the university. As director of the museum and botanical garden of the university, he introduced important improvements. He has reputation not only as a botanist, but as an orator, and has twice represented the university of Upsal in the diet. His most valuable work is *Summa Vegetabilium Scandinaviæ* (2 vols., Upsal, 1846-'8). He has also published over 100 dissertations and numerous treatises on botany, especially on mycology.

FRIES, JAKOB FRIEDRICH, a German philosopher, born in Barby, Prussian Saxony, Aug. 23, 1773, died in Jena, Aug. 10, 1843. He was educated in the school of the Moravian brethren, and studied philosophy at the universities of Leipsic and Jena. He passed several years in Switzerland as a private teacher, after which he became professor of philosophy successively at Heidelberg and Jena. Being deprived of his professorship for having taken part in the democratic movement of 1819, he was in 1824 appointed to the chair of physics and mathematics in the latter university, which he held till his death. His works are numerous, chiefly upon problems of speculative philosophy. Proceeding from Kant, he inclines to the doctrine of faith as developed in the system of Jacobi. He maintains that there is only subjective certainty, that mental phenomena are the only objects of knowledge, but recognizes a principle which he names faith, by which we have a presentiment of the existence of outward things, and of the eternal existence of the ideas of the pure reason. The system of Fries formed the basis of the religious philosophy of De Wette.

FRIESLAND, or VRIESLAND (anc. *Frisia*), sometimes called West Friesland to distinguish it from East Friesland in Hanover, the most northerly province of Holland, bounded N., W., and S. W. by the North sea and Zuyder-Zee, E. by the provinces of Groningen and Drenthe, and S. E. by that of Overijssel; length 45 m., breadth 40 m.; area, 1,261 sq. m.; pop. in 1858, 270,618. The surface is mostly flat, many parts of it being lower than the level of the sea, from the encroachments of which it is protected by dikes. It is intersected by numerous draining canals, the principal of which is the Great canal, extending from Haarlingen on the W. coast, through Franeker, Leeuwarden, and Dokkum, to Groningen. The whole management of the canals, dikes, &c., is vested in a board called the *Water-Stadt*, and the expense of keeping them in repair is met by a tax levied on the land owners. The only river worth mentioning is the Lauwers. There are many small lakes. Dairy farming is very extensively carried on, 5,000,000 lbs. of butter and 1,000,000 lbs. of cheese being, on an average, annually exported. The chief manufactures are woollen stuffs, linen, sail cloth, salt, paper, starch, spirits, hardware, and tiles. A considerable portion of the people are employed in digging turf for fuel, and fishing. Capital, Leeuwarden.—EAST FRIESLAND, an old principality, now mainly comprised in the Hanoverian district of Aurich. It was part of the territory of the ancient Frisians, and in the 18th century passed to Prussia. Napoleon I. took it from the latter in 1806, but it was restored after the peace of 1814, and a little later was ceded by Prussia to Hanover. (See FRISIAN LANGUAGE AND LITERATURE, and FRISH.)

FRIEZE, in architecture, the middle, principal member of the entablature, or that part which separates the architrave from the cornice. It has a flat surface, and is often enriched by sculpture in bass-relief. The celebrated frieze of the Parthenon, which was adorned in this way, was a part of the entablature of the second or inner range of columns which surrounded the edifice.

FRIGATE, in naval architecture, originally a name for a class of long vessels common in the Mediterranean, navigated with sails and oars; now applied to ships of war, generally two-deckers, built with special reference to speed. They mount from 20 to 40 guns; sometimes more.

FRIGATE BIRD (called also frigate pelican and man-of-war bird), a tropical web-footed species, belonging to the family *pelecanidae* (Gray), and to the genus *tachypetes* (Vieillot). The bill is longer than the head, strong, hooked at the end, and sharp; wings long and pointed, the first 2 quills the longest; the tail lengthened, deeply forked, of 12 feathers; the tarsi short and strong, feathered for half their length; toes long, united by a deeply indented web; claws curved, small, and pectinated, the latter character (according to Audubon) enabling the bird to remove insects from parts of the body

and head beyond the reach of the bill; at the base of the lower mandible is a small orange-colored sac, capable of distention. The neck is short and stout, and the body slender; the plumage is compact, the eyelids, sac, and front of the upper neck bare. The color of the adult male, in the 4th year, is brownish black, with green and purple reflections; the wings are tinged with gray and brown; the tail dark brown, the shafts white underneath; bill pale purplish blue, white in the middle, and dusky at the tip; iris dark brown; feet reddish above, orange below. In the female the sides of the neck and a broad space on the breast are white, the wings and tail more brown, and the plumage of the back less shining. The length to end of tail is 41 inches, the extent of wings 7 feet or more, and the weight about 3½ lbs. Only 2 species are described by Gray, the *T. aquilus* (Vieill.), very generally distributed in the tropical regions of the globe, and the Australian species, *T. ariel* (Gould). In proportion to their size, their wings are longer than in any other bird; their flight is so powerful that they are seen more than 1,000 miles from land, and so rapid that they descend upon their prey (in the words of Audubon) "with the velocity of a meteor," surpassing even the swiftest falcons; they can glide smoothly along like a kite, and breast the hurricane without apparent effort, rising with ease above the tempest clouds whenever they please; they often fly in flocks so high as to be scarcely visible. They move with great difficulty on land, and rarely alight on the water; by raising the wings perpendicularly and spreading the half-erect tail, they readily ascend from a level surface. They do not dive in search of food, but obtain it on the wing; the smallness of the webs prevents them from being good swimmers. The food consists principally of fish, which their acute sight enables them to detect from a great height; when one sees a shoal of fish, he swoops rapidly down, but does not plunge, quickly changing his course and skimming along the surface with the neck and feet stretched horizontally; then raising the wings above the back, and fixing them one against the other, the bird darts at its prey, which it rarely fails to seize. It follows the shoals of flying fishes, and catches them in the air; it also picks up dead fish and floating garbage like the gulls; during the nesting period young birds form a favorite article of food, its own nestlings suffering in like manner from the turkey buzzards. But its favorite way of providing for its wants, and that which has given it its warlike name, is that pursued by the bald eagle with the fish hawk; possessing great strength, and with superior power of wing, it pursues the terns and gulls which have secured a fish, and by beating them with wings and beak forces them to drop or disgorge it; then descending with great rapidity, it seizes the prey before it reaches the water. It is believed by some that they harass the pelicans and boobies in this manner, but Audubon and others say that this is not the

case, as these large birds, with a single stroke of their powerful bills, could easily destroy their aggressors. They are very quarrelsome, and the robbers despoil the original thief whenever opportunity offers. With all this strength of wing, Audubon says the keel of the sternum is no more developed than that of the short-flying grouse and partridge, showing the insufficiency of this bony crest as a means of indicating the power of flight. They are not shy; when shot at and wounded they disgorge the contents of the stomach, generally of the most fetid character; their only note is rough and croaking, and very seldom uttered; the flesh is totally unfit for food. They are rarely found further north than Charleston, S. O., but are abundant in the south from Florida to Texas, and in California. These marine vultures, as they have been called, breed in great numbers on the Florida keys, generally making their nests of coarse sticks in mangrove trees, beginning about the middle of May; the eggs are 2 or 3, about 8 inches long and 2 broad, of a greenish white color; the young grow slowly, and are fed by regurgitation.

FRIGGA, the highest and eldest goddess of the ancient Scandinavians, the daughter of Fjörgyn, wife of Odin, and mother of the race of Asen or celestial gods. Her dwelling place is the magnificent mansion of Fensalir (the marshy halls), which denotes the deep, moist earth; and in the representation of the Asen as the children of Odin by Frigga or the earth, the idea is expressed that the supreme Being united himself with the earth to produce the inferior divinities. The favorite servant and intimate confidant of Frigga is Fulla, who is the 5th in rank of the goddesses, and is intrusted with the toilette and most important secrets of her mistress. Gna, the 13th of the goddesses, is Frigga's messenger to the various worlds.

FRINGE TREE (*chionanthus Virginica*, Linn.), a beautiful tree of 10 or 20 feet in height, with somewhat oval, smooth, entire leaves, remarkably 4-cornered pyramidal buds, white, narrow-petalled flowers in drooping racemes, and oval, purple drupes, growing wild at the south. Its light and pure clusters of blossoms are not only suggestive of its English name, but of the generic title of *chionanthus*, blossoms of the snow. It is found in the United States from latitude 39° to the gulf of Mexico, and forms an attractive feature in garden shrubbery.

FRISI, PAOLO, an Italian mathematician and philosopher, born in Milan, April 13, 1728, died in the same city, Nov. 22, 1784. He studied with the Barnabites, whose order he entered, and he composed at the age of 22 years a dissertation on the shape and size of the earth, demonstrating more completely than Newton had done its spheroidal figure. He was professor of philosophy successively at Casale, Novara, Milan (1753-'56), and Pisa (1756-'64), and also taught mathematics at Milan. He afterward travelled through France, England, Holland, and Germany, and was received with distinction by the savants of those countries. He was

consulted in numerous disputes concerning rivers and torrents, directed a school of architecture at Milan, and was the first to introduce the lightning rod into Italy. The most important of his numerous writings is the *Cosmographia Physica et Mathematica* (Milan, 1774-'5), which has been compared with the *Mécanique céleste* in practical utility to the astronomer.

FRISIAN LANGUAGE AND LITERATURE. The *Freesche Sprék* is one of the most ancient Teutonic dialects, belonging to the low German group, nearly related to the old Saxon and Anglo-Saxon, as well as to the Icelandic. The rhyming chronicle of Klaas Kolins (1190) shows its transition into the Flemish, out of which the Dutch was developed in the 14th and 15th centuries. Its ancient form exists only in some very remarkable ancient books of law, and its modern vernacular tongues are of 8 kinds, viz.: the N. Frisian (*Strand-Vriesisch*), on the W. coast of Schleswig, on its islands, and on Helgoland; the Westphalian varieties of Rustringen, Wursten, E. Friesland, and Saterland (between Ems and Münster); and the Batavian, whose varieties are the common W. Frisian, and those of Mulkweren and of Hinderloopen. In this language the demonstratives *thi*, *thju*, *thet*, answer to the German articles *der*, *die*, *das*. The declension and other accidents of the noun are similar to those in Anglo-Saxon and German. The personal pronouns are: *ik*, I; *thu*, thou; *hi*, *hju*, *hit*, he, she, it; *wi*, we; *i*, you; *hja*, they. The numerals are: *én*, *twá* (*twéne*), *thryu* (*thre*), *fjuwer*, *fif*, *sex*, *sjugun*, *achta*, *njugun*, *tian*; *andlota*, 11; *twilif*, 12; *fiftine*, 15; *twintich*, 20; *thritich*, 30; *hundred*, *thusend*, &c. The following are examples of verbs: *ik brensze*, I bring; *thu brenchst*, thou bringest; *hi brencht*, he brings; plural, *brenszath*, &c.; imperfect, *brochte*; passive participle, *ebrocht*, brought; *hi heth esweren*, he has sworn; *is efunden*, is found; *sketh-er enich daddel*, if there happen any death or murder. The derivation and composition are analogous with those in other Germanic tongues. The syntax is less Latinical than that of the Anglo-Saxon; e. g.:
Hwer sá him sine clathar wet werthat.
 Where so him his (Ger. *seine*) cloths wet become.
Thruich thet, thet ma hach alle thjiva
 Though that, that one (Ger. *man*) has all thieves
alsá feste to bindande thet se nene monne nenne
 so fast to bind that they no man none
skatha ne due.
 Injury (scathe) no do.

In this sentence three negatives are used to express a simple negation.—In the literature of the old Frisian we find the most ancient sources of Teutonic jurisprudence, the most important of which are: the *Sendrjucht* (ecclesiastical law), edited by Winsem (Franeker, 1622); *Ost-Frieslandrecht*, by Wicht (Aurich, 1746); *Hunsinger Landrecht* of 1252 (Groningen, 1778); *Fivelinger und Oldamster Landrecht*, by Wiarda (1784); *A-sega-buch* (right-say book) of the Rustringians on the Weser, with a German version by Wiarda (Berlin, 1805); *Will-Kären*

(decisions, arbitrations) *der Brokmänner* (a free Frisian people), by the same (1820); *Emsiger Landrecht* of 1812 (Hanover, 1824). Collections of Frisian laws have been made by G. F. van Schwartzenberg (Leeuwarden, 1768). Diplomas and other documents are contained in the histories of Friesland by Schotan and Winshem. See also Montan. Hettema's *Jurisprudentia Frisica* (1834), and "Journey through the Sagelterland" (Saterland), 1836. Among the few specimens of Frisian literature are: the "Wedding of Waatze Gribberts," a comedy (1712); the "Life of Aagtje Ysbrants," a novel; the poems of Alhuysen (Leeuwarden, 1755); Wiarda's history of the language (1784), and of Friesland (1791); and Michelsen's "History of North Friesland" (Schleswig, 1828).—For Frisian grammar, see the *Friesche Rymlerie*, by Gysbert Japicz (Franeker, 1684). Some scattered and not altogether faultless materials on the subject are found in Jacob Grimm's *Deutsche Grammatik* (Göttingen, 1819). See also B. Bendsen's North Frisian grammar; R. Rask's grammar, translated into German by F. H. Bass (Freiberg, 1834). Among Frisian vocabularies are Wiarda's *Alt-Friesisches Wörterbuch* (Aurich, 1786, inaccurate); Japicz's *Door Epkema, Woordenboek op de Gedichten* (Leeuwarden, 1824); and N. Outzen's *Glossarium der Friesischen Sprache* (Copenhagen, 1837).

FRISII (in the Frankish period also *Frisonen* or *Frisiones*), a German tribe, who in the time of Drusus dwelt between the mouths of the Rhine and the Ems, N. of the district inhabited by the Bracteri, in the modern provinces of Friesland and Groningen. Having lived on friendly terms with the Romans for some time after the first expedition of Drusus, they were soon driven to hostilities by oppression, were partially subdued in 47, and rebelled again with the Batavians under Civilis. In the 5th century a host of Frisii joined the Saxon invaders of Britain. They were afterward subdued by the Franks and converted to Christianity, and Charlemagne defined their rights in 802 by a *Lex Frisionum*. Their country was divided into 8 districts, 2 of which were annexed on the division of the Carolingian empire to the possessions of Louis the German, and one to those of Charles the Bald. The latter part was called West Frisia (W. Friesland), the two former together East Frisia (E. Friesland). The limits of the modern provinces of the same names, however, do not precisely coincide with those of the time of the division. The distinctive national features of the people were gradually lost by continual contact with their neighbors, and their modern history is chiefly connected with that of the Netherlands and Hanover.

FRITH, or FIRTH (Lat. *fretum*, a strait), properly a narrow passage of the sea, or a deep narrow inlet, particularly on a rocky coast; but in Scotland the name is generally applied to the estuaries of the most important rivers. It is equivalent to the Danish and Norwegian *fjord* and the Icelandic *fiördur*.

FRITH, WILLIAM POWELL, an English artist, born in Harrogate, Yorkshire, in 1820. He is one of the most successful painters of *genre* of the modern English school, selecting his subjects from Shakespeare, Cervantes, Goldsmith, the "Spectator," and kindred sources. Of late years he has produced some striking representations of every-day life.

FRITZ, SAMUEL, a German Roman Catholic missionary, born in Bohemia in 1650, died in Xeberos, Ecuador, in 1730. Being sent as a missionary to the Omagua Indians of South America, he selected as his field of labor the district between the mouths of the Rio Napo and the Rio Negro on the upper Amazon, where in 1688 he had succeeded in attaching 5 other tribes to the Omaguas, among whom he had established 40 missions. The whole number of Indians to whom the gospel was thus preached was about 40,000, forming an active and peaceful population, living in admirable order, distributed into 6 provinces, each of which had its capital. Having in passing through Portuguese territory made geographical observations for the construction of a map, he was arrested by order of the governor of Para, and obtained his liberty only by appeal to the king of Portugal. In 1710 the war of the Spanish succession which was occupying Europe seemed to the Portuguese of Para sufficient reason for making an irruption into the country of the upper Amazon, and of the Indians in the district of Father Fritz more than 20,000 were carried captive to Para, and most of the others fled to their native forests. The missionary bore his complaints to Quito and Lima, but was never able to reestablish his Indian villages. He made a large map of the river Amazon, which long maintained its authority.

FRIULI (Germ. *Friaul*; anc. *Forum Julii*), an old province of N. Italy, formerly divided between Austria and the republic of Venice, and now forming the circle of Goritz, part of Trieste, and the delegation of Friuli or Udine in Venetia. It was one of the most important duchies of the Longobard kingdom, and after the overthrow of that monarchy by Charlemagne, and even up to the 15th century, when it was conquered by Venice and its territories dismembered, it retained a considerable degree of independence. The modern administrative division is bounded N. by the Tyrol, N. E. and E. by Illyria, S. by the Adriatic and the delegation of Venice, S. W. by Treviso, and W. by Belluno; area, 2,520 sq. m.; pop. in 1850, 429,844. It is watered by numerous rivers and traversed by the railway from Trieste to Venice; its S. part is fruitful in grain and the vine, and the more hilly districts in the N. afford excellent pasturage. There are extensive marshes near the coast, but the climate is generally healthy. More cattle are reared here than in any other part of Austrian Italy. Iron and copper are worked to some extent; there are 6 quarries of good marble, and fine potter's clay is easily manufactured. Capital, Udine.

FROBEN, or FROBENTUS, JOHANN, a Swiss printer, born in Hammelburg, Franconia, in 1460, died in Basel in 1527. He was an intimate friend of Erasmus, whose works he published, and was the first to introduce into Germany the Roman letter in place of the Gothic characters. The emblem of Froben was the caduceus of Mercury surmounted by a dove, and with mottoes in Hebrew, Greek, and Latin.

FROBISHER, SIR MARTIN, the first Englishman who attempted to discover a N. W. passage to Asia, born near Doncaster, Yorkshire, in what year is not known, died in Plymouth, Nov. 7, 1594. After spending 15 years in fruitless endeavors to get up an expedition, he at length obtained the patronage of Dudley, earl of Warwick, and with 3 barks sailed from Deptford, June 8, 1576, going as far as Labrador and Greenland, discovering the strait now known by his name, and returning in October. Indications of gold were discovered, which led to the despatch of a large squadron in the following year; and the ore brought back being thought valuable, still a third expedition was fitted out with 15 ships in 1578, but the fleet, being scattered by storms on the coast of Greenland, was obliged to return early in the winter without having effected any settlement. In 1585 Frobisher went with Sir Francis Drake to the West Indies; and in 1588, on the defeat of the Spanish armada, was knighted for his services in the action. He afterward commanded a fleet on the Spanish coast, and in 1594 supported Henry IV. against the leaguers and Spaniards, and died of a wound received in an attack on Croyzon.

FROBISHER STRAIT, an arm of the sea in British North America, setting up westward from the Atlantic near the entrance to Davis's strait, between Hudson strait and Northumberland inlet. It separates the regions called Metaincog and Nita, is 240 m. long, 30 m. in average breadth, and has rugged and mountainous shores. It was discovered by Sir Martin Frobisher in 1576.

FROEBEL, FRIEDRICH, a German educator, founder of the *Kindergärten* system of schools for children, born in Oberweissbach in 1782, died in Marienthal, June 21, 1852. In 1826 he published the 1st volume of his work on education (*Die Menschenerziehung*). In this work, as well as in a weekly journal which he edited subsequently (*Wochenschrift für alle Freunde der Menschen Bildung*), he advocated a full and harmonious development of the human faculties. In 1837 he founded a school or *Kindergarten* for little children at Blankenburg, Thuringia, which became the model of similar institutions in many parts of Germany and in foreign countries, especially in Switzerland. His object was to give a wise direction to the mind of the child from its earliest infancy; he regulated the amusements of the children, and rendered them happy at the same time that he endeavored to teach them to think. The duke of Meiningen gave him the use of his mansion of Marienthal, near Liebenstein, for the establishment of a normal

school, where female teachers were instructed. His system of education, however, subjected him to many attacks and misrepresentations. The great freedom which he allowed to the children was considered dangerous, and his schools were denounced as nurseries of socialism and atheism. His nephew, Karl Froebel (born in 1808), had founded a school for girls at Hamburg, the programme for which furnished a pretext to the Prussian government for prohibiting (Aug. 7, 1851) all *Kindergärten* in which the Froebel system of education prevailed. Saxony also prohibited them, but they continue to exist in other parts of Germany.—JULIUS, nephew of the preceding, a German author and traveller, born in Griesheim in 1806. He is the son of a clergyman, and engaged successively at Stuttgart, Munich, and Weimar in various scientific, literary, and statistical labors, the proceeds of which gave him the means of attending the university of Jena and afterward of Berlin. In 1833 he was appointed professor of geography, natural history, and history, at Zürich. Subsequently he officiated in the high school of that city as professor of mineralogy, to which science he has made an important contribution by his *Grundzüge eines Systems der Krystallogie* (Zürich, 1843; 2d ed. 1847). Having become a naturalized citizen of Switzerland in 1826, he took part in politics, in the interest of the extreme radical party, and edited the "Swiss Republican." He also founded a publishing house at Zürich and Winterthur under the name of *Literarisches Comptoir*, and, devoting himself exclusively to this establishment, he relinquished his professorship in 1844, and issued several scientific works and many political pamphlets, which found a large circle of readers. But many of them were suppressed by the government, and having returned to Germany, he was expelled from the Prussian territory and took up his abode in Dresden until the revolution of 1848, when he became a popular leader of the democratic party and a member of the German parliament at Frankfort-on-the-Main. He accompanied Robert Blum to Vienna, was arrested, but acquitted by the same court martial which pronounced the sentence of death upon his unfortunate friend. On the dissolution of the parliament he repaired to Switzerland, and afterward to the United States. He lectured in New York on German politics, engaged in commercial pursuits there, went in 1850 to Nicaragua, and afterward engaged in one or two commercial expeditions to Santa Fé and Chihuahua. In 1855 he edited a journal at San Francisco, and in 1857, after his return to Germany, he was expelled from Frankfort—a proceeding against which the American consul protested upon the ground that he had become a naturalized citizen of the United States. He has since resided in London. Among his works, which include many on geography and politics, are: *System der sozialen Politik* (2 vols., Mannheim, 1847); *Die Republikaner*, a historical drama (Leipsic, 1848); and *Aus Amerika*, Er-

fahrungen, Reisen und Studien (2 vols., Leipzig, 1858). An English translation of the latter work appeared in London in 1859 under the title of "Seven Years' Travel in Central America, Northern Mexico, and the Far West of the United States."

FROG, a well known batrachian reptile of the anourous or tailless order, embracing the group *phaneroglosses* (Dum. and Bib.), with the families *ranidæ* or common frogs, and the *hyladæ* or tree frogs. The general characters of the class and order have been sufficiently given in the article AMPHIBIA, so that the principal families, genera, and species will only be mentioned here. The family of frogs or *ranidæ* includes those genera the free extremities of whose fingers and toes are not dilated into disks, and whose upper jaw is provided with teeth; among these there are many whose thick and clumsy bodies resemble those of toads (*bufonidæ*) rather than of frogs; in addition to maxillary teeth, most have also teeth on the palate and vomer, whose groupings, together with the form of the tongue and the visibility of the tympanum, are characters distinctive of genera and species. Almost all have, in the males, the vocal vesicles in the throat, communicating with the mouth, by the entrance of air into which their remarkable and loud sounds are produced; the nostrils open laterally, near the end of the snout; they have 4 non-palmated fingers, with the rudiment of a thumb, and 5 webbed toes; the back is generally irregularly roughened by glandular and other eminences, while the under surface is smooth. Frogs pass most of their time in the water, being excellent swimmers; the length of their hind limbs enables them to make considerable leaps, and to travel over land in this way long distances in search of water; they are unable to climb trees, like the family *hyladæ* or tree frogs. Some species prefer moist localities and damp woods, where they hide in the grass and under leaves; others dwell in subterranean hollows which they dig on the borders of marshes, coming forth at evening or on rainy days. All the species when adult are decidedly carnivorous, even the smaller eating mollusks, insects, and worms, and all are characterized by great voracity. The frog family is found throughout the globe, though most abundantly in America; indeed 5 of the 8 genera admitted by Duméril and Bibron are peculiar to the new world; after America come Asia, Europe, Africa, and Polynesia, in the order of abundance of species. Of the numerous genera described, the genus *rana* (Linn.), which includes the common frogs, is the best known and the most interesting. The principal characters of the skeleton of the frog are the small number of vertebræ, the absence of true ribs, the development of the transverse processes of the sacrum, the mobility of the iliac bones, the length of the coccyx, the presence of occipital condyles and an arch of scapular bones constituting a shoulder, and the elongation of the bones of the lower extremi-

ties. The muscles of the thigh and leg resemble considerably those of man and mammals. When a frog is at rest, the articulations of the pelvis, thigh, leg, and foot form 4 great folds or levers, by the sudden opening of which at the same time its remarkable leaps are effected; the swimming of the frog, which has erroneously been taken as a model for man in this respect, consists in a series of horizontal leaps, the body being sustained by the water, and its general form offering little resistance, and the anterior limbs being folded against the trunk instead of acting as aids to the legs in locomotion; walking of course must be difficult and slow where there is such disparity in the length of the arms and legs. The skin is smooth, made up of the usual layers, and in many parts of the body separated from the muscles to such an extent that it may be considerably distended at the will of the animal; the thin epidermis is frequently renewed; in the pigment layer are seated various colors, especially bright in the season of fecundation. The sense of smell is very imperfect; the tongue is not an organ of taste but of prehension, soft and covered with a viscid mucus, its base attached to the concavity of the lower jaw, its bifurcated point extending backward, and the whole organ capable of being projected from the mouth in a reversed position for the seizure of its insect prey; the organ of hearing has a tympanum, and an aerial cavity under it communicating with the throat. The mouth is very widely cleft, and some of the larger species have been known to swallow small mammals and birds; like other amphibians, they cannot drink. The structure of the heart, gills, and lungs, and the phenomena of the circulation in the tadpole and adults, and of the branchial, pulmonary, and cutaneous respirations, have been described in the article AMPHIBIA. The well known voice of the frog varies so much in intensity and tone as to render it difficult from the sound to ascertain the distance of the animal, far surpassing in this respect the efforts of the most skilful ventriloquist; it can make a dull sound even under water. Among the many authors who have attempted to imitate in words the sounds of the frog, one of the most successful is Aristophanes, in whose comedy of the "Frogs" a frequent verse in the chorus is *brekekekex koax koax*, whose night-long repetition in spring and summer sometimes renders sleep impossible to those unaccustomed to it. By their power of retarding or accelerating the respiratory movements, and of aerating the blood through the vessels distributed to the skin, frogs are able to resist considerable changes of cold and heat, and to sustain life during their winter torpidity; the absorption and exhalation performed through the skin explain their occurrence and prolonged existence under circumstances where ordinary animals would soon perish, as under water and in air-tight places. The sexes are separate, and the reproductive functions are performed in the same mechanical and passionless manner as in

most fishes; the ova are fecundated at the moment of their exclusion. As the eggs are expelled they are enveloped in a glairy mass, in which the embryos are seen distributed like black dots; the development is very rapid under favorable circumstances of temperature, the head and tail becoming perceptible in the course of the 2d day, the gills on the 3d, and the tadpole at the temperature of 80° F. (as in Rusconi's experiments) may leave the egg on the 4th or 5th day; but in the ordinary seasons of temperate Europe and America, the young are not hatched until about a month after the deposit of the eggs. The tadpole is half an inch long when hatched; the mouth is distinct, but small and without lips; the gills rapidly enlarge, and when at their maximum development afford beautiful objects for displaying the circulation; the gills soon begin to decrease in size, and are finally withdrawn within the branchial cavity, as in fishes, and concealed by an opercular fold of integument; the eyes are perfectly formed; the mouth acquires movable lips, is placed nearer the end of the head, and is used for the introduction of vegetable food; the caudal fin increases in size, and serves for rapid locomotion. Without any great change in form, the size is rapidly increased; 2 small tubercles appear near the vent, the rudiments of the posterior legs, which are soon developed into the perfect limbs; the anterior limbs are afterward formed under the skin in a similar manner; as the legs are perfected the tail is gradually absorbed from the tip to the base, and progression is effected by the hind limbs. The lungs are now fitted for the respiration of air, and the little creatures come on land in search of worms and insects, and in such multitudes in damp weather as to give rise to the belief, still popularly adhered to in many places, that it has rained frogs. They grow rapidly during the summer and autumn, and in winter plunge into the mud to pass their stage of hibernation. In the tadpole state great numbers are devoured by fishes, other reptiles, and by each other; and the adults furnish food for all classes of vertebrata from fishes up to man himself. It is probable that not more than one in a thousand of those which come from the egg in the spring live to reach their winter retreat; if fortunate enough to escape from all enemies, frogs may live many years. Serpents among reptiles, pickerel among fishes, vultures, storks, herons, and cranes among birds, are the worst enemies of frogs; were it not for the storks of Egypt, that country would be overrun with frogs. When it is remembered that each female frog of the hundreds in a single locality may produce 1,000 young, which hide in crevices in the earth and under stones, ready to come forth to enjoy the genial summer showers, there is no necessity for any attempt to explain the appearance of the frog multitudes by supposing them to have fallen from the clouds, as has been believed even from the time of Aristotle, or by the supposition that they have been taken up from some marsh by a

whirlwind and let fall during a rain; the latter occurrence, on a small scale, is not impossible, in exceptional cases. The frogs which thus appear bear marks of their recent metamorphosis, in the remnant of a tail and other organs; crawling as they naturally would into the ground, the swelling of the earth from rain would drive them out by compression. From facts recorded in the "Annals and Magazine of Natural History" (1858, pp. 841 and 482), it would seem that frogs and toads may be reproduced without passing through the intermediate stage of tadpole; it is only of late years that many common fishes have been ascertained to be viviparous, and it is not improbable that eggs laid in localities where water cannot be obtained, as in cellars and hot houses and beds, may produce frogs, whose larval form is very soon exchanged for the perfect state, the gills being prematurely cast to enable the animal to accommodate itself to its new circumstances; and it may be, as Mr. Jenyns remarks, that the frogs are hatched on land in the perfect state, the gills either never having existed or having disappeared immediately after birth. On the other hand, it has been ascertained that the larval or tadpole state may be unnaturally prolonged; Prof. J. Wyman (in the "Proceedings of the American Academy of Arts and Sciences," vol. iii. p. 85) experimented on the tadpoles of the common bullfrog, the greater number of which pass the winter without having undergone metamorphosis, not becoming perfect animals until the following spring; he found that the tadpole state, by the influence of darkness and low temperature, could be prolonged certainly from one to two years, and probably much longer; possibly some of the cases referred to by Mr. Jenyns and others may admit of explanation by prolongation rather than an absence of the larval condition, the young frogs having been the result of tadpoles which had passed their larval condition in some other locality, or in the same in a torpid state for a year.—The tenacity of life in frogs is very great; they survive the severest wounds, live a long time after the heart and entrails are removed, and display muscular contractility and the phenomena of circulation in various organs for many minutes and even hours after death has actually taken place. On this account the frog has from time immemorial been selected as a subject of experiment to ascertain and illustrate the most important phenomena of human physiology, and has in this way been of inestimable advantage to mankind. The change of a fish-like animal, breathing by means of gills in water, to a leaping, air-breathing creature, with the corresponding modifications of food and habits, is well calculated to excite the admiration of a thinking person. The air cells of the frog's lungs, the membrane of its foot, and the delicate fringe of the tadpole's gills, afford admirable and easily obtained tissues for demonstrating under the microscope the circulation in the capillary vessels, with their chains of moving blood globules. The structure of the lungs and

the mechanism of their respiration furnished to anatomists and physiologists proof of the changes which the blood undergoes under the influence of the oxygen of the air through the medium of a thin intervening vascular wall. The sensibility of their muscles to the galvanic currents led Galvani and Volta to most important discoveries in electricity and galvanism, whence flowed the great results obtained by Bell, Faraday, and Matteucci in the physiology of the nervous system, and by Davy and others in physics and the chemical constitution of bodies previously supposed simple. The phenomena of cutaneous absorption, exhalation, and respiration have derived their fullest illustration and explanation from experiments made on the soft and naked skin of the frog. Thus this despised creature has rendered the greatest services to anatomy, physiology, physics, and chemistry, and has thrown light which no other animal could on the functions of innervation, muscular contractility, circulation, respiration, absorption, and generation. The frog is not only a graceful and harmless animal, but is actually useful in destroying insects and slugs injurious to vegetation. Though in England and the United States frogs are rarely eaten by man, in France and southern Europe they are largely consumed as food; they are caught in various ways, and are preserved in large "froggeries" until wanted for the table; the flesh is most delicate and nutritious at the time when they are about to enter their winter quarters, yet great numbers are eaten in the spring, when they are more easily caught; the hind limbs are generally the only part eaten, and these are cooked in various modes, in all of which they are as much more delicate than chicken as that is superior to veal and pork. In the materia medica the flesh of frogs has long been used by continental physicians as the basis for anti-scorbutic and restorative broths.—The largest species of the genus *rana* in the United States is the bullfrog (*R. pipiens*, Latr.), which often measures when extended 18 or 21 inches; the general color above is green in front, dusky olive behind, with irregular black blotches, and below yellowish white, with dusky marks; the limbs dusky, with black bars. The bullfrog, so called from its loud voice, is rather solitary in its habits, living about stagnant and sluggish water, not very abundant in one place except during the breeding season; it is the most aquatic of the frogs, and an excellent swimmer, often living for years in wells, where it is allowed to remain under the supposition that it purifies the water; it is also an active leaper, taking to the water when alarmed. Its voracity is extreme; it devours young ducks, snakes, moles, mice, insects, worms, snails, its own tadpoles, and any small animal it can catch; it does not seize prey unless alive or in motion. The species is very generally distributed over the United States. A smaller species, the northern bullfrog (*R. Horiconensis*, Holbr.), is dark olive above, silvery and flesh-colored below; found

near the outlet of Lake George. The spring frog (*R. fontinalis*, Le Conte) is green above, with dusky spots behind; throat and abdomen yellow; hind limbs dark green, with dusky bars; a cutaneous fold or ridge from the orbit to the hind legs; the total length is about 8½ inches; it is fond of springs of cold water, and feeds on worms and insects; it is common from Maine to Virginia. The marsh frog (*R. palustris*, Le Conte) is pale brown above, with 2 longitudinal rows of dark brown square spots on the back and sides, yellowish white below, with the posterior half of the thighs bright yellow mottled with black; it is slender and delicately formed, about 8 inches in total length; it is found from Maine to Virginia, on the borders of marshes and pools, and sometimes at a great distance from water; it has a peculiar strong and disagreeable odor; from its being a favorite bait for pike, it is often called the pickerel frog. The shad frog (*R. halocina*, Kalm) is one of the handsomest species, being green above, with ovate spots of dark brown margined with yellow, and yellowish white beneath; it is about 8½ inches in total length, active, and able to leap a distance of 8 to 10 feet when alarmed; it is called shad frog from its appearing in the middle states in the spring with this fish; it is also called water and leopard frog; it is very widely distributed in the United States, and is the nearest representative here of the common frog of Europe, being like that sought after by epicures. The wood frog (*R. sylvatica*, Le Conte) is pale reddish brown above, and yellowish white below; the head has a dark brown stripe extending from the snout to the tympanum through the eye; the total length is a little over 5½ inches; it is found from Michigan to the Carolinas, chiefly in thick woods, preferring those of oak; it is active, when pursued hiding itself under leaves; it rarely approaches water except in the breeding season. The crying frog (*R. clamitans*, Boac), a slender species, is olive-colored in front, dusky behind, and silvery white below; the total length is 8½ inches; it is very active, and when leaping frightened into the water utters a short loud cry; it is a southern species, taking the place of the spring frog of the north.—Like all other reptiles, the common frog of Europe (*R. temporaria*, Linn.) differs from all American species; the color is generally brown, inclining to reddish or yellowish above, with irregular spots of black or brown, and transverse bands on the legs, and yellowish white below with smaller and fewer spots; the most constant mark is an elongated brown patch behind the eye on each side; the total length is about 7 inches; it is found very generally over Europe. The green frog of Europe (*R. esculenta*, Linn.) is of a general greenish color above, with black or brownish marks, and sometimes with 3 yellow stripes on the back, and yellowish white below; the total length is about 8 inches; it is distributed over Europe, Asia, and northern Africa, and is the species most sought after for food.—There are several species of small frogs,

principally American and subtropical; belonging to the genus *cystignathus* (Wagler), characterized by the almost entire absence of webs to the toes; for their description the reader is referred to the works of Dr. Holbrook (vol. i.), and of Duméril and Bibron (vol. viii.). The genus *ceratophrys* (Boie) or *phrynoceros* (Tschudi) will be described under HORNED FROG; the tree frogs (*hyla*, Laurenti) and the peeping frogs (*hylodes*, Fitz.) will be noticed under TREE FROG, belonging as they do to the family *hyladae*.—The frogs are considered by Agassiz lower than the toads among anourous batrachians, on account of their aquatic habits, the persistence of the embryonic webs between the toes, and the non-existence of glands developed in the substance of the skin. The family *ranidae* are the most numerous represented of the fossil anourous batrachians, and their remains occur in the tertiary and diluvian formations, sometimes of large size. The gigantic *cheirotherium* or *labyrinthodon* is placed by Jüger, Fitzinger, and Owen among batrachians; this immense frog-like animal, with a head 2 or 3 feet long and the body 10 or 12, first appeared in the carboniferous period, was abundant in the triassic, and probably disappeared before the jurassic epoch. This creature, whether saurian or batrachian, is interesting in connection with the fossil footprints of the Connecticut valley. (See FOSSIL FOOTPRINTS.) From facts now ascertained it would appear that the muddy shores and flats of remote geological ages were inhabited by batrachoid forms as strange as the flying *pterodactyle* or the great *ichthyosaurus* and *plesiosaurus*, and that possibly frogs 12 feet long (like *cheirotherium*), and deprived perhaps of anterior extremities, leaped and croaked in the ancient marshes.

FROISSART, JEHAN, or JEAN, a French chronicler and poet, born in Valenciennes in 1337, died in Chimay about 1410. His father, a heraldic painter, destined him from infancy to the clerical profession, although his natural disposition seems not to have fitted him for that calling. He was scarcely 20 years old when, upon the invitation of Robert of Namur, lord of Beaufort, he undertook to write a history of the wars and adventures of his time. He compiled from the *Vraies chroniques* of Jehan Le Bel, canon of St. Lambert in Liège, the 1st part of his own "Chronicles," embracing the period from 1326 to 1340. When this was completed he went to England in 1360 and presented it to Philippa of Hainault, the queen of Edward III., who richly rewarded him. But the queen, discovering that he was the victim of a hopeless passion for a lady of exalted rank in his own country, out of compassion sent him back with a good equipment. In 1362 he returned, and was made clerk of her chapel (having already taken holy orders), and also her secretary. In 1364 he visited Scotland, where he was kindly treated by King David Bruce, and enjoyed the hospitality of the Douglasses. He made his journeys on horseback, attended only by his

greyhound, and gathering on his way much valuable information, which he used afterward in the continuation of his *Chronicles*, which henceforth embodied the results of personal observation and experience. After gathering ample materials in Great Britain, he returned to the continent, and in 1366 went to the English court at Bordeaux. Thence he returned for a short time to England, and in 1368 we find him accompanying Lionel, duke of Clarence, to Italy, and, with Chaucer and Petrarch, witnessing in Milan the celebration of the marriage of that prince with the daughter of Galeazzo Visconti. He visited several other Italian courts, and large gratuities were bestowed upon him by some of the Italian princes. In 1369 his protectress Philippa of Hainault died, and he commemorated her virtues in an elegy; he has also feelingly narrated her death in the 2d part of the 1st book of his *Chronicles*. He now repaired to his native country, where he obtained the living of Lestines. But the life of a country priest did not suit him, and he attached himself to Wenceslas of Luxembourg, duke of Brabant, a liberal, pious, and courteous prince, and himself a poet, who intrusted him with the care of collecting and writing down his rondeaus, ballads, songs, and virelays. To these Froissart added some of his own compositions, and the collection formed a volume with the title of *Melyador*, or the "Knight of the Golden Sun." But Wenceslas died before the work was completed, and Froissart had to look for other employment. Guy, count of Blois, made him clerk of his chapel, and sent him with a letter of introduction and gifts to Gaston Phébus, count of Foix, at whose court Froissart found himself in a congenial sphere. After sojourning a long while at Orthez and receiving from Gaston Phébus on his departure a gratuity of 80 florins, he accompanied this prince's niece, Jeanne de Boulogne, when she went to Riom to marry the duke of Berry. Thence he repaired to Paris, and visited the lord of Coucy in his castle of Crèvecœur, receiving from him much valuable information upon the political relations between France and England. He afterward travelled again through Holland, Languedoc, and other countries. In 1390 he settled at Chimay, having been appointed canon and treasurer to the church there, and, with the exception of the time spent in a visit to England for the purpose of presenting Richard II. with a collection of his poems, he there devoted his later years to the completion of his great work. His book is a living picture of his age. An admirer of heroic deeds, an instinctive courtier of every prince or lord, delighted with feasts and pageants, he vividly depicts all that interests him, and gives more prominence to individual exploits than to important events. He is devoid of patriotism, and shows no partiality to the French, narrating their defeats with as much gusto as their victories; he has no philosophical views nor political opinions; but he is incontrovertibly the most amusing and viva-

cious of chroniclets. He also left no fewer than 80,000 verses, a few specimens of which have been occasionally published; but his fame rests exclusively upon his historical work. This embraces the annals of the 14th century from 1326 to 1400, and was printed for the first time about 1498 at Paris by Antoine Vérard (4 vols. fol.), under the title of *Chroniques de France, d'Angleterre, d'Écosse, d'Espagne, de Bretagne, de Gascogne, Flandres, et lieux d'alentour*. The last and best edition is by Buchon (15 vols. 8vo., Paris, 1824), reprinted with important additions and improvements in the *Panthéon littéraire*, under the title of *Les chroniques de sire Jean Froissart, qui traitent des merveilles entreprises, nobles aventures, et faits d'armes advenus en son temps en France, Angleterre, Bretagne, Bourgogne, Écosse, Espagne, Portugal, et es autres, nouvellement revues et augmentées d'après les manuscrits, avec notes, éclaircissements, tables, et glossaire* (8 large vols. 8vo., Paris, 1835-'6). This, however, is far from being judged satisfactory by the learned, and a competent scholar has been for years preparing a new edition. A volume of extracts, containing the most interesting parts, was published in 1846. His Chronicles were first translated into English by Bouchier, Lord Berners (2 vols. fol., London, 1523-'25), reprinted in 1812 in 2 vols. 4to. Sir Walter Scott was of opinion that for artlessness and vivacity of style, this old version is to be preferred to the more exact and learned translation made by Thomas Johnes, under the title of "Sir John Froissart's Chronicles of England, France, and the adjoining Countries" (4 vols. 4to., Hafod press, 1803-'5). An edition of Johnes's translation has been published by Henry Bohn (2 vols. roy. 8vo., London, 1845).

FRONDE, a political faction in France which headed an insurrectionary movement during the latter part of the minority of Louis XIV. The name of *frondeurs*, which means literally slingers, was applied to its members in derision; in their sneering and flippant attacks upon Cardinal Mazarin they were said to resemble boys throwing stones from slings. The long and powerful rule of Richelieu had completed the work of centralizing all the power of France in the hands of the royal government, and finally broken the might of the independent families in the kingdom. The spirit of opposition, which was crushed in its last conspiracies, revived under his feeble successor in the parliaments or high judicial bodies, of which that of Paris numbered many persons of rank and distinction. Mazarin was hated by the great as a foreigner and friend of foreigners, and by the people for his extortions; he was beside despised, in spite of his successful management of foreign affairs, as an unworthy disciple of Richelieu. The parliament of Paris made use of its privilege to refuse the registration of some new financial acts of the court. It was in vain that several *lits de justice* of the king ordered the registration; the resistance became still more active. Mazarin resorted to violence, causing

the arrest of the two most zealous opponents of the court (Aug. 26, 1648). But the next day the people of Paris rose in arms, dispersed the Swiss guards, and erected barricades in the streets adjoining the royal palace. The frightened court repealed the new taxes and promised a better administration of justice. This still more encouraged the *frondeurs* of the parliament, whose continued opposition finally compelled the court to retire to St. Germain (Jan. 6, 1649). Paris was now in the hands of the insurgents, and Prince Louis Condé at the head of 7,000 men undertook to besiege it. The parliament called the people of the city to arms; the prince of Conti, the dukes of Longueville, Beaufort, Orleans, Bouillon, Elbeuf, Vendôme, and Nemours, the marshal de la Mothe, and the genial and popular De Retz, came forward as their leaders; spirited and beautiful ladies, among whom the duchess de Longueville was the most conspicuous, inspired their courage; and foreign aid was expected from the Netherlands. But the leaders of the movement, having it in their power to change it into a complete revolution like that which had just been achieved in England, became afraid of the consequences of their own victory, and hastened to conclude (March 11) a treaty with the court at Ruel. The subsequent phases of the Fronde were composed of intrigues and contentions for power between the princes of the blood and the cardinal-minister. After the return of the court to the capital (Aug. 18), Mazarin again used violence, and had Longueville and the princes of Condé and Conti arrested (Jan. 18, 1650). This caused risings in the provinces, and Marshal Turenne hastened to the rescue of the princes. After several advantages, however, the great general was routed in the engagement of Rethel (Dec. 18). The triumphant minister could not long enjoy his success; the united opposition of all parties compelled him to release the princes, and to fly to the Netherlands. The parliament proclaimed his banishment, and Condé reigned at court. The contest now degenerated into mere intrigue; the queen mother prevailed on Turenne to desert his party; the coadjutor De Retz, the soul of the first movement, was brought over by Mazarin. Condé fled to Guienne, rejected the compromising proposals of the young king, who at the age of 14 had nominally commenced his reign (Sept. 2, 1651), repaired to Bordeaux, armed his numerous adherents, and marched toward the capital; but Turenne commanded against him, and Condé would have been routed near Paris (July 2, 1652) if the gates of the city had not been thrown open to him. Paris, however, tired of commotions, treated with the court, which had withdrawn, and Louis promised an amnesty and the dismissal of the hated minister. Condé, having received a reinforcement of 12,000 men from Lorraine, rejected the propositions, and marched into Champagne; but finding no adherents, he went over to the Spaniards in the Netherlands. Louis XIV. having returned to his capital (Oct. 21), proscribed Condé, and forbade all political

action on the part of the parliament. Mazarin also returned triumphantly (Feb. 3, 1653) to his post. Many who had distinguished themselves in the parliament or under Condé were temporarily banished, and the movement in the provinces soon subsided (1653).—See De Barente, *Le parlement et la fronde* (Paris, 1859).

FRONTENAO, a county of Canada West, bounded S. by the river St. Lawrence, near its head in Lake Ontario; area, 1,342 sq. m.; pop. in 1852, 80,735. It is traversed by the Grand Trunk railway of Canada, which passes through Kingston, the county seat, and by the Rideau canal, which has a terminus at that city.

FRONTIGNAO, a sweet muscat wine made in Frontignan, in the department of Hérault. It is of two kinds, white and red, and is an agreeable table wine.

FROST. By fall of the temperature of the air to the freezing point, the moisture upon the surface of the earth is congealed, and appears in the form of icy particles, which, as well as the phenomenon itself, are designated as frost. Continuance of low temperature causes the frost to penetrate into the interior of plants, and further and further below the surface of the ground; that is, the moisture is converted into ice, the effect of which, by reason of its increase in bulk, is to burst the fibres of the plant, causing more or less injury, according to the delicacy of its organization, and the quantity of water it may have imbibed. In the soil a similar result takes place when by thawing the earthy particles are freed from the binding effect of the disseminated ice; and when in the spring the frost is said to have come out of the ground, its useful effect is perceived in the finely pulverized state to which it has reduced the clods. This action of the frost extends also to the disintegration of the rocky strata, and it is found to be a most powerful agent in the conversion of the solid materials of the earth to the condition of soil. The water penetrating into the crevices of the rocks and there freezing bursts off the layers, sometimes throwing them violently to a distance with an explosion, as if they had been blasted with powder. The force has even been applied as a mechanical power for splitting rocks, water being poured into the seams and allowed to freeze. What is called white or hoar frost, which is seen in cool mornings covering the ground and objects exposed to the weather, is frozen dew, formed when the air is not so cool as to prevent the dew from being precipitated, but when the surfaces upon which it falls have been reduced by radiation of heat (increased often by rapid evaporation) to so low a temperature as to cause it to congeal. Sometimes the frost does not appear until after the sun has risen, its rays having the effect to reduce the temperature of the surface for a time by increasing the evaporation. (See **EVAPORATION**.) A bright morning sun may thus aggravate the injurious effects of frost upon vegetation. To protect plants from frost, it is enough to prevent the radiation of heat from

their surface; but this can be done upon a small scale only. A thin covering of any kind of cloth spread over them will serve to check evaporation and the chilling effect it produces. Black frost is the effect produced when plants are frozen by congelation of the moisture within them without the appearance of congealed moisture upon their external surface.

FROST, WILLIAM EDWARD, an English painter, born in Wandsworth, Surrey, in Sept. 1810. He commenced his career as a portrait painter, and executed in the course of 14 years upward of 300 pictures of this class. In 1839 he attempted historical composition, and his "Prometheus Bound," exhibited in that year, gained the gold medal at the academy. In 1843 he won a prize of £100 in the Westminster hall competition by his cartoon of "Una alarmed by the Fawns and Satyrs." He thenceforth abandoned portrait painting, and has since confined himself chiefly to classical subjects, or those suggested by the poems of Spenser and Milton.

FROTHINGHAM, NATHANIEL LANGDON, D.D., an American clergyman and poet, born in Boston, July 23, 1798. He was graduated at Harvard college in 1811, and after teaching in the Boston Latin school and as private tutor, became in 1812 instructor in rhetoric and oratory at Harvard, an office which he was the first to hold. Meantime he pursued the study of theology, and in 1815 was ordained pastor of the First Congregational church in Boston. This charge he retained till ill health compelled his resignation of it in 1850. He is the author of more than 50 sermons, published occasionally, and also of a volume of "Sermons in the Order of a Twelvemonth" (Boston, 1852), none of which had otherwise appeared. He has also contributed many articles to religious periodicals, chiefly to the "Christian Examiner." While a student at Cambridge he delivered a poem at the installation of President Kirkland, and he subsequently contributed several versions from the German and original poems to magazines. In 1855 a collection of these was published in Boston under the title of "Metrical Pieces, Translated and Original," which are distinguished, as well as his prose writings, for refinement of sentiment and graceful expression.

FROTHINGHAM, RICHARD, jr., an American historian, journalist, and politician, born in Charlestown, Mass., Jan. 31, 1812. At an early age his attention was turned to politics and literature, and he formed a connection with the "Boston Post," of which journal he is yet one of the proprietors, as well as its managing editor, and the chief contributor to its columns. Having become known as a political writer and speaker, he was chosen to the Massachusetts house of representatives in 1839 by his native town, where he has always resided. He was reelected in 1840, '42, '49, and '50. He was during each of these terms a prominent member of the house, on account of his intimate acquaintance with parliamentary law and general history. In 1850 he was

Nominated for the office of representative in congress by the democrats of the (then) 4th district, but failed of an election. In 1851 he was a delegate to the national convention of the democratic party, and had an effective part in the measures which, in 1852, led to the nomination of Gen. Pierce for the presidency. Mr. Frothingham was elected one of the delegates from Charlestown to the convention called in 1853 to revise the constitution of Massachusetts. He took an active part in the debates of that body, especially on the subject of the judiciary, banking, corporations, the qualifications of voters, the frame of government, the house of representatives, and the militia. For many years he has been a powerful writer on banking, and his opinions with regard to it have been sanctioned by the laws of Massachusetts. In 1851, and in the two following years, he filled the office of mayor of Charlestown, and declined a 4th term. His "History of Charlestown" was published in 1848. In 1849 appeared his "History of the Siege of Boston, and of the Battles of Lexington, Concord, and Bunker Hill," which quickly passed to a second edition. No monograph on the American revolution has greater merit, and it is regarded as of the highest authority both in this country and in Europe. Mr. Frothingham is understood to be now engaged on another historical work. He is a member of the Massachusetts historical society, holding in it the office of treasurer, which he has discharged for several years.

FROUDE, JAMES ANTHONY, an English historian, a son of the late Archdeacon Froude, born at Dartington rectory, Totness, Devonshire, in 1818. In 1836 he entered Oriel college, Oxford. He took his degree in 1840, and 2 years after obtained the chancellor's prize for an English essay, and was elected fellow of Exeter college. Mr. Froude's sympathy with the high church views which then prevailed led him to entertain the idea of studying for the ministry; and he proceeded so far as to be ordained deacon in 1845. But he never undertook any clerical duty, and soon abandoned theology for literature. In 1847 he published a volume of stories, entitled "The Shadows of the Clouds," and in 1849 "The Nemesis of Faith," a well written but gloomy book, the tendency of which is to throw doubt on the usual theories of revealed religion. Shortly after the appearance of this book, Mr. Froude resigned his fellowship, and was obliged to give up an appointment which he had received to a teachership in Tasmania. For 2 or 3 years he wrote almost constantly for "Fraser's Magazine" and the "Westminster Review." One of his articles in the latter on the book of Job has been reprinted in a separate form. In 1856 the first 2 volumes of his "History of England from the Fall of Wolsey to the Death of Elizabeth" appeared, and in 1858 the 3d and 4th. The materials for this work are mainly derived from the public documents of the time, and the boldness and originality of the author's views have attracted

much attention. One of its marked features is an elaborate attempt to vindicate the reputation of Henry VIII.—RICHARD HURRELL, brother of the preceding, an ardent supporter of the "Oxford movement" in the church of England, in its earlier stages, born March 25, 1803, died Feb. 28, 1888. He was educated at Eton and Oxford, in 1826 was elected to a fellowship in Oriel college, and 8 years after was ordained by the bishop of Oxford. Four volumes of "Remains," made up of extracts from his journals, correspondence, and writings, in which may be seen the simplicity and sincerity of his character, and the Roman tendencies of the Oxford movement even at that early period, were published in London in 1888.

FROZEN OCEAN, a term sometimes used to denote those bodies of water near the polar regions in which vast masses of ice are found floating. (See ANTARCTIC, and ARCTIC.)

FRUIT, that organ of a plant which contains the seeds. The term is used in reference to every kind of plant which produces seeds or seedlike bodies, which, if not true seeds, answer the same end in reproducing the species. Thus the urn or capsule of a moss, the *apothecium* of a lichen, the *perithecium* of a fungus, the *sporangium* of an alga, the *archegonium* of a fern, are the fruits of these several kinds of plants. The pistil of a flower, which is in the centre of the blossom, itself a modified leaf, folds itself into a hollow chamber called the ovary, and when this has swelled and grown to maturity, becomes the fruit. Even in the lowest orders of vegetables, there is something answering to the pistil; and the fruit is therefore the ripened pistil. The shape and consistence of the fruit should be dependent on the nature of the pistil; but if it differs, the causes are to be referred to expansion, development, or suppression of some particular portions of it. The term fruit, in common language, and in horticultural books, signifies the matured envelopes of the seeds, such as the apple, pear, peach, nut, &c.; but in botany, as we have seen, the term is more extensive, and at the same time more natural. The fruit, then, being the ripened pistil, we should expect to see some trace of this upon the fruit; and such is the case, even in those fruits usually called seeds or grains, as the withered silky thread on Indian corn, or the remains of the summit of the pistil on the triangular grains of the sedge grasses, which are also seen in the withered eye of the apple. Some of the most juicy of the pulpy fruits, according to horticultural nomenclature, are merely the calyx monstrously developed, and in the apple, quince, pear, and the like, the hulls containing the seeds are the carpellary ovary and its cells. The ripened ovary, thus changed, bears the title of pericarp, and is composed of 3 layers, readily seen in the peach, where the skin is the epicarp, the pulp is the sarcocarp, and the stone is the endocarp. The seed is still within, and forms the kernel of the stone. Even these distinctions do not exist in all fruits which have pericarpal ovaries at first, for they may be all fused into one uni-

form substance, as in the nut, hardening into a woody shell; for example, the hazel nut and acorn. Fruits are divided into two classes, simple and multiple. The simple are the result of one flower, as the apple, &c.; the multiple are the result of several flowers, as the pineapple, where each eye or pip bears on its summit some trace of the pistil, and the entire flower spikes have grown together into a fleshy mass.

FRY, ELIZABETH, an English philanthropist, born in Bramerton, near Norwich, May 21, 1780, died in Ramsgate, Oct. 12, 1845. She was the daughter of John Gurney, a wealthy merchant and banker of Norwich, and one of her brothers was the author J. J. Gurney. The family belonged to the society of Friends, but did not adhere strictly to the usages of the sect either in dress, language, or social habits. Elizabeth with her 6 sisters dressed and conversed gayly, and took part in many of the social amusements of Norwich, which she even introduced into Earlham hall, her father's country residence. At the age of 17 she visited London in the height of the season, attended theatres and the opera, made acquaintance with Mrs. Inchbald, Amelia Opie, and Dr. Wolcot (Peter Pindar), and took especial delight, as she herself says, in "scandal and grand company." In 1798 an American Quaker, William Savery, who was travelling in England on a religious mission, preached in the Friends' meeting house at Norwich. The assembly consisted of about 200 persons, among whom were the 7 Earlham ladies, and Savery was astonished and pained to find himself in presence of the gayest company of Quakers he had ever seen. As he lamented in his discourse the departure of the ancient plainness and gravity of the sect, Elizabeth was profoundly affected, and subsequent discourses and conversations with the preacher contributed to her change to the strict piety and usages of a "plain Friend." In 1800 she was married to Joseph Fry, whose family belonged to the strict section of the Quakers, and she afterward resided in London, till in 1809 she removed to Plasket house, Essex. In 1810 she became a minister among the Quakers, and in 1813 made her first visit to Newgate prison, where she witnessed nearly 800 women crowded together in rags and filth, without bedding, and suffering all the privations and neglect of the old prison system. Her liveliest sympathies were awakened, and she supplied them with clothing, and did all that was then in her power to ameliorate their condition. After several other visits in 1817, she succeeded in establishing a school and manufactory within the prison, organized a ladies' association for the reformation of the prisoners, and thenceforward devoted all her energies to the promotion of prison reform. Within a few years she personally inspected prisons in many parts of Great Britain, extending the improvements which had already been introduced into Newgate, and instituting committees for visiting female prisoners. Her influence was apparent in most of the gaols, houses of correction, lunatic

asylums, and infirmaries of the United Kingdom. No prisoner who had once been under their superintendence was allowed ever to be lost sight of. Those under sentence of transportation were supplied with religious books, and a more favorable treatment of them was obtained from successive ministries. From 1837 to 1842 Mrs. Fry made several journeys in France and in northern and central Europe, visiting prisons, and expounding her plans of improvement to the public authorities. The baron de Gerando was her companion through the hospitals of Paris. The poet Crabbe addressed to her the lines, which appear also in his "Maid's Story":

Once I beheld a wife, a mother, go
To gloomy scenes of wretchedness and woe;
She sought her way through all things vile and base,
And made a prison a religious place;
Fighting her way, the way that angels fight,
With powers of darkness to let in the light.

She was greatly aided in her arduous labors by an exquisitely sweet and soothing voice, which at once subdued the most intractable nature.—See "Memoirs of Elizabeth Fry, with Extracts from her Journals and Letters; edited by Two of her Daughters" (2 vols., London, 1847).

FRY, WILLIAM HENRY, an American composer and journalist, born in Philadelphia, Aug. 1815. His father, William Fry, was proprietor of the "National Gazette" newspaper of Philadelphia. The son was educated in his native city and at Mount St. Mary's college, Emmitsburg, Md. His aptitude for musical acquirements was very early apparent, and his studies in this direction were guided by Mr. Leopold Meignen. His first orchestral productions were 4 overtures performed by the philharmonic society of Philadelphia in 1835, for which the composer received an honorary medal from the society. "The Bridal of Dunure" and "Aurelia," his first two operas, have never been represented, although selections from them have been given in concerts, lectures, &c. In 1839 he became regularly connected with the "National Gazette." In 1844 he was engaged as editor of the Philadelphia "Ledger" when the native American riots raged. He afterward wrote for the Philadelphia "Sun." In 1845 the opera of "Leonora" was written by him for the Seguin troupe, and was produced in June of that year at the Chestnut street theatre. An Italian version was performed in the spring of 1858 at the academy of music in New York. In 1846 Mr. Fry visited Europe, and remained there 6 years, residing chiefly in Paris, and corresponding with the New York "Tribune," the Philadelphia "Ledger," and other newspapers. Mr. Fry returned to America in 1852. In the same year he delivered in New York a series of 10 lectures on the history of music. Two new symphonies, "The Breaking Heart" and "A Day in the Country," were written as illustrations for these lectures by Mr. Fry. These, with two other symphonies, "Santa Claus" and "Childe Harold," were also soon after played by M. Jullien's orchestra in various parts of the

United States. Mr. Fry's next composition was the music to an ode written for the opening of the great industrial exhibition at New York in 1853. His last published musical work was a *Stabat Mater*, composed in 1855 with full orchestral and vocal score for performance at the New York academy. His most recently performed works are some violin quartettes. Since his return from Europe Mr. Fry has been attached to the staff of the New York "Tribune." He has also become known as a political orator, and as a popular lecturer on miscellaneous subjects.

FUCHS, or FUCHSIUS, LEONHARD, a German botanist and physician, born in Wemding, Swabia, Jan. 17, 1501, died May 10, 1566. He studied at Erfurt and Ingolstadt, adopted the doctrines of Luther, became in 1526 professor of medicine at Ingolstadt, and in 1528 first physician to the margrave of Anspach, and held the chair of medicine at Tübingen from 1535 till his death. He contributed much toward overthrowing the authority of the Arab physicians and to restoring the Greeks to honor. As a botanist he corrected many current errors in the nomenclature of plants. An American plant, the *fuchsia*, bears his name. He wrote a great number of medical and botanical works, of which the most important is a *Historia Stirpium* (fol., Basel, 1542).

FUCHSLA, popularly called EARDROP, a genus of ornamental and very showy plants, belonging to the natural order of *onagraceae*. The flowers of the fuchsia have the tube of the calyx drawn out and 4-cleft at the apex; within there are 4 petals of a different color, 8 stamens, and a threadlike pistil. The fruit is a 4-valved, 4-celled, many-seeded berry, which is ovate-globose or oblong in shape. The species are low shrubs, having usually opposite leaves, the flowers borne upon single axillary pedicels, though sometimes they are disposed in racemes at the ends of the branches. Perhaps the history of no other greenhouse plant presents so many interesting items as do the changes produced by the hybridizing and rearing of new varieties of this elegant flower. Loudon, in his "Encyclopædia of Plants" (1829), gives only 4 species and a single variety; and in his "Arboretum and Fruticetum" (1844) he gives 21 species. A writer in the "Penny Cyclopædia" (supplement) enumerates 50 species as the number described; and the flower catalogues of the present time (1859) furnish double the number of the choicest varieties only. For many years the only kind known in the United States was the *F. coccinea* from Chili, considered, not more than 20 years ago, one of the most elegant of plants, conspicuous for its axillary and drooping flowers, with scarlet calyx and violet-colored petals. We have lost sight of this older kind in collections. The small-leaved fuchsia (*F. microphylla*) has pubescent branches, with opposite, small, elliptic-oblong, acutish toothed, glabrous, slightly ciliated leaves; the flowers have a scarlet calyx and deep red petals, blossoming from June to September. It was found on the volcanic mountain Jorullo in Mexico by

Humboldt and Bonpland, and first known in England in 1828. The corymbose fuchsia (*F. corymbiflora*, Ruiz and Pavon) has somewhat 4-angled branches, opposite, petiolate, oblong-lanceolate, almost entire leaves; the flowers are 2 inches long, scarlet, and hang down in beautiful corymbs; an elegant shrub about 6 feet high, native of Peru about Obinco and Muna. *F. fulgens*, a Mexican species, is somewhat similar, and of magnificent proportions. The tree-like fuchsia (*F. arborescens*) not unfrequently attains a height of 15 feet; its branches are smooth, the leaves disposed in whorls of threes, oval-oblong, acuminate at both ends, petiolate, quite entire; the panicle terminal, trichotomous, nearly naked; the calyx funnel-shaped, with the lobes ovate-acute, spreadingly reflexed, as are also the petals; a native of Mexico. The graceful fuchsia (*F. gracilis*, Lindley) has the branches finely pubescent, leaves opposite, smooth, on long petioles; the flowers with convolute, retuse calyx, lobes of a scarlet color, and the petals purple. There are others, at one time much esteemed, such as *F. conica*, *F. macrostemma*, *F. globosa*, *F. excorticata*, low shrubs fit for bedding out in open ground in the summer; others 6 and 8 feet high, and others still from 12 to 16 feet, such as the apetalous fuchsia (*F. apetalæ*, Ruiz and Pavon), and *F. arborescens*. It would be difficult, if not impossible, to determine at this time from what sources the present highly reputed varieties have been obtained; yet probably the species we have cited and briefly described, and which were among the first known in Europe, were the parents. A writer in the "Gardener's Magazine" (London) thinks that many, at the time of his communication, may have come from *F. coccinea* and *F. arborescens*, as he found on experiment that certain species mingle freely, and that other species do not. The taller-growing kinds are frequently trained to single stems, and form superb-looking objects for the conservatory. The late Mr. Downing, in his "Letters from England," speaks of "fuchsias grown like standard roses to a wonderful size, with straight stems 16 feet high, and branching into spreading and dependent heads, covered with pendent flowers." He thought the *F. corallina*, among many kinds, was the finest sort for this treatment. Old plants which have flowered can be taken up on approach of frost, and kept through the winter in rather dry sand in any cellar which does not freeze; and when planted out in May in good soil, in some moist shady place, they will prove great ornaments to gardens. The taller kinds, which have been kept in the greenhouse, turned out of their pots into the border, would perhaps do better still; and cuttings put in for blooming plants on the previous summer, making thrifty young stocks, are very elegant when trained for outdoor blossoming. The larger-flowered sorts are considered preferable, though many of the smaller-flowered are exceedingly graceful and unique for pot culture. Some varieties have large white-calyxed

and scarlet-corolled blooms, and are unsurpassed; others of equal size have rosy calyxes; and by freak, the colors have become reversed, the corolla being white instead of the calyx, which is red or scarlet. As yet such kinds have poor, weak, and insignificant stems, foliage, and habits, and are cultivated more as objects of curiosity than of value. Even approaches to striped flowers are being made; and in fine, such is the propensity to sport in the fuchsia, that almost any kind may in time be anticipated. Indeed the facility with which the different sorts impregnate each other and produce showy flowers from new seedlings, the result of the union, has caused the fuchsia to take rank with the geraniums in floriculture.—The uses of these plants seem to be as yet very limited. The wood of *F. coccinea* is used in Chili to make a black coloring matter; and the leaves and branches are used for some kinds of medicine. The berries of *F. microphylla* are very sweet. Those of *F. excorticata*, a native of New Zealand, are greedily eaten by swine; and so sweet are they when ripe, that attempts have been made to introduce the species into other similar regions as a sugar plant.

FUCUS (Gr. *φυκος*, a sea weed), a genus of marine plants included with other genera in the common name algæ. Its relations have already been described, and some of the species named, in the article **ALGÆ**. Beside living species of fuci, there are others of particular interest from the occurrence of their fossil remains in the most ancient stratified rocks, associated with those of the oldest forms of animal life, also marine, to which they no doubt served as nutriment. They are abundantly met with in the sandstones of the Appalachians, covering the surface of the slabs with irregularly shaped ridges. The flagstones obtained from the Portage group of the New York system so abound with them, that the fossils are seen in every village where these stones are used for the sidewalks. They are particularly noted in the streets of Geneva, N. Y. (See Hall's "Geology of New York," p. 242.) The fossil fuci of the most ancient formations, according to A. Brongniart, are most nearly related to existing species, which belong to tropical climates; but the forms of marine vegetation found fossil in the rocks of the secondary and tertiary formation resemble those now living in temperate climates.—The living species of fuci found about the islands off the southern extremity of South America are so remarkable as to deserve particular notice. They grow up from deeply sunken rocks, and spread over the surface of the ocean, presenting the appearance of extensively inundated meadows. Ships penetrate with difficulty through the obstructions they present. The stems grow very rapidly, and have been known to attain the length of 700 feet; Lamouroux describes them as even exceeding 800 feet. Dr. J. D. Hooker, in the "Botany of the Antarctic Voyage of H. M. Discovery Ships Erebus and Terror, in the Years 1839-'43," gives an interesting ac-

count, among others, of the two gigantic species *Lessonia fucens* and the *macrocystis*. Seen from the surface in sailing over them, they appear like groves of trees, their stems from 8 to 10 inches in diameter, and the branches of the former species spreading out and dividing into sprays, from which the leaves are suspended. Covered with parasitic algæ, and with numerous species of adhering shell-fish, as the chitons and patellæ, and many crustacea and radiata swarming among their tangled roots, while fish of different species are seen darting through their foliage, they remind one of the coral reefs of tropical seas. Their stems strewed upon the beaches appear like driftwood, and, as they decay, exhale an almost insufferable odor like that of putrid cabbage. The *macrocystis* is a single stem, without branches, vegetating upon rocks in water not exceeding 8 or 10 fathoms in depth; but when swept away from these, it attaches itself to rocks 40 fathoms below the surface, and then elongates itself indefinitely. It is seen upon the beaches rolled up by the waves in great strands larger than a man's body, entangled one with another. The harbors about the Falkland islands, Cape Horn, and Kerguelen Land, are so filled with it that boats can hardly be forced through. The gulf weed is a species of fucus (*F. natans*). It is found floating in the Gulf stream, and in the great tracts of the Atlantic ocean called the Sargasso sea is collected as in the whirl of a vast eddy. It is this sea, presenting boundless fields of floating weeds, that gave alarm to the sailors of Columbus, who feared they might never escape from its entanglements. The fuci are remarkable among vegetables for the large amount of inorganic matter or ash they afford. It is from this ash that the principal supply of the carbonate of soda of commerce, called soda ash, has until recently been obtained. Dr. Thomson states that the gulf weed, which he calls *Sargassum vulgare*, contains 22.58 per cent. of ash; the *padina pavonia*, after drying, 84.75 per cent. They also yield iodide of sodium, and various salts of lime, magnesia, soda, and potash. Along the coast of the British isles, especially on the shores of Ayrshire, the plants are collected in large quantities after storms. They form a valuable manure, and on the west coast of Ireland the poorer classes are almost entirely dependent upon this material for the cultivation of their potatoes. It is carried to Galway from Slyne Head, 50 to 60 m. distant, and is then conveyed sometimes 80 m. into the interior. It is used raw as a top dressing, and the ash for the under crop. The plant also serves as a fuel for the poorer people, and is sometimes cooked for the food called dulse. Long before it was known to contain iodine it was esteemed a purifier of the blood and efficacious in warding off or curing scorbutic or glandular affections. The Icelanders also use different species of the fucus for food. The plants are washed in fresh water, then dried, when they give out a white powdery substance called mannite, sweet and palatable. This is

collected and packed away in tight casks, and is afterward eaten with milk, fish, or rye flour. Cattle and sheep are said to be very fond of this substance. Carrageen moss and the edible birds' nests are derived from fuci. Bromine and iodine are prepared from its ash or kelp.

FUEGO. See TERRA DEL FUEGO.

FUEL (Fr. *feu*, fire, contracted from Sp. *fuego*, Lat. *focus*, fireplace), the material used for producing heat by combustion. The term is commonly applied only to substances originally derived from the growth of plants, as wood, peat, charcoal, coke, and the various kinds of mineral coal. Even thus limited, it might properly include the inflammable gases, which are used of late for the sake of the heat generated by their combustion. The oils, animal fat, wax, alcohol, &c., are to some extent employed for the same purpose, and might be treated as species of fuel. But in the present article reference will be made only to the materials included in the popular use of the term; and these we propose to treat only in relation to their comparative values as articles of fuel, referring for further details respecting each to its own place in this work.—Some kind of fuel has always been an article of prime necessity to man, at least from the time when he began to prepare his food by the heat of fire, or had learned to prize its comfortable warmth in the cold of winter. His dependence upon it is shown by the substitutes he makes use of in passing through the barren wastes left by nature without fuel or water. The dung of the camel, dried in the sun, is gathered for fuel; and in parts of China and other eastern countries, the dung of cows and horses is collected and mixed into balls, with dust of coal, refuse vegetable matters, and clay; these balls are an article of traffic, and in China are transported upon the canals to distant places. As man gained experience in the properties and uses of the materials around him, the applications of fuel to supply his increased wants were greatly multiplied. By means of it clay was converted into better bricks than those baked in the sun, limestone was burned for cement, and the ores were made to give up the valuable metals they held concealed; and the subsequent treatment of these for obtaining the articles they were fitted to produce was also wholly dependent on the use of fuel. So from the fruits of the field were obtained by various processes, dependent on the combustion of fuel, new products, the continued preparation of which adds not a little to its value. But the modern discovery of its being the most available source of motive power has given to it a new importance hardly inferior to that derived from its other uses, causing it to contribute more than all the other resources of nations to their wealth and prosperity. The questions then of its supply and most economical application are of the highest interest.—Its original source, as already stated, is vegetable growth; but although the provisions of nature are such that the materials that supply this can never fail—inasmuch as the products of the decay or combustion of

all vegetable as well as animal bodies are the food of the growing forests, swept through their leaves by the four winds of heaven, which have gathered them up from all quarters—still the annual growth is so widely distributed, that the portion available for the wants of man would not long prove sufficient. The deficiency is amply supplied by the vast stores of fuel laid up from remote ages in beds of mineral coal. Though these are by no means inexhaustible, their extent is proved to be sufficient to justify a reliance upon them for many hundred years to come, when we may safely trust that the need of immense supplies of fuel will no longer be felt by man, or will be furnished from some other source of which we are now ignorant. Wood, the most universally known variety of fuel, presents itself in forms and qualities varying with the tree, and to some extent with the part of this from which it is obtained. It is made up of several compounds—the woody tissue or lignin, the sap, and the alkaline and earthy matters which remain after combustion as its ash. It also contains a variable proportion of water. The first two named are its combustible ingredients, upon which its value as fuel depends; and of these the lignin is of chief importance, often constituting in thoroughly dried wood 95 per cent. or more of its weight. Yet it is not the ingredient which gives to the wood its distinctive character, except so far as this depends on its density, for pure lignin, freed from the matters soluble in water, alcohol, or alkalies, is of uniform composition in all woods and leaves. The sap and the matters it brings with it differ in the different woods; on those of the pine family the sap bestows their resinous properties, on the oak its tannin, &c., and on the beech and birch the peculiar extractive matters which distinguish these. Its composition is not materially different in the proportions of carbon, hydrogen, and oxygen from that of the lignin; but the arrangement of these elements is such as to produce a variety of compounds of different properties. Its proportion is small in the mass of the wood, and is variable in the different seasons. In the spring it flows freely through the vessels, bringing life and vigor to the tree, and this is therefore the season for felling the tree when the object is to secure the principles contained in the sap; but on account of the increased quantity of water present, the wood is not so well adapted for fuel as in its drier condition in the winter. Schübler found that the ash tree felled in January contained of water 28.8 parts, while that cut in April contained 88.6 parts; the sycamore, 88.6 in January, and 40.8 in April; the white fir, 52.7 and 61.0. As the expulsion of the water present involves the consumption of a portion of the carbon of the wood, the more thoroughly this is air-dried or seasoned, the greater is its heat-producing power. As it dries it loses sometimes $\frac{1}{3}$ of its weight, yet from 20 to 25 per cent. of that which remains is moisture. If this be all expelled by methods carefully contrived to effect this without altering the relations

of the other constituents, the wood will absorb from the air 10 per cent. or more of moisture. The mean quantity of hygrometric water in 100 parts of various specimens of wood is thus given in the treatise of Richardson and Ronalds; in cord wood the seasoning would not have been so effectual as in the specimens employed:

Six months after felling.	Resinous woods.	Non-resinous woods.
Trunk wood.....	22	26
Brush wood.....	32	34
Young branch wood.....	33	36
In the driest state.		
Trunk wood.....	15	17
Brush wood.....	15	20
Young branch wood.....	15	9

The gravity of wood varies greatly with the different species, and also with its condition as to dryness. Though the solid fibre is heavier than water, the air contained in the cells buoys up the wood, and causes it commonly to float. As the fibre is the heaviest ingredient, a greater weight in dry wood indicates a greater proportion of woody or combustible matter. But even an approximate comparative determination of the quantity of this is attended with much uncertainty. The following table gives the specific gravities of the different kinds of wood named, according to the experiments of the best authorities:

The experiments of Wernek are not considered so accurate as those of Hartig and Winkler. His samples were dried in an oven so long as they continued to lose weight, and the specific gravity was then taken by immersing them in water. Winkler's experiments were upon exact cubic inch samples, uniformly dried for 6 months in a heated chamber and weighed in the air. The recent experiments of Karmarsh, made upon woods in the green state and in the dried state, give the following results:

weight in English pounds of one cubic foot of each kind, air-dried, the mean only being given of the two extremes of the original table. The experiments of Marcus Bull upon American woods were conducted with great nicety, the specific gravity of each being taken by coating the dry sample with a varnish of the same weight as water, thus retaining the air in the cells. The following table is contained in his original memoir, read April 7, 1826, and published in the "Transactions of the American Philosophical Society" (vol. iii., new series, pp. 1-60). This gives the weight of a cord of wood as it should be put up, the interstitial matter even then amounting to 44 parts in 100 of the whole bulk; as it often much exceeds this, the measure affords an estimate of the quantity of woody matter, even more uncertain than would be the estimate by weight, variable as this has been shown to be. The arrangement of the columns is as follows: A, specific gravity; B, lbs. avoirdupois in one cord; C, charcoal in 100 parts of dry wood by weight; D, specific gravity of dry coal; E, lbs. of dry coal in one bushel; F, lbs. of dry coal from one cord of dry wood; G, bushels of coal from one cord of dry wood; H, time in hours and minutes during which 10° of heat were maintained in the room by the combustion of 1 lb. of each wood; I, value of specified quantities of each wood compared with shell-bark hickory as the standard.

The last column of the above table contains the

The lignin of wood was first shown by Prout to be of the same composition in the different species of trees, by analyzing portions from the box and the willow, after they were freed from all soluble matters and thoroughly dried in the air. The box gave 50 per cent. each of carbon and of the elements of water, and the willow 49.8 of carbon and 50.2 of hydrogen and oxygen. Its composition is therefore thus expressed: $C_{24} H_{24} O_{24}$. Liebig, however, from the analyses of Gay-Lussac and Thénard, which were of oak (carbon 52.58, water 47.47) and of beech (carbon 51.45, water 48.55), gives the formula $C_{24} H_{22} O_{22}$. As the gaseous elements uniting in the combustion to produce water have but a feeble agency in developing heat, the calorific disengaged must be due to the union of the carbon with the oxygen of the air. To convert 52 parts of carbon into carbonic acid, there are required 138 parts of oxygen, and the heat developed in this reaction is sufficient to raise 3,666 parts of water from 32° to 212°. This accords with the practical results obtained by Ramford and Hassenfratz, giving 3,600 to 3,680 as the equivalent for dry woods. The composition of the sap is so nearly the same as that of the woody fibre, and its quantity is so small, that its presence modifies the result only in a very slight degree. The mineral constituents of some parts of the tree may have more influence, as in the bark of some trees they amount to 8 per cent.,

and in the leaves to 7. In the ultimate analysis of the wood there is also found about 1 per cent. of nitrogen. The analyses of M. Violette of different parts of a cherry tree, prepared with special precautions, exhibit in the following table these peculiarities of composition:

ELEMENTARY SUBSTANCES FOUND IN 100 PARTS OF WOOD.

When wood is exposed to the action of heat, its more volatile ingredients, as the hygrometric moisture, first escape; its gaseous elements are next disturbed from their state of equilibrium, and the hydrogen and oxygen when set free from one combination enter into new ones; portions of these gases combine to produce water; other portions seize upon the carbon and form with this a multitude of unstable compounds,

varying with the degree of temperature and the proportions of the elements present. If the process be conducted in close vessels away from the action of air or oxygen, the volatile ingredients may be driven off in the form of inflammable gases, and of vapors of water holding in solution numerous combustible principles, and last of all the vapors of the resins and ethereal oils constituting tar. Oxygen is required to complete their combustion and bring the elements of the fuel to their goal of carbonic acid (CO_2) and water (H_2O). In this process but a small portion of the carbon has been taken up and made volatile by uniting with the hydrogen and oxygen. This fixed ingredient is left behind in the form of charcoal, retaining the form of the wood. So when wood is consumed in the air, heat is first applied to drive out the volatile elements. The hydrogen eliminated in the pores of the fuel at a heat below that of redness takes hold of a portion of the solid carbon, and meeting the air they rapidly enter into combination with its oxygen, emitting light and heat. By the latter new supplies of the volatile ingredients are disturbed further within the mass of the burning body, and there by their ignition serve to keep up the process. There being no lack of oxygen, the combustion is complete, and the volatile products of the distillation process, if generated at all, pass immediately into the stable compounds of carbonic acid and water. The carbon attacked at its surface by the oxygen of the air yields more slowly, and the principal portion of it is left behind after the flame and rapid chemical action caused by the combustion of its volatile associates have disappeared with their departure. The combustion of this charcoal, going on only in the space it occupies, produces an intensity of calorific effect far superior to that derived from the burning of the gaseous elements. Hence, where concentration of heat is required, as in the smelting of ores, a condensed form of fuel like charcoal is more effective than one containing gaseous elements, which in their combustion dispense a very uncertain amount of heat, as they flit, perhaps but partially consumed, past the points where the effect is wanted, carrying with them a portion of the carbon of the fuel, and also more caloric rendered latent than the product of combustion of an equal weight of carbon is capable of absorbing. This will be again alluded to in this article in treating of the heating power of fuels. The difference in the pyrometrical effect of wood and charcoal would be still greater than it is, were it not for the property of charcoal of rapidly absorbing moisture from the air. When it is desirable to apply the heat generated by combustion at a distance from the fire, as in reverberatory furnaces, fuel is preferred that burns with a flame. So where the gaseous products are the object, to be used for purposes of illumination or otherwise, the fuel most abounding in hydrogen is sought for, and this may be the lighter kinds of wood, the resinous and oily products distilled off from its

fixed carbon, or the highly bituminous coals. The natural fuels thus give rise to a variety of artificial products better applicable for special purposes.—As charcoal is obtained from wood by charring, so from peat this fuel is obtained in a condensed form called peat charcoal, and from the bituminous coals the mineral charcoal or coke. The mode of occurrence of peat has already been treated in the article *Bog*. This fuel, found in great abundance and easily procured in many of the European countries, where other fuels are scarce, is there much more highly appreciated than it is in the United States. Its qualities have there been thoroughly investigated, and various methods have been contrived for improving its adaptation to the uses for which it is fitted. (See *PEAT*.) As a fuel, this material is much used for domestic purposes in the countries where it abounds, and it is applied both in the raw state and charred to manufacturing operations. In the neighborhood of Carolinen-Hütte, near Aichthal, in Styria, successful attempts have been made to smelt iron with it in its raw state, mixed with wood; while the charcoal obtained by charring it has long been successfully applied to the same purpose in Bohemia, Bavaria, France, Russia, and other countries. For generating heat this charcoal is stated by Dr. Muspratt to be, when of good quality, "as efficient as bituminous coal, and some varieties are even above the average heating power of the latter kinds of fuel." When freshly cut, peat contains from 80 to 90 per cent. of water, which by drying is commonly reduced to about 25 per cent. When well dried, the heating power of good peat is about the same as that of wood, and about half that of bituminous coal. The following analyses by Sir Robert Kane and Dr. W. K. Sullivan, editor of the Dublin "Journal of Industrial Progress," are of peat dried at 220°F . The proportions are calculated after deducting the ash. The percentage of the mineral ingredients varies in good peat from 1 to 5; some qualities contain much more, even 33 per cent., but such are worthless for fuel.

Varieties.	Carbon.	Hydrogen.	Oxygen.	Nitrogen, mean.

Dense peat, "	61.247	5.616	31.446	1.6904

—Reference has already been made to the practice of the Chinese in mixing together refuse combustibles with clay, and making of this compound an artificial fuel. Similar processes have been in use among other people, some of which are of very ancient date. The petroleum that is found so abundantly near the Caspian sea and in other parts of the eastern countries is converted into fuel by making a mixture of it with clay; and the Norwegians have long used sawdust and tar in a similar manner. The methods recently introduced in western Europe

of utilizing the dust of mineral coals and of charcoal are nearly all based upon the same principle of making these substances cohere by thoroughly incorporating them with tar or pitch, and then exposing the compound, when moulded into blocks, in some cases to a current of air to dry them, and in others to a high temperature in vessels serving the purpose of retorts. The former mode of drying is employed for mixtures of charcoal dust, tan, and similar substances, with tar or pitch, and the latter when refuse bituminous coal is used with about $\frac{1}{4}$ of its weight of pitch. Unless this distillation is conducted at a heat of from 400° to 600° F., so as to dispel the volatile ingredients, there is danger of subsequent spontaneous combustion. Some of these compounds of fine bituminous coal, pitch, &c., are found to possess equal if not superior heating power to that of the natural coal, and have the advantage moreover of being conveniently handled and stowed away. As the process is conducted at Blanzky in France, the coal is jigged to separate the slaty and pyritous particles. It is then crushed and introduced into a circular metallic basin, which revolves horizontally in a reverberatory furnace, the flame of which passes under it. Hot tar or pitch is gradually let in upon the coal from a reservoir over the fire to the amount of 7 or 8 per cent., and the mixture is stirred by stationary rakes attached to rods let down through the arched cover. When sufficiently mixed, the materials are made to drop through the bottom into a receptacle, whence they are removed while plastic to the moulds and there pressed by the hydraulic machine. The process of Mr. Bessamer appears to be most highly approved. It is applied only to fine bituminous coal without mixture, the object being to render this plastic by heat and mould it by heavy pressure into convenient shapes. In the softening process the coal may be exposed to the heat long enough for a portion of its volatile elements to be expelled, by which the product is rendered more dense and of the nature of coke; or it may be softened so quickly as to be but slightly altered in its chemical composition. The apparatus employed for the heating is a long rectangular iron retort, set in brick work over a fire and its horizontal flue. The hopper for feeding it is at the front end, which projects from the brick work, and the discharge is through the floor of the retort also in the extreme front end. The fine coal is introduced by a feeding drum arranged to keep the aperture tightly closed. The coal is received upon a horizontal shelf, which extends nearly to the back end of the retort, and it is moved on in that direction by an endless chain, which is furnished with scrapers, and is carried round a drum at each end of the retort inside. As the coal falls from the back end of the shelf upon the floor of the retort, it is pushed along by the chain and scrapers in the opposite direction, till it is discharged at the front end into a vessel placed underneath to receive it. In the bot-

tom of this vessel are 8 openings that communicate with the same number of horizontal cylindrical cavities arranged side by side in a massive block of iron. This block is strongly secured to heavy iron bedplates by keys and bolts, and upon the same foundation is placed the shaft, with its fly wheels and cranks that carry the piston rods or plungers, which work in the cylindrical cavities to compress and push out the blocks of coal. The arrangement of these is exceedingly ingenious. One set of 8 plungers, attached to the same crosshead, are connected by a short pitman directly with the crank in the centre of the shaft; while another set of 8 are worked in guides attached to the bedplates beyond the other end of the cylinders. These plungers, entering the opposite end of the cylinders from the first set, are set in motion by 2 long connecting rods, which pass outside of the bedplate, and are attached at one end to a crank on each extremity of the shaft, and at the other to the crosshead, to which the plungers are keyed as they pass through it. Both sets are thus moved by the same shaft, yet by the arrangement of the cranks upon this, those of the 2 sets being at an angle of 45° with each other, the piston rods are made to approach each other in the block to give the required pressure, and then to separate as the coal is pushed out of the back end by the plungers of the first set. This being done, the revolution of the shaft carries the back plungers in again, a new charge is compressed and thrust out, and thus the operation goes on, delivering 8 of the cylinders of coal with each revolution. The machinery is set in motion by a steam engine. The speed of the feeder drum and the chain and scrapers can be regulated to produce coal more or less volatilized as desired. The gas can be saved by passing it into a gas holder. It is found advantageous to use an air pump for reducing the pressure in the retort; the escape of the gases is thus facilitated at the lowest possible temperature, and the product is more dense when pressed. Highly heated steam may be employed instead of the fire, the steam being driven directly into the retort with the coal, and passed out into the gas holder. Where anthracite dust is cheaply obtained, together with large supplies of refuse bituminous coal, this process may be found still more useful by mixing the two varieties. —The composition of fuels is commonly expressed by stating the proportions of coke or charcoal, volatile matters, moisture, and ash. The ultimate analysis reduces the whole to its elements, and expresses the proportions of carbon, hydrogen, oxygen, nitrogen, and the ingredients of the ash. In order to ascertain the fitness of fuel for making gas and producing the fatty products, the proportion of volatile ingredients must first be ascertained, and then the nature of these, as the proportion of the inflammable gases to the liquid products. For other purposes the simple form of analysis is commonly sufficient. The ash is obtained by thorough combustion in an open platinum crucible, continued till

nothing is left but the gray or brown ash. The difference of weight of the crucible and its contents before and after the operation, deducted from the weight of the fuel employed, gives that of the ash. Another weighed sample subjected in a similar way to a heat of about 800° will give by loss of weight the amount of moisture; the crucible containing it is then closely covered to exclude the air, and is set in a Hessian crucible also closed with a cover, and containing calcined magnesia. This supports the platinum crucible, and keeps it from contact with the outer one. The whole is now exposed to a red heat for an hour. The volatile matters are thus driven off, and the difference of weight of crucible and contents before and after the operation gives their proportions. The charcoal or coke is the difference between the crucible with the residuum it contains and that of the crucible alone less the weight of the ash. This may be again obtained by consuming the carbonaceous residue exposed to a current of air. The heating power of fuel is often estimated by what is called the lead test, a method introduced by Berthier, founded on the theory of Walter that the quantity of heat developed by the combustion of bodies is proportional to the amount of oxygen assimilated. If this law were sound, the determination of the oxygen required to take up the combustible constituents in a certain weight of fuel would give at once its comparative calorific value. The results are so nearly correct, and the process is so easily conducted, that the method is still much employed. A weighed portion of the fuel finely powdered is mixed with 80 or 40 times its weight of litharge (oxide of lead), and introduced into an earthen crucible, the mixture being covered with a layer of litharge. The crucible is then carefully closed and exposed to a moderate heat till the carbon and hydrogen have abstracted the oxygen they require for their combustion, and left behind an equivalent amount of metallic lead. This being removed and weighed determines the oxygen that has been assimilated. Johnson found in his experiments that the results thus obtained were constantly about $\frac{1}{2}$ short of the truth. The defect of the process is that it gives the same result whether it is hydrogen or carbon that abstracts the oxygen, the difference of the calorific effect of the same weight of these two elements not being in fact proportional to the difference of oxygen they consume. This has been ascertained by determining, after the method proposed by Rumford, the increase of temperature communicated to a certain quantity of water in the process of oxidizing a certain quantity of fuel or other oxidizable body. The results thus obtained from a great number of substances by different chemists are given in the following tabular form by Dr. Muspratt in the 2d vol. of his "Chemistry." The table referred to presents the results of more than 90 experiments upon 29 different combustibles, including in these various gaseous, fluid, metallic, and other solid bodies.

From such a table, the proportions of carbon, hydrogen, and oxygen in any fuel being ascertained by analysis, the number representing its relative heating power may be calculated from the proportions of carbon and hydrogen, after deducting from the latter an equivalent to the oxygen present, the excess only being accounted available for raising the temperature. Still, though the figures of such a table correctly express the total amount of heat evolved and absorbed by the products of combustion of 100 parts of the fuel, the real pyrometrical effect is only known when allowance is made of the quantity absorbed by these products; and this involves the consideration of the quantity of oxygen or air consumed, and of the specific heat or capacity of taking up heat of the several products. This allowance being made, the remarkable prominence of hydrogen in increasing the calorific effect of bodies containing it is found to be greatly reduced; for in its union with oxygen it absorbs $\frac{3}{4}$ times as much heat as in that of carbon with oxygen; and the amount of this being calculated for the quantity employed, the deduction for the hydrogen will be found considerably greater than for the carbon. It is for this reason, and others which have been mentioned in a previous part of this article, that wood and the bituminous coals are charred, their pyrometric effects being increased by the larger proportion of carbon in the charred product. The intense degree of heat evolved in the use of the condensed fuels adds largely to the capacity of heat of the aqueous vapor, and hence further lessens the value of hydrogen in fuels intended for the uses to which they are applied. But for other objects, requiring a quick heat and at the same time diffused over considerable space, the more inflammable fuels are found more efficient; and according to the mode in which their heating power is estimated they may even be claimed as producing a greater amount of heat than the more carbonaceous varieties. Whenever the heat from the combustion of hydrogen can be concentrated, as in the hydro-oxygen blowpipe, a more intense degree is obtained than by the use of any other fuel. Other considerations, therefore, beside the chemical composition of fuels, affect their value. For practical purposes a more change in the mechanical structure may

give an entirely different character to them, while their real calorific power is not altered. This is apparent in the coals, which are rendered almost worthless when reduced to dust, until in the patent fuels they are reconverted into solid form. Wood possesses very different values in solid sticks, in shavings, and in saw-dust. In ordinary use other circumstances are to be taken into account, as the arrangements for utilizing the heat produced, so that there shall be the least amount lost; also the provisions for insuring perfect combustion of the fuel. The loss of heat resulting from imperfect arrangements in these respects alone has been estimated at full one half of all that generated. The chimney necessarily carries off a considerable portion, as there will be no draught, and consequently no continued supply of air to support the combustion, unless the column floating upward by its rarity produces a partial vacuum to be filled with fresh air passing through the fire. The quantity of this admitted should be limited to a proper excess only of that absolutely required for the thorough combustion of the fuel, and this can be determined for each variety of fuel only by the experience and good judgment of the operator, the object in view being a uniform rate of combustion more or less rapidly conducted, according to the fuel employed and the special purpose to which it is applied. The quantities necessary for complete combustion of one pound of the different fuels are given in the following table, the temperature of the air being 66.2° F. and its weight 0.075 lb.:

Name of fuel	Cubic feet.
Peat	70 to 149
Peat charcoal	155 to 238
Bituminous coal, by the lead test (average 238)	170 to 279
Bituminous coal, Dr. Richardson	273 to 306
Bituminous coal, average qualities from the coal formation, Regnault	330 to 333
Bituminous coal from the upper secondary formation, Regnault	293 to 324
Coke	194 to 250
Anthracite, by the lead test	233 to 277
Anthracite, Regnault	313

We present below portions of various tables which have been prepared by different authorities to represent the comparative values of the fuels named, according to the methods adopted of determining these. The first is from Scheerer's *Metallurgie*, in which the heating effect is calculated from the results of analysis according to the method explained above, the estimations of Dulong being the standard. The figures in the first column refer to the heating effect of carbon taken as unity.

Table continued.

The following tables contain the results of experiments by the lead test, and of the evaporating power of fuels, as given by different authorities. In each table, column A gives the lbs. of lead reduced by 1 lb. of the respective fuel; B, the lbs. of water that may be heated from 32° to 212° by 1 lb. of the fuel; C, air at 66° F. required to consume 1 lb. of fuel (given for wood in Hessian lbs. and cubic feet); D, lbs. of oxygen required for complete combustion of 1 lb. of wood; E, lbs. of water according to analyses.

The qualities of the American coals have been ably investigated by Prof. W. R. Johnson, who was commissioned by the U. S. government for this purpose, and whose report was addressed to the navy department in 1844 (Senate Document No. 386). The results are presented in a condensed form by Prof. Johnson in the Amer-

ican edition of Knapp's "Chemical Technology." His operations were conducted upon a large scale, 4 trials being usually made in ascertaining the evaporative power of each coal, and each trial consuming from 800 to 1,200 lbs. The total number of trials was 144, in which 62½ tons were consumed. The object was particularly to determine what coals were best adapted for steam navigation; and the points of special attention were essentially the same as those to which the attention of the commission afterward appointed by the British government was directed, viz.: 1, the capacity of the coals for raising steam quickly; 2, for raising it abundantly for the quantity consumed; 3, freedom from dense smoke in its combustion; 4, freedom from tendency to crumble in handling; 5, capacity, by reason of its density, of close stowage; and 6, freedom from sulphur. The names and exact localities of the particular kinds of coal which were employed in these experiments are now in most instances lost; but their composition being preserved in the records of their analyses, the principles established are readily applied to other coals of similar composition. It should also be added that the semi-bituminous coals experimented upon were chiefly from the northern margin of the coal basin, but that coals more highly esteemed have since been obtained in the central portions of the basin on George's creek, which, from the preference they enjoy in the coal trade, it is believed would have furnished still better results for this class; and late investigations of Prof. Doremus of New York prove that these coals from George's creek cannot be considered as liable to spontaneous combustion. The English commissioners were Sir Henry De la Beche and Dr. Lyon Playfair. Their first report was made in 1848, and the final report in 1851. Convenient reference for the most important results of these may be made to the article "Fuel" in Tomlinson's "Cyclopædia of the Useful Arts." The table below was arranged by Prof. Johnson from the more detailed tables contained in his report, and was published in the work above referred to. It contains 25 varieties of coals, 5 from each one of 5 different classes, and is succeeded by one summing up the results or presenting a general scale of relative values made up from the averages of the classes. From this it appears that in evaporative power under equal weights the Cumberland class surpasses the anthracite by about 2.3 per cent., and under equal bulks by 1.4 per cent. From single experiments, however, the most water evaporated was with anthracite. [See note, vol. v. p. 884 of this work, article COAL.] The anthracites also surpass the foreign bituminous coals 20 per cent. when we compare equal weights, and 26 per cent. by equal bulks. In freedom from clinker the anthracites stand preëminent; in rapid production of steam, when once in action, the Pennsylvania bituminous coals are somewhat superior to all others, and for rapidly getting up steam the foreign bituminous coal

are most effective." Column A gives the relative evaporative power of equal weights of coal; B, comparative power of equal bulks of coal; C, relative freedom from tendency to clinker; D, rapidity of action in evaporating water; E, facility of ignition, or readiness with which steam is got up; F, sum of the relative values in the preceding columns.

FUENTERRABIA, or FONTARABIA, a city and port of Spain, in the Basque province of Guipuzcoa, at the mouth of the Bidassoa, on the French frontier; pop. 2,035. It was formerly well fortified, but the French dismantled it in 1794. It has some manufactures of hempen shoes, linen, cloth, marine stores, and earthenware. It has sustained several sieges, and was the scene of a victory over the Carlists by the auxiliary British legion under Gen. Evans in 1837. During the peninsular war, the Fuenterrabians were reproached with singularly inhospitable treatment of disabled British troops.

FUEROS (probably from Sp. *fuera*, outside, or foreign), the term applied in Spain to the ancient constitutional privileges of the Basque provinces, Guipuzcoa, Álava, Biscay, and Upper Navarre. The original meaning of the word in-

dicates that those provinces are outside of the ordinary administration of the kingdom. Their government is essentially republican, the king having only the power of nominating the corregidor or chief magistrate, whose nomination has to be confirmed by the junta of the province, a legislative body elected by almost universal suffrage. The inhabitants of these provinces are exempt from all taxes and imposts except such as they vote themselves, and claim by virtue of their birth the privileges of Spanish nobility. From the remotest antiquity they have maintained their rights against all the dynasties of Spain. In the 13th century the fueros were embodied in a written code, which was enlarged and reconfirmed in the reign of Charles V. In 1838 the assertion of their privileges by the Basques gave rise to civil war, which lasted for several years and terminated in the formal admission of the validity of the fueros by the cortes and queen of Spain in 1844.
